All which Method of Arguing, will be clear enough to one that considers 'tis the Property of all Fluids, from the known Laws of *Hydrostatics*, to have their infinitely small Columns, of which they consist, to be every where a Balance to one another.

PARADOX VII.

That a Body immersed in a Fluid, sustains a lateral Pressure from the Fluid; which also increaseth as the Body is placed deeper beneath the Surface of the Fluid.

Take a slender Glass Tube, and let it be bent so near the Bottom, that the lower Part FG may very nearly make a Right Angle with the other Part

EF . Dip this Pipe or Syphon in Oil of Turpentine, and take up about 3 or 4 Inches of it in the Pipe, which you may keep there by applying your Finger to the upper Orifice.

This done, move the Syphon into a Glass of Water, and place it so there, that the longer Leg may stand perpendicularly to its Surface, and that the other lower Leg may be so far below the Surface of the Water, as that the upper Surface of the Oil in the longer Leg, be but a little higher than that of the Water in the Glass: For then if you remove your Finger from the Top, the Oil in the Tube will very little, if at all, change its Station; which shews plainly, that there is a lateral Pressure against the Oil at the lower Orifice G , which hinders its running out, though pressed by the Cylinder of Oil contained in the perpendicular Leg. And as if you raise the Pipe up higher (keeping it still in its perpendicular Posture) the Oil will drop out; so if you sink it lower, the Water will get in at G , and force the Oil all out of that Leg $G F$, and raise the Oil proportionably in the perpendicular one EF : Nay, if you thrust it low enough, the Water will rise up into the longer Leg, and bear the Oil above it; which last Circumstance proves, That Water hath a lateral

a lateral Pressure against it self; as great as the perpendicular one from above, since that only can force the Water up into the perpendicular Leg.

If also keeping the Tube at the same Depth, you turn the Horizontal Leg here and there, or place its Orifice *G* in any Part of the imaginary Plane *FG*, the Oil will keep its former Station in the Tube, and neither rise nor sink; which shews, That this lateral Pressure is equable and uniform in all Places or Parts of a Vessel of Water, at the same Distance from its Surface.

Our Noble Author confirms the Truth of this Paradox by the following Experiment:

A small Glass Bubble *X*, of the Figure in the Scheme annexed, with a very slender Neck, and so well poised, as that it could just float in the Water,

and no more, being provided, was put into a wide-mouth'd Glass Vessel, near filled with Water, and there left to float at the Surface of that Liquor. Then a Cover or Stopple of Cork was well fitted to the Mouth of the Glass, and was thrust hard into it; after which there was an Hole burnt (with a hot Iron) thro' the middle of the Cork, into which was put a long slender Glass Pipe, reaching a good

way into the Glass, and standing perpendicularly to the Surface of the Cork.

Also in another Part of the Stopple was another small Hole burnt, and into that was fitted another small Glass Tube, which lay sloping; but yet reached a pretty way down below the Cork.

The upper Orifice of this sloping Tube was well stopp'd with Cement: With the same Matter also were all the Junctures between the Cork and the Glass, and between the Tubes and the Cork, carefully stopp'd.

This all done, the Vessel was inclined several ways, that the Bubble *X* might get as far as it could from the Pipe; and then more Water being poured in at the upper Orifice of the open Pipe *EE*, till it reached to a good Height, as suppose to *K* in the said Tube, the Bubble *X* would presently sink to the Bottom of the Vessel, and there continue as long as the Water was continued at the same Height in the Tube *EF* (the reason of which you have already in *Experiment 2. Paradox 2.*) Now this proves, That the Pressure of the Water contained in the Tube *EF*, doth not only affect the Parts of the Water immediately subjacent to it, but also those that are remote from it; nay, and above it, since it could force the Water into the Bubble *X*, and so make it sink, tho' it lay not near the Orifice *F* of the open Tube.

PARADOX VIII.

That Water may be made to depress a Body lighter than it self, as well as to buoy it up.

A slender Glass Syphon *EF GH*, whose shorter Leg *GH* was about 3 or 4 Inches long, and turn'd up

up as near as could be parallel to the longer *EF*, was dipp'd in Oil of Turpentine, till the Oil filled the shorter Leg, and rose to an equal Height in the longer.

Then the Orifice *E* being stop'd with the Finger, the Pipe was moved into a Glass Vessel of fair Water, and sunk down there till the Surface of that Liquor was about an half Inch above the Surface of the Oil in the Syphon: And then the Finger being removed from the Top, the Oil in the shorter Leg was immediately driven downwards about an Inch; and as the Tube was sunk lower, much more, till at last the Oil was driven out of that Leg quite, and the Water following it supported the Oil in the longer Leg, raising it also in the same Proportion. The reason of which is obvious from what hath been said in the former Paradoxes.

Our Author found also, that when he used a Syphon of the Figure annexed, the Water would

first press the Oil Horizontally from *L* to *M*, then downwards from *M* to *N*, and at last (by sinking the Tube still lower) upwards from *N* to *P*: From whence it appears, that Water presses against any Body placed in it all manner of Ways, and that proportionably to the Depth of the Body in it.

PARADOX IX.

That whatever hath been said of Positive Levity, a Parcel of Oil, lighter than Water, may be kept in that Liquor without ascending in it.

This may very easily be experimented, by taking only a small Glass Tube, and immersing it an Inch or two under Water: Stop the upper Orifice with the Pulp of your Finger, and then a Column of Water of an Inch or two in length will remain suspended in the Tube: Keep it so, and next dip the same Tube into a Vessel of Oil of Turpentine, and removing your Finger, as much Oil of Turpentine as you please will rise into the Tube; which, by putting on your Finger to the upper Orifice, may be there easily suspended, as the Water was before. Keep it so, and then immerse the Tube in a Glass of Water 3 or 4 Inches beneath its Surface, and you will find on the removal of your Finger, that the Water will rise up into the Tube, and keep the parcel of Oil suspended between two little Columns of Water. The Reason of which is sufficiently accountable from many things already delivered.

PARADOX X.

That the Cause of the Ascension of Water in Syphons, and its flowing thro' them, may be explicated without having recourse to Nature's Abhorrence of a Vacuum.

Provide a pretty large Cylindrical Glass Tube Vessel of about 18 Inches, or two Foot long, as *ABCD*; provide also a Syphon of two Legs, *KF* and *KG*, with a hollow Pipe, as *KE*, opening into, or communicating with them; to each of these two Legs of the Syphon (one of which must be longer than the other) tie with a String a Tube of Glass *I* and *H*, sealed at the Bottom. Pour then in Water at *E*, and let it run out at *I* and *H*, till it hath filled the Tubes hanging at the Ends of

the Legs of the Syphon so far, that the End of each Leg be a little beneath the Surface of the Water.

This done, and the Pipe and Syphon fastened in its true erect Position, if you fill the Vessel *ABCD* with Oil of Turpentine, till it reach higher than the Syphon *K*, stopping in the mean time, if you please, the upper Orifice of the Pipe *EK* with your Finger.

After this you will find the Oil to press so on the Water in the Tubes *I* and *H*, as to force it up into the Legs of the Syphon as high as *K*; and that on the removing of your Finger from the Top *E*, the Water will begin to run out of the upper Tube *I* into the lower one *H*, as in or thro' a common Syphon or Crane.

Now 'tis plain, in this ingeniously contrived Experiment, that the Water runs through the Legs of the Syphon, tho' the Air coming down by *EK*, hath a free Communication with them both, so that here no *fuga Vacui* can be pretended as the Cause of the Waters running; but that 'tis plainly occasioned by the Pressure of the (lighter Fluid)

Oil of Turpentine, on the Surface of the Water in the Tube *I*, till it force it up into the empty Leg of the inserted Syphon as high as *K*, and then it descends down into the lower Vessel or Tube *H*, thro' the other longer Leg of the Syphon. Indeed the Oil will gravitate on the Surface of the Water in both the Tubes *I* and *H*; and there being a longer Column of Oil over *H*, than there is over *I*, by about an Inch in length, the Pressure will be greater on the Surface of the Water in *H*, by the Weight of an Inch of Oil of Turpentine. But then it must be considered, that the Column of Water which descends in the Leg *G*, though resisted in its motion by the Weight of an Inch of Oil, more than the Water which tends downwards in the Leg *F*, is yet also longer by an Inch than the other Column of Water in the shorter Leg *F*; and an Inch of Water of the same Dimensions being heavier than an Inch of Oil, the Tendency or Motion of the Water must be from *F* towards *G*, not from *G* towards *F*; and consequently the Syphon will work or run that way.

The Application of this Experiment to the Solution of the Motion of Water through Cranes or Syphons is very easy:

For when once a Syphon, by Suction or otherwise, is filled with the Liquor 'tis to transmit; if the Legs of it be not above 34 or 35 Foot in length, and one of them be longer than the other, the Liquor must continue to run thro' it as long as there is any to rise in it, or that the Syphon hold stanch: For since the Pressure or Weight of the incumbent Atmosphere is capable of raising Water in Pipes (where it cannot come to press) to the Height of 34 or 35 Feet, as our Noble Virtuoso proves in his *Physico-Mechanical Experiments*; and here being manifestly no Gravitation of the Air on the Water included in the Syphon, as long as the Syphon is right and stanch, the Water must continue to keep running, because the Difference of the Pressure of the Air on the lower Vessel of Water, and on the upper, being nothing near so considerable as the Difference between the Weight of the Water in the longer Leg of the Syphon, and that in the shorter, the Tendency or Motion must be out of the shorter into the larger.

But then, if never so little an Hole be made in the Crane or Syphon, or any Leak be there, the Water can no longer run, because the Air now comes to press on the Water within the Syphon, as well as on that without it, and consequently must hinder it's Course of running.

PARADOX XI.

That a Solid Body, as ponderous as any known, tho' on the Surface of the Water it will sink by its own Weight; yet if it be placed in a greater Depth than that of 20 Times its own Thickness, it will not sink, if its Descent be not assisted by the Weight of the incumbent Water.

Fill a deep Glas Vessel, of about 2 or 3 Feet in length (a large Tube, sealed at the End, will do very well) with Water, as in the Figure: If then a little Cylinder or Cube of solid Brass, as *E*, be any where placed, either at the Surface, Middle, or towards the Bottom of the Vessel, still it must sink to the Bottom, because the compound Column of Water and Brass together (which Brass is almost

most 9 times as heavy as common Water) will gravitate or press more than any Column of Water only of the same Length and Diameter ; and consequently the Brass will displace the Water under it, and sink lower and lower till it come to the Bottom ; and this is the Case of a Stone, or any other heavy Body, &c. But yet, if you suppose this Piece of Brass placed on the imaginary Surface *LM*, above 9 times its depth under Water, and that it were possible to keep off the Pressure of the Water perpendicularly incumbent upon it, it is not reasonable to suppose, That the Brass should sink at all, but be supported and buoyed up there : For the Brass can in this Case charge the Water under it at *F*, with no more than just its own proper and absolute Weight ; whereas all the other Parts of the Surface *LM*, are charged or pressed upon by Columns of Water, which, supposing them to be of the same Diameter with the Piece of Brass, or singly heavier than the Brass, because they are above 9 times as long as the Brass is thick ; and therefore press-

which, tho' it would stop the Valve exactly, would yet easily fall out, if not suspended or supported by

ing or gravitating more on *LM* than the Brass doth, must keep the Brass suspended ; which cannot sink, because it cannot remove a Weight of Water heavier than it self. And from the same Principles 'tis plain from Reason, That if the Brass be placed yet lower, and the Pressure of the incumbent Water be, as before, taken off, instead of sinking, it must needs rise, and be forcibly lifted upward. This also must be the Case of a Piece of Gold, if it were placed in these Circumstances, in a Vessel of Water, where the perpendicularly incumbent Pressure was kept off, and the Gold above 19 Times its own Thickness in the Liquor.

To make good which probable Reasoning by Experiment, our Author proceeded thus :

A large deep Glass Vessel was provided, of the Figure annexed, which was filled with Water near to the Top, as to *XY* : Then at the Bottom of a Glass Tube, open at both Ends, there was, by good Cement, fastened a Brass Valve, into which was turned and fitted a Piece of solid Brass *EF*,

any thing : To the upper Side of this Brass Piece *EF* let there be a Button fastened, whereby it may, by means of a String coming up through the Pipe *PO*, be drawn up close, so as to stop the Valve.

All things being thus-fitted, if you sink the Tube with its Valve and Brass Stopple, and by the String keep the Stopple fast in, till the Brass be about 9 times its Thickness beneath the Surface of the Water in the Glass Vessel, you will find, tho' you loosen the String, that the Brass Stopple will not fall out ; because the Valve being close, and the Sides of the Glass Tube not capable of being premeated by the Water, there can no more of that Liquor press upon the Brass Stopple perpendicularly ; but whatever Pressure it sustains, is from the Tendency of the Water upwards, which must needs serve to support it, since that is greater than the Weight of the Brass. But if you raise the Tube up towards the Top of the Water, the Brass Weight over-balancing there the Pressure of the Water upward, it will soon, if not held by the String, slip out of the Valve and fall down, and the Water will immediately rise in the Tube.

And if, instead of raising the Tube up towards the Surface of the Water *XY*, you should sink it down much deeper toward the Bottom, you will find that

that this Brafs Stopple, which will fall out readily in the former Station, will now support a considerable Weight (as *Z*) fastened to it by a Bottom made on the under Surface of it; but that on the raising of the Tube upward, this additional Weight will make the Stopple drop out much sooner than before: As suppose, when the Tube is raised only to the Height of 3 or 4 Inches, &c. which Experiments do abundantly confirm the Truth of this Paradox; and no doubt can be made, but that if a Gold Stopple had been used instead of a Brafs one, and the Tube let down into the Vessel, till the Gold had been above 19 times its Thickness under Water, even that ponderous Metal would have there remained without sinking.

N. B. This Experiment may most readily and easily be tried (as I have often done my self) with Mercury: If you take a slender Glass Tube or Pipe, of about $\frac{1}{2}$ of an Inch Bore, or rather less, and dipping the lower End into a Vessel of Mercury, you then stop the upper End with your Finger, by which means you may keep half an Inch, more or less, of that ponderous Fluid suspended in the Pipe; and then if, keeping your Finger thus, you immerse the Tube into a long Glass of Water, till the little Column of Mercury be more than 13. or 14 times its length under Water, you will find on removing your Finger, that the Mercury will be kept suspended in the Tube by the Pressure of the Water upwards; but that if you raise the Tube up but a very little above the former Station, the Mercury will immediately run out: Whereas, if before you had removed your Finger from the Top, you had sunk the Pipe so low, as that the Mercury were 12 or 14 Inches, $\frac{2}{3}$ below the Surface of the Water, that then the Mercury would be violently forced up, and make several Ascents and Descents in the Tube, till by degrees it had gained its proper Station in it, according to the Laws of Specific Gravity.

Indeed this Experiment will not be of a very long Continuance, because the Water will by degrees get up between the Mercury and the Sides of the Tube; but it will last a few Minutes, and longer if the Tube be very slender, which is time enough to satisfy any one of the Truth of this Paradox.

From hence may the Adhesion of the two polished Marbles together, when the upper is suspended, and a great Weight hung to the latter, be easily accounted for: For since the Atmosphere presses or gravitates with its whole Weight on the under Surface and Sides of the lower Marble, but cannot do so at all on its upper Surface, which is closely contiguous to the upper and suspended Marble, it must needs keep the Stone buoyed up or pendulous, 'till such time as either the Air insinuate it self in between the Stones, or that a Weight be affixed to the lower Stone, which exceeds the Weight of a Pillar of Air, whose Diameter is that of the Marble, and its Height reaching to the Top of the Atmosphere: And that this is the reason of their Cohesion, is plain, because when they are thus suspended, and do adhere to each other in the Receiver of the Air Pump, on a very few Pumpings of the Air out of the Receiver, they will immediately disjoin and fall asunder.

Thus far went this Excellent Gentleman; But that the Mathematical Reader may also be pleased in his way too, he has the following short Account of

Hydrostaticks, drawn up from Dr. Wallis and some other Authors.

PROP. I.

Let the Vessel *ARIB* be fill'd with Water, or any other Fluid, whose Surface we suppose to be even; (which, though in reality it will not be a Plane, but part of the Surface of a Sphere concentric with the Earth; yet we shall all along consider it as a Plane, or as differing insensib'y from one;) I say, if this Surface be supposed even at first, 'twill still remain so.

Which is thus demonstrated :

Let the even Surface AB of the Vessel $AKIB$ (See Fig. 1.) be either not pressed at all, or else pressed equally in every Part, as will be the Case, allowing the Pressure of the Air, which is an Homogeneous Body with respect to Gravity, and presses equally in all the Parts of so small a Surface. Now since the Parts of the Fluid below are all acted upon by Gravitation, they cannot ascend, and so elevate any part of the Surface AB ; nor can the Fluid subside in one part, and so be elevated in another, being the Pressure against the Bottom is every where equal, and consequently hinders one another's Subsidence, supposing the Fluid divided into any number of equal Columns: Hence it follows, from the contrary Pressure of these equal Columns at the Bottom of the Vessel, that there can be no Motion; that is, the Surface will remain even without any manner of Disturbance. *Q. E. D. See Dr. Wallis's Mecha. Prop. 8. Cap. 2. de descensu gravium.*

But if the Fluid be put out of this State by some external Force, so that one part of it, as *D* (Fig. 1.) be elevated above the rest, do but remove the Force, and it will return to its former Horizontal Position, partly upon the Account of its Fluidity; the Parts above flowing down into those Places that are below them, and also because the subjected Part *C* being more prest than the other Parts of the Surface *AB*, this Pressure will be continued to the Bottom of the Vessel; where, by reason of the resistance made by the Bottom, it will be communicated to those Parts that are less prest, forcing them to ascend so long till the *Equilibrium* be again restored, *i. e.* till *AB* become even and parallel to the Horizon: So that altho' the Surface be not a Plane, as it was supposed in the foregoing Proposition, yet if the force be removed that made its Surface unequal, it will again recover its former State.

There

There may be some Accidental Variations which we shall not at present consider, as that the Parts of the Fluid may happen to be tenacious, &c.

If the Fluid be pressed more in one part than another, as in *C*, by reason of the incumbent Body *D* (Fig. 1.) (which Body is supposed to be specifically heavier than Air) then will the part of the Fluid *C* subside, forcing the other Parts of *AB* to rise, in order to make way for it; and this will happen till such time as *C* is no more pressed than any other Parts of the Surface *AB*.

And what we have said of *AB* is equally true of any parallel Surface with the Fluid; as of *EF*, whose Surface is Horizontal, and will remain so, the Pressure being every where equal: But if the immersed Body *H* be specifically heavier than the Fluid, the subjected Part *G*, as sustaining a greater Weight, will be depreſt, forcing the Fluid to rise in the parts about *EL* and *MF*, which parts have a less Pressure upon them than the part *LM*.

COROLLARY I.

Fig. 1. If the Body *D* be precisely as heavy as so much Air equal to it in Bulk, then will *NO*, that Portion of the Surface which *D* insits upon, have the same Pressure upon it with *AN* and *OB*; and consequently the Surface will retain its Horizontal Position, as having still every where an equal Pressure upon it.

COROLLARY II.

If the Body *D* (Fig. 2.) be specifically lighter than Air, and if it be supposed not to fly away, then will that part of the Fluid it insits upon, be less pressed than *AN* and *OB*, and consequently will rise so high, till *K* and *D* together be equal in Weight to that Column of Air whose Room they possess; for then, and not till then, the Pressure upon *ANOB* will be equal.

COROLLARY III.

If the Body *D* (Fig. 3.) be specifically heavier than Air, but lighter than Water, it will then depreſt that part of the Fluid that is under it, and subſide ſo far into the Water (suppoſe to *G*) until the Gravity of that part of it which is above the Surface of the Water, viz. *I* bears the same Proporti-

on to as much Air as equals it in Bulk: As the Gravity of as much Water as is in Bulk equal to *K*, (viz. *I*) bears to the Gravity of the immerſed part *G*. To illustrate which, put *G* for the Gravity of *I*, *g* for the Gravity of an equal Portion of Air, *M* for the Gravity of *K*, and *m* for the Gravity of *L*; then, before the parallel Surface *EF* can have an equal Pressure upon it, *GM* must be equal to *gm*, (i. e.) $G : g :: m : M$.

COROLLARY IV.

If *D* or *H* (Fig. 1.) be, Bulk for Bulk, heavier than Water, then will *C* and *G*, the Parts they insit upon, have a greater Pressure upon them than the other Parts of the two Surfaces *AB* and *EF*; and this will be every where true, so that *D* or *H* must sink to the Bottom of the Vessel *KL*.

COROLLARY V.

If *D* (Fig. 1.) be precisely as heavy as Air, then (by Cor. 1.) it will insit upon the Surface without subſiding at all; for it will be the same thing as if so much Air preſt in the room of it: But if it be specifically as heavy as the Fluid it is immersed in, then where ever it be placed within the Fluid, there it will remain; for as to Gravitation, there will be no Difference between the Fluid and it.

PROP. II.

If *A* be a Body specifically lighter than *B* (Fig. 4.) an equal Portion of the Fluid (in which it is immersed) then will it rise with a Force proportionable to the Exceſs of Gravity of *B* + above *A*.

Demonstration.

For the Gravity of *A* put x ; for that of *B*, $x + y$ (y representing the Exceſs of Gravity of *B* above *A*) then take a Body, as *D*, with the Gravity y , and let *D* + *A* be immersed in the Vessel *ABCD*, and it will subſide ſo far, till $x + y : x :: y : x$ is to the Gravity of a Quantity of Air equal to *D*, (which, because 'tis very inconsiderable, may be neglected) or till *B*, a Quantity of Water equal in Bulk to the immerſed part *A*, shall be equal in Gravity to the whole *D* + *A*: But a Quantity of Water, equal in Bulk to *A*, shall (by the Suppoſition) have its Gravity equal to the Gravity of *D* + *A*; therefore *A* is the part immerſed.

From this Equilibrium it is evident, That the Force with which *A* preſſes upwards, is equal to the Gravity of *D* downwards; but the Gravity of *D* is equal to the Exceſs of Gravity of *B* above *A*; therefore

H Y D

therefore *A* ascends with a Force proportionable to the Excess of Gravity of *B* above *A*. *Q. E. D.*

P R O P. III.

If the Body *A* (Fig. 4.) be supposed heavier than *B*, (an equal Portion of the Fluid in which it is immersed) it gravitates with the Excess only of its Gravity above that of *B*.

Demonstration.

Let the Gravity of *B* be $= x$, and that of *A* $= x + y$; then these two Forces being directly contrary, x and x destroy one another, so that *A* only gravitates with y , the Gravity by which *A* exceeds *B*. *Q. E. D.*

C O R O L L A R Y.

Hence it is manifest, That of Bodies immersed in Water, or any other Fluid, we only perceive the Difference between the Weights of the immersed Body, and of such a Quantity of Water, or any other Fluid, in which the Body is immersed, which is equal to the Bulk of that Body.

P R O P. IV.

All Fluids press upon subjected Bodies according to their perpendicular Altitude, and not according to their Latitude.

Which is thus demonstrated.

Let there be a Vessel *ALBMHCDE* full of Water (Fig. 5.) then because the Column *BF* is heavier (because longer) than *HG*, 'tis certain, that if the Vessel was open at *H*, *GH* would ascend

till such time as the Columns *BF* and *HG* were in an *Equilibrium*; or of an equal Height; but seeing the Vessel at *H* is shut, and consequently hinders *GH* from ascending, the Pressure upwards upon *H* is equal to the Difference of the two Columns *BF* and *HG*, i.e. *BL*. And since all Pressure is reciprocal, i.e. as much as *H* is pressed upwards by the Liquor, so much it presses the Liquor downwards against the Bottom (Action and Reaction being always equal one to another.) If to this Pressure be added the Gravity of *GH*, the Pressure upon the Bottom *G*, will be the same as if it had the entire Column *BF* insisting upon it.

The same may be demonstrated of all the rest of the equal imaginary Columns; and consequently

H Y D

'tis evident, That the Bottom of the Vessel *ED* sustains as great a Pressure, as if *NEOD* were full of Water! *Q. E. D.*

S C H O L I U M, by Mr. Ditton:

The Momenta of Fluids pressing upon any Fund, may be look'd upon as Products; the Quantity of Matter being one of the Factors that compose these Momenta: The other, the *pressive Velocity*, gravitating *Conatus*, or whatever else you please to call it; only remember, that in the following Considerations I shall make use of the Word *pressive Velocity*, as being the fittest I can at present think of.

C A S E I.

In Vessels having equal Altitudes, tho' different Forms, the Momenta will be equal from *Prop. 4.* therefore their Quantity of Matter, and pressive Velocities, will be reciprocally proportional: So in the Cylindrick Vessel *BCFE* (Fig. 6.) and the Conical one *LGE*, the Moments being equal, the Quantity of Matter in the former: will be to the Quantity of Matter in the latter reciprocally: as the pressive Velocity of the whole Fluid in the latter: is to that in the former. But the Ratio of their Quantities of Matter is known from Geometry; therefore the Ratio of their pressive Velocities will be known too.

C A S E II.

In the Vessel *LCF*, 'twill be an easy thing to find the Momenta of the Fluid pressing upon the several imaginary parallel Funds, as *CF*, *IK*, &c. for the Momentum of *LCF*: is to the Momentum of *LIK*: as the Momentum of the Cylinder *BCFE*: to the Momentum of the Cylinder *GIKH*. But universally, the Momenta of Cylinders are as their Altitudes, by the last: Therefore let *LCF* be what Figure it will, the Pressure upon a Fund, as *IK*: is to the Pressure upon a Fund, as *CF* in the Vessel continued so far: as the Abscisse *La*: is to the Abscisse *LO*; that is, as $1/a$, to CO : And if you suppose it a parabolick Vessel, as *Laq*, to COq , &c.

N.B. We here consider the Fund *IK*, as making a distinct Vessel, and not merely an imaginary one; so that *LIK* and *LCF* may be considered as two distinct Vessels.

From what is said may be found the Proportion of the pressive Velocities in the Vessels *LCF*, *LIK*; for we know the Ratio of their Momenta, and the Ratio of their Magnitudes; therefore that also of their pressive Velocities, the other Factor of their Momenta, will be known too.

But the Momenta of Vessels of different Heights, having the same common Fund, will be as those Altitudes.

Suppose AD and AC two parabolick Vessels, having the same common Abscissa AB ; then will their Momenta upon the common Fund AB , be as their Ordinates BC and BD , i.e. as the Area's of the two Semi-parabola's ADB and ACB , or in a Sub-duplicate Ratio of their Parameters, as is evident from Conicks.

Likewise in Hyperbolical and Elliptical Vessels, having the same Transverse Diameter and Abscissa common to both, the Pressure upon the common Abscissa, as a Fund, will be as the Area's ACB and ACD of the Semi-Ellipsis and Semi-Hyperbola.

CASE III.

But now we come to consider the Vessels LIK and LCF , (Fig. 6.) as communicating with each other: And here the pressive Velocities will be very different from what they were in the former Supposition: In order to express the Proportions of which, we must consider the Momenta of the several Portions of the Fluid taken from the Vertex, and imagin'd to be cut off by Plains parallel to the Base: And first, the Momentum of the Portion LIK , upon the Fund CF , is equal Momentum of $AMBN$, on the Fund DC ; therefore the Momentum LCF : Is to the Momentum of LIK :: As the Momentum of the Cylinder $ABDC$: To the Momentum of the Cylinder $AMBN$; i.e. as LO , La. But having the Momenta's and Quantities of Matter, we can easily find the other Factors; that is, the pressive Velocities of LCF and LIK , upon the Fund CF ; which may be expressed thus:

The Ratio of the Momenta's is equal to $\frac{LO}{La}$ and the Ratio of the Magnitudes is equal to $\frac{LCF}{LIK}$; therefore the Ratio of the pressive Velocities will be $\frac{LO \times LIK}{La \times LCF}$.

CASE IV.

To compare together the pressive Velocities in both these distinct Cases, (viz. 2, 3.) 'twill be only necessary to consider, That in the First Case, where we imagin'd a different Fund, as IK , the Momentum of the Portion LIK , is equal to that of the Cylinder $GHIK$; and in the Latter Case, where we suppose all one and the same Vessel, and so the Fluid LIK pressing on the Fund CF , that then the Momentum of that Portion LIK , will be equally the Momentum of the Cylinder $AMBN$; therefore the two Momenta's being as the Cylinders $AMBN$; and $GHIK$, (which have equal Alti-

tudes) will be as MN to IK , i.e. as NP to IK .

But having the Ratio of the Momenta's, we have also that of the pressive Velocities of one and the same Quantity of the Fluid LIK , when conceived, as pressing upon the Fund IK in one Case, and on the Fund CF in the other.

CASE V.

Let BE (Fig. 8.) be a Vessel fill'd with Mercury to the Altitude AE ; then, as in the way of making the *Torricellian* Experiments, take a pretty long Glass Tube, shut at the End D , but open at C , which fill with Mercury; and stopping the open End C , invert the Tube, and put the said End C into the Mercury BE : 'Tis evident from the first and general Proposition, That if the Mercury contained in the Tube, press more upon C , than the Air upon the other Parts of the Mercury which are expos'd to it; 'tis evident, I say, That the Mercury in the Tube will descend so far, (suppose to D) till the Pressure be equal on all the Parts of the Surface of the Stagnant Mercury in the Vessel: But if the Mercury in the Tube press less upon C , than the external Air does on the Mercury without, then the Mercury within the Tube will ascend so high, till the Pressure of the Mercury within the Tube be equal to that of a Column of Air of the same Diameter in any Part of the Vessel without.

This is clear from *Prop. 1.* and needs no other Demonstration.

But here it may be enquired, Why, if the erect Tube CI (Fig. 9.) be put in an Oblique Position, as in GE , the Quicksilver should notwithstanding be found at the same perpendicular Height as before; since GE being longer than CI , 'tis certain there must be more Mercury contained in that, than in this.

To this I Answer :

The Figure of the Surface of the Mercury in the Base E of the Tube EG , will become Elliptical, and consequently enlarged by this Oblique Position; for tho' it will be of the same Breadth still, yet it will be so much longer, as is the Ratio of the Diameter E , to the Diameter C : *i. e.* as the Transverse Axe of that Ellipsis to its conjugate.

But I shall demonstrate, That the Diameter of the Base C : Is to the Transverse of the Base E :: As the Length of the Tube CI : Is to the Length of the Tube EF .

For suppose LCM the Base of the erect Cylinder CD , which will be a Circle; and NCO the Base of it cut Obliquely, which will be an Ellipsis.

Then let the Cylinder CD be reclined into the Position EG , so that NCO may become NEO , *i. e.* in an Horizontal Position; the Cylinder EF will be equal to an erect Cylinder upon the same Elliptical Base NEO , and between the same Parallels HF, NO : From F therefore let fall FC perpendicular to NEO produced; and by this Means we shall have the Triangles FEC and ENL similar; for the Angles at C and L are right, and the Angle $FEC = LNE$, seeing each of them, together with LEN , makes a Right Angle: Therefore $FE:FC$ (is CI) :: $NE:EL$:: $2NE:2EL$; Or as the Base E : Is to the Base C . $Q. E. D.$

And now the Reason plainly appears, why more Mercury is kept suspended in EG than in CI ; (Fig. 9.) For the Base E of the Oblique Tube EG : Is as much greater than the Base C of the erect Tube CD :: As is the Length of the Former: Than the Length of the Latter.

But then it may be further enquired, Why, in the two equal Cylinders EF and EH , (Fig. 10.) the Mercury should not rise higher in the Former than in the Latter, since Dr. Wallis has demonstrated, Cap. 2. Prop. 19. That equal Bodies gravitate in Proportion to their Declivities; and consequently the Gravity of the Fluid within the Tube EF , being weaken'd by the Obliquity of the Tube, 'tis but reasonable to suppose, That the Mercury should be rais'd to a greater Height than in the erect Tube EH , whose Position does not at all weaken or hinder the Gravitation of the Fluid.

But here it ought to be consider'd, That tho' the Gravity of the Fluid in the Tube EF be lessened in proportion to the Obliquity of the Tube, yet at the same time the Pressure upwards is weakened or hindered in the same proportion, the Angles EFC and FEH being equal; so that here is a sort of Compensation made, and the same Force which keeps the Mercury suspended in EH , will be no more

than sufficient to buoy up that in EF of an equal Altitude with the Former.

Also, since Tubes and Vessels, having the same or equal Bases and Altitudes with Cylinders and Prisms, may, notwithstanding, contain more or less Mercury than those Cylinders and Prisms (as is apparent from Fig. 11.) it may very reasonably be

ask'd, Why the Mercury stands at the same Height in all? *Viz.* Why in the Tube CH , with a round Head, the Mercury should stand at the same Height that it does in the Cylinder CI , upon the same or an equal Base? And why in the Vessel DKB , it should not rise higher than it does in $EDBF$?

The Reason of these two Phenomena I take to be this:

First, In the Tube CH , the Mercury contain'd in the Head, without the inscribed Tube CI , is not supported by the Base C , but by the Sides of the Head of the Tube; and consequently the Pressure upon C , is the same in both Tubes CH, CI ; therefore the Altitude of the Mercury in both of them must be the same.

Secondly, Although the Vessel DKB be much less than the Circumscribing one, yet it will be an easy Matter to account for the Mercury's rising no higher in that than in this; for at those Parts of the Base, as C , where the Mercury has a free Ascent, it arises to a certain determinate Height, as CI , in the Vessel DKB ; but the Ascent of the other Parts DE and EB , is impeded by the Sides of the Vessel DK and KB , as much as if EDI prest upon it; therefore it cannot rise any higher than the Mercury in the Circumscribing Vessel $EDBF$.

PROP. V.

If the Mercury in the Tube CD (See Fig. 9.) be kept suspended at the Altitude CI , yet if the Aggregate of the Tube and Mercury be left to it self to descend freely, it will sink into the Stagnant Mercury so far, till the Gravity D or DC (the Part above the Surface AB) bears the same Proportion to the Gravity of as much Air equal to it in Bulk :: As the Weight of a Quantity of Mercury equal in Bulk to that Part immersed, bears to the Weight of the immersed Part of the Tube, together with the Mercury included in CI .

For the Air upon the Out-side D , of the Top of the Tube DC , is very nearly equal to the Pressure of the Air upon the other Parts of the Surface of the Mercury AB ; but this Pressure upon the Top of the Tube being added to the Pressure of the included Mercury, together with the Weight of the Tube, will make the Pressure upon C more than double to the Pressure upon any other Part, being

being the Effect of a double Column of Air of the Diameter of the Tube: and the Weight of the Tube and incumbent Air being not sustained otherways, (by *Cor. 3. Prop. 1.*) the Tube will subside so far, till the Part above the Surface bears the same Proportion to as much Air equal to it in Bulk, as a Quantity of Mercury equal in Bulk to the Part immersed, bears to the immersed Part: *Q. E. D.*

COROLLARY. I.

If the Tube *DI* be kept suspended with its End *C* just under the Surface of the Mercury, the Weight or Tendency of the Tube downwards, is equal to the Gravity of a Column of Air, insinuating upon the Top of the Tube *DI*, together with the Excess of the Gravity of the Tube above an equal Portion of Air; or, which is nearly the same Thing, equal to the Weight of the inclosed Mercury *DC*, together with the forementioned Excess.

COR. II.

But if *DC*, the Altitude of the inverted Tube, be less than *CI* (where the Mercury, as in a common Barometer, would stand, were it not hinder'd) and consequently, if the Air press more upon the other Parts, than the Mercury *DC* does upon *C*; then will so much of the Weight of the Tube and Mercury be abated, or so much Weight may be supposed to be taken out of the Scale *P*, (*Fig. 12.*) as is equal to the Excess of the Pressure upon the other Parts above that upon *C*; for the Force upwards in *C* can sustain so much Mercury, as is contained in a Tube whose Altitude is *CI*: Therefore

if the Altitude *CD* be less than *CI*, 'tis plain the Pressure upwards at *C* will be able to buoy up as much more Weight than *DC*, as *DC* wants of *CI*; that is, so much Weight may be taken out of the Scale *P*, to bring it to an *Equilibrium*.

For the Pressure of the incumbent Air upon the Parts of the Surface *AB*, surrounding *C*, is sufficient to sustain either a Column of Air of an equal Weight with the former, or a mixt Column made up of 'em both, which does not exceed the Gravity of one of them, but cannot sustain them both together, or any Thing more than what is equal to the Gravity of one.

Suppose the Part *C* of the Surface of the Mercury *AB* (*Fig. 12.*) exposed to the open Air, then there will be sustained a Column of the incumbent Air, equal to what is sustained by every other equal Part of the Surface; but neither Mercury, nor any thing else more intensively or specifically heavier

than Air, for that would destroy the *Equilibrium*, by *Prop. 1.*

2. If, as in the *Torricellian* Experiment, which suppose made, the Pressure of the incumbent Air be kept from acting upon *C* by *I*, the Top of the Tube *CI*, or any how else; the Pressure at *C* upwards will then sustain a Column of Mercury equal in Gravity to a Column of Air upon the same Base, but it can sustain nothing else; so that the Tube, with the incumbent Column of Air upon the Top of it, must be sustained some other way, either by the Hand, or by an equal Weight in the opposite Scale, &c.

3. If the Pressure of the incumbent Air be kept off only in Part; that is, if the Pondus in the Scale *P*, be less than the Gravity of the Air resting upon the Top of the Tube, and the Tube it self; then *C* will sustain a mixt Column, i.e. partly of Air, part of Mercury: And the Quantity of Air sustained by *C*, is equal to the Excess of the Weight of the incumbent Air and Tube above the Pondus *P*; and the Mercury within the Tube wants just so much of the Weight of the Mercury in the last Case, as that Excess amounts to.

4. If the Pondus in the Scale *P*, be greater than the Weight of an incumbent Column upon the Top of the Tube, together with the Tube it self, then it will elevate the Tube out of the Mercury.

This Matter will still be more clear by the following Instances.

Suppose *C*, (*Fig. 12.*) that Part of the Surface *AB* upon which the Tube insinuates, to be so large, as that being exposed to the open Air, it can sustain a Column of Air of 10 Ounces: Then if the *Torricellian* Experiment be made, and *C* be defended from the Gravitation of the Air upon it, then will, in its room, be suspended a Column of Mercury, or any other Fluid which does not exceed 10 Ounces.

Let us imagine the Weight of the Tube to be two Ounces; then will the Weight of the Tube, together with the incumbent Air, be equal to 12 Ounces nearly, (I say nearly, for any one will perceive, from *Prop. 5.* that it wont be exactly so;) from which Pressure *C* must be entirely freed, which may be done by the Hand, or by 12 Ounces in the Scale *P*.

Now let us suppose 4 Ounces taken out of the Scale *P*, then there will remain only 8, which cannot be a Balance for 12: Therefore the Tube *DC* will sink down into the stagnant Mercury, (the Pressure downwards upon *C* being greater by 4 Ounces, than the Pressure any where else on the Surface of the stagnant Mercury) till the included Mercury weigh only 6 Ounces.

But here it may seem strange, Why 8 Ounces in the Scale *P*, can buoy up the Tube equal to 2 Ounces, added to the Weight of the incumbent Air equal to 10 Ounces: But the Reason of this is evident; for the Pressure upwards in *C*, is 4 Ounces greater than any where else; or, which is the same Thing, 4 of those 12 Ounces (the Weight of the Tube and incumbent Air) will not be perceived, by reason of the contrary Tendency of the Mercury upwards at *C*; so that there will remain only 8 Ounces, equal to the Weight of the Pondus in *P*.

But if, instead of 4 Ounces, the whole Pondus had been taken out of the Scale *P*, *C* would then have a greater Pressure upon it than it is able to bear, and consequently will give way, and suffer the Tube and Mercury to sink quite down to the Bottom of the Vessel.

If, instead of 4 Ounces; 2 only had been taken out of the Scale *P*, there will remain 10 Ounces, which will take off 10 of the 12 Ounces, (the Weight of the Tube and Air together) and the remaining 2 Ounces will press upon *C*; which, with 8 Ounces of Mercury, will make 10; so that the Mercury in the Tube, in this Case, will weigh 8 Ounces, as before it weighed only 6; *i. e.* the Tube will ascend till the Mercury within it weigh 2 Ounces more than it did before.

If 2 Ounces more be added to *P*, the Tube will rise until the Mercury in it weigh 2 Ounces more than before, *i. e.* 10; but if any more Weight be added to *P*, the Tube will be elevated out of the Mercury.

From the foregoing Principles 'twill be no difficult Matter to account for that Experiment of Water rising higher in very narrow Tubes, than the Surface of the Water in which they are immers'd; for if you take a very slender Tube, open at both Ends, and put one End in a Vessel of Water, the Water within the Tube will be found something above the Level of the Water without, more and more proportionably to the Smallness of the Tube in which the Experiment is made.

Robault, in the First Part of his *Physicks*, *Cap. 22. Sect. 85.* tells us, That he thinks this Phenomenon may be thus accounted for: He fancies, That the Particles of Air cannot move so briskly in slender Pipes, as in larger; and consequently, are hinder'd from exercising a Force sufficient to suppress the Water.

Tho' had but this Gentleman made the same Experiment with Mercury, he would have found the quite contrary Effect, and that the Mercury in small Tubes is depress'd below the Mercury without.

Besides, his Solution will appear precarious to any one that considers the Thing; for I wonder what a free Motion of the Particles of Air hath to do in depressing or elevating Liquors contain'd in Tubes: This is certainly the Effect of Gravity, whose Action is Rectilinear; but this Rectilinear Pressure is no more hinder'd in small Tubes than in larger.

And therefore the Reason why Water in small Tubes rises higher than the Level of the Surface without, according to Hydrostatical Principles, must be either because the Pressure without is increased, for the Pressure within the Tube diminished; but the Pressure without does not seem to be increased by barely putting the Tube into Water, and therefore it follows, the Pressure within is lessen'd: How this can be, is now to be accounted for.

Let there be a small Cylindrical Tube, *abcd*, immersed in the Surface of the Water *ed*, upon which Surface let the Cylinder of Air *efgh* likewise insit: Then let us suppose, that upon the Diameter of each Tube can stand a certain determinate Number of Particles of Air, *viz.* 8; or let 8 Particles of Air, placed in a Right-line, be equal to the Latitude of both Tubes: I say, it can seldom, nay, I believe, it can never happen, that the Eight can be intro-mitted in the Cavity of the Tube; for the upper Edges of the Tube will intercept the First and Eighth, so that only six can fall upon the Water: And the same will hold true of any other Series of Globules, whose two Extream Particles will always fall upon the Brinks of the Tube. Hence it is, that the whole Round of Globules insit upon the Edges of the Tube, together with *am* and *bu*, which they perpendicularly insit upon, gravitate only upon the Edges of the Tube, and never come to the Water *qr*, which is only gravitated upon by a Cy-

linder of Air, whose Diameter consists of six Globules: But 'tis quite another thing in the Aerial Cylinder *efgh*, taken in any Part of the Surface without, where the Extream Globules are not in-

lintercepted by the Sides of the Cylinder *ge* and *ab*, which are purely imaginary, but act freely upon the subjected Liquor: Consequently the Fluid without, is more acted upon than the Fluid within; by how much the Series of Globules insit upon this, exceeds the Series of Globules insit upon that; so that the Liquor without must subside a little, forcing that within the Tube to ascend, till such time as the Pressure be every where equal: But this is scarce perceivable in Tubes of larger Diameters; for the Air insit upon the Brinks of a Tube, bears a greater Ratio to the Air without, whose Pressure is not hinder'd, in small Tubes than in larger, as the subsequent Calculation will make appear.

Let the Diameter of the Aerial Cylinder *efgh* be 7 Globules, and that of the Cylinder *opqr* be 6 Globules; then the Area of the Base of the former will be 38½, and that of the latter 28½, whose Difference is 10½; so that *ef* is press'd upon above ½ more than the Base of the latter *ed*: But if the Diameter of the Base of the External Cylinder

be 14 Globules; and that of the Internal one a Globule less, viz: 13, the Area of the former will be 154, and that of the latter 132 $\frac{1}{2}$, whose Difference will be 21 $\frac{1}{2}$; so that the Pressure of that is now $\frac{1}{2}$ part greater than the Pressure of this: From whence it appears, That the Difference of Pressure is a great deal less in large Tubes than in small.

Upon the same Principles 'twill follow, That lighter Liquors will rise higher in small Tubes than heavier: And now we shall give an Account, why Mercury in a very small Tube should subside below the Level of the external Mercury.

And here it may not be improper to observe, That some People, from the Ascent of Liquors in small Tubes, have vainly hoped for a perpetual Motion; for, say they, 'tis but making a Tube extremely small, and not too long, and then the Ascent of the Liquor being proportional to the Smallness of the Tube, 'twill flow out at the Top, and that continually: But had those People but thoroughly consider'd the Matter, they could not have drawn any such Conclusion; for though the Liquor contained in the Tube be forced to the Top of the Tube, by reason of a less Pressure; yet when it comes to the Top, it meets there with the Globules which before acted only upon the Edges of the Tube, and consequently is hinder'd from overflowing, the Pressure above and below being equal.

But here it may very well be objected, That tho' the Aerial Cylinder *ghf* press upon the subjoined Liquor, yet this Pressure is not wholly derived to the Tube, but partly broken; for the Globules of Water *st*, cannot so exactly flow into the Tube, but the extream Globules *s* and *t*, must light on the Edges of the Bottom of the Tube, and consequently their Pressure be rendered ineffectual, as were *a* and *b* above: and this being true of the whole Round of Globules, they see no reason why the Water should ascend at all, being the Pressure is equally debilitated both above and below.

To obviate which Objection, it may be considered, That the Particles of Water are more volatile and flexible; upon which account they easily glide into the Tube, without suffering any considerable Detriment; whilst those of Air, being more stiff and rigid, suffer much from the Sides of the Tube: Besides, the Particles of Water are smaller than those of Air, as Mr. Boyle has prov'd by several Experiments, and consequently, though the extream Globules *s* and *t* do light upon the Edges of the Tube, yet still the Pressure upwards will be greater than the Pressure downwards, and the Water forc'd to ascend.

These Things being considered, 'twill be no difficult Matter to account for the subsiding of Mercury in small Tubes below the Level of the Mercury without: for by the Law of Contraries, the Particles of Mercury will be more gross than those of Air; and consequently the Pressure of the Particles of Mercury below, upwards will be less than the Pressure of the Air down, and the Mercury forced to descend.

L E M M A.

Hitherto we have only taken notice of the Gravity of the Air, without any regard to that other remarkable Property of it; I mean its Elasticity, which Mr. Boyle has prov'd by various Experiments. Now this Elasticity is a Power that Air compressed, either by its own Gravity, or any other way, has

of restoring it self to its former State; and this Elastick Force acts indifferently every way, though in case any Part of the compressed Air be less prest'd upon than the rest, 'twill that way endeavour to free it self from the Pressure upon its other Parts, in order that the Pressure may be equal every where; and this restitutive Force increases in proportion to the Compressive, and is always equal to it.

If any one desire a fuller Account of this Matter, he may consult Dr. Wallis's *Mechanical Philosophy*, P. 1. C. 13. Pr. 1. and L. 14. Pr. 11. This being premis'd, I proceed to the following Proposition.

P R O P. VI.

The Elastick Force of Air contain'd in any Vessel, and which is of the same Nature with the external Air, i. e. is neither more nor less compress'd, does the same thing as the whole Weight of the external Air.

Let there be a Tube, as *D*, or a Vessel, as *H*, of any Form, whose Orifice at *E* is open, and consequently the internal Air communicates with the external; then 'tis plain, that if the external Air be more compress'd than the internal, it will dilate it self, compressing the internal till such times as there be an *Equilibrium*; but on the contrary, if the internal be more compress'd than the external, then will this dilate it self, compressing the other till the *Equilibrium* be again restor'd; i. e. till the Elasticity of the included Air be equal to the compressive Force without; or, which is the same thing, to the whole Weight of the incumbent Air: And if *E* be close, the Elasticity of the included Air will still be equal to the Weight of the external incumbent Air; for the Elasticity won't be in the least altered by the Orifice being stopp'd; therefore the Proposition is clear.

P R O P. VII.

*If the Orifice *E*, of the Tube *D*, or the Vessel *H*, (fill'd with Air of the same Nature with the external *Air*) be put in the Surface *AB* of a Vessel of Mercury, that Fluid will neither rise nor be depress'd.*

Demonstration.

For *C*, that part of the Surface *AB* which the Orifice *E* insits upon, is equally prest with the other Parts of the Surface *AB*, seeing the Elasticity of the Air in *D* and *H*, is equal by the last Proposition, to the Weight of the external incumbent Air; (Here it must be observ'd, that we suppose the Vessel to be sustain'd some other way) and consequently, by Prop. 1. the Mercury will neither ascend nor descend. Q. E. D.

The Ingenious Mr. John Keil thus Mathematically demonstrates the Reason, why Fluids keep at the same Height in Canals, or Pipes of different Dimensions.

Let there be a larger Pipe or Cylinder, as $abcd$, which is connected with the more slender one mnh , at c .

Water being put in at either Orifice, will keep the same Level in both Pipes, or will stand at the same Height in both Legs; so that the Surface of the Water, ad and fg , shall be in the same Plain.

For if by any Force the Water in the larger part $abcd$ should be impelled down, suppose to IL , it must rise so much higher in the lesser Leg of the Siphon, suppose to mn , that the Cylinder of Water mnh shall be equal to the empty part $adiL$.

But when Cylinders are equal, and are of different Bases and Heights, their Bases and Heights must be reciprocally proportional; therefore here $fm:ai::$ As the Orifice ad : To the Orifice mn or fg : But $fm:ai::$ As the Velocity of Ascent in one Tube: Is to the Velocity of Descent in the other; and the Orifice ad : Is to the Orifice $fg::$ As the Water in ac : Is to the Water in the part of the Pipe fH , (for Cylinders of equal Height are as their Bases:) Wherefore the Velocity of the ascending Water in the Pipe fH : Will be to the Velocity of the descending Water in the Pipe $ac::$ As the Water in the Pipe ac : Is to the Water in the Pipe fH ; that is, the Velocities of the ascending and descending Portions of Water are reciprocally proportional, and consequently their Moments must be equal; and being contrary one to another, they will equi-balance each other, and consequently make the Water stand in both Legs at one and the same Height.

The Physical Reason of which Phenomenon is, That no more Water presses on the Orifice c , than what is contained in the Cylinder oc , perpendicularly incumbent on the Orifice (the rest being sustained by the Bottom of the larger Pipe, which extends beyond the Orifice c all round it): Now the Cylinder oc being equal every way to fg , the Water in each will be of the same Height.

From hence also, by the by, may the Reason appear, Why Water, or any other Fluid, flowing out of a larger Pipe or Canal into a slenderer, moves there with a greater Celerity.

Hence also in an Animal Body, if the Ramifications of the Arteries (or the Capillary Arteries) have the Sum of all their Orifices, or rather of their Transverse Sections, greater than the Area of the Transverse Section of the Aorta; or great Artery, the Velocity of the Motion of the Blood in them will be less than in the Aorta; but if the Sum be less, the Motion of the Blood there will be swifter than in the Aorta.

HYDROTICKS, or Medicines that provoke Sweating, are those which by fermenting and attenuating the small Parts, penetrate into the closest Pores of the Blood, divide its Particles, rarify them, and turn them into a kind of Vapour, which, together with whatever they meet, and can carry with them, they drive out into the Surface of the Body, and there being condens'd into an insensible Liquor, they appear in the Form of Sweat. *Blanchard*.

HYEMAL-SOLSTICE: See *Solstice*.

HYGIEA, is Health, which consists in a good Temperature, and right Conformation of Parts.

Health is a Disposition of the Parts of an Human Body, fit for the Performance of the Actions of that Body.

Signs of Health are Three, due Action, suitable Qualities, and when things taken in and let out are proportionable. *Blanchard*.

HYGIEINA, is that Part of Physick which teaches the way of preserving Health: Some divide it into three Parts.

Prophylactick, which takes Notice of future imminent Diseases.

Synteritick, which preserves present Health: And,

Analeptick, which recovers the Sick. *Blanchard*.

HYGROCYSOCELE, is a Branch of any winding Veins, swoln with ill Blood, accompanied with other Moisture. *Blanchard*.

HYGROMETER, the same with *Hygroscope*; which see.

HYGROSCOPE, is a Philosophical Instrument, contrived to shew the Moisture or Dryness of the Air, according as it abounds with watry or dry Steams; and to measure and estimate the Quantity of such Moisture or Dryness.

To make a Hygroscope with Oil of Vitriol.

Procure a good nice pair of Scales, not too slight, that will turn with about $\frac{1}{2}$ part of a Grain, (or $\frac{1}{4}$ part of a Grain will do pretty well) into one of these in a flat Glass of about 3 or 4 Inches in Diameter (such a kind of Glass as holds the stagnant Mercury in the Baroscope) put 3 or 4 Drams of the Oil of Vitriol; hang up the Balance in a place free from the heat of the Sun's immediate Beams, or a Fire; and put Weights in the other Scale, to reduce it to an *Equilibrium*, you will be surpris'd to find that this Liquor will, if it was good, and well dephlegmated, double, nay, perhaps treble the Weight in a Fortnight, by attracting and imbibing the Moisture of the Air: But so it will certainly do more or less, according to the Season of the Year, and the Temper of the Weather. You must let this Liquor hang till you find it hath gain'd its utmost Increase of Weight, which will be in less than a Fortnights time, unless it be exceeding dry and hot Weather.

And then you may begin to make use of it as an *Hygroscope*: For as the Oil of Vitriol preponderates, the Air increases in Moisture; and as the other

ther Scale, where the Weights are, preponderates, its Drought increases in the same Proportion. The Degrees of Moisture, or Dryness, may be computed either by small Weights put into the lighter Scale, or else by having the Handle of the Scale very long, as also the Tongue; so that it shall with its Top mark the Divisions on an Arch of Brads, that may be applied for that purpose on the Top of the Handle, over the Tongue of the Balance.

The Hygroscope of Mr. William Mollyneux, Secretary of the Philosophical Society at Dublin, is thus made:

Fasten a Piece of Whip-cord, of about 4 Foot long, to an Hook or Staple, in some convenient Place of the Ceiling of a Room, and at the Bottom hang a Weight of about a Pound: Let thereon, or into the Bottom of the Weight, be fastened an Index of about a Foot long, and under it, on a Table, or on a Piece of Board, place a Circle, divided into what Number of Degrees you please, and fit it so that the Center of the Index may hang just over the Center of the Circle.

After it has hung thus 2 or 3 Days to stretch the Cord, you may begin to measure by it, the Degrees of Moisture or Drought in the Air: For the Cord will twist one way, and contract it self for Wet, and untwist it self again on the contrary way for Dry. You will find this plain and simple Instrument the nicest *Hygrometer* of any, for it will shew you very small Alterations of the Temper of the Air, and is subject to fewer Inconveniencies than any other Instrument of this kind.

A very good Hygroscope may be thus easily made.

Take a small Deal-Box, and to the Bottom, or one of the Sides of it, fasten strongly a pretty large Piece of Lute-string or Cats-gut; and then bringing the other End thro' a Hole purposely made for it in the opposite Part or Side of the Box, and which must be so much bigger than the String, that the String may turn easily round in it any way: Fasten to the String (without) a light Index, made of a Piece of Cedar or Deal, &c. and round about the Hole where the String comes thro', draw a Circle on the Box, and divide it into Degrees; so that the String twisting and untwisting it self, as it will do against wet or dry Weather, may turn the Index along with it, and that will shew in the graduated Limb of the Circle, the Measure of the Air's Moisture or Dryness.

I have often tried this kind of Hygroscope, and found it to do very well. But Dr. Hook, in his *Micrographia*, saith, Nothing will shew the Variations of Moisture and Dryness in the Air like the Eard of a Wild Oat; which he there (P. 147.) shews you how to fit in a proper Box or Frame, and with an Index, &c. But I believe the Cats-gut one, tho' not so very tender as this, (and yet I have known one go twice round the same way) may retain its twisting and untwisting Property much longer.

I always found the Wind to have a peculiar effect upon this Instrument.

Another Hygroscope of two Plain Boards.

Plain two pieces of Deal, or (which is better) of Poplar Boards, of about two Foot long, and a Foot and a half in breadth, and let them be shotten or jointed, so that their Edges will meet even together;

let those be set close together like a Pannel of Wainscot, with their Tops and Bottoms let into the Groove of a strong Oaken-Ledge, and their four outward Corners pointed into the Groove; But there need be no Ledges on the Sides, that the Boards may play the better.

Then, since every one knows that these Boards will shrink very much in exceeding dry Weather, and consequently gape or open from each other; suppose the utmost Distance that they will shrink from each other to be a quarter of an Inch, more or less, it matters not much. Take a thin piece of Brads of two or three Inches long, and about a quarter of an Inch broad, and measuring at one end of it a quarter of an Inch (or that distance you suppose your Boards will shrink) divide it into five equal Parts, and then with a small File cut those Divisions into so many small Teeth, like those of a Watch-wheel: Then drilling 2 or 3 Holes in this piece of Brads towards the other end, with some small Nails fasten it on one of your Boards, so that the first of the 5 Teeth may lie just over the Junction of the Boards, and the rest lie over the other Board. Next on the end of a piece of thick Iron-wire, make a Pinion of 3 Teeth to answer the 5 Notches in the Brads-plate; and by means of a Bracket, let it be so fasten'd on the other Board, that its Axle playing in the Bracket, it may fit the Teeth of its Pinion to the Notches in the Brads-plate; and then whenever the Boards shrink asunder, the Brads being drawn a little away, must needs turn this Axle more or less; and when the Boards have shrink'd a quarter of an Inch from each other, the Axle will have made one entire Revolution. If then you fasten a long and light Index on the Extremity of this Axle, and make a Circle round it, divided into what number of parts you please, the Motion of the Point of the Index, backwards or forwards, will shew you the Degree of Moisture or Drought in the Air.

You may easily have the Axle so long, as that its Index-end shall come thro' a round Plate of Wood or Metal, which may hide all Contrivances, and make it appear only like a Clock or Watch.

HYGROSCOPE STATICAL, was invented by that Noble Philosopher Mr. Boyle. The best way to make it, is to take a Dram weight of fine Sponge, and having well cleaned it and dried it, let it be put, when the Air is of a moderate Temperature, into one of the Scales of a very nice and tender Ballance, (that will turn, when so loaded, with half a quarter of a Grain) and in the other Scale put so much weight as will just equi-ponderate it. Then will the Sponge by its increase and decrease of Weight, daily shew the Moisture or Dryness of the neighbouring Air, and measure its Quantity by Weight; whence it hath its Name of the *Statistical Hygroscope*.

I have often tried this Instrument myself, and have found it to answer very nicely, and to increase or decrease in Weight very conspicuously, according as the Air hath been Moist or Dry.

If you think the taking out or putting in of such small Weights, as Grains, or their Subdivisions, (of which there will be constant occasion) to be troublesome, you may easily fit the Arch of a Semi-circle well divided, as that against it the Tongue of the Ballance shall play, and by the Degree there cut, shew you the quantity of the increase or decrease in weight of the Air's Moisture: But the former way is more exact and will be easy enough with a little Practice.

The

The above-mentioned Honourable Gentleman hath a little Treatise upon the Uses and Advantages of *Hygroscopes*; wherein he proves this *Statical one* to have many Advantages above the other Kinds. For,

1. It will last good longer than most of them.
2. As it is easily made at first, so 'tis as easily repaired or mended, if it come to any Injury.
3. The Quantity of the Drought or Moisture of the Air it measures, is easily communicable to a Correspondent by Letter, &c. because it is estimable in the known Weights of Grains and their Parts; whereas in most other *Hygroscopes* 'tis not so easy for another Person, besides the Observer, to judge of the Quantity of the Alteration.

The Uses and Advantages of these kind of Instruments when well made, and carefully observed, he judges may be such as these:

1. To discover in what part of Day or Night the Air hath its greatest degree of Moisture; and how at such times the Baroscope stands affected; whether near the Sea-side, the Ebbing and Flowing of the Sea make any sensible Alteration as to the Moisture or Driness of the Air; and whether at the Fall and New Moons the Atmosphere be most damp and moist; and whether the Menstrual or Annual Spring-Tides, have any sensible Operation on this Instrument.
2. To discover how much one Year and Season is drier or moister than another; whether the multitude or fewness of Solar Spots occasion (as some Astronomers have observed) any Alteration in the Temperature of the Air, as to Wet or Dry; And those that are Astrologically given, may observe, whether the Aspects of the Planets, their Eclipses, Conjunctions, &c. have any Influence this way on our Atmosphere.
3. To discover and compare the Changes of the Temperature of the Air made by Winds, strong or weak; or by Frosty, Snowy, or other Weather.
4. To compare the Temperature of differing Houses, and differing Rooms in the same House; which may be of great Use to Tender and Sickly Persons; and to keep a Chamber, if there be occasion, constantly to the same, or any assigned degree of Driness.

HYMEN, is a circular Folding of the inner Membrane of the *Vagina*: and this being broke (in *primo Coitu*) its Fibres contract in three or four places, and so form the *Glandule Myrtiformes*.

HYOIDES, and by some *Os Upsilonoides*, from its being in Figure like the Letter Υ , is a Bone placed at the Basis of the Tongue upon the Larynx: It hath 10 Muscles which keep it in its place above by its upper *Cornua*; 'tis fastened to the *Apophyses Scyloides* of the Temple-Bone, and below to the Wings of the *Cartilago Theorides* of the Larynx.

HYOTHYROIDES, are two Muscles of the Larynx, proceeding from the Inferior Part of the Bone *Hyoides*, laterally and opposite to the Origination of the *Ceratoglossus*.

This pair of Muscles descends directly to the lower part of the *Cartilago Scutiformis*: Its Use is to draw the Larynx upwards in an Acute Tone of the Voice; the Canal of the *Aspera Arteria* being also freighted by it.

HYPETHRON, is an open Gallery or Building, the inside whereof is uncover'd, and exposed to the Weather. The Ancients gave this Name to all Temples which had no Roof; as that of *Jupiter O-*

lympius at Athens, having 10 Columns in Front, as also two Rows in its exterior Sides, and one in the Interior.

HYPALLAGE, or *Immutation*, a Grammatical Figure, when of different Expressions, which give the same Idea, we make choice of that which is least used; or, when there is a mutual Permutation or change of Cases: As in this Instance, *Dare Classibus Austros*, instead of *Dare Classes Austris*.

HYPERBATON, a Grammatical Figure, where there is too bold and frequent a Transposition of Words.

HYPERBOLA, in Geometry, is a Section of a Cone made by a Plane, so that the Axis of the Section inclines to the opposite Leg of the Cone, which in the Parabola is parallel to it, and in the Ellipsis intersects it. The Axis of the Hyperbolical Section will meet also with the opposite side of the Cone, when produced above the Vertex.

Thus, in the annexed Figure, the Curve *GEHF* is an *Hyperbola*.

Where the Line *ED*, being the Continuation of the Axis till it meet with the opposite Cone, or opposite side of the former Cone *CB* produced, is called by the Name of the *Latus Transversum*; and the middle Point of that Line *ED*, is called the *Center of the Section*, or rather of the *opposite Sections*.

PROP. I.

In an Hyperbola *GEHF*, the Square of the Ordinate *IK*, is equal both to the Rectangle *LJ*, made under the Parameter *LE*, and the Abscissa *EI*; and also to the Rectangle *LS*, made under the Abscissa *EI* (or *LR*) and another Line *SR*, which is a fourth Proportional to *DE* the Latus Transversum, *EL* the Parameter (or Latus Rectum) and *EI* the Abscissa.

Let the side of the Cone *AB*, in which the Section is, be called *a*; and thro' *B* the Vertex of the Cone, draw *BM* parallel to the Axis of the Section, and which call *b*. Let the intercepted part of the

$DE = ob$, and $EI = eb$ and $DFE = oibb + iibb$, as was proved just above. Now there is no doubt but $oobb + eebb : oibb + iibb :: e + ee : oi + ii$; wherefore these Rectangles are as the Squares of the Ordinates. Q E D.

COROLLARY I.

If the *Latus Rectum* LM be applied so, as that N be the Focus, then will $LN = \frac{ocd}{2b}$ and its

Square $= \frac{oocdd}{4bb}$: But (by this Proposition) As the Square KI : Square LN : So is the Rectangle DIE : Rectangle DNE ; that is, as $oecd + eecd : \frac{oocdd}{4bb} :: oebb + eebb : \frac{oecd}{4}$, which will be found to be the fourth Term by this way of Notation! Also this Rectangle DNE (being made out of the whole Line DE , with the Part added EN , multiplied by that Part added EN) together with the Square of CE , the Half of DE ($= \frac{1}{2}$ of $oobb$, i. e. $\frac{1}{4}$ of ob -Square) is equal to $\frac{oecd + oobb}{4} = CN$ Square, the half Line with the Part added: Wherefore CN is the Distance from the Focus $= \sqrt{\frac{oecd + oobb}{4}}$, of which the former Part $\frac{oecd}{4}$, is the fourth Part of the Rectangle under the *Latus Rectum* ($\frac{ocd}{b}$) and *Transversum* (ob); or, as *Apollonius* calls it, the fourth Part of the Figure; and the other Part $\frac{oobb}{4}$ is $\frac{1}{4}$ of the Square of the *Latus Transversum*: So that from hence we may have a Canon to determine the Focus of any Hyperbola; thus,

Add the Fourth Part of the Figure (or of the Rectangle under the *Latus Rectum* and *Transversum*) to the Square of half the *Latus Transversum*; and extract the Square Root of the Sum, that Root shall be the Distance of the Focus from the Center $= CN$. And if from CN you take half the *Latus Transversum* CE , the Remainder EN is the Distance of the Focus from the Vertex.

Which Rule is very easie in Practice, for $\frac{oobb}{4}$ is nothing but the Square of CE , and $\frac{oecd}{4}$ is only $\frac{1}{4}$ of DE multiplied into LM .

Wherefore find a mean Proportional between $\frac{1}{2}$ of $DE = MO$, and LM , which let be MN (in this Figure.)

And then make $MC = CE$ of the Hyperbola; for then shall the Hypotenuse NC , be the Distance from the Center C to the Focus N required.

COROLLARY II.

Since the Rectangle $DNE +$ Square $CE =$ Square CN , therefore the Square $CN =$ Square $CE =$ Rectangle DNE : Put therefore, for Brevities sake, $m = CN$, and then will the Rectangle $DNE = mm - \frac{oobb}{4}$ in this Notation, of which more below:

PROP. III.

In the Hyperbola (See Fig. of Prop. 1.) the *Latus Rectum* is to the *Latus Transversum* as the Square of any Ordinate IK is to the Rectangle DIE , contained under the Lines intercepted between it and the Vertices of the *Latus Transversum* and the Abscissa.

For here (as above) $\frac{oecd}{b} = \text{Latus Rectum, } ob = \text{Latus Transversum, and } oecd + eecd, \text{ will be } KI \text{ Square; and the Rectangle } DIE \text{ is } oebb + eebb$; wherefore place those Terms according to the Condition of the Proposition; as

$$\frac{oecd}{b} : ob :: oecd + oecd : oebb + eebb$$

And trying by multiplication of the Extreams and Means, you will find the same Quantity $e o o b b d + e e b b o d$ arise from both, and therefore the Terms are truly proportional. Q E D.

COROLLARY I.

In the Hyperbola (see Fig. 1. of Cor. 1. of Prop. 2.) if AC Square, or its equal FE Square ($= \frac{oacd}{4}$, which is $\frac{1}{4}$ of DE multiplied into LM) be taken out of CF Square, or its equal CN Square (i. e. out of $\frac{oecd + oobb}{4}$, by Cor. 1. Prop. 2.) there will remain $\frac{oobb}{4}$ whose Square Root is $\frac{ob}{2} = CD =$ half the *Latus Transversum* DE .

Wherefore here, if the Axis be given, the Foci are so too: For draw thro' the Vertex E , EF perpendicular to ED , and equal to CA , and with the Distance CE , setting one Foot of the Compasses in C , cross the Axis at N and N ; so shall these Points be the Foci required.

COROLLARY II.

Since (by Cor. 1. Prop. 2.) the Rectangle DNE $= \frac{oocd}{4}$; which Quantity $\frac{oocd}{4}$, is also (by Cor. 1. of this Proposition) proved equal to AC Square; 'tis plain the Rectangle $DNE = AC$ Square, or to a fourth Part of the Figure, as Apollonius calls it.

COROLLARY III.

Hence 'tis plain, That the Square of CE , half the Transverse Diameter: is to the Square of AC or EF , half the Second Diameter, as 'tis called :: as the Latus Transversum: to the Latus Rectum.

For $\frac{oobb}{4} : \frac{oocd}{4} :: oobb : oocd :: obb : ocd :: ob : \frac{ocd}{b}$.

COROLLARY IV.

Again, Since CE Square : AC Square :: $ob : \frac{oocd}{b}$ (by Cor. 3.) that is, As the Rectangle DIE : IK Square (by this Proposition) :: the Square of half the Transverse Diameter : is to the Square of half the Second Diameter; (or, by Cor. 2. to the Rectangle $ENE = AC$ Square) :: as the Rectangle DIE : to the Square of the Ordinate IK .

COROLLARY V.

Hence the Square of the Ordinate KI (Prop. 3.) which hitherto in the Hyperbola hath been denoted by $oecd + eebb$, (see Prop. 1.) may receive a new and useful Notation, thus: since $CE = \frac{ob}{2}$

its Square will be $\frac{oobb}{4}$; say therefore, As CE Square: to the Rectangle $DNE ::$ Rectangle DIE : to a fourth Term, which will be the Square of the Ordinate IK ; and in this Notation it will stand thus;

As $\frac{oobb}{4} : mm - \frac{oobb}{4} ::$ so is $oebb + eebb$: to $\frac{4emm}{o} + \frac{4emm}{oo} - oebb - eebb$; so that the Square IK is equal to $\frac{4emm}{o} + \frac{4emm}{oo} - oebb - eebb$. The Use of which will follow in the next Proposition.

PROP. IV.

In the Hyperbola, the Difference between the Right Lines KN and Kn , drawn from the same Point in the Curve to both the Foci, is always equal to the Transverse Diameter or Axis DE .

From the Point K in the Curve, let the Ordinate KI be applied; then will EI be the Abicissa, and noted e . Let CN or Cn , the Distance from the Focus to the Center, be called m , as in Cor. 2. of Prop. 2. then will $IN = CI + CN = \frac{1}{2}ob + eb + m$; and $In = CI - Cn = \frac{1}{2}ob + eb - m$.

Square each, and IN Square $= \frac{1}{4}oobb + oebb + eebb + obm + 2ebm + mm$: And In Square $= \frac{1}{4}oobb + oebb + eebb - obm - 2ebm + mm$.

To each of which Squares add the Square of the Ordinate IK , which in this Notation will be found to be $\frac{4emm}{o} + \frac{4emm}{oo} - oebb - eebb$, (see Cor. 5. of Prop. 3.) and there will arise the Square of the Hypothenuses $KN = \frac{1}{4}oobb + obm + 2ebm + mm + \frac{4emm}{o} + \frac{4emm}{oo}$, and of $Kn = \frac{1}{4}oobb - obm - 2ebm + mm + \frac{4emm}{o} + \frac{4emm}{oo}$.

Out of which Quantities extract the Square Roots, as may easily be done, and there will be found,

$$KN = \frac{1}{2}ob + m + \frac{2em}{o};$$

And

$$Kn = \frac{1}{2}ob - m - \frac{2em}{o};$$

Whose Sum is just ob . Q. E. D.

N.B. Tho' the last, $Kn = \frac{1}{2}ob - m - \frac{2em}{o}$, be an impossible Equation, yet 'tis no matter here, because all the Parts, but $\frac{1}{2}ob$ are lost in the Addition.

PROBLEM I.

To describe an Hyperbola, having the Transverse Diameter DE , and the Foci N and n given.

From N , at any convenient Distance, as NE , strike an Arch, and keeping the Compasses at that Distance with one Foot in E , mark the Point G in the Axis continued; then with the Length GD , and one Foot in n , cross the former Arch F , so shall you find a Point which is in the Hyperbola: and by this Method repeated, you may find another Point f further on, and so many as you please. The Reason of which is evident from this Proposition.

PROP.

PROP. V.

Let the Second Axis or Conjugate Diameter of the Hyperbola BA be brought down and placed at the Vertex parallel to the Ordinates, as OP ; then if from the Center C , you draw thro' the Points O and P two Right Lines running on infinitely: And after this draw a Parallel to this Diameter within the Hyperbola, as QR , I say,

It will be plainly demonstrable,

I. That the Parts of the produced Ordinates GQ and HR , intercepted between the Curve and the Asymptotes, will always be equal.

For the Triangles CEP and CFR , being similar, as also CEO and CFQ , it must be, As CE : EO (or EP): : CF : FQ or FR : But OE and EP are equal; wherefore QF and FR must be equal; from which taking the equal Ordinates, the Remainders HR and DG must be equal. $Q. E. D.$

II. The Rectangle under QG and GR (or RH and HQ) will ever be equal to the Square of EO ($= ood$) or to a fourth Part of the Figure.

For the Triangles CEO and CFQ being similar, CE : EO : : CF : FQ : : or as the Square CE : Square EO . That is, (by Cor. 3. Prop. 3.) as the *Latus Transversum*, to the *Latus Rectum*. That is, by the same Proposition, as the Rectangle DFE , is to FG Square. And CE Square EO Square: : CF Square: FQ Square. But if from CF Square, you take away the Rectangle DFE , there will remain CE Square (by 6. E. 2. Euclid.) And if from the Square of FQ you take the Square of FG , there will remain the Rectangle QGR , (by 5. E. 2. Euclid.) and as will presently appear, if you try it Algebraically, after the manner of the Demonstrations in that Book. Wherefore these two Remainders must be to each other, as their Wholes, i. e. as the Square of CF , to the Square of FQ : : or as CE Square: EO Square; and then it will stand thus:

$$CE \square : EO \square :: CE \square : \text{Rectangle } QGR.$$

Or Inversely: As,

$$EO \square : CE \square :: \text{Rectangle } QGR : CE \square.$$

That is, the Square of EO , and the Rectangle QGR , have the same Proportion to the same thing, and consequently are equal one to another.

And this will be the Case every where, let the Asymptotes run never so far. And since the farther you go from the Vertex of the Angle C , the longer must the Lines GR , gr , of necessity grow, since the Rectangle between GR and QG is always the same, viz. $= OE$ Square, the shorter must GQ , gq , continually grow; and consequently decrease infinitely, as the others increase infinitely; i. e. The Curve will infinitely approach to the Asymptote.

But yet they can never coincide, or meet with one another: For if the Points G and Q , or g and q , &c. should ever come to be co-incident, it will be, As the Rectangle DFE : FG Square: : So

will CF Square: be to FG Square (for GF Square and FQ Square, would then be the same thing); that is, Rectangle DFE would be $=$ to CF Square, which is utterly impossible, as is plain from 6. E. 2. Euclid.

Wherefore these Lines are true Asymptotes, as Apollonius named them from this Impossibility of Co-incidence with the Curve of the Hyperbola; when placed in this Position, Vid. Apoll. Prop. 1. Lib. 2.

HYPERBOLE (in Rhetorick) is a Figure which represents Things greater, lesser, better, &c. than in reality they are; and is used in Discourse, when our ordinary Terms are too weak or too strong, and carry no Proportion with our Idea; and left we should speak too little, we fly out, and say too much, or the contrary: As to express the Swiftnefs of a Horse, one should say, He was *swifter than the Wind*; if the Slowness of a Person, That he moves *slower than a Snail*.

HYPERBOLICK SPACE, is the Area or Space contained between the Curve of an Hyperbola and the whole Ordinate.

Any Hyperbolick Space $GEHG$: is to any other Hyperbolick Figure of the same Height $geb g$, (whose *Latus Rectum* and *Transversum*, as in the Circle, are equal, and also both equal to DE , the *Latus Transversum* of the former Space): : As the Conjugate Axe AB : is to the *Latus Transversum* DE .

For the Square of gF (the Ordinate) is $=$ to the Rectangle DFE , (by the Hyperbola): Wherefore the Rectangle DFE ($=$ Square FG): is to the Square FG : : as *Latus Transversum*: is to *Latus Rectum* of the Hyperbola $GEHG$; i. e. as the Square DE : Square AB . Wherefore the Roots of these Squares will be also proportional, and consequently Fg : FG : : DE : AB ; the former two Terms of which being each an Indivisible of the two Hyperbolick Spaces, it will follow, that the whole Spaces are in the same Proportion.

Wherefore $geb g$: $GEHG$: : DE : AB .

Or $GEHG$: $geb g$: : AB : DE .

$Q. E. D.$

Hence, if you find the Quadrature of any Hyperbola, whose Parameter and *Latus Transversum* are equal, you may square any other Hyperbola.

In *Philosoph. Transact. Numb. 34.* there is a Quadrature of the Hyperbola by an infinite Series of Rational Numbers.

In *Numb. 53.* there is a Method communicated by Sir Christopher Wren, for grinding Glasses of an Hyperbolick Figure.

HYPERBOLICUM ACUTUM, is a Solid made by the Revolution of the infinite Area of the Space contained between the Curve and the Asymptote, in the Apollonian Hyperbola, turning round that Asymptote; this produces a Solid or Body infinitely long, and yet as Torricellius plainly demonstrates,

$D d d 2$

(who

(who gave it this Name) it is equal to a finite Solid, or Body.

HYPERCATALEPTICK Verse : See *Deposition*.

HYPERCATHARSIS, is a Purge that works too much.

HYPERCRISIS, is a Critical Excretion above measure.

HYPERDISYLLABLE, is a Word of more Syllables than two.

HYPEROON, are the two Holes in the Upper Part of the *Ossa Palati*, which receive the pituitous Humours from the Mamillary Processes, and after they are separated, discharge them at the Mouth. Tho' those a Branch of the Fifth Pair of Nerves passes to the Palate, Uvula, and Gums.

HYPEREPHIDROSIS, is too much Sweating.

HYPERSARCOSIS, is an Excrescence of Flesh in any part.

HYPERTHYRON, in Architecture, is a large Table, usually placed over Gates or Doors of the Dorick Order, above the Chambrante, in form of a Frize.

HYPHEN, is an Accent in Grammar, that implies two Words are to be join'd, as *Male-Sanus*.

HYPNOTICKS, are those Things, which by either fixing the Spirits, or by straining and shutting up the Pores, cause Sleep. *Blanchard*.

HYPOBIBASMUS : See *Equation*, N. 4.

HYPOBOLE, is a Figure in Rhetorick, whereby we answer what we prevented to be objected against by an Adversary.

HYPOCHONDRIACA Affectio : See *Hypochondriacus Affectus*.

HYPOCHONDRIACUS Affectus, is (saith *Blanchard*) a kind of Convulsive Passion or Affectio, arising from the flatulent and pungent Humours in the Spleen or Sweet-bread, which afflicts the Nervous and Membranous Parts.

Or, as others say, it proceeds from windy Humours bred in the *Hypochondres*, whence a black Phlegm ariseth that infects the Animal Spirits, and they the Mind, and is what they call *Hypochondriack Melancholy*.

HYPOCHONDRIUM, or *Subcartilagineum*, is the Upper part or Region of the *Abdomen*, under the Cartilages of the Chest or short Ribs : In the Right *Hypochondrium* lies the Liver, and a part of the Stomach ; in the Left the Spleen, and a greater part of the Stomach.

HYPOCHYMA, is a depraved Sight, whereby Gnats, Cobwebs, little Clouds, or such like, seem to swim before the Eyes. The Cause of it seems to consist in turbid Humours, or sometimes in the Optick Nerves, whose little Pores are obstructed by the Matter that is thrust into them. *Blanchard*.

HYPCHYSIS, the same with *Hypochyma*.

HYPOCRATIS Manica, *Hippocrates* his Sleeve : See *Manica Hippocratis*.

HYPOGASTRICK-ARTERY, is by some said to be a Branch of the internal *Iliaca*, and distributes it self among the parts of the *Hypogastrium*, to the Bladder, *Rectum* (in Females to the outer and inner side of the *Matrix* and *Vagina*) *Vesiculae Seminales*, *Prostate Penis*, and to the *Os Sacrum*, and all Parts continued in the *Pelvis* : Then it gives two considerable Branches, which go out of the lower Belly ; the first passes under the *Pyriformis*, and goes to the *Glutei* ; the second goes to the *Obrutators* and the *Gluteus Major*.

HYPOGASTRIUM, is the lowermost Region of the *Abdomen*, reaching from three Inches below the Navel, to the *Abdomen*, *Os Pubis*, and Groins.

HYPOGLOSSIS, or *Ranula*, is an Inflammation or Exulceration under the Tongue : Also a Medicine that takes away the Asperity of the Larynx. *Blanchard*.

HYPOMOCHLION, or *Prop*, in Mechanicks, signifies the Roller, which is usually set under the Leaver, or under Stones or Pieces of Timber, to the end that they may be more easily lifted up or removed.

HYPOPHTHALMIA, is a Pain in the Eye under the Horney Tunick. *Blanchard*.

HYPOPHORÆ, are deep, gaping, and fistulous Ulcers. *Blanchard*.

HYPOPHYLLOSPERMOUS-PLANTS, are such as bear their Seeds on the Backsides of their Leaves, as the *Capillaries* : See that Word.

HYPOPHYSIS, the same with *Hypochyma*.

HYPOPYON, is a gathering of Matter under the Horney Tunick of the Eye, which sometimes covers the whole *Pupil*, hindering the Sight, and sometimes incompasses the Circle of the *Iris*, like the paring of a Nail ; whence 'tis called *Oxyx* or *Unguis*.

HYPOSARCA, the same with *Anasarca*.

HYPOSARCIDIUM, the same as *Anasarca*.

HYPOSILOIDES : see *Hyoides*.

HYPOSPATHYSMUS, is an Incision in the Forehead, made by three Cuts or Divisions, and where the Spatula is thrust in under the Skin. *Blanchard*.

HYPOSPHAGMA, is a Blood-shot from a stroke upon the Eye.

HYPOSTASIS Urine, is that thick Substance which generally subsides at the Bottom of the Urine.

HYPOSTASTICAL Principles ; *Paracelsus* and his Followers, called the three Chymical ones, *Salt*, *Sulphur*, and *Mercury*, so.

HYPOTENAR, is a Muscle which helps to draw the Little-finger from the rest.

HYPOTHENAR, is the Space from the Fore to the Little-finger. *Blanchard*.

HYPOTHENUSE, in a Right-angled Triangle, is that side which subtends the Right-angle, and consequently the longest. The Square of this Line in a Right-angled and Right-lined Triangle, is always equal to the Sum of the Squares of the other two sides, *Prop. 47. E. 1. Euclid* : see the Demonstration under *Triangle*.

HYPOTHESIS, the same with *Supposition* : When for the Solution of any *Phenomena* in Natural Philosophy, Astronomy, &c. some Principles are supposed as granted, that from thence an intelligible and plausible Account of the Causes, the Effects of the proposed *Phenomena* may be given, the laying down or supposing such Principles to be granted, is called an *Hypothesis* ; and the thing said to be accountable easily according to that *Hypothesis*, if it give a clear and easie Solution of the *Phenomena*. Wherefore an *Hypothesis* is a Supposition of that which is not, for that which may be ; and it matters not whether what is supposed be true or not, but it must be possible, and should always be probable.

An *Hypothesis*, in some Sense, falls in with a System : But this Word is usually taken in respect to the Universe, and in Relation to the Dispositions of the Heavens, and the Motion of the Stars : An elaborately contrived *Hypothesis* about which, is called a System ; as the *Ptolemaick*, *Copernican*, or *Tychonian* System.

HYPOTRACHELION, in Architecture, is the Top or Neck of a Pillar, or the most slender Part of it which toucheth the Capital.

It is taken by some for that part of the *Tuscan* and *Doric* Capitals which lies between the *Echinus* and the *Astragal*; and is otherwise called the *Collar*, *Gorge*, or *Frize of the Chapter*.

HYPOTYPOSIS, is a lively and exact Description of any Object made in Fancy.

HYPOZOMA, is a Membrane that parts two Cavities, as the *Mediastinum* in the Thorax. *Blanchard*.

HYPSILOGLOSSUS: see *Basioglossus*.

HYSTERALGIA, is a Pain in the Womb, proceeding from an Inflammation, or otherwise. *Blanchard*.

HYSTERICA, are Medicines against the Diseases of the Womb.

HYSTERICA-PASSIO, Fits of the Mother, is (according to some) a Convulsion of the Nerves of the *Par Vagum* and Intercostal in the *Abdomen*, proceeding from a pricking Irritation or Explosion of the Spirits: This Distemper does not always, nor indeed usually, depend upon the Womb, as is commonly thought: 'Tis seen sometimes in Men, because the Spleen, Pancreas, and other adjacent Bowels, are often the Cause of it. *Blanchard*.

Dr. Purcell, in his Book of Vapours, attempts to prove, and with Probability, That the Cause of Hysterick Fits is neither the *Six Non-natural Things*, nor the solid Parts of the Body, nor the Blood, nor any of the Recrements, nor the Womb, nor Vapours thence arising, nor the irregular disorderly Motion

of the Animal Spirits; nor is it in the Chyle, or in the Ferment of the Stomach or Guts, &c. But he supposes the true Cause to be Crudities and Indigestions in the Aliments, which, by little and little, gather together in the Wrinkles and Folds of the Stomach and Guts; where they (as he supposes) lie for some time without much sensible Motion or Fermentation within themselves, till at last by the Heat of the circumjacent Parts, their grosser Salts are divided and put into Motion; which Fermentation is augmented by the various Juices which flow into the Guts from the many Glands which are placed in the Lower Belly; and by this means they are so dissolved and liquified, as to enter in by the *Vena Laëna* into the Blood, where they produce those Accidents which cause the Symptoms of this various Disease.

HYSTEROMOTOCIA, or *Setio Casarea*, is a cutting the Child out of the Womb; which is done thus: You make a *Semi-lunar Section* under the Navel along the *Linea Alba*, the Cavity whereof looks towards the said Line; then according to the leading of the Fibres, the *Fœtus* being extracted after the Section, the Wound in the Womb contracts of it self, so that the Blood scarce flows more plentifully than in a Natural Birth; but if the Mother be dead, choose the most convenient Place you can. *Blanchard*.

HYSTEROTOMIA, is an Anatomical Dissection of the Womb,

I C E

JACOB'S-STAFF, a Mathematical Instrument for taking Heights and Distances; the same with *Crofs-staff*; which see.

IAMBUS, is a Foot of a Latin Verse, consisting of two Syllables, when the first is short, and the other long, as *Tēnax*.

JANITOR, the same with *Pylorus*.

JAUNDICE: see *Icterus*.

ICE: In *The Works of the Learned* for July, 1701, there is an Abridgment of a French Book, called *Nouvelle Conjecture pour expliquer la Nature de la Glace*; in which the Nameless Author modestly proposes the following Conjectures about Freezing and Ice.

Water freezes only because its Parts lose their Natural Motion, and cleave close to one another; but we must observe,

1. That the Water, whilst it freezes, seems to dilate it self, and that it becomes more light; whereas it should seem that it ought to become more weighty.

2. That frozen Water is not quite so transparent, and that the Bodies transpire not so freely thro' it as formerly; tho' one would think the contrary should happen, if it be true, that the Water dilates it self as it freezes. These are the seeming Contrarieties which are found in the Effects and Properties of Ice, that make the Nature of it obscure and difficult to be explained.

'Tis the common Opinion of Philosophers, That Ice is made by certain Spirits of Nitre, which in the Winter mix with the Parts of the Water, and being of themselves improper for Motion, because of their Figure and Inflexibility, inflexible and destroy gradually that of the Parts to which they are joined. This Opinion is supported by some

I C E

Experiments, which prove, at least, that on certain Occasions the Spirits of Salt and Nitre contribute to form the Ice.

Our Author has no Design to controvert those Experiments: He says only, That 'tis not certain that the Spirits of Nitre do always enter into the Composition of Ice; and that tho' they enter'd the same constantly, that alone would not be sufficient to explain all the Effects.

For Instance; We cannot conceive how the Spirits of Nitre, which enter the Pores of the Water, and fix the Parts of it, can oblige the Water to dilate it self, and make it more light; whereas Naturally they ought to augment the Weight of it. This Difficulty, and some others that might be insisted upon, shew the Necessity of a new System to explain the Nature of Ice: Therefore our Author gives this that follows, which he conceives explains all things with more Ease, and in a more simple manner, than the ordinary System.

He alledges, That Water freezes in the Winter, because its Parts being more closely joined together, they mutually embarrass one another, and lose all the Motion they had; and he supposes the Air to be the sole, or at least the principal Cause, why the Parts of the Water join so closely together. He explains it thus:

There are an infinite Number of small Parts of gross Air mixt among the Parts of the Water, as every Man may plainly perceive; for if we put into a Pneumatick Machine an open Vessel full of Water, in that same Proportion as you pump the Air out of the Machine, you will see the Water bubble up, and send forth a great Quantity of gross Air.

Those Parts of gross Air being dispersed among those of the Water, they have each of them the Virtue of a Spring; which is now so well proved in Natural Philosophy, that no Man will call it in question.

If then it can be shewed; That the small Springs of gross Air, mixed with the Water, have more Force in the Winter, and that then they unbend themselves a little; it would easily be conceiv'd, that on one side those Springs unbending themselves in that manner, and on the other the external Air continuing to press the Surface of the Water, the Parts of the Water shut up betwixt those small Springs which repulse them on all sides, must needs being locked up one against another, lose their Moisture, and form a hard Body, that is to say, *Ice*. All the Difficulty lies in this, How to know whether in reality the Springs of the Air, which are dispersed in the Water, unbend a little in the Winter; which 'tis easie to prove they do.

The gross Air, which we cannot perceive in the Water whilst it is Liquid, is easily seen when 'tis Frozen; we see then very often a great Quantity of Bubbles of Air very sensibly; and when they are too small to be observed every one apart, we may see them confusedly and in gross; for frozen Water is always a little whiter than 'twas before; and they that have studied any thing of the Nature of Colours, know that this Whiteness proceeds only from the small Bubbles of Air mix'd with the *Ice*. This is the Reason that all Scums are whitish, and that the Bubbles of Air mix'd with Glaſs or Chryſtal, appear whiter than the rest;

Add to this, That the little Bubbles of gross Air, which are absolutely insensible in the Water, so long as 'tis liquid, cannot become sensible in frozen Water, but because each of them becomes grosser than they were: And they cannot become grosser, but for one of these Reasons: Either because the Water, when it freezes, hath attracted new Air; or because the Air already dispersed in the Water, takes up a greater Space, and that its Springs are a little more unbended. We cannot conceive how the Water, as it freezes, could attract new Air, since the Pores of the *Ice* are certainly less than those of the Water, thro' which the gross Air cannot pass but with Difficulty. It must be then, that the Air already dispersed among the Parts of the Water, is dilated, and that the Springs are a little unbended.

But why, when 'tis cold, have the Springs of the Air more Strength to unbend themselves, than at another Season?

It is answered in the First place, That to establish this System here laid down, it is enough to prove that the Thing happens really so, without any Necessity of explaining the Cause of it.

Secondly, That this Cause is not very difficult to be found. Every one knows that Bodies with Springs have so much more Force as they are more stiff, and that they are so much the more stiff, as their Pores are less; but it is the Property of Cold to restrict the Pores: And during the Heat, the Pores are more open, because the subtil Matter which passes always thro' them, being then in a more violent Motion, hath the more Force to extend them and keep them open; whereas in the Winter, their Motion being much slackened, all the Bodies shut themselves up, and their Pores are straitened. Hence it comes, that in the Winter the Bodies of Animals transpire much less than in another Season. Since then the Cold locks up the least Parts of the gross Air, and makes them less pliable, and more stiff, because it straitens the Pores; we must say also, that it

augments the Force of their Springs, the Springs becoming more violent, according as the Body becomes more stiff.

Thus, during the Winter, the Springs of Air which are dispersed in the Water, having considerably more Force, they must unbend themselves a little, and as they unbend, they press against one another the small Parts of Water which they hold shut up.

This being supposed, there is nothing in *Ice* but what may be explained naturally enough.

1. That Water as it freezes, ought to make a hard Body, because then its Parts being pressed one against another, they embarrass one another mutually, and so lose all the Motion they had.

2. That Water as it freezes, ought to become more light; for tho' its Parts be more press'd than they were before, yet the Mass being composed of the Parts of the Water thus press'd, and of Air dilated, ought to be more large, and by consequence more light, than it was when the Water was liquid.

3. Frozen Water takes up a greater Space than when 'tis liquid, because the Springs of Air dispersed in the Water, by unbending themselves, do oblige the Water to rise in the Vessel which contain'd it. It is true, that the external Air presses also the Surface of the Water, and makes an Effort to repel it; but this external Air being freer, and its little Springs less bended, because they unbended themselves according as the Cold lock'd up the neighbouring Bodies, it hath less Force than that which is shut up in the Water, whose Springs cannot unbend, but by making the Bulk of the Water larger.

4. If you shut up a Vessel full of Water in the Pneumatick Machine, the Air dispersed in the Water dilates it self in an extraordinary manner when they pump the Air of the Machine; yet the Water freezes not, because the external Surface of the Water being no more press'd, the Air which it contains may, by unbending it self, escape freely, as in reality it does.

5. Frozen Water must always be less transparent than the same Water when it is liquid, because the Bubbles of Air which are insensible in the Water, by reason of their Smallness, being more sensible and large in the *Ice*, must also make it appear to be more white, and by consequence less transparent.

6. The Bodies must much less transpire through the *Ice*, than through the Water, because the Parts of the frozen Water are, in effect, more press'd than they were before, and so leave a less free Passage to foreign Bodies.

7. The Water, from which there is abundance of Air drawn by means of the Pneumatick Engine, must also freeze with less Difficulty; of which an able Man told our Author he had made the Experiment.

8. The Spirit of Wine, Brandy, and other Liquors of the same sort, cannot freeze at all, or at least rarely; for their Parts being in a great Motion, as appears by the Evaporation made of them, it follows, that the Air dispersed into the Parts of those Liquors, is much more subtil, and by consequence hath less of a Spring, than that which is dispersed in the Parts of common Water, since the Spring of the Air is principally in its gross Parts.

9. Oil, Fat, and other viscous Liquors, must congeal more easily than Water freezes, because their Parts being improper for Motion, do speedily embarrass one another; but those Liquors, when they congeal, cannot become so hard as *Ice*, nor dilate themselves in the same manner; for tho' they contain

contain among their Parts a greater Quantity of Air than Water does, yet that Air is more subtil, hath less Spring, and easily makes its way thro' the Pores of those Liquors.

10. Quick-silver cannot freeze, because it does not contain a great enough Quantity of gross Air; its Parts also are much polish'd, and they can easily slide one against another, without embarrassing or stopping one another.

11. According as the Cold grows more sharp, the Springs of the Air, dispersed in the Ice, ought to have more Force to repel the Parts of the frozen Water; and the Bulk composed of the Air and frozen Water, must needs grow larger and larger. This hath been proved in the following manner: They fill'd with Water an hollow Iron Bullet, which had a Hole of three or four Lines Diameter; the Water being frozen in that Bullet, and not being strong enough to break it, the Ice issued at the Hole, and form'd a sort of Stalk or Ice-sickle, which lengthened according as the Cold increased, and grew to the Length of a Finger; this Stalk being broke, and the Bullet exposed to the Air during a very cold Night, it made a new Stalk, but not so long as the former, the Ice's pining it self, if we may be allowed so to speak, as it passed through the Hole of the Bullet; as Gold and other Minerals do, by passing through the Wire-drawer's Instruments.

12. In the Hypothesis here laid down, the Spirits of Nitre may also contribute to form the Ice, in as much as by joining themselves to the small Parts of the Air dispersed in the Water, they contribute towards rendering them more stiff and inflexible, and to augment the Force of its Springs.

ICHOGRAPHY, in Perspective, is the View of any thing cut off by a Plane parallel to the Horizon, just at the Base or Bottom of it: And in Architecture is taken for the Geometrical Plan or Platform of an Edifice, or the Ground-plot of a House or Building delineated upon Paper, describing the Form of the several Apartments, Rooms, Windows, Chimneys, &c. And this is properly the Work of the Master-Architect or Surveyor, being indeed the most abstruse and difficult of any.

ICHOGRAPHY, in Fortification, is in like manner the Plane or Representation of the Length and Breadth of a Fortress, the distinct Parts of which are mark'd out either upon the Ground it self, or upon Paper.

ICHOR, is a sulphureous and watery Humour which flows from Ulcers. *Blanchard.*

ICHOROIDES, is a Moisture like Corruption.

ICOSIHEDRON: see *Regular Bodies*. This Solid consists of twenty *Triangular Pyramids*, whose Vertexes meet in the Center of a Sphere that is imagined to circumscribe it, and therefore have their Height and Bases equal: Wherefore the Solidity of one of those Pyramids, multiplied by 20, the Number of Bases, gives the solid Content of the *Icosihedron*.

The following Figure being drawn on Pastebord cut half thro', and then folded up neatly together, will represent an *Icosihedron*.

ICTERUS, the Jaundice, is a changing of the Skin into a Yellow Colour, from an Obstruction of the *Ductus Choledochus*, or the Glandules of the Liver, thro' Weakness, Obstruction, or a *Schirrus* of the Liver; or because the Gall abounds more than can be conveniently excreted, so that it stays in the Blood. The *Latins* call it, *Regius Morbus*, the Kingly Disease, because it is easily cured in Courts with the Pastimes and Diversions there which cheer the Mind. It is also called a Suffusion of the Gall. *Blanchard.*

IDEA, is whatsoever the Mind perceives in it self, or stands there for the immediate Object of any Phantasm, Notion, Species, Thought or Understanding.

IDENTITATE NOMINIS, is a Writ that lies for him, who upon a *Capias* or *Exigent*, is taken and committed to Prison for another Man of the Name.

IDEOTA *inquirenda vel examinanda*, is a Writ to the Escheator or Sheriff of any County, where the King hath Notice that there is an *Ideot*, Naturally born so weak of Understanding, that he cannot govern or manage his Inheritance, to call before him the Party suspected of the *Ideocy*, and examine him; and also by the Oath of Twelve Men, to inquire whether he be sufficiently witted to dispose of his own Lands with Discretion, or not, and to certify accordingly into the Chancery: For the King hath the Protection of his Subjects, and by his Prerogative, the Government of their Lands and Substance, that are naturally defective in their own Discretion.

IDES of a Month, among the *Romans*, were the Day after the *Nones* were out. They commonly fell out on the 13th of every Month, except in *March, May, July, and October* (which they called the *Full Months*, as all the others were called *Hollow*) for then they were on the 15th, because in those Months the *Nones* were on the 7th. The Etymology of the Word is variously given, and to be seen in most Dictionaries: See *Danet's Greek and Roman Antiquities*.

IDIOCRAZY, the proper Disposition or Temperament of a Thing or Body.

IDIOPATHY, is a primary Disease, which neither depends on, nor proceeds from any other.

IDIOSYNCRASY, is a Temperament peculiar to any particular Animal Body; whereby it hath, either in Sickness or in Health, a peculiar Aversion against, or Inclination for some particular Things; or on which some Things will have no such, or a more than usual Operation, than they will have on other Bodies.

JECAR-CAPSTAN: see *Capstan*.

JECUR, the same with *Hepar*.

JECUR Uterinum: see *Placenta Uteri*.

JEER, or *Jeer-Rope*, is a Piece of a Hawser fastened to the Main-yard and Fore-yard (in great Ships only) close to the Ties; then 'tis reeved thro' a Block, which is seized close to the Top, and so comes down again, and is reeved through another Block at the Bottom of the Mast close by the Deck; there are usually two of these, one on each side the Ties: Its Use is to help hoist up the Yard, but more especially to succour the Ties, and to keep the Yard from falling, if they should break.

JEJUNUM *Intestinum*, is the Second of the Small Guts, so called, because it is most times found empty: 'Tis in Length about Eight Foot in Men; it begins on the Right Side under the *Colon*, where the *Duodenum* ends, and fills a good Part of the Umbilical Region, especially on the Left Side;

'tis

'tis continued to the *Ileum*, but is easily known from it by its Emptiness, by the great Number of its Veins and Arteries, which make it look a little Reddish, and also because the Wrinkles in its Coats are more in number, and nearer to one another, than those in the *Ileum*, and the Coats themselves are much thicker.

JEOPAIL, in Common Law, signifies an Over-sight in pleading, touching which you have a Statute, 32 H. 8. 30. whereby it is enacted, That if the Jury have once past upon the Issue, tho' afterward there be found a *Jeopail* in the Pleading, yet Judgment shall likewise be given, according to the Verdict of the Jury.

JESSANT, when in a Coat of Arms a Lion or other Beast is born over some Ordinary, as over a Chief, a Bend, a Fesse, &c. that Lion or Beast is blazoned *Jessant* or *Jacent*, i. e. lying over all.

JET D'EAU, is the French Word for a Pipe of a Fountain, which casts up the Water any considerable Height into the Air.

Mr. Mariotte, in his Treatise *du Mouvement des Eaux*, &c. saith, That a *Fet d' Eau* will never rise so high as its Reservatory, but always falls short of it by a Space, which is in a subduplicate Ratio of that Height; and this he proves by several Experiments.

He saith also, That if a greater branches out in many smaller ones, distributed to different Jets, the Square of the Diameter of the main Pipe must be proportioned to the Sum of all the Expences of its Branches; and particularly saith, That if the Reservatory be 52 Foot high, and the *Adjutage* half an Inch in Diameter, the Pipe ought to be 3 Inches in Diameter.

JETSON: see in *Floſſon*.

IGNIS-FATUUS, is a certain Meteor that appears chiefly in the Summer-Nights, for the most part frequenting Church-yards, Meadows and Bogs, as consisting of a somewhat viscous Substance, or a fat Exhalation; which being kindled in the Air, reflects a kind of thin Flame in the Dark, yet without any sensible Heat, often flying about Rivers, Hedges, &c. because it meets with a Flux of Air in those Places. This Meteor is well known among the Common People, under the Name of *Will-of-the-Whisp*, or *Jack-with-a-Lantern*.

IGNIS PERSICUS, the same that *Gangrana*: it is taken also for a Carbuncle.

IGNIS ROTÆ: see *Wheel-fire*.

IGNIS SACER, the same that *Erysipelas*: Yet some take it for an *Herpes*.

IGNIS SYLVESTRIS, the same that *Phly-Elena*.

IGNITION, is Calcination made by Fire.

IGNORAMUS, in Law, is a Word used by the Grand Inquest, impannelled in the Inquisition of Causes Criminal and Publick, and written upon the Bill when they dislike their Evidence, as defective or too weak to make good the Presentment: The Effect of which Word so written is, That all farther Enquiry upon that Party, for that Fault, is thereby stopped, and he delivered without farther Answer.

I L E, is the Cavity from the *Thorax* to the Bones of the Thighs: *Pliny* observes, That all the Intestines in all Animals, except a Man and a Sheep, are called *Ile*. *Blanchard*.

I LEUM, is the Third of the small Guts, so called *ἀπὸ τῆς ἰλίου*, a *Circumvolvendo*, because of its many Turnings, &c. It begins where the *Jejunum* ends, and ends it self at the Gut called *Cecum*, at the Beginning of the *Colon*: It is about 21 Hands

Breadth in Length: There can be no such thing as twisting of the Guts, but sometimes the Coats being doubled inward, the upper Part of an Intestine sinks or falls with the lower, which makes the *Iliack Passion*, or *Volvulus*. The *Ileum* oft falls down into the *Scrotum*, and then the Rupture is called *Intestinalis*. The Passage of the *Ileum* is a little narrower than that of the *Jejunum*, and its Coats are somewhat thinner.

ILIA, the *Flanks* are the lateral Parts of the *Abdomen*, betwixt the last Rib and the Secret Parts.

ILIACK PASSION, the same with *Miserere*, or the Twisting of the Guts.

ILIACK VESSELS, are those double-forked Vessels of the Trunks of the great Artery, and the great Vein of the *Abdomen*, about the Place where the Bladder and the Womb are situate. *Blanchard*.

ILIACUS INTERNUS, is a Muscle of the Thigh, which arises fleshy from above half the Superior Region, and Internal Concave Part of the *Os Ilium*; and in its Descent over the Inferior Part of the last-named Bone, joins with the *Psoas Magnus*, and is inserted with it, partly under the Termination of the *Pectineus*: This, together with the *Psoas Magnus*, move the Thigh forwards in Progreſſion.

ILINGUS: see *Scoromia*.

ILIUM OS, is the first and upper Part of the Bone called *Ossa Innominata*, which are two large Bones situated on the sides of the *Os Sacrum*. This Part of it, *Ilium*, is so named, because it contains the Gut *Ilium*, which lies between it and its Fellow. Its Circumference is circular, being a little convex and uneven on its external side. 'Tis a large Bone, and is connected to the sides of the three superior *Vertebrae* of the *Os Sacrum*: The upper Part of it, of its Edge or Circumference, is called *Spina*, the Concave Internal Side *Costa*, and the External Convex one *Dorsum*: It is joined to the *Os Sacrum* by a true Suture: It is larger in Women than Men.

ILLUMINATIVE-MONTH, is that Space of Time that the Moon is visible to be seen betwixt one Conjunction and another.

IMAGE, in Opticks, is the Projection of an Object in the distinct Base of a Convex-glass.

To find the Diameter of an Image, in the distinct Base of a Convex-Glass, Mr. Molyneux gives this Rule.

As the Distance of the Object from the Glass:
To the Distance of the Image from the Glass::
So the Diameter of the Objects Magnitude:
To the Diameter of the Image.

Wherefore, if the Diameter of the Sun subtend an Arch of 32 Minutes of a Great Circle in the Heavens, the Diameter of the Sun's Image represented in the distinct Base of a Convex Glass, subtends an Arch of 32 Minutes also of such a Circle as hath for its Radius the Distance of the distinct Base from the Glass.

IMAGINATION, is an Application of the Mind to the Phantasm or Image of some Corporeal Thing impressed in the Brain.

IMBRICATED, is a Word used by Mr. Tournefort, and some other Botanists, to express the Figure of the Leaves of some Plants, which are hollowed in like an *Imbrex*, or Gutter-Tile.

IMMENSE,

IMMENSE, is that whose Amplitude or Extension no Finite Measure whatsoever, or how oft soever repeated, can equal.

IMMERSION, the Plunging of any thing under Water; 'Tis also used by Astronomers, to signify that any Planet is beginning to come within the Shadow of another, as in Eclipses, whenever the Shadow of the Eclipsing Body begins to fall on the Body Eclipsed, we say, that is the time of *Immersion*; and when it goes out of the Shadow, is the Time of *Emergence*.

IMMERSUS: see *Subcapularius*.

IMMUTATION: see *Hypallage*.

IMPALED, when the Coats of a Man and his Wife (who is not an Heiress) are born in the same Escutcheon; they must be Marshallled in *Pale*, the Husband's on the Right side, and the Wives on the Left; and this the Heralds call *Baron and Femme*, two Coats Impaled.

If a Man hath had two Wives, he may Impale his Coat in the middle between theirs; and if he hath had more than two, they are to be Marshallled on each side of his, in their proper Order. See *Clifford's Coat* in *Guillim*, p. 399. who had seven Wives.

IMPARLANCE, or *Emparlance*, is a Motion made in Court upon the Account of the Demendant by the Tenant, or Declaration of the Plaintiff by the Defendant, whereby he craveth Respite, or any other Day to put in his Answer.

This Imparlance is either *General* or *Special*.

The *Special* is with this Clause, *Salvo omnibus advantageis tam ad jurisdictionem curie quam breve & narrationem*.

The *General* is made at large, without inserting that or any other like Clause.

IMPENETRABILITY, is the Distinction of one extended Substance from another, by which the Extension of one thing is different from that of another; so that two things extended, cannot be in the same Place, but must of Necessity exclude each other.

IMPERATIVE-MOOD (in *Grammar*) implies a Command to such a one to do such a thing.

IMPERFECT CONCORDS: see *Concords*.

IMPERFECT Flowers of Plants, are such as want the *Petala*, or those finely coloured little Leaves which stand round and compose the Flower: And therefore they are sometimes called *Apetalous*, and sometimes *Stamineous*; because they have only the *Stamina* and *Style* of a Flower.

IMPERFECT NUMBERS, are such whose Aliquot Parts taken altogether, do either exceed, or fall short of that Whole Number, of which they are Parts: And these are of two sorts, either *Abundant* or *Deficient*; which see.

IMPERFECT PLANTS, are by the Botanists accounted such as either really want Flower and Seed, or rather seem to want them; since no Flower or Seed hath yet been discovered to belong to much the greatest part of them.

These Mr. Ray distinguishes according to the Place of their Growth; into,

I. *Aquaticks*, or such as grow in the Water; and that either in the Sea, and then they are called

Marine Plants; and those are either of an hard and stony Consistence, as the *Coral*, *Corallines*, *Porus*;

Or of a more Soft and Herbaceous one.

Of these some are like Herbs, and are of two Kinds:

The Greater, which are *Cauliferous*, as the *Fucus*,

The Lesser, as the *Alga*.

The others are more of the *Musci* or *Fungus* Appearance, as the *Spongia*.

Fresh-water Plants, and those have either no Leaves, but are *Capillaceous*, as the *Conserve*;

Or their Leaves divided into three Parts; as the *Lent palustris*, *Lenticula*.

II. Such *Imperfect Plants*, as inhabit the dry Ground, he divides into,

First, Such as have a Substance, either Woody, or Flethy; and these have scarce any thing common to the Perfect Plants, neither the Green Herbaceous Colour, nor the Texture of Herbs, nor Flower, Seed, nor Leaf, properly speaking, as all the *Fungi*; which are,

1. Such as grow on Trees, and therefore called *Arboreous*; as the *Fungus Laricis*, called *Agarick*, and the *Fungus Sambuci*, which we call *Jews-Ear*, *Auricula Juda* in *Latin*.

2. *Terrestrial*; and these are either *Cauliferous*, with Heads either *Lamellated*, or *Porose* underneath; or without Stalks, as the *Pezize* of *Pliny*, and *Fungus Pulverulentus*, *Crepitus Lupi*, or common *Puff-Balls*.

3. *Subterraneous*; as the *Tubera Terra*, or *Truffles*.

Secondly, Such as have a more soft and dry Consistence, and more like that of Herbs: Of which some are both *Cauliferous* and Branched, as the *Musci* or *Mosses*.

Others are without Stalks, adhering like a Crust to the Surface of the Earth, Stones, Trees, or Wood; as the *Lichen Terrestris* and *Arboreus*.

IMPERIAL-TABLE, is an Instrument made of Brass, with Box and Needle, and Staff, used to measure Land: see *Vol. II*.

IMPERSONAL-VERB, in *Grammar*, is such an one as is only used in the Third Person Singular, as *Oportet*, *Licet*, &c.

IMPERVIOUS: Bodies are said to be Impervious to others, when they will neither admit the Rays of Light, &c. nor the Effluvia of other Bodies to pass thro' them.

IMPETIGO CELSI, the same with *Lepra Graecorum*. *Celsus* makes four sorts of it :

The most harmless, says he, is that which is like a Scab, for it is red and hard, exulcerated and gnawed : But it differs from it, in that it is more exulcerated, and is accompanied with speckled Pimples : And there seem to be in it certain Bubbles, from which after a certain time there fall, as it were little Scales, and it returns more certainly.

Another sort is worse, almost like a sort of Meazles, or hot Pimples in the Skin, but more rugged, and redder, and of different Figures : In this Distemper little Scales too, fall from the Surface of the Skin, and it is called *Rubrica*.

The third sort is yet worse ; for it is thicker and harder, and swells more, and is cleft on the top of the Skin, and gnaws more violently : It is Scaly too, but black, and spreads broad and slow : It is called *Nigra*.

The fourth sort is altogether incurable, of a different Colour from the Red ; for it is something white, and like a fresh Scar, and has pale Scales ; some whitish, some like the little Pulse called *Lintel*, which being taken away, sometimes the Blood follows : Otherwise the Humour that flows from it is white, the Skin hard and cleft, and spreads farther.

All these sorts arise especially in the Feet and Hands, and infest the Nails likewise.

Impetigo some reckon the same with *Lichen*, *Blanchard*.

IMPETIGO PLINII, *Pliny's Impetigo*, is the same with *Lichen Graecorum*. *Blanchard*.

IMPROPER FRACTIONS, are such as have their Numerators equal to, or greater than their Denominators, as $\frac{7}{4}$, $\frac{11}{3}$, &c. which are not Fractions properly speaking, but either Whole or Mixt Numbers ; and are only put into the Form of Fractions, in order to be added, subtracted, multiplied, or divided, &c.

INACCESSIBLE HEIGHT or *Distance*, is that which cannot be Measured, by reason of some Impediment in the Way ; as Water, &c.

INADEQUATE IDEA'S, are such, which are but a partial, or incomplete Representation of those Archetypes or Images to which the Mind refers them.

INANITY, is the School-Term for Emptiness or absolute Vacuity, and implies the Absence of all Body and Matter whatsoever ; so that nothing remains but bare Space.

INCALESCENCE, is a Thing growing hot by some Internal Motion, or Fermentation ; as when Quick-lime grows hot by pouring Water upon it.

INCALESCENT MERCURY, so *Mr. Boyle* calls some Mercuries of an uncommon Preparation, which by being mingled with a due Proportion of Gold Leaves, or small Fillings, would Amalgamate and grow hot with the Gold, even in the Palm of our Hand.

IN CASU CONSIMILI, is a Writ : see *Casu Proviso*.

IN CASU PROVISIO, is a Writ : see *Casu Proviso*.

INCEPTIVE of *Magnitude*, is a Word used by *Dr. Wallis*, expressing such Moments or first Principles, as tho' of no Magnitude themselves, are yet capable of producing such. Thus a point hath no Magnitude it self, but is Inceptive of a Line, which it produces by its Motion : A Line considered one way, hath no Magnitude as to Breadth, but is capable by its Motion of producing a Surface which hath Breadth, &c.

INCERATION, is a mixture of Moisture with something that is dry, by a gentle soaking, till the Substance be brought to the Consistence of Soft Wax. *Blanchard*.

INCIDENCE. In Opticks, the Angle $a c P$, made by the Ray $a c$, and the Perpendicular $P c$, is called the *Angle of Incidence* ; but *Dr. Barrow*, and some others, call it the *Angle of Inclination* ; and by the *Angle of Incidence*, they understand its Complement $e c a$.

Mr. Molyneux, in his *Dioptricks* uses the Words *Inclination* and *Incidence* promiscuously, and by the *Angle of Incidence* or *Inclination*, always intends the first named Angles $a c P$.

The Angle $P c b$, is called, *The Angle of Reflexion*, and is always $=$ to the Angle of Incidence $a c P$: Which is thus proved by *Leibnitzius*.

Every Ray of Light goes the shortest way that possibly it can : But if you suppose the Ray $a c$ to fall on the Plane-Glass, or Surface $e g$, and thence to be reflected to b , so that the Angle $a c e$ be $= b e g$, then will the two Lines $a c$ and $c b$ be the two shortest Lines that can possibly be drawn from the Points a and b , to the Plane $e g$: For Instance, they will be shorter than $a d + d b$, or any others.

Produce $c b$ to f , and draw $d f$, because the opposite Angles at c are ; the Arch $e f (= b g) = a e$ by the Supposition ; but 'tis plain that $f c = a c$, and $c f = c b$. Wherefore $f b (= a c + c b)$ will be less than $d f$ (i. e. $a d$) $+ d b$: and so it will be every-where else. Wherefore since the Ray must go the nearest way, the Angle of Incidence will always be $=$ to that of Reflexion : For the two Angles $e c a$ and $b c g$, being thus equal, their Complements $a c P$ and $P c b$ must be so too.

That the Angle of Incidence $a c P$, is $=$ to that of Reflexion $P c b$, may very briefly be thus proved.

Produce the Ray $a c$ directly till it meet with the Perpendicular $g b$ in the Point b : Then make $c R = g b$, and draw $c K$: I say $c K$ is the Reflected Ray, and that the Angle $P c k = r c P$: For $P b$ being drawn perpendicular to the Plane $e g$, the Angle $e c a + a c P = K c g + P c K$, because both are $= L$: But $e c a = g c b$, because Vertical and $c g b = g c K$ by Construction. Wherefore $e c a = b e g$: And consequently their Complements $a c P$ and $P c b$ are equal. Q. E. D.

In *Dioptricks*, the Sines of the Angles of Incidence, and Reflected Angles, are to each other reciprocally, as the Resistances of the Mediums, as is demonstrated

strated by *Leibnitz* in *Acta Erud. Lipsie. Anno 1682.* p. 185. And in *Mr. Moineux's Dioptrica Nova,* Part II. Chap. I.

Sir *Isaac Newton* discover'd, That from Air to Glass, the Sine of the Angle of Incidence: is to the Sine of the Refracted Angle :: as 300: 10 193, or nearly, as 14 to 9.

And on the contrary, That from Glass to Air, the Sine of the Incidence: is to the Sine of the Refracted Angles :: as 193: to 300, or as 9 to 14.

But in his *Dissertations concerning Light and Colours*, he has demonstrated, that the Rays of Light are not all *Homogeneous*, or of the same sort, but of different Forms and Figures; so that some are more Refracted than others, tho' they have the same or equal Inclinations on the Glass; And therefore there can be no constant Proportion set between the Sines of the Incident, and Refracted Angles.

But the Proportion that comes nearest the Truth, for the middle and strong Rays of Light, is nearly as 300 to 193, 14 to 9.

INCIDENCE-POINT, (in Opticks) is that Point in which a Ray of Light is supposed to fall on a Piece of Glass.

INCIDENT-RAY, in *Catoptricks* and *Dioptricks*: see *Ray of Incidence*.

INCINERATION, is the Reducing the Bodies of Vegetables and Animals into Ashes by a violent Fire.

INCISIVUS, is a Muscle which pulleth the Upper Lip upwards.

INCISORES DENTES, the same with *Primores*.

INCISIVI, the same with *Primores*.

INCLINATION, is a Word frequently used by Mathematicians, and signifies the mutual Approach, Tendency or Leaning of two Lines or two Planes towards each other, so as to make an Angle.

What the *Angle of Inclination* signifies in Opticks, see in *Incidence*.

The *Inclination* of two Planes, is the acute Angle made by two Lines, drawn one in each Plane, and perpendicular to their *Common Section*.

INCLINATION of the Axis of the Earth, is the Angle which it makes with the Angle of the Ecliptick; or the Angle between the Planes of the Equator and Ecliptick.

INCLINATION of a Planet, is an Arch of the Circle of Inclination, comprehended between the Ecliptick and the Place of a Planet in his Orbit.

INCLINATION of a Plane, in Dialling, is the Arch of a Vertical Circle, perpendicular to both the Plane and the *Horizon*, and intercepted between them.

To find the Inclination of a Plane,

Take a Quadrant, and apply its Side to the Side of a Square, and apply the other Side of your Square to your Plane; if the Plummer fall parallel to the Side of the Square, then the lower Side of the Square stands level; by which draw an Horizontal Line, whereon erect a Perpendicular, and apply your Square to that Perpendicular, and if the Plummer falls parallel to the Side of the Square, then that is also a level Line, and your Plane stands Horizontally: If the Plummer falls not parallel to the Side of the Square, then turn your Square until it does, and draw an Horizontal Line, on which erect a Perpendicular, to which apply your Square, and observe what Angle your Plummer makes on the Quadrant, with the Side of the Square; that is, the Angle of the Inclination of the Plane,

INCLINATION of a Ray, in *Dioptricks*, is the Angle which this Ray makes with the *Axis of Incidence* in the first Medium, at the Point where it meets the second Medium.

INCLINATION of a Right Line to a Plane, is the acute Angle which this Right Line makes with another Right Line drawn in the Plane, through the Point where the inclined Line intersects it, and thro' the Point where it is also cut by a Perpendicular drawn from any Point of the inclined Lines.

INCLINATIONS of the Planes of the Orbits of the Planets, to the Plane of the Ecliptick, are thus: *Saturn's* Orbit makes an Angle of 2 Degrees 30 Minutes; *Jupiter's* 1 Degree; and $\frac{1}{2}$; *Mars's* little less than 2 Degrees; *Venus's* is 3 Degr. and $\frac{1}{2}$; *Mercury's* is almost 7 Degrees.

INCLINING Direct South or North Dials: see *Direct South or North Inclining Dials*.

INCLINING Declining Dials: see *Declining Inclining Dials*.

INCLINING Planes, are those which lean or incline to the Horizon.

INCOMMENSURABLE Numbers, are such as have no Common Divisor that will divide them both equally.

INCOMMENSURABLE Quantities, are those which have no Aliquot Parts, or any Common Measure that may measure them; as the *Diagonal* and Side of a Square: for altho' that each of those Lines have infinite Aliquot Parts, as the Half, the Third, &c. yet not any Part of the one, be it never so little, can possibly measure the other, as is demonstrated in 117. El. 10. Eucl.

INCOMPLEX Terms in Logic: see *Complex*.

INCONGRUITY: see *Congruity*.

INCORPORATE: To *Incorporate*, in Chymistry or Natural Philosophy, signifies accurately to mix the Particles of one Body with another.

INCRASSATING, or thickening things, are those which being endued with thick rosy Parts, and mixed with thin liquid Juices, bring them to a thicker Consistence, by joining and knitting their Parts together. *Blanchard*.

INCUBUS: see *Ephialtes*.

INCUMBENT, in Common Law, is a Clerk resident on his Benefice with Cure; and called *Incumbent* of that Church, because he doth, or ought to bend his whole Study to discharge his Cure.

INCURVATION of the Rays of Light: see *Light and Refraction*.

INCUS, the Anvil, is a Bone of the inner Part of the Ear: It is like a Grinder-tooth, and lies under the Bone called *Malleus*. It has two Legs, the shorter of which is tied to the Side of that Conduite or Passage which goes to the *Processus Mammillaris*; and the longer Leg to the Head of the third Bone, called the *Stapes*.

INDAGATOR, a Searcher or Inquirer into Nature.

INDEFINITE, is what hath no Bounds or Limits determined; or what is considered as not having any.

INDENTED, a Term in Heraldry, when the Outline of a Bordure, Ordinary, &c. is in the Form of the Teeth of a Saw: Thus;

INDENTURE, is a Writing comprising some Contract between two, and being *indented* in the Top answerable to another, that likewise containeth the same Contract.

INDETERMINED Problem in Geometry: see *Local*.

INDEX, is the same with what is sometimes called the *Characteristick* or Exponent of a Logarithm; and sheweth always of how many Places the Absolute Number belonging to the Logarithm doth consist, and of what Nature it is; *i. e.* whether an Integer, or a Fraction: Thus; In this Logarithm 2.562293, the Number standing on the Left-hand of the Point, is called the *Index*; and because it is 2, shews you that the absolute Number answering to it, consists of 3 Places; for 'tis always one more than the Index, because the Index of 1 is 0; of 10 is 1; of 100 is 2, &c.

As in this Example;

0 1 2 3 4 5 6 7 8 9

1 2 3 4 5 6 7 8 9

Where the upper Numbers are Indices to the lower. And therefore in those small Tables of *Briggs's* Logarithms, where the Index is omitted, it must always be supplied before you can work by them. If the absolute Number be a Fraction, then the Index of the Logarithm hath a negative Sign, and is marked thus, 2.562293; which shews the corresponding Number to be a Decimal Fraction of 3 Places, *viz.* 1.365.

Mr. *Townly* hath a peculiar way of noting these Indices, when they express Fractions, and 'tis now much in Use, *viz.* by taking instead of the true Index, its Arithmetical Complement to 10; and therefore he would write the Logarithm now mention'd thus, 8.562293. How they are added and subtracted, see in *Addition* and *Subtraction*.

INDICATION, a Word used by Physicians and Surgeons, and signifies a Discovery of what is to be done, and what Course is to be taken for the Recovery of the Patient's Health; as if on Examination Bleeding be found necessary, they say, Bleeding is indicated.

INDICATIONS are usually accounted Threefold:

1. *Preservatory*, which shew what is to be done for the Continuation and Preservation of Health.

2. *Curative*, which shew how the Disease is to be removed, that the Patient at present labours under.

3. *Vital*, which respect the Patient's Life, Strength and way of Living.

INDICATIVE-MOOD, in Grammar, demonstrates simply what we affirm.

INDICATOR; see *Extensor Indicis*.

INDICAVIT, is a Writ or Prohibition, that lieth for a Patron of a Church, whose Clerk is Defendant in Court-Christian, in an Action of Tythes commenced by another Clerk, and extending to the fourth part of the Church, or of the Tythes belonging to it; for in this Case the Suit belongeth to the King's Court; wherefore the Patron of the Defendant being like to be prejudiced in his Church and Advowson, if the Plaintiff obtain in the Court-Christian, hath this Means to remove it to the King's Court.

INDICTION: see *Cycle of Indiction*.

INDICTMENT: see *Enditement*.

INDIGNATORIUS, an Epithet attributed to the fourth streight Muscle of the Eye, because that Motion or Cast of the Eye is peculiar to Men in the Passion of Anger. For this Muscle being one of the *Abducent*, serves to draw the Eye outward from the inner Corner to the outer.

INDIVIDUUM, in *Logick*, is that which signifies but one only thing: Of which they make a fourfold Division.

1. *Individuum Vagum*, is that which tho' it signifies but one Thing, yet may be any of that kind; as when we say, *A Man, A certain Person, or One* said so or so; tho' but one Person is meant, yet that one Person, for ought appears to the contrary, may be any Body.

2. *Individuum Determinatum*, is when the Thing is nam'd or determin'd; as *Alexander*, the River Nile, or Mount *Abois*: This also is called *Signatum*.

3. *Individuum Demonstrativum*, is when some Demonstrative Pronoun is used in the Expression; as *This Man, That Woman*.

4. *Individuum ex Hypothesi*, or by Supposition; when an universal Name or Term is restrained by the Supposition to a particular Thing; as when we say, the *Son* of such an one, and it be known that he had but one Son.

INDIVISIBLES, in Geometry, are such Elements or Principles as any Body or Figure may ultimately be resolv'd into. And these *Elements* or *Indivisibles*, are in each peculiar Figure supposed to be infinitely small.

With regard to which Notion, a Line may be said to consist of Points; a Surface of Parallel-Lines, and a Solid of Parallel and Similar Surfaces: And then, because each of these Elements is supposed Indivisible, if in any Figure, a Line be drawn thro' the Elements perpendicularly, the Number of Points in that Line, will be the same as the Number of the Elements.

Whence we may see, that a Parallelogram, Prism or Cylinder, is resolvable into Elements, or Indivisibles, all equal to each other, parallel, and like to the Base. A Triangle into Lines parallel to the Base, but decreasing in Arithmetical Proportion, and so are the Circles which constitute the *Parabolick Conoid*, and those which constitute the Plane of a Circle, or the Surface of an Isoleles Cone.

A Cylinder may be resolv'd into Cylindrical Curve Surfaces, having all the same Height, and continually decreasing inwards, as the Circles of the Base do, on which they insit.

This Method of *Indivisibles*, is only the Ancient Method of *Exhaustions* a little disguised and contracted: It was first introduced by *Cavalieri* in his *Geometria Indivisibilium*, Anno Dom. 1635. pursued after by *Torricellius* in his Works, printed 1644. and again by *Cavalieri* himself in another Treatise, published 1647. And is now allowed to be of excellent Use in the shortening of Mathematical Demonstrations: Of which take the following Instance in that famous Proposition of *Archimedes*;

That *A Sphere is two thirds of a Cylinder circumscribing it.*

For suppose (as in the Figure) a Cylinder, Hemisphere, and an Inverted Cone, to have the same Base and Altitude, and to be cut by Infinite Planes all parallel to the Base, of which *dg* is one: 'Tis plain, the Square of *dh* will every where be equal to the Square of *KC* (the Radius of the Sphere) the Square *bc* = *eb* Square; and consequently, since Circles are to one another, as the Squares of the Radii,

Radii, all the Circles of the Hemisphere will be equal to all those of the Cylinder, deducting thence

all those of the Cone : Wherefore the Cylinder, deducting the Cone, is equal to the Hemisphere ; but 'tis known, the Cone is one third of the Cylinder, and consequently the Sphere must be two thirds of it. Q. E. D.

INDUCTION, is commonly taken for the giving Possession to an Incumbent of his Church, by leading him into it, and delivering him the Keys, by the Commissary or Bishop's Deputy, and by his ringing one of the Bells.

INDURANTIA : see *Sclerotica*.

INDUSIUM : see *Ammios*.

INEDIA, is abstaining from Meat, when one eats less than formerly.

INEFFABLE-NUMBERS, the same with *Surd-Numbers*.

INEQUALITY of Natural Days. Tho' the Sun is supposed vulgarly to measure our Time equally, yet he is very far from doing so : And as 'tis impossible for a good Clock, or Movement, to keep Time with the Sun ; so one that is truly such, will measure Time much more truly, and go exacter than any Sun-Dial.

The usual Reason, and one good one it is, of the Inequality of Natural Days, you have under the Word *Equation of Time* : But the Truth is, there is also another ; and that is, That the Motion of the Earth it self, round its Axis, is not exactly Equable or Regular, but is sometimes swifter, and sometimes slower.

INERGETICAL Bodies or Particles, are such as are sluggish and unactive.

INESCUTCHEON, in Heraldry, signifies all the Escutcheons, containing $\frac{1}{4}$ of the Field, and is born within it as an Ordinary, thus :

He beareth *Ermin*, an *Escutcheon Gules*.

This is also sometimes called, An *Escutcheon of Pretence* ; which is born when a Man marries an Heir-ess : For then he bears her Coat of Arms on an *Escutcheon*, or *Escutcheon of Pretence*, in the Middle of his own Coat.

INFERNAL-STONE, or *Perpetual Caustick*, is a Chymical Operation, whereby Silver is rendred *Caustick* by the Salts of Spirit of Nitre.

'Tis thus made ;

Dissolve in a Vial any Quantity of Silver in thrice its Weight of Spirit of Nitre ; and then in a Sand-heat evaporate $\frac{2}{3}$ of the Moisture : The Remainder put into a good large *German Crucible*, which place over a gentle Fire ; let the Matter alone, and heaving 'till at last it sinks quietly to the Bottom : Then increasing the Fire a little,

'twill turn into an Oil ; and as soon as you perceive it to be so, it must immediately be poured into an Iron-mold, purposely made for it, that is a little oil'd and greas'd, where it will presently coagulate and harden. After 'tis taken out, it must be kept in a Vial well stop'd ; 'tis a great *Caustick*, and will last for ever, if it be kept from the Air. Some make them of Copper, but those are not so good as these.

INFIMUS VENTER : see *Abdomen*.

INFINITE, is that which has no Bounds, Terms, nor Limits.

INFINITE QUANTITY. Of the several Species of Infinite Quantity, and of the Proportions they bear one to the other, the learned Mathematician Capt. Halley, in *Philosoph. Transactions*, N. 193, gives the following Account :

That all Magnitudes infinitely great, or such as exceed any assignable Quantity, are equal among themselves, though it be vulgarly received for a Maxim, is not yet so common as it is erroneous ; and the Reason of the Mistake seems to be, That the Mind of Man coming to contemplate the Extensions of what exceeds the Bounds of its Capacity, and of which the very Idea does include a Negation of Limits ; it comes to pass, that we acquiesce generally, and it suffices to say, such a Quantity is *Infinite*.

But if we come more nearly to examine this Notion, we shall find, that there are really besides *Infinite Length*, and *Infinite Area*, no less than three several sorts of *Infinite Solidity* : All of which are *Quantitates sui generis*, having no more Relation or Proportion the one to the other, than a Line to a Plane, or a Plane to a Solid, or a Finite to an Infinite ; but that among themselves each of these Species of *Infinities*, are in given Proportions, is that which is to be made plain.

But first, *Infinite Length*, or a Line infinitely long, is to be considered, either as beginning at a Point, and so infinitely extended one way, or else both ways from the same Point ; in which case the one, which is a beginning *Infinity*, is the one half of the whole, which is the Sum of the beginning and ceasing *Infinity*, or of *Infinity a parte ante*, and a *parte post*, which is analogous to Eternity in Time or Duration, in which there is always as much to follow as is past from any Point or Moment of Time : Nor doth the Addition or Subduction of finite Length or Space of Time alter the Case, either in Infinity or Eternity, since both the one and the other cannot be any Part of the Whole.

As to *Infinite Surface* or *Area*, any Right Line infinitely extended both ways on an infinite Plane, does divide that infinite Plane into equal Parts, the one to the Right, and the other to the Left of the said Line : But if from any Point in such a Plane, two Right Lines be infinitely extended, so as to make an Angle, the infinite Area, intercepted between those infinite Right Lines : is to the whole infinite Plane :: as the Arch of a Circle, on the Point of Concourse of those Lines as a Centre, intercepted between the said Lines : is to the Circumference of the Circle ; or as the Degrees of the Angle, to the 360 Degrees of the Circle.

For Example,

Two Right Lines meeting at a Right Angle, do include, on an infinite Plane, a quarter Part of the whole infinite Area of such a Plane.

Bur

But if so be two parallel infinite Lines be supposed drawn on such an infinite Plane; the Area intercepted between them will be likewise infinite; but at the same time will be infinitely less than that Space which is intercepted between two infinite Lines that are inclined, tho' with never so small an Angle; for that in the one Case, the given finite Distance of the Parallel Lines, diminishes the Infinity in one Degree of Dimension; whereas in a Sector, there is Infinity in both Dimensions; and consequently the Quantities are the one infinitely greater than the other, and there is no Proportion between them.

From the same Consideration arise the three several Species of infinite Space or Solidity, as has been said; for a Parallelopiped or a Cylinder infinitely long, is greater than any finite Magnitude, how great soever; and all such Solids supposed to be formed on given Bases, are as those Bases, in proportion to one another: But of these, three Dimensions are wanting, as in the Space intercepted between two parallel Planes infinitely extended, and at a finite Distance; or with infinite Length and Breadth with a finite Thickness; all such Solids shall be as the given finite Distances one to another; but these Quantities, tho' infinitely greater than the other, are yet infinitely less than any of those wherein all the three Dimensions are infinite. Such are the Spaces intercepted between two inclined Planes infinitely extended; the Space intercepted by the Surface of a Cone, or the side of a Pyramid likewise infinitely continued, &c. of all which, notwithstanding the Proportions one to another, and to the vast Abyss of infinite Space, (wherein is the Locus of all things that are or can be; or to the Solid of infinite Length, Breadth and Thickness taken all manner of ways) are easily assignable. For the Space between two Planes: is to the whole: as the Angle of those Planes: to the 360 Degrees of the Circle.

As for Cones and Pyramids, they are as the Spherical Surface intercepted by them, is to the Surface of the Sphere; and therefore Cones are as the Versed Sines of half their Angles to the Diameter of the Circle. These three sorts of *Infinite Quantity*, are analogous to a Line, Surface, and Solid, and after the same manner cannot be compared, or have no proportion the one to the other.

Besides these, there are also several other Species of *Infinite Quantity*, arising from the Contemplation of Curves, and their Asymptotes, which he leaves to the Speculation of the learned Mathematicians.

INFINITE SERIES: see *Series*.

INFINITIVE-MOOD, in Grammar, is when a Verb is used so as to determine neither any particular Person, or Number.

INFLAMMATIO: see *Pblegmone*.

INFLATION, is the Distention of a Part from its natural Matter.

INFLECTION (in Opticks) is a Multiplicate Refraction of the Rays of Light, caused by the unequal Density of any Medium, whereby the Motion or Progress of the Ray is hindered from going on in a Right Line, and is Inflected or Deflected by a Curve, saith the ingenious Dr. Hook, who first took notice of this Property in his *Micrography*, p. 217. And this he saith, differs both from Reflection and Refraction, which are both made at the Superficies of the Body, but this in the middle of it within.

Sir Isaac Newton, as you will find under the Word *Light*, discovered also by plain Experiment this Inflection of the Rays of Light; and Mr. de la Hire saith he found, That the Beams of the Stars being observed in a deep Valley, to pass near the Brow of

an Hill, are always more refracted than if there were no such Hill, or the Observations were made on the Top thereof; as if the Rays of Light were bent down into a Curve, by passing near the Surface of the Mountain—See Vol. 2.

INFLECTION-POINT of any Curve, in Geometry, signifies the Point or Place where the Curve begins to bend back again a contrary way: As for Instance;

When a Curve-Line, as *AFK*, is partly Concave and partly Convex towards any Right-Line, as *AB*, or towards a fix'd Point, then the Point *F*, which divides the Concave from the Convex Part, and consequently is at the Beginning of one, and End of the other, is called the Point of *Inflection*, as long as the Curve, being continued in *F*, keeps its Course the same; but 'tis called the Point of *Retrogression*, when it inflects back again towards that Part or Side from whence it took its Original: See the next Figure save one.

Before the Theory of this Inflection and Retrogression of Curves can be understood, a certain Principle must be explain'd, which is this, as communicated by Mr. Dutton.

Whatsoever finite Quantity (or if it be a Fluxion 'tis all one) goes on continually increasing or decreasing, it cannot change from a Positive to a Negative Expression, or from a Negative to a Positive one, without first becoming equal to an Infinite, or to Nothing: It is equal to Nothing, if it does continually decrease, and equal to an Infinite, if it does continually increase.

To illustrate this, Let there be two Circles touching one another in the Point *E*, their Diameters *AE* and *EI*, lying in one and the same Right-Line. Let *AE* or *EI* be $= d$. Let the Distance between the Extremity *A*, and any Ordinate in either of the Circles be $= x$ perpetually. I consider now, what will be the Expressions of the Lines intercepted between *E* the Point of Contact of the Circles; such as are the Lines *EB* and *EF* intercepted between *E* and the Ordinates *CB* and *GF*. 'Tis certain therefore, That taking a Point, as *B*, any where between *A* and *E*, that then the Expression of the intercepted *EB* is $d - x$; but taking a Point, as *F*, between *E* and *I*, the Expression of the intercepted *EF*, shall be $x - d$. For *AB*, or

AF being taken for x indifferently, the Values of the intercepted Lines will appear with this Change of Signs.

In one Case therefore the Expression is Positive, in the other Negative. But as the points *B* or *F* approach to *E*, the Quantities *BE* and *EF* decrease continually, and at the point *E* are equal to nothing.

So that it is plain, That there is no passing from a Positive to a Negative Expression, in this Case of a Quantity continually decreasing, without passing thro' nothing. For the other part,

Let us consider the Tangents (as *DA* or *HI*) cut off by Lines continually drawn from *E* the point of the Circles contact. If *CB*, or *GF*, be put equal to *y*, the Expression of any such Tangent will be $\frac{y}{d-x}$ or $\frac{y}{x-d}$, according as we take it

on the one or the other side of the point *E*; in one Case therefore 'tis Positive, in the other Negative. But as the Points *B* or *F* approach to *E*, the Tangents *DA* and *HI* increase continually, and at the Point *E* they become infinite: Therefore a Quantity that continually encreaseth, cannot pass from a Positive to a Negative Expression, without being infinite.

All this is Universally True, whether it be a Finite Quantity or a Fluxion that we consider. There is no changing from Positive to Negative, without passing thro' Nothing or Infinite.

Applying this therefore to Fluxion, it will follow from hence, That the Fluxion of a Quantity, that expresses a Maximum, or a Minimum, must be equal to Nothing or to Infinite. And upon this Foundation we may now easily proceed to the Speculation of the Points of Inflection and Retrogression.

In order to find a General Theorem to assist us in this Matter, let us consider the Curve *AFK*, whose Diameter is the Right-Line *AB*; and its Ordinates *PM*, *ef*, parallel to one another. If thro' the Point *F* be drawn the Ordinate Applicate *EF*, together with the Tangent *FL*; and from any other Point as *M*, on the same side with *AF*, he draws the Ordinate Applicate *MP*, as likewise the Tangent *MT*: It is evident,

1. In these Curves that have a Point of Inflection, that the Abscissa *AP* encreaseth continually, and

that the Part *AT* of the Diameter, intercepted between *A* the Original of *X*, and *T* the Concourse of the Tangent and the Axe, encreaseth such time as the Point *P* fall upon *E*, and after it again begins to diminish: From whence it is apparent, that *AT* must become the Maximum *AL*, when the point *P* falls upon the point *E* required.

2. In those Curves that have a Point of Retrogression, 'tis evident, that the part *AT* encreaseth continually, and that the Abscissa encreaseth so long, till the point *T* fall upon *L*, after which it again diminisheth: From whence it is clear, That *AP* must become a Maximum, when the point *T* falls upon *L*.

Now if *AE* be put $= x$, *EF* $= y$, then, will *AL* be $= \frac{y}{x} - x$, whose Fluxion, which is

$\frac{y^2}{x^2} \frac{x - y}{x} - \frac{y}{x}$ (supposing *x* invariable) being di-

vided by *x*; the Fluxion of *AE* must become Nothing or Infinite; that is $-\frac{y}{x^2} = \text{Nothing or}$

Infinite: So that the multiplying by y^2 , and divi-

ding by $-y$, y will be $=$ to Nothing or Infinite; which in the Sequel will serve for a general Form to find *F* the Point of Inflection or Retrogression. For the Nature of the Curve *AFK* being given,

the Value of *y* may be found in *x*; and taking the Fluxion of this Value, and supposing *x* invariable, the Value of y^2 will be found in x^2 , which being put equal to Nothing, or Infinity, serves in either of these Suppositions to find such a Value of *AE*, as that the Ordinate *EF* shall intersect the Curve *AFK* in *F* the point of Inflection or Retrogression. Of this I shall only now, from the *Analyse des Infiniment Petits*, give one

EXAMPLE.

Let *AFK*, be a protracted Semi-cycloid, whose Base is longer than the Circumference of the generating Circle *ADB*, whose Center is *C*. 'Tis required to find *E* in the Diameter *AB*, so that the Ordinate Applicate *EF* shall cut the Semi-cycloid in *F*, the Point of contrary Flexion.

Sup-

Suppose the known Quantities $ADB = a$; $BK = b$; $AB = 2c$, and the unknown Quantities $AE = x$, $ED = z$, the Ark $AD = u$, $EF = y$; then by the Property of the Cycloid $y = z + \frac{bu}{a}$;

and therefore $y = z + \frac{bu}{a}$: But by the Property of the Circle $z = \sqrt{2cx - xx}$, and consequently

$$z = \frac{cx - xx}{\sqrt{2cx - xx}}, \text{ and } u(\sqrt{x^2 + z^2})$$

$$= \frac{cx}{\sqrt{2cx - xx}}. \text{ Therefore substituting for } z \text{ and } u \text{ their respective Values, we have } y$$

$$= \frac{acx - axx + bcc}{a\sqrt{acx - xx}}, \text{ and the Fluxion thereof, (supposing } x \text{ invariable) is,}$$

$$\frac{bcx - acx - bcc}{2cx - xx} \times \frac{cx}{\sqrt{2cx - xx}} = 0; \text{ that is,}$$

$$AE(x) = c + \frac{ac}{b}, \text{ and } CE = \frac{ac}{b}.$$

Hence it is evident, That to have F , a Point of contrary Fluxion, b must be greater than a ; for if it be less, then CE would exceed CB .

INFLUENCES of the Planets, or Heavenly Bodies, are such Physical Powers or Forces, as they are supposed to have on Sublunary Things.

Mr. Boyle is inclined to believe (tho' he had no Opinion of Judicial Astrology in other respects) that the Planets may have some Physical Influence or Operation on Bodies belonging to our Globe, from these Considerations.

1. That it cannot be denied, that all the Affections and Dispositions of Moisture, Heat, Cold, Drought, the Course of all Winds, Showers, Thunder, &c. and whatever else helps to produce the great and universal Effects of Rarefaction and Condensation in our Atmosphere, do in a great Measure, if not entirely, depend on the Motion, Position, Situation, and Aspects of the Superior Celestial Bodies or Planets. That every Planet hath its own proper Light distinct from every other, which Light not being a bare Quality, but designed for a further use than meer Illumination, must be accompanied with some peculiar Tincture, Virtue, or Power.

2. That this Light of each particular Celestial Body, not being at all Refracted in the Ætherial Spaces, it is transmitted thro', descends entirely and unchanged into our Atmosphere.

3. That whatever is received into our Atmosphere, is also received by the Thin and Subtile Air, which is contiguous to the Atmosphere; which cannot but be capable of being moved, stirred, altered, and influenced by these differently disposed Lights which penetrate each part of it.

4. And since the Thin and Subtile Air is capable of being thus affected, moved and altered by these Planetary Virtues, it must needs variously impress, move, agitate and infect the Spirits or Subtiler parts of all Bodies within its reach; and consequently must have a considerable influence upon the Bodies wherein such Spirits reside, and whom they actuate.

5. This is also farther confirmed, as true in Fact, by those sudden strokes of Cramps, Convulsions, Bites, Colds, Pestilential Invasions, &c. which do not only often, as it were in an Instant, seize on our Bodies, but which do also continue for a long time, &c.

IN FORMA PAUPERIS, in Law, is when any Man that hath a just Cause of Suit, either in the Chancery, or any other of the Courts of Common Law, will come either before the Lord Keeper, Master of the Rolls, either of the Chief Justices, or Chief Baron, and make Oath that he is not worth five Pounds, his Debts paid, either of the said Judges will in his own proper Court, admit him to sue in *forma Pauperis*, and he shall have Council, Clerk or Attorney assigned to do his Business, without paying any Fees.

INFORMATUS NON SUM, or rather *non sum Informatus*, in Law, is a formal Answer made of Course by an Attorney, that is commanded by the Court to say what he thinketh good in defence of his Client; who being not instructed to say any thing material, says, He is *not informed*, by which he is deemed to leave his Client undefended, and so Judgment passeth for the Adverse Party.

INFORMED STARS, are such of the *Fixed Stars*, as are not cast into, or ranged under any Form: see *Sporades*.

INFRASPINATUS, or *supra Scapularis inferior*, is a Muscle of the Arm, so called, because it is placed below the Spine. This arises fleshly from the inferior part of the *Basis Scapula*, as also from its Spine, and Inferior *Costa* and *Dorsum*; from hence passing in a Triangular Form, according to the Figure of the Part, lessening it self as it marches over the Juncture it becomes Tendinous, and is inserted like the *Supra Spinatus* to the Head of the *Os Humeri*. This moves the Arm directly backward.

INFUNDIBULUM CEREBRI, the same that *Choana*.

INFUNDIBULUM RENUM, is the Pelvis or Basin thro' which the Urine passes to the Ureters and the Bladder.

INFUSION, is an Extraction of the Vertue of Medicines with a convenient Liqueur, which if it be Purgative, it is usually taken at one Dose; and to this the Name properly agrees.

INGREDIENTS, are the several Parts or Simples that go to the making of any Compound Medicine; and in general it signifies the Constituent Parts or Principles of a mixt Body.

INGRESS, in Astronomy, signifies the Sun's entering the first Scruple of one of the four *Cardinal Signs*, especially *Aries*.

INGRESSU, is a Writ of Entry, whereby a Man seeketh Entry into Lands and Tenements: It lies in many Cases, and hath many several Forms: see *Entry*.

This Writ is also called in particular, *Præcipe quod reddat*, because those be formal Words in Writs of Entry.

The Writs, as they lie down in divers Cases, are these, set down in the *Old Nat. Brev. vix*.

INGRESSU ad communem Legem, is a Writ which lieth where a Tenant for Term of Life, or of another Life, Tenant by Courtesie, or Tenant in Dower, maketh a Feoffment in Fee, and dieth: He in Reversion shall have the aforesaid Writ against whomsoever that is in the Land after such Feoffment made.

INGRESSU ad Terminum qui præterit, a Writ which lieth where the Lands or Tenements are let to

to a Man for Term of Years, and the Tenant holdeth over his Term.

INGRESSU *Causa Matrimonii prelocuti* : see *Causa Matrimonii prelocuti*.

INGRESSU *cui ante divortium* : see *Cui ante divortium*.

INGRESSU *dum fuit infra etatem*, is a Writ which lies where one under Age sells his Lands, &c.

INGRESSU *dum non fuit compos mentis*, is a Writ which lies when a Man selleth Lands or Tenements, being out of his Wits, &c.

INGRESSU *in Casu consimili* : see *Casu consimili*.

INGRESSU *in Casu proviso* : see *Casu proviso*.

INGRESSU *in le per*, is a Writ which lies where one demandeth Lands or Tenements, lett by another after the Term is expired.

INGRESSU *sine assensu capituli*, is a Writ given by the Common Law, to the Successor of him that alienated, *sine assensu capituli*, &c. and so called from those Words contained in the Writ.

INGRESSU *super disseisina in se quibus*, is a Writ which lies where a Man is disseised, and dieth, for his Heir against the Disseisor.

INGRESSU *sur cui in vita*, is a Writ that lies where one demandeth Lands or Tenements of that Tenant that had Entry by one, to whom some Ancestor of the Plaintiff did lett it for a Term now expired.

INGROSSATOR *magni Rotuli* : see *Clerk of the Pipe*.

INGROSSER, in Common Law, is one that buys Corn growing, or dead Victuals, to sell again.

Also a Clerk that writes Records or Instruments of Law in Skins of Parchment.

INGROSSING of a *Fine*, is making the Indentures by the *Chirographer*, and the Delivery of them to the Party unto whom the Cognizance is made.

INGUEN, is that Place from the Bending of the Thigh to the Secret Parts.

INHARMONICAL Relation, a Term in Musick : see *Relation Inharmonical*.

INHERITANCE, is a Perpetuity in Lands or Tenements to a Man and his Heirs : For *Littleton lib. 1. cap. 1.* says, This Word *Inheritance* is not only understood where a Man hath *Inheritance* of Lands and Tenements by Descent of Heritage, but also every Fee-simple or Fee-tail that a Man hath by his Purchase, may be laid by *Inheritance*, for that his Heirs may inherit after him.

INHIBITION, is a Writ to *inhibit* or forbid a Judge from farther proceeding in the Cause depending before him : see *F. N. B. Fol. 39.* where *Prohibition* and *Inhibition* are put together. But *Inhibition* is most commonly a Writ issuing out of a higher Court-Christian to a lower and inferior ; and *Prohibition* out of the King's Court to a Court-Christian, or to an inferior Temporal Court.

INJECTION, is the casting (by a Syringe, &c.) some liquid Medicine into Wounds or Cavities of the Body, or of the Vessels ; Clysters are hence by some called *Injections*.

Several Experiments have been made about

INJECTION of *Liquors*, into the Veins of Animals, from whence probably some good Hints may be taken ; I shall therefore mention some of them.

Sir *Fraxastati*, Professor of Anatomy at *Pisa* in *Italy*, injected a little *Aqua Fortis* diluted into the Crural and Jugular Vein of a Dog, and he died presently ; and had (on opening him) all his Blood

found fixed, except about the Guts : some of the great Vessels were burst.

Some Spirit of *Vitriol* being injected into the Veins of another Dog, he died not so soon, but fetched his Breath thick and difficultly, and foamed like an Epileptick ; but dying at last, he opened him, and found his Blood fix'd in his Veins Grumous and like Soot.

Oil of *Tartar* injected, did not kill the Dog, tho' tried upon him several times ; but he grew more eager for Meat than before, and getting some Bones, he gnawed them most greedily.

Oil of *Sulphur* injected, swelled the Dog and killed him ; his Blood was found not coagulated, but more thin and florid than ordinary ; which Constitution, perhaps, may be as fatal in the Blood, as its being curdled and fixed.

INJUNCTION, is a Writ grounded upon an Interlocutory Order in Chancery ; sometimes to give Possession to the Plaintiff, for want of the Defendant's Appearance ; sometimes to the King's Ordinary Court, and sometimes to the Court-Christian, to stay Proceedings in a Cause upon Suggestion made, That the Rigour of the Law, if it take place, is against Equity and Conscience in that Case.

INIUM, is the Beginning of the oblongated Marrow, which is the common Sensory, because the Species which are received from the external Organs are conveyed thither by the Nerves. *Blanchard*.

INLAGARY, a Term in Law, signifying a Resstitution of one Ourlaw'd to the King's Protection, and to the Benefit or Estate of a Subject.

INNATE Principles, according to some Philosophers, are primary Notions or Characters which they will have to be stamp'd upon the Mind of Man when it first receives its Being, and which it brings into the World with it.

INNOMINATA *Tunica Oculi*, the Tunick of the Eye that wants a Name, is a certain subtile Expansion of the Tendons, from the Muscles which move the Eye to the Circumference of the *Iris* or Horney Membrane.

INNOMINATA *Ossa*, are two large Bones situated on the sides of the *Os Sacrum*, and in a *Femur* may each be separated into three Bones, *Ilium*, *Os Pubis*, and *Ischium*, joined by Cartilages, and appear distinct by three Lines 'till seven Years old, but grow all into one Bone at riper Years : they are by some called *Cuneiformia*.

INNOMINATUS *Humor*, or *Infitus*, is a Secondary Humour, as the Ancients call it, wherewith they thought the Body was nourished : For those Nutritious Humours they talked of are four, *Innominatus*, *Ros*, *Gluten*, *Cambium*. *Blanchard*.

INNOTESCIMUS, in Law, are Letters Patents which are always of a Charter of Feoffment, or some other Instrument not of Record, and so styled in the Words of the Conclusion, *Innotescimus per presentes*.

INNS-OF-COURT, are so called, because the Students there study the Laws, to enable them to practise in the Courts of *Westminster*, or elsewhere. These are the *Middle* and *Inner Temple*, *Lincoln's Inn*, and *Gray's Inn*. There are also two Serjeants-Inns, and eight Inns of Chancery.

INNUENDO, is a Word frequently used in Writs, Declarations and Pleadings ; and its Use is only to declare and ascertain the Person or Thing which was named or left doubtful before.

INOCULATION, is a kind of Grafting by the Insertion of the Bud of one kind of Fruit-Tree

into the Bark of another, so as to make different Kinds of Fruit grow on the same Tree; and the same common Sap supply them all.

INOSCULATION: see *Anastomosis*.

INQUIRENDO, is an Authority given to a Person or Persons, to enquire into something for the King's Advantage.

INQUISITION, in Law, is a manner of proceeding in Matters Criminal, by the Office of the Judge, or by the great *Inquest* before Justices in Eyre.

INQUISITORS, are Sheriffs, Coroners, *super visum corporis*, or the like, who have Power to enquire into certain Cases.

INROLMENT, in Law, is the Registering, Recording, or Entering of any Lawful Act in the Rolls of the Chancery, as a Recognisance acknowledged, or a Statute, or a Fine levied; or in the Rolls of the Exchequer, King's-Bench, or Common Pleas; or in the Hustings of London, or by the Clerk of the Peace in any County.

INSANIA, or *Amentia*, Madnets, is an Abolition or Deprivation of Imagination and Judgment.

INSCONCED, a Term in the Art Military, implying that a Part of an Army hath fortified themselves with a Sconce or small Fort, in order to defend some Pass, &c. See *Sconces*.

INSCRIBED, in Geometry, a Figure is said to be *inscribed* in another, when all the Angles of the Figure *inscribed* touch either the Angles, Sides, or Planes of the other Figure.

INSCRIBED Bodies: see *Regular Bodies*.

INSESSUS, is a Bath for the Belly, proper for the Lower Parts, wherein the Patient sits down to the Navel. They are for several Uses, as for easing of Pain, softning of Parts, dispelling of flatulent Matter, and frequently for exciting the Courses.

Blanchard.

INSIMUL Tenuit, is one of the Species of the Writ called *Formedon*; which see.

INSISTING, the Angles in any Segment, in Geometry, are said to be *insisting* upon the Arch of the other Segment below.

INSITIO, the Botanick Word for *Grafting*; it signifies in general, the Insertion and Uniting of any Cyon, Bud, &c. into the Substance of the Stock, and is of divers Kinds.

INSOLATION, is exposing of any Body to be warmed or heated by the Beams of the Sun.

INSEXIMUS, are Letters Patent, so called because they begin, after the King's Title, with this Word *Inseximus*; and is the same with *Exemplification*.

INSPIRATIO, is an alternate Dilatation of the Chest, whereby the Nitrous Air is communicated to the Blood, to accend it by the Wind-pipe and its *Vesicular Parts*.

The Cause of *Inspiration* doth not seem to consist only in the Dilatation of the Thorax, as is commonly thought, but also in the Contraction of the *Tunick*, which covers the upper part of the *Oesophagus*, and the most close Recesses of the *Aspera Arteria*. *Blanchard*.

INSTANT, is such a Part of Duration wherein we perceive no Succession; or is that which takes up the Time of only one *Idea* in our Minds, without the Succession of another, wherein we perceive no Succession at all.

INSTITUTIONS, or *Institutes*, Part of the First of the Four Tomes or Volumes of the Civil Law, and is a Compendium of the Digest drawn into Four Books, composed on purpose by the Emperor for the Use of young Students, that so having

the first Elements of the whole Profession in this little Treatise, they might the sooner gain a competent Knowledge of it, without being discouraged by the Largeness of the former Books.

INTACTÆ, are Right Lines, to which Curves do continually approach, and yet can never meet with them: These are usually called *Asymptotes*; which see.

INTEGERS, from the Latin *Integrum*, signifies in Arithmetick whole Numbers, in Contradiction to Fractions.

INTENSION, is a Writ that lies against him that enters after the Death of a Tenant in Dower, or other Tenant for Life, and holds him out in the Reversion or Remainder: And every Entry upon the Possession of the King, is called an *Intension*; as where the Heir of the King's Tenant enters after Office, and before Livery, this is called an *Intension upon the King*.

Intension, in Natural Philosophy, signifies the Increase of the Power or Energy of any Quality, such as Heat, Cold, &c. for of all Qualities, they say, they are *Intended* and *Remitted*; that is, capable of Increase and Diminution. Under the Word *Quality* you will find it demonstrated, That the *Intension* of all Qualities increases reciprocally, as the Squares of the Distances from the Center of the Radiating Quality decreases.

INTENTION, or *Study*, is when the Mind with great Earnestness, and of Choice, fixes its View on any *Idea*, considers it on all sides, and will not be called off by the ordinary Solicitation of other *Ideas*.

INTERCALARY-DAY, is the odd Day put in or inserted in the *Leap-Year*.

INTERCEPTED-AXE, a Term in Conick Sections, signifying the same with *Abscissa*; which see.

INTERCOLUMNIATION, is the Space or Distance between the Pillars of any Building.

INTERCOLUMNS, or *Intercolumniation*, in Architecture, are the Spaces between Column and Column in any Portico or great Piazza, &c.

INTERCOSTAL-ARTERIES, are Arteries, according to some, so called, because they go to the Regions about the Ribs: The upper bestows it self among the Muscles that are between the four highest Ribs; and the under one goes to every Muscle that is between the rest of the Ribs.

INTERCOSTAL-VESSELS, are the Veins and Arteries that run along the Intervals or Spaces of the lower and upper Ribs; on which account they are distinguished into Superior and Inferior.

INTERCOSTALES *Externi* & *Interni*, are Muscles placed in the Intervals of the Ribs, as their Names declare. Their Number on each side is twice eleven, equal to the Interstices in which they are lodged. Their Originations are differently assigned by Anatomists; but 'tis most probable that they do arise from the lower Edge of each superior Rib, and are inserted to the upper Edge of each inferior one. These are thin and fleshy; the Fibres of the External pass from above obliquely downwards to the Fore-part, or *Ossa Pubis*: Those of the Internal descend in like manner obliquely towards the Back-part, or *Ossa Sacrum*, their Fibres decussating each other like the Letter X.

INTERCUS; see *Anasarca*.

INTEREST, is the Sum reckoned for the Loan or Forbearance of some principal Sum lent for (or due at) a certain Time, according to some certain Rate, and therefore called *Principal*, because it is the Sum that procreates the *Interest*, or from which their

the *Interest* is reckoned; and is either *Simple* or *Compound*.

I. *Simple Interest*, is counted from the *Principal* only, and is easily computed by the *Simple* or *Compound Golden Rule*, thus:

Let that which is the principal Cause of the *Interest* be put into the first place; and that which becometh Time, be in the second place; and the remaining in the third: Under this Conditional part place the two other Terms, each under its like, and there will be a Blank to supply under one of those above, either under the first, second, or third:

E X A M P L E

If 100 l. in 12 Months gain 6 l. (this is the Conditional part;) What shall 50 l. get in 3 Months?

Place them down as in the Rule:

l.	m.	l.
100.	12	6
50	3	

Here the Blank will be under the third place, and by this

R U L E I.

Multiply the three last for a Dividend, and the two first for a Divisor, the Quotient of these gives the sixth.

That is, $6 \times 50 \times 3 = 900$, and $100 \times 12 = 1200$.
Now $1200 \div 900 = .75 = 15 \text{ s. required}$.

But if the Demand had been, In how many Months would 50 l. have gained 15 s. Or if 100 l. in 12 Months gain 6 l. What shall the Principal be, that in 3 Months would gain 15 s. In these two Cases the Blank would have been under the first or second Terms: Then by this

R U L E II.

Multiply the first, second, and last for a Dividend, and the third and fourth for a Divisor; the Quotient is the Answer.

l.	m.	l.
103	12	6
	3	.75 = 15 s.

Then by the Rule, $100 \times 12 \times .75 = 900.00$.
And $6 \times 3 = 18$ 900. (50 l. required.

This Rule shews *Simple Interest* and all that belongs to it with ease, and was thus found;

Put P for the Principal, T for the Time, and G for the Gain in the Conditions; and p, t, g answering, it will be, $P : G :: t : p$. $\frac{G p}{P}$.

And $T : G p :: t : \frac{G p t}{T P} = g$, which is the first Rule, that is, multiply the three last for a Dividend, and the two first for a Divisor.

And because $\frac{G p t}{T P} = g$, therefore $G p t =$

$T P g$; and consequently $t = \frac{T P g}{G p}$, and $p = \frac{T P g}{G t}$, which is the second Rule,

II. *Interest Compound*, is that which is counted from the *Principal*; and *Simple Interest* forborn, called also *Interest upon Interest*.

And for the resolving of Propositions relating to *Compound Interest*, first state the Question propos'd, as tho' the Demand lay upon one Pound only; and having found a fit Answer (according to the Import of the Question) for one Pound, to a convenient Number of Decimal parts, multiply the Sum or Number of Pounds, &c. propos'd in the Question, into that Answer agreeing to one Pound, the Product arising from thence will be the Answer required.

Mr. Ward hath done this very well at the End of his Algebra, thus:

For the easier expressing of the several parts given or sought, they may be represented by the following Letters;

Let $P =$ the Principal, $\left\{ \begin{array}{l} \text{given or sought in any Question.} \\ \text{For Number of Years or Days,} \\ \text{\&c. given or sought.} \end{array} \right.$
 $t =$ the Time,
 $a =$ the Amount, $\left\{ \begin{array}{l} \text{of one Pound, for one Year,} \\ \text{or Day, \&c. according to any} \\ \text{Rate proposed.} \end{array} \right.$
 $\Sigma =$ the Sum, $\left\{ \begin{array}{l} \text{for amount of Principal and} \\ \text{Interest given or sought.} \end{array} \right.$

Note, That in the Cases of *Compound Interest*, (t) is the Index of the Power of (a).

Now, by considering the two following Propositions, a General Theorem may be raised, by which all Questions in *Compound Interest* may be resolved.

First, $1 l. : a :: g : a a :: a a : a^2 :: a^2 : a^3 :: a^3 : a^4 :: a^4 : a^5 \text{ \&c. in } \dots$

That is, As one Pound: Is to its Amount (or one Pound with its Interest) at one Years End: So is that Amount: To the Amount of one Pound at two Years; and so on.

Whence 'tis plain, That *Compound Interest* is grounded upon a Rank of Geometrical Proportionals continued, the last of which is known by the Number signified by (t) and is a^t .

Secondly, $1 l. : a^t :: P : \Sigma$; Ergo $P a^t = \Sigma$.

That is, As one Pound: Is to the Amount of one Pound for any Time propos'd: So is 10, 100, 1000, or any Sum propos'd: To its Amount for the same Time.

From these two Proportions the General Theorem $P a^t = \Sigma$ is sufficiently demonstrated, and may be clearly understood.

Quest. 1. Suppose 250 l. hath been at Interest seven Years; What doth it amount to at 6 per Cent. per Annum, Compound Interest?

Here is given $P = 250$ l. $t = 7$, and $a = 1.06$.

For $100 : 6 :: 1 : 1.06 = a$, the first Year.

Then if a be involved so often, until its Index $= t$, viz. $a^7 = a^7$, and then multiplied into P , it will produce \tilde{z} , as appears by the Theorem $P a^t = \tilde{z}$.

But $a = 1.06$, involved 7 times $= 1.50363$.

And $250 \times 1.50363 = 375.9075 = \tilde{z}$.

That is, 375 l. 18 s. 2 d. is the Sum produced from 250 l. having been at Compound Interest seven Years (as above proposed.)

Quest. 2. Suppose 375 l. 18 s. 2 d. were to be paid seven Years hence; What is it worth in ready Money, abating 6 per Cent. per Annum, Compound Interest?

Here is given $\tilde{z} = 375.9075$, $t = 7$, and $a = 1.06$; to find P .

General Theorem is $P a^t = \tilde{z}$, therefore $\frac{\tilde{z}}{a^t} = P$.

But $a = 1.06$, and involved 7 times $= 1.50363$.

And $\frac{375.9075}{1.50363} (= 250 = P)$; that is, worth 250 l. ready Money.

Quest. 3. Suppose 250 l. hath been at Interest, and the Amount is 375 l. 18 s. 2 d. at 6 per Cent. Compound Interest; How long hath it been forborn?

Here is given $P = 250$, $\tilde{z} = 375.9075$, and $a = 1.06$, for one Year; thence to find t , the Index of the Power of a .

General Theorem, $P a^t = \tilde{z}$; ergo, $\frac{\tilde{z}}{P} = a^t$.

Consequently, if a^t be continually divided by a , until it become $\frac{a}{a} = 1$, the Number of such Divisions will be t : For such Number of Divisions discovers how oft a was involved.

But $\frac{375.9075}{250} (= 1.50363 = a^t)$

And $\frac{1.50363}{1.06} (= 1.418518)$

Also $\frac{1.418518}{1.06} (= 1.338225)$

And so on till it become $\frac{1.06}{1.06} (= 1$, which will be at the seventh Operation.

Then will $t = 7$, the Number of Years required.

Quest. 4. Suppose 250 l. had been forborn seven Years, and the Debtor is willing to give up both Principal and Interest, proffering 375 l. 18 s. 2 d. to be cleared; What Rate of Interest, per Cent. (allowing Compound Interest) doth he hereby offer to the Creditor?

Here you have given $P = 250$, $\tilde{z} = 375.9075$, and $t = 7$, to find a .

General Theorem, $P a^t = \tilde{z}$, ergo $\frac{\tilde{z}}{P} = a^t$.

That is, $a^7 = a^7$, consequently $\sqrt[7]{\frac{\tilde{z}}{P}} = a$.

But $\frac{\tilde{z}}{P} (= 1.50363 = G)$.

Let $a = r + e$.

Then $r^7 + 7 r^6 e + 21 r^5 e^2 + 35 r^4 e^3 + 35 r^3 e^4 + 21 r^2 e^5 + 7 r e^6 + e^7 = G = 1.50363$.

$\frac{1}{7} r^7 + r^6 e + 3 r^5 e^2 = \frac{1}{7} G$.

$\frac{1}{7} r r + r e + 3 e e = \frac{1}{7} G$.

$r e + 3 e e = \frac{1}{7} G - \frac{1}{7} r r = D$.

Hence this Theorem, $\frac{D}{r + 3 e} = e$.

Let $r = 1$ $1.50363 = G$.
 $.214804 = \frac{1}{7} G - \frac{1}{7} r^2$.
 $-.142857 = \frac{1}{7} r r$.

$r = 1$ $.071947 = D$ ($.06 = e$).
 $+ 3 e = .18$ $.708$

Divid. $= 1.18$ $.21480428 = \frac{1}{7} G$.
 $.16051432 = \frac{1}{7} G - \frac{1}{7} r^2$.

First $r = 1$ $.16051428$
 $+ e = .06$ $.00000004$

New $r = 1.06 = a$

Then $1 : 1.06 :: 100 : 6 =$ the Rate of the Interest required.

But if in any Questions, either of Interest or Annuities, the Time given or sought be not terminated by whole Years, but by Weeks, Months, Quarters, Half-Years, Three Quarters, &c. for resolving such Questions, first reduce such broken or Fractional parts of the Year into Days, viz. $\frac{1}{4} = 91.25$ Days, $\frac{1}{2} = 182.5$ Days, $\frac{3}{4} = 273.75$ Days; and so for any odd Number of Days that falls betwixt such even parts of the Year.

This done, find an Answer according to the Demand of the Question, (and agreeing to one Pound as before) for the Number of the Days proposed.

To perform which, it will be requisite to resolve this following Question.

Quest. 5. What is the Amount (or Interest) of one Pound for one Day, at 6 per Cent. per Annum, Compound Interest?

Put a for the Amount sought, then 'twill be,

$1 : a :: a : a^2 :: a^2 : a^3 :: a^3 : a^4 :: a^4 : a^5 :: a^5 : a^6$, &c. \div .

That is, As one Pound : Is to its Amount for one Day :: So is that Amount : To the Amount for two Days :: And so is that of two Days : To that of three Days; and so on to 365 Days.

The

The last of which will be $a^{365} = 1.06$.
 Let $a = r + e$.
 Then $r^{365} + 365 r^{364} e + 66430 r^{363} e^2 = 1.06 = G$.
 $\frac{1}{365} r^{365} + r^{364} e + 182 r^{363} e^2 = \frac{1}{365} G$.
 $\frac{1}{365} r r + r e + 182 e e = \frac{1}{365} G$.
 $r e + 182 e e = \frac{1}{365} G - \frac{1}{365} r r = D$.

Whence this Theorem, $\frac{D}{r + 182 e} = e$.
 Let $r = 1$. $.00290410 = \frac{1}{365} G$.
 $+ 182 e = .0182 - .00273972 = \frac{1}{365} r r$.
 Divisor = 1.0182 . $.00016438 = D(.00016 = e$
 10182
 New $r = 1.0001$ 625600
 $+ 182 e = .01092$ 606612
 Divisor = 1.01102

New $r = 1.00016$, for a second Operation.
 Then is, $.00274025636372 = \frac{1}{365} G$.
 $-.00274060280986 = \frac{1}{365} r r$.

Here the Excess lieth upon $\frac{1}{365} r r$, and therefore the Difference or new Resolvend will have the Sign -, and consequently must be -e.

Then—.00000634644614=D(.0000003=e
 $r=1.00016$ 30003162
 $+ 182 e = 1.0000546$ 46414520 (-464=
 Divisor 1.0001054 40004216
 Last $r = 1.00016$ 6413004
 $- e = .0000003464$ 6000530
 $a = 1.0001596536$ 409674
 400040

This Value of a , is the Amount of 1 l. for one Day ; from which, if 1 l. be subtracted, the Remainder will be the Interest of 1 a for one Day ; i. e. .0001596536 : Consequently, if any proposed Sum be multiplied into either of these, the respective Product will be the Amount or Interest of that Sum for one Day.

Hence, if a Table of the several Powers of a was calculated, it would be,

$a : a^2 : a^3 : a^4 : a^5 : a^6 : a^7 =$ the Amounts.
 1, 2, 3, 4, 5, 6, 7, = the Days.
 And so on to $a^{365} = 1.06$, the Amount for 365 Days.

Such a Table would be very useful for the speedy resolving of all Questions relating to Compound Interest, &c. for any Number of Days less than one Year.

III. Annuities, Pensions, Leases in Reversion, &c. differ from Compound Interest in this ; that Compound Interest is grounded upon a Rank of Geome-

trical Proportionals continually increasing ; but Annuities, &c. upon a Rank of Geometrical Proportionals continually decreasing ; and may be thus represented,

Let $p =$ the $\left\{ \begin{array}{l} \text{Pension or Annuity ; and is the first} \\ \text{or greatest Term in the Progression.} \end{array} \right.$
 $t =$ the $\left\{ \begin{array}{l} \text{Time of Continuance (as in Interest)} \\ \text{and is the Number of all the} \\ \text{Terms except the first.} \end{array} \right.$
 $a =$ the $\left\{ \begin{array}{l} \text{Rate of Interest for one Pound (as} \\ \text{before) and is the Common} \\ \text{Ratio of all the Terms.} \end{array} \right.$
 $\Sigma =$ the $\left\{ \begin{array}{l} \text{Sum of all the Terms, except the} \\ \text{first, and is the Price, or present} \\ \text{Worth of any Annuity or Pension,} \\ \text{\&c.} \end{array} \right.$

Hence the Progression will be,

$$p : \frac{p}{a} :: \frac{p}{a} : \frac{p}{a^2} :: \frac{p}{a^2} : \frac{p}{a^3} :: \frac{p}{a^3} : \frac{p}{a^4} :: \frac{p}{a^4} : \frac{p}{a^5} :: \frac{p}{a^5} : \frac{p}{a^6} :: \frac{p}{a^6} : The very Ingenious and Learned Capt. Halley hath, in his Observations on the Breslaw Bills of Mortality, (in *Philos. Trans.* N. 196,) shewed several ways of estimating the Values of Annuities and Lives, and computing the different Degrees of Mortality, or rather, as he calls it, Vitality; where he proves, That 'tis 80 to 1, that a Person of 25 Years old doth not die in a Year: That 'tis 5 and a half to one, a Man of 40 lives 7 Years: That a Man of 30 may reasonably expect to live between 27 and 28 Years, &c. And he gives Rules for the Valuation of 2 or 3 more Lives, and what an Annuity is worth during the Continuance of any of them, &c.

INTERFORAMINEUM, or *Interfemineum*, the same with *Perineum*.

INTERJECTION, in Grammar, is an indeclinable Word used in a Sentence, to declare the Affections or Passions of the Mind, and to compleat the Sense of it.

INTERIOR Polygon: see *Polygon Interior*.

INTERIOR Talus: see *Talus*.

INTERLOCUTORY Order, is that which decides not the Cause, but only settles some intervening Matter relating to the Cause; as where an Order is made by Motion in *Chancery*, for the Plaintiff to have an Injunction, to quit his Possession till the hearing of the Cause; this, or any other such Order not being final, is *Interlocutory*.

INTERMISSIO Febrium: see *Apexia*.

INTERMITTENS Morbus, is a Disease which comes at certain times, and then remits a little.

INTERNAL Angles: see *Angles Internal*.

INTERNODIUM, in Botany, is the Space contained between any two Knots or Joints of the Stalk of a Plant.

INTERNUS Auris, is a Muscle which lies in a Bony Channel evacuated in the *Os Petrosum*, which makes one of the *Parietes Tympani*: One part of this Channel is without the *Tympanum*, and lies in the upper part of the Bony Passage which goes from the Ear to the Palate; the other part, which is within the *Tympanum*, advancing as far as the *Fenestra Ovalis*, makes in that place a rising, upon which, as on a Pulley, the Tendon of this Muscle passes to the other Side of the *Tympanum*, and inserts it self at the posterior part of the Handle of the *Malleus*, a little below the Insertion of the External Muscle, by which means it draws towards the *Os Petrosum*. When this Muscle acts it pulls the *Manubrium* of the *Malleus* towards the *Os Petrosum*, whereby the *Membrana Tympani* becomes somewhat concave outwardly.

INTEROSSEI Manus, are the Muscles of the Fingers, which are distinguished into External and Internal; they are aptly to named from their Situations. Authors disagree in their Number, some reckoning six, others eight, amongst which they esteem the *Abductor Minimi Digiti*, and *Indicis*; but Mr. *Cowper* inclines to the first Opinion, conceiving the two latter named Muscles do not deserve these Denominations. They arise fleshy internally in the Palm from the superior parts of the Metacarpal Bones next the *Carpus*, whence descending, they become Tendinous at the first Internode of each Finger laterally, and pass to their Insertions with the *Extensor Digitorum Communis*; each Interstice of the Metacarpal Bones entertaining two Muscles inserted to the Sides of the Fingers. When all these *Interossei* act together, they draw the Fingers near each other, and assist in their Extension, as *Galen* takes notice; at which time they, together with the *Abductor Indicis*, and *Minimi Digiti*, are capa-

ble of divaticating the Fingers, which Action cannot be performed without some Difficulty by them when they are bended; which Contrivance of the most Wise Architect is also observed by *Galen*.

INTEROSSEI Pedis, are Muscles of the Foot; they are reckoned to be seven in Number. They derive their Names from their Situation, and may each deserve a proper Appellation from their Use.

The First may be called *Abductor Minimi Digiti*.

The Second, which is the largest, draws the next Toe towards the lesser, and may be called, *Abductor Auricularius*.

The Third antagonizes the former, and is an *Abductor of the Toe*.

The Fourth may be called *Abductor Medii Digiti*.

The Fifth is an *Abductor of the same*.

The Sixth is an *Abductor*; and Seventh, *Abductor Indicis Pedis*.

All these arise fleshy from the superior part of the *Ossa Metatarsi* of the lesser Toes, and becoming bellied, grow Tendinous at their Insertions to the first Internode of each lesser Toe laterally.

INTERROGATION, is a Figure in Rhetorick, in which the Passion of the Speaker introduces a thing by way of Question, to make its Truth the more conspicuously appear.

INTERRUPTION, as some call it, is the same with Disjunction of Proportion in Geometry, and is noted thus, ($::$) and signifieth the breaking off of the Ratio in the middle of four disjunct or discrete Proportionals, As $A : B :: C : D$; that is, As A is to $B ::$ So is C to D .

INTERSCAPULARIA, are the Cavities betwixt the Shoulder-blades and the Vertebres.

INTERSECTION, in Mathematicks, signifies the cutting of one Line or Plane by another: Thus we say, that the mutual Intersection of two Planes, is a Right Line.

INTERSPERSUM Vacuum: see *Vacuum*.

INTERSPINALES Colli; these are small fleshy Muscles of the Neck, arising from the superior parts of each double spinal Process of the Neck, except of the second *Vertebra*; and are inserted to the inferior Parts of all the said double Spines. When these Muscles act, they draw the Spines of the *Vertebra* of the Neck nearer each other. These were first discovered in the Year 1690.

INTERSTELLAR, a Word used by some Authors, to express those parts of the Universe that are without and beyond our Solar System; and which are supposed as Planetary Systems moving round each fix'd Star as the Center of their Motion, as the Sun is of ours: And if it be true, as 'tis not improbable, That each fix'd Star may thus be a Sun to some habitable Orbs that may move round it, the *Interstellar* World will be infinitely the greater part of the Universe.

INTERTRIGO, or *Atritus*, is cutting or fretting the *Cuticula* off of the parts near the Fundament, or betwixt the Thighs.

INTERVAL, in Musick, is the Distance or Difference between any two Sounds, whereof one is more Grave, and the other more Acute. They make several Divisions of an *Interval*, as first into *Simple* and *Compound*: The *Simple Intervals* are the *Octave*, and all that are within it, as the *Second*, *Third*, *Fourth*, *Fifth*, *Sixth*, and *Seventh*, with their Varieties: The *Compound* ones are all those that are greater than an *Octave*, as the *Ninth*, *Tenth*, *Eleventh*, &c. with their Varieties.

An *Interval* is also divided into *Just* or *True*, and into *False*: All the above-mention'd *Intervals*, with their

IONICK Order of Architecture, is the Form of a Column or Pillar invented by the *Ionians* in Ancient Greece, by way of Improvement of the Beauty of the *Dorick Order*; which as it was taken from the Figure of a robust Man's Body; and designed to represent Solidity and Strength, so the *Ionians* having more regard to Beauty, chose an Order of a more Elegant Proportion, which occasioned this Order to be called, *The Feminine Order*; and soon after it sprung up that of the *Caryatides*.

The Promotions of this Pillar, as they are taken from the famous one in the Temple of *Fortuna Virilis* at Rome, now the Church of St. Mary the Egyptian, are these;

The intire Order from the Superficies of the *Arca* to the *Cornice*, are 22 Modules or 11 Diameters.

The Column with its Base and Capital, contains 18 Modules.

The *Entablature* (i. e. the *Architrave*, *Frieze*, and *Cornice*) contain 4 Modules.

The *Voluta* of the Capital, is of an Oval Form.

The Columns in this Order are often hollow'd and furrow'd with 24 Gutters; and sometimes 'tis done only to the third part of the Column, reckoning from the Bottom; and then that third part hath its Gutter filled with little Rods or Baroons, all the part of the Hollow above being left empty.

JONTHUS, or *Varus*, is a little hard, callous Swelling in the Skin of the Face. *Blanchard*.

JOURNEYS Accounts, is a Term in Law, to be thus understood: If a Writ be abated without the Default of the Plaintiff or Demandant, he may purchase a new Writ, which if it be purchased by *Journeys Accounts*; (that is, within as little Time as he possibly can after the Abatement of the first Writ) then this second Writ shall be as a Continuance of the first, and so shall ought the Tenant or Defendant of his Voucher, Plea, or Non-tenure, Joint-tenancy fully administered, &c. or any other Plea which arises upon Matter happening after the Date of the first Writ; and 15 Days have been held a convenient Time for the Purchase of the new Writ.

JOY, is a Delight of the Mind, from the Consideration of the present, or assured approaching Possession of a Good; and we are then possessed of any Good, when we have it so in our Power that we can use it when we please.

JOYNTURE, is a Covenant, whereby the Husband, or some other Friend in his Behalf, assureth unto his Wife, in respect of Marriage, Lands or Tenements for a Term of Life: Or otherwise

It is so called, either because granted *Ratione Juncture in Matrimonio*; or because the Land in *Frank-marriage* is given jointly to the Husband and Wife, and after to the Heirs of their Bodies, whereby the Husband and Wife be made Joint-Tenants during the Coverture.

IRIS, is that fibrous Circle next to the Pupil of the Eye, distinguished with Variety of Colours: see *Uvea Membrana*. 'Tis so called from its Similitude to a Rainbow, (in Latin *Iris*.)

Also those changeable Colours which sometimes appear in the Glasses of Telescopes, Microscopes, &c. are called *Iris* for the same Reason; as is that coloured *Spectrum*, which a Triangular Prismatick Glass, will project on a Wall, when placed (at a due Angle) in the Sun-beams: see *Rain-bow*.

IRONY, is a Trope in Rhetorick, by which we speak contrary to our Thoughts; as to say, *Such a one is a very honest Man*, when we know he is notoriously Corrupt.

IRON-SICK, a Ship or a Boat is said to be *Iron-sick*, when her Spikes are so eaten with Rust or

Nails, and so worn away, that they make Hollows in the Planks, whereby the Ship leaks.

IRRADIATION, is a Word used by *Van Helmont*, and some other Chymists, to express the Operation of some Mineral Medicines, which they will have to impart their Virtue, without emitting any thing Material or Substantial out of them, or without the Emanation of any Corporeal Effluvia.

Thus, for Instance, They tell you, That some Antimonial Preparations, as is *Glass* and *Crocus Metallorum*, will give an Emetick Quality to Wine, &c. without any manner of Diminution of its Weight: But it doth not appear that they were well enough exercised in Statical Experiments, either to have nice Scales, or to know how to use them, and therefore, doubtless, do too boldly call that Diminution, which was only not so sensibly so to them: But how a Body should communicate its Vomitive Quality to a Liquor, without impregnating it with some of its fine and subtle Emetick Particles, is hardly possible to conceive.

IRRATIONAL Numbers: see *Surd Numbers*.

IRRATIONAL Quantities: see *Rational Quantities*.

IRREGULAR Bodies, are Solids which are not terminated by equal and like Surfaces.

IRREGULAR Fortification: see *Fortification*.

IRREGULAR Lines or Curves: see *Regular*.

ISAGON, in Geometry, is sometimes used for a Figure consisting of equal Angles.

ISCHÆMA, are Medicines that stop the Blood; which, with a binding, cooling, or drying Virtue, close up the Openings of the Vessels, or diminish and stop the Fluidity or violent Motion of the Blood. *Blanchard*.

ISCHIAS, the Gout in the Hip.

ISCHIAS Major, is a Branch of the *Crural Vein* which goes to the Muscles and Fat of the Leg, and is divided afterwards into several Branches, which are distributed to the Toes.

ISCHIAS Minor, a Branch also of the *Crural Vein*, being but a little one, and is wholly spent on the Muscles and Skin, which are about the upper Joint of the Femur.

ISCHIUM, is the Hip or Huckle-Bone.

ISCHURETICA, are Medicines which force Urine, in the Case of a Suppression of it.

ISCHURIA, is such a Suppression of Urine in the Bladder, that little or nothing of it can be discharged.

ISLES, in Architecture, are Sides or Wings of a Building.

ISOCHROME, Vibrations of a Pendulum, are such as are made in the same space of Time, as all the Vibrations or Springs of the same Pendulum are, whether the Arks it describes be longer or shorter; for when it describes a shorter Ark, it moves so much the slower; and when a long one, proportionably faster.

ISOMERIA, in Algebra, is the same with *Conversion of Equations*, (see *Equations*, N. 1.) or of clearing any Equation from Fractions.

ISOPERIMETRICAL Figures, in Geometry, are such as have equal Perimeters or Circumferences.

Of all *Isoperimetric* Figures, the Circle is the greatest.

For if a Right Line could be disposed into the Form of the Circumference of a Circle, it would contain more Space than any other Figure or *Regular Polygon* whatsoever.

As suppose the Circumference of the Circle $abcd$, to be disposed into the Form of a Square, or any other Regular Polygon: so that all the Sides eg , gb , bi , and ic together, may be equal to the

Circumference of the Circle $abcd$; I say the Circle is greater than that Square.

For the Circle is equal to a Rectangle-Triangle, one of whose Legs is the Radius fa , and the other the Circumference. And the Polygon is equal also to such a Triangle, one of whose Legs is the same Circumference $abcd$, or the Sum of the Sides $geib$: And the other Leg is the Line fo , but as fo is less than the Radius fa , so the Triangle, which is equal to the Polygon, must be less than that which is equal to the Circle: Therefore the Square or Polygon must be less than the Circle. W. W. D.

ISOSCELES-TRIANGLE: see Triangle.

PROP. I.

The Angles opposite to the equal Sides of an Isosceles-Triangle are equal; and a Line drawn from the Top (or Vertex) cutting the Base into two equal Parts, is perpendicular to the Base.

Let the Isosceles-Triangle be APC , and let its Base AC be supposed to be divided into two equal Parts in m .

I say Pm is perpendicular to AC ; and the Angle PCA , is equal to the Angle PAC .

Demonstration.

For the Triangle z hath all its Sides equal to those of x , and therefore must have all its Angles also respectively equal to those in x : And then the Angle $PmA = PmC$, because they are both right;

therefore Pm is perpendicular to AC , and the Angle $PAm = PCm$. Q. E. D.

PROBLEM I.

To Divide a Right Line into Two equal Parts.

Let the Line given be AC , opening the Compass to any Distance more than half the Line AC , and setting one Foot in C , strike an Ark both above and below the middle of the Line; then keeping them at the same Distance, set one Foot in A , and cross the former Arks in O and B ; a Ruler laid from O to B , shall cut the Middle of the AC , or divide it into two equal Parts.

Demonstration.

Draw the Lines AB , BC , BO , AO , and CO .
1. Then will the Triangles BAO , and BCO , have all their three Sides respectively equal, and consequently be equal to one another; and therefore the Angle $CBO = \text{Angle } ABO$.

2. The Triangles z and x , have the same two Angles ABm , and CPm equal, and the Side AB equal to the Side BC , and Bm common to both: Therefore all are equal, and consequently $Am = Cm$. Q. E. D.

N. B. By this Problem also, a Perpendicular may be let fall to the middle of any given Line; for here 'tis plain, Bm is perpendicular.

PROBLEM II.

To Divide an Angle given into Two equal Parts.
Let the given Angle be ABC .

Open your Compass to any convenient Distance, and setting one Foot in B , cross the Legs of the Angle in AO , strike an Ark below as at O , and removing the Compass to A , cross the former Ark in the Point O , so a Line drawn from B to O shall Bisect the Angle;

The Demonstration is the same with that of the last Problem.

ISSUANT, a Term in Heraldry, when a Lion, or other Beast, is drawn in a Coat of Arms just issuing out of the Bottom Line of any Chief, Fesse, &c. but if it come out of the Middle of any Ordinary, they call it *Naissant*; that is, *Nascent*, just coming out as it were from the Womb.

ISSUE, a Term in Common Law, having divers Applications; sometimes 'tis taken for the Children begotten between a Man and his Wife; sometimes for Profits growing from Amerciaments or Fines; and sometimes from Profits of Lands or Tenements; sometimes for that Point of Matter depending in Suit, whereupon the Parties join, and put their Cause to the Trial of the Jury: And yet in all these it hath but one Signification, which is an Effect of a Cause proceeding, as the Children be the Effect of the Marriage between the Parents: The Profits growing to the King or Lord, from the Punishment of any Man's Offence, is the Effect of his Transgression: The Point referred to the Trial of Twelve Men, is the Effect of Pleading or Process.

Issue in this last Signification, is either *General* or *Special*.

General Issue, seemeth to be that whereby it is referred to the Jury to bring in their Verdict, whether the Defendant hath done any such thing as the Plaintiff layeth to his Charge.

For Example :

If it be an Offence against any Statute, and the Defendant plead, *Not Guilty*; this being put to the Jury, is called, *The General Issue*.

And if a Man complain of a private Wrong, which the Defendant denieth, and pleads no Wrong nor Disseisin, and if this be referred to the Jury, it is likewise the *General Issue*.

The *Special Issue* then must be that, when Special Matters being alleged by the Defendant in his Defence, both Parties joyn thereupon, and so grow rather to a Demurrer, if it be *Questio Juris*, or to Trial by the Jury, if it be *Questio Facti*.

ISTHMUS, in Geography, is a little Neck or Part of Land joining a *Peninsula* to the *Continent*.

ISTHMUS, in Anatomy, according to some, is that Part which lies betwixt the Mouth and the Gullet, like a Neck of Land; also the Ridge that separates the Nostrials.

ITINERARIUM, is a Chyrurgeon's Instrument, which being fixed in the Urinary Passage, shews the Neck or Sphincter of the Bladder, that an Incision may be more surely made to find out the Stone: 'Tis usually thrust up thro' the Cavity of a Fistulous Catheter, which saves it from wounding the *Urethra* as it goes.

ITHMOIDEA *Offa*: see *Ethmoides*.

JUBA, a Botanick Word, signifying a soft loose Beard, which hangs at the Ends of the Husks of some Plants of the *Fruentaceous Kind*; as particularly in *Millet*.

JUDGE and *Judges*, have all their Commissions bounded with this Limitation, *Facturi quod ad justitiam pertinet secundum legem & consuetudinem Anglie*.

The *Judge*: at his Creation takes this Oath, "That he shall indifferently minister Justice to all them that shall have any Suit or Plea before him; and this he shall not forbear to do, tho' the King by his Letters, or by exprefs Word of Mouth, should command the contrary, &c."

JUDGMENT, in Law, is the Censure of the Judges so called, and is the very Voice and Final Doom of the Law, and therefore is always taken for unquestionable Truth.

Of *Judgments*, some are *Final*, and some *Not Final*: see *Coke* and *Littleton*, Fol. 39.

JUDGMENT, Mr. *Lock* defines to be a Faculty of separating carefully one from another, those *Idea's* wherein any, even the least Difference can be found, thereby to avoid being misled by Similitude and by Affinity, to take one thing for another.

Others define it to be that Action of the Mind, by which assembling together several *Idea's*, we either deny or affirm *This* to be *That*.

Thus, considering the *Idea* of the Earth, and the *Idea* of Roundness, we affirm or deny the *Earth* to be *Round*.

JUGALE *Os*, the same that *Zygoma*.

JUGULAR-VEINS, are those Veins which go towards the Skull by the Neck; and are of two sorts, *viz.* External and Internal.

The *External Jugulars* ascend on the Outside of the Neck, and are usually open'd where one is let Blood in that Part for any Distemper in the Head, *Quinsy*, &c.

The *Internal Jugulars* arise from the *Subclavian*, by the sides of the Wind-pipe, and passing along the Skull in two Branches, are dispersed thro' the *Dura Mater*, &c.

JUGULUM, the same that *Furcula*.

JULAP, from the Greek *Zudama*, or, as some say, from the Persick Word *Zuleb*, which signifies a *sweet Potion*; is a grateful Medicine composed of Distilled Waters, Spirits, &c. and sweetened to the Patient's Palate with Sugar, or some agreeable Syrup.

JULIAN-YEAR, is the *Old Account* of the Year, instituted by *Julius Caesar*, which to this Day we use in *England*, and call it the *Old Style*, in Contradistinction to the *New Account*, framed by *Pope Gregory*, which is Eleven Days before ours, and is called the *New Style*.

JULIAN-PERIOD, is a Cycle of 7980 Consecutive Years, produced by the continual Multiplication of the three Cycles, *viz.* That of the Sun of 28 Years, that of the Moon of 19 Years, and that of the *Indiction* of 15 Years; so that this *Epocha*, although but Artificial or feign'd, (and which was the Invention of the famous *Julius Scaliger*) is yet of very good Use; in that every Year within the Period, is distinguishable by a certain peculiar Character; for the Year of the Sun, Moon, and *Indiction* will not be the same again, till the whole 7980 Years be revolved: *Scaliger* fix'd the Beginning of this Period 764 Years before the Creation.

For the finding the Year of the Julian Period, you have this Rule,

Multiply the Solar Cycle by 4845, the Lunar by 4200, and the *Indiction* by 6916;

Then divide the Sum of Products by 7980, and the Remainder of the Division (without having Regard to the Quotient) shall be the Year enquired after.

Example.

Let the Cycle of the Sun be 3, of the Moon 4, and of the *Indiction* 5;

Multiply

Multiply 8485 by 3, 'twill be 14535; and 4200 by 4 = 16800; and 6916 by 5, gives 35580.

The Sum of the Products is 65915, which divided by 7890, gives 8 in the Quote, and leaves 2075 for a Remainder, which is the Year of the *Julian Period*.

JULUS, is a Botanick Word for those *Catalins*, as some call them, or long Wormlike Tufts, or *Palms*, as they are called in Willows, which at the Beginning of the Year grow out of, and hang pendulous down from Hazels, Walnut-Trees, &c.

The Accurate Mr. Ray thinks them to be a kind of Collection of the *Stamina* of the Flowers of the Tree; because in Fertile Trees and Plants they have abundance of Seminal Vessels or Seed-Pods.

JUPITER: The Proportion of *Jupiter* to our Earth, is about 60 to 1.

The Periodical Time of *Jupiter's* Revolution about the Sun, is in the Space of 12 Years, or 4380 Days; and he revolves round his Axis in the Space of 10 Hours; which very swift Motion may cause that Excess of his Equatorial Diameter above his Polar, which you will find below; whereas in the Sun and Moon, which take, the one 27, the other 28 Days in their Revolution round their Axis, there is no such Inequality between their Polar and Equatorial Diameters observed.

The Mean Distance of *Jupiter* from the Sun, according to *Kepler* 519650; to *Bullialdus* 522520; according to the Periodical Time of its Revolution 520116: Such Parts of which the Mean Distance between the Earth and Sun is 100000; that is, about 280862640 English Miles.

According to Mr. *Cassini*, *Jupiter's* greatest Distance from the Earth is 142919; his mean Distance 115000; and least Distance 87081 Semi-diameters of the Earth.

And the Diameter of *Jupiter* is equal to 27 and a Half Semi-diameters of the Earth.

Wherefore the Globe of *Jupiter* must be greater than that of the Earth by 2460 times.

The Semi-diameter of *Jupiter*, seen from the Sun, is but 19 Seconds, $\frac{1}{2}$.

In the Year 1664, *Campani* by the help of an excellent Telescope observed certain Protuberances and Inequalities in the Surface of this Planet.

He saw also in his Body the Shadows of his *Satellites*, and followed them with his Eye till he saw them go off the Disk.

In the same Year, May the 9th, 2 Hours, P. M. Mr. *Hook*, with a Telescope of 12 Foot, observed a small Spot in the biggest of the three obscurer Belts of *Jupiter*; and within two Hours after he found that the said Spot had moved from East to West about half the Length of the Diameter of *Jupiter*.

Mr. *Cassini* observed also, near the same Time, a permanent Spot in the Disk of *Jupiter*; by whose help he not only found that *Jupiter* turns about upon his own Axis, but also the Time of such Conversion, which he estimates to be 9 Hours, and 56 Minutes.

Which was also confirmed by better Observations of a Spot in the Year 1691.

The Equatorial Diameter of *Jupiter* to his Polar one, Sir *Is. Newton* computes to be as 40 $\frac{1}{2}$ to 39 $\frac{1}{2}$.

Captain *Halley*, in his Preface to his Catalogue of the Southern Stars, saith, That he found *Jupiter* to move swifter than he is supposed to do by the Astronomical Tables.

The same Learned Person thinks, That the Reason of the Error (of about 3 or 4 Minutes in Time) of the Tables in calculating the Eclipses of the Sa-

telles, arises from some small Excentricity in the Motion of the Planet, and from the Oval Figure of his Body newly mentioned, whose quick Rotation round his Axis by the *Vis Centrifuga*, dilates his Equinoctial Parts, and makes his Meridians much Elliptical, so as to be discernable by the Telescope.

The Sun's Heat in *Jupiter*, is at most not above one twenty fifth part of what it is with us; and consequently 'twould be very uncomfortable living there (if at all possible) for Men of our Constitution; and yet some are very fond of thinking *Jupiter* an excellent Place to live in.

The Distance of *Jupiter* from the Sun, is above five times as great as that of the Earth from the Sun, (see *Gregory's Astron.*) and consequently the Diameter of the Sun to any Eye in *Jupiter*, will be not a fifth part of what it appears to us, and therefore his Disk will be above 25 times less, and in the same Proportion will his Light and Heat be.

The Artificial Day and Night (each of 5 Hours) is of the same length in *Jupiter* all over his Surface; because the Axis of his Diurnal Revolution, is nearly at Right Angles to the Plane of his Annual Orbit round the Sun.

Although *Jupiter* hath four Primary Planets below him; yet an Eye placed there, and of no sharper Sight than one of ours, could never behold any one of them, unless as Spots transiting over the Sun's Disk, when they happen to be between the Jovial Eye and the Sun: For *Mars*, which goes furthest of all from the Sun, will not in *Jupiter* be seen above 18 Degrees from him; and since that Planet is but small, and reflects but a weak Light, so near the Sun it cannot be visible: So that *Saturn* is the only Planet that can be seen in *Jupiter*, except his own four Moons or Satellites.

The Sun's Parallax seen from *Jupiter*, will scarce be sensible any more than *Saturn's*; neither being much above 20 Seconds; so that the Sun's apparent Diameter in *Jupiter* will not be above 6 Minutes: But the outermost of his Satellites will appear almost as great as the Moon doth to us; viz. of five times the Diameter, and 25 times the Disk of the Sun, seen from the same Planet; and if the other Satellites are not less than the outermost, they will yet appear much greater, (and the Learned Mr. *Hugens* conceives them not much less than our Earth) and gives the Planet a good Light in the Nights, which also can never there be very long.

Dr. *Gregory*, (from whence this comparative Astronomy is collected) saith also, That an Astronomer placed in *Jupiter*, would easily compare the Distances of the four inferior Planets with the Diameters of *Jupiter*, as we do the Distances of us from the Planets, by comparing them with the Diameter of the Earth: And this would be done as to the four nearest ones, easier than we compute the Distance of the Moon by the Earth's Diameter; for the Horizontal Parallax of the remotest of the Planets seen from *Jupiter*, is above twice as great as the Horizontal Parallax of the Moon seen from the Earth, and therefore must be very sensible and considerable. And tho' the Globe of *Jupiter* be vastly large, in comparison of our Earth; yet the Sun's Parallax, when he's beheld from *Jupiter*, will not be quite 20 Seconds, and consequently scarce sensible: Nor will the Parallax of *Saturn*, (though when in Opposition to the Sun, and next to *Jupiter*) be much greater; and therefore 'twill be very difficult for the Jovial Astronomer to estimate the Distance of *Saturn*, or of the Sun, from that Planet.

Indeed, if he can discover that *Jupiter* moves round the *Sun*, he may be able (as the Doctor shews, *Prop. 3.*) to determine the Ratio of the Distance of *Jupiter* and *Saturn* from the *Sun*, otherwise not.

Our *Jovial Astronomer* therefore, by the Help of his Senies, would distinguish two kinds of Planets; four nearer to him, which are the Satellites, and two (as the *Sun* and *Saturn*) more remote; and these latter would appear with a lesser Diameter, the former with a greater: Of the remotest, the *Sun* would appear in a Diameter about six Minutes, but the Diameter of *Saturn* would scarce be $\frac{1}{2}$ of a Minute.

Of the four nearer Planets or Satellites, the Fourth would appear to an Eye in *Jupiter* of the Bigness the Moon doth to us; that is, with a Diameter five times greater, and a Disk twenty five times greater than the *Sun* doth there: Besides, the four nearer, and apparently greater ones, will be distinguished from the more remote and lesser ones, in this, That in the nearer Planets, the Squares of the Periodick Times, are as the Cubes of their Distances from the Center of *Jupiter*; which would by no means be true, if any one of the greater were compared with any one of the lesser. And although the nearer these Planets are, they appear the greater; yet the *Sun* will be immensely more bright than they; for from their Faces, which depend upon their Situation, with respect to the *Sun*, they will appear like so many Moons: From whence a Spectator in *Jupiter* will have four kinds of Months, according to the Number of Moons. There will be contained above 2407 of the least Months in a Year, and about half the Number of Months next to these: The Number of the Months of the third Satellite contain'd in a Year, will be nearly subduple of the second, or subquadruple of the first; and the Months of the greatest will be about 254: So that although the Notation of Time be much more intricate in *Jupiter*, by reason of the great Number of Days which their Year contains; yet it is much facilitated by these four kinds of Months; for in the least Month there are only 4 Days and a Quarter, but in the greatest something more than 40.

Besides, these Moons suffer an Eclipse when they, being in Opposition to the *Sun*, happen to fall into the Shadow of *Jupiter*; and again, when they, (being in Conjunction with the *Sun*, project their Shadows to *Jupiter*, they make an Eclipse of the *Sun* to an Eye placed in that Region of *Jupiter*, where the Shadow falls (which Region is a very small part of *Jupiter's* Surface) just as our Moon does: But because the Orbits of those Moons about *Jupiter*, are in a Plane which is inclined to, or makes an Angle with *Jupiter's* Orbit about the *Sun*, and are all of them nearly in the same Plane, excepting the second, which deviates a little; upon this Account, I say, their Eclipses are Central, and consequently most lasting, when the *Sun* is in one of the Nodes of those Moons: But when the *Sun* is out of this Position, the Eclipses may be Total, though not Central, because the Breadth of *Jupiter's* Shadow, is nearly decuple the Breadth of any of the Satellites; and the apparent Diameter of any of those Moons, is nearly quintuple the apparent Diameter of the *Sun*. And this remarkable Inequality of the Diameters, and the small Inclination the Plane of the Orbits of the Satellites has to the Plane of *Jupiter's* Orbit round the *Sun*, is the Reason why in each Revolution there happens Eclipses both of the Satellites and of the *Sun*, though the *Sun* be at a considera-

ble Distance from the Nodes: And the inferior of these Satellites, though the *Sun* to a Spectator in *Jupiter*, be at his greatest Distance from their Nodes, are nevertheless Eclipsed, and Eclipse the *Sun*; but the remotest of them in this Case, for two Years together, escapes falling into *Jupiter's* Shadow, and *Jupiter* into its Shadow; and the Phenomena of partial Eclipses in the intermediate Times and Places, will be apparent to a Spectator in *Jupiter*. Further, it sometimes happens here, that one Moon Eclipses another, whose Phasis is sometimes very different, nay, contrary to the Eclipse of a Moon, falling into the Shadow of *Jupiter*, which was described above; for in this the Oriental Limb is first darkened, and the Occidental Limb emerges last; but in others of them the Occidental Limb is first darkened, and the Oriental Limb emerges last; and in others contrarily.

The Shadow of *Jupiter*, though it go far beyond its Satellites, yet does not reach any other Planet, as the Shadow of all other primary Planets do; for no other Planet, except *Saturn*, could be immersed in it, tho' it was infinite; but the Shadow of *Jupiter* cannot reach *Saturn*, except the Diameter of *Jupiter* were half the Diameter of the *Sun*, and it is scarce $\frac{1}{2}$ of it.

If the Surface of *Jupiter* were chiefly Water, and we suppose the Seas there to be Navigable, the Sailors would have great Advantages, as well because the Nights are very short, and very light from the Numbers of their Moons; as because these Moons would be of singular use to 'em in directing their Courses.

For from those manifold Eclipses, the Longitude of a Place would be easily determined, and Hydrographical Tables accurately constructed, which is very Advantageous in so vast a Globe as that of *Jupiter*; whose Surface being Centuple, (nay, according to *Hugens*, 400 times as much) the Surface of the Earth would render its Mensuration very laborious: But the Flux and Reflux of the Sea, occasion'd by these four Moons, (for the Force of the *Sun* would be very little there) would be very different, and besides, would be very difficultly brought to a Calculation.

JURATS, are in the Nature of Aldermen, for Government of their several Corporations: As the *Mayor* and *Jurats* of *Maidstone*, *Rye*, *Winchelsea*, &c. So *Jersey* hath a Bayliff and Twelve *Jurats*, or (worn Assistants, to Govern the Island.

JURISDICTION, is a Dignity which a Man hath conferred on him to do Justice in Cases of Complaint.

JURIS Utrum, is a Writ that lieth for the Incumbent, whose Predecessor hath alienated his Lands or Tenements.

JUROR, is one of those twenty four or twelve Men, which are sworn to deliver a Truth upon such Evidence as shall be given them touching the Matter in question.

JURY, in Common Law, signifies either twenty four or twelve Men sworn to enquire of the Matter of Fact, and declare the Truth upon such Evidence as shall be delivered them touching the Matter in Question: Of which *Jury* some may, and some may not be impannel'd: See *F. N. B. Fol. 165.*

In *England* there are three sorts of Trials, viz. one by Parliament, another by Battle, and the third by *Affize* or *Jury*.

The Trial by *Affize*, (be the Action Civil or Criminal, Publick or Private, Personal or Real) is referred

ferred for the Fact to a Jury, and as they find it, so passeth the Judgment.

This *Jury* is not only used in Circuits of Justices Errant, but also in other Courts and Matters of Office: And though it appertains to most Courts of the Common Law; yet it is most notoriously in the Half-year Courts of the Justices Errants, commonly called, the *Great Assizes*; and in the Quarter-Sessions, and in them it is most ordinarily called a *Jury*, and that in a Civil Cause; whereas in other Courts 'tis usually called an *Inquest*, and in the Court-Baron, a *Jury of the Homage*.

In the *General Assize* there are usually many *Juries*, because there be store of Causes both Civil and Criminal commonly to be tried; whereof one is called, *The Grand Jury*, and the rest *Petite Juries*; whereof it seemeth there should be one in every Hundred.

The *Grand Jury* consists of Twenty four Grave and Substantial Gentlemen, or some of the better sort of Yeomen, chosen indifferently by the Sheriff out of the whole Shire, to consider of all Bills of Indictment preferred to the Court; which they do either approve, by writing upon them, *Billa Vera*; or disallow, by indorsing *Ignoramus*. Such as they do approve, if they touch Life and Death, are further referred to another *Jury* to be considered of, because the Case is of such Importance; but others of lighter Moment, are upon their Allowance, without more Work, fined by the Bench; except the Party traverse the Indictment, or challenge it for Insufficiency, or remove the Cause to a higher Court by *Certiorari*; in which two former Cases it is referred to another *Jury*; and in the latter, transmitted to a higher: And presently upon the Allowance of this Bill by the Grand Inquest, a Man is said to be indicted: Such as they disallow are delivered to the Bench, by whom they are forthwith cancelled or torn.

The *Petite Jury* consists of Twelve Men at the least, and are empanelled as well upon Criminal, as upon Civil Causes: Those that pass upon Offences of Life and Death, do bring in their Verdict, either Guilty, or not Guilty; whereupon the Prisoner, if he be found Guilty, is said to be Convicted, and so afterwards receiveth Judgment and Condemnation; or otherwise is acquitted and set free. Those that pass upon Civil Causes Real, are all, or so many as can conveniently be had, of the same Hundred where the Land or Tenement in Question doth lie, being four at the least; and they, upon due Examination, bring in their Verdict either for the Demandant or Tenant.

JURY-MAST, so the Seamen call whatever they set up in the room of a Mast lost in a Fight, or by a Storm; which, if they can save it, some great Yard, which they put down into the Step of that lost Mast, fastening it into the Partners, and fitting to it the Miffen, or some lesser Yard, with Sails and Ropes, as they can, they make a hard shift to sail with it instead of the Mast which they have lost.

JUSTICE, signifies him that is deputed by the King to do Right by way of Judgment. Of these *Justices* there are divers sorts in England; of the manner of whose Creation, with other Appurtenances, read *Fortesque, Cap. 51*.

JUSTICE of the Common-Pleas, is a Lord by his Office, and with his Assistants originally did hear and determine all Causes at the Common Law; that is, all Civil Causes between Common Persons,

as well Personal as Real; for which Cause it is called, *The Court of Common-Pleas*, as distinguishing it from *The Pleas of the Crown*, or the *King's Pleas*, which are Special, and appertaining to him only.

JUSTICE of the Forest, or *Justice in Eyre of the Forest*, is a Lord by his Office, and hears and determines all Offences within the Forest, committed against Venison or Vert: Of these there be two, whereof one hath Jurisdiction over all Forests on this Side Trent, the other of all beyond.

JUSTICE of the King's-Bench, is a Lord by his Office while he enjoys it, and the Chief of the rest: His Office (especially) is to hear and determine all Pleas of the Crown, viz. such as concern Offences committed against the Crown, Dignity, and Peace of the King; as Treasons, Felonies, Mayhems, and such-like: He also, with his Assistants, heareth all Personal Actions, and Real also, if they be incident to his Jurisdiction.

JUSTICES of Assize, are such as were wont by Special Commission to be sent into this or that County, to take Assizes for the Ease of the Subjects; for whereas these Actions pass always by Jury, so many Men might not, without great Damage and Charge, be brought up to London, and therefore Justices for this Purpose, by Commission particularly authorized, were sent down to them: And twice every Year they go the Circuit, by two and two, through all England, dispatch their several Businesses by several Commissions; for they have one Commission to take Assizes, another to deliver Gaols, and another of Oyer and Terminer, &c.

JUSTICES in Eyre, are those who were sent with Commission into divers Counties to hear Causes, especially those that were termed *Pleas of the Crown*: And this was done for the Ease of the People, who would else have been hurried to the *King's-Bench*, if the Cause were too high for the County-Court.

JUSTICES of Gaol-Delivery, are such as are sent with Commission to hear and determine all Causes appertaining to such, as for any Offence are cast into the Gaol.

JUSTICES of Nisi Prius, are now all one with *Justice of Assize*; for it is a common Adjournment of a Cause in the *Common-Pleas*, to put it off to such a Day, *Nisi prius justiciarii venerint ad eas partes ad capiendas Assisas*: And upon this Clause of Adjournment, they are called *Justices of Nisi Prius*, as well as *Justices of Assize*, by reason of the Writ or Action they have to deal in.

JUSTICES of Oyer and Terminer, were Justices deputed upon some special or extraordinary Occasion, to hear and determine some peculiar Causes.

JUSTICES, is a Writ directed to the Sheriff, for the dispatch of Justice in some Special Cause, of which he cannot by his ordinary Power hold Plea in his County-Court.

By this Writ *Justicies*, the Sheriff may hold Plea of a great Sum; whereas of his ordinary Authority he can hold no Pleas, but of Sums under forty Shillings.

JUXTA-POSITION, is the ranging the Particles or Corpuscles of any mix'd Body into such an Order, Position, or Situation, that the Particles being contiguous to one another, shall determine or denominate a Body to be of such a Figure or Nature, or to be indued with such Properties as are the proper Result of such a Configuration and Disposition of Parts.

K E E

KALENDAR : See *Calendar*.

KALENDS : See *Calends*.

KECKLE ; when the Cables of a Ship gaul in the Hawse, or the Bolt-ropes do so against the Ship's Quarter, the Seamen wind some small Ropes about them ; and this serving of these Ropes is called *Keckling*.

KEDGING, at Sea, is when a Ship is brought up or down in a narrow River, the Wind being contrary to the Tide, and yet she is to go with the Tide ; then they use to set their Fore-sail, or Fore-top-sail and the Muffen, and so let the Ship drive with the Tide, that so they may flat her about ; and if she happen to come over too near the Shoar, they have a small Anchor in the Head of their Boat with a Hawser fastened to it from the Ship, which Anchor they then let fall in the Middle of Stream, and so wind or turn her Head about, lifting the Anchor up again when she is come fully about : This Work is called *Kedging*, or to *kedge* up a River, and the Anchor made use of is called the

KEDGER, or *Kedge-Anchor*.

KEEL, is the lowest Piece of Timber in a Ship, in the Bottom of her Hull ; one End whereof is at the Stern, the other at the Stem : Into this are all the Ground-Timbers and Hooks fastened, and bolted fore and aft. When a Ship hath a deep Keel, she is said to have a *Rank Keel* ; and this serves well to keep her from rowling ; but if she is over-floaty and rowls too much, a new Keel is sometimes put on, called a *False Keel*.

KEEL-ROPE, a Hair-Rope running between the Keelson and the Keel of a Ship, to clear and Limber-Holes when they are choaked up with Balast, &c.

KEELSON, the next Piece of Timber in a Ship to her Keel, lying right over it next above the Floor-Timber.

KEEPER of the Great Seal, is a Lord by his Office, and stiled *Lord-Keeper of the Great Seal of England* : He is one of the King's Privy-Council ; through whose Hands pass all Charters, Commissions, and Grants of the King under the *Great Seal* ; without which *Seal* all such Instruments by Law are of no force : For the King is, in the Interpretation of Law, a Corporation, and passeth nothing firmly but under the said Seal, which is as the publick Faith of the Kingdom, in the high Esteem and Reputation justly attributed thereto.

This *Lord-Keeper* hath the same Place, Authority, Preheminence, Jurisdiction, Execution of Laws, and all other Customs, Commodities, and Advantages, as the *Lord-Chancellor* of England hath for the Time being. He is constituted by the Delivery of the *Great Seal* to him, and taking his Oath.

KEEPER of the Privy Seal, is a Lord by his Office, through whose Hands pass all Charters signed by the King, before they come to the *Great Seal*, and some things which do not pass the *Great Seal* at all. He is of the King's Privy-Council, and one of the Great Officers of the Kingdom.

KEEPER, or *Chief Warden of the Forest*, is he who hath the principal Government of all things belonging to the same.

KENKS, in the Sea Phrase, are Doublings in a Cable or Rope, when 'tis handed in or out, so that

K N E

it doth not run smooth ; or when any Rope makes Turns, and doth not run smooth and clever in the Block, they say it makes *Kenks*.

KENNETS, in a Ship, are small Pieces of Timber nailed to the Inside of the Ship, unto which the Tacks and Sheets are belayed, (as they call it ;) i. e. fastened.

KETCH, a smaller Vessel, but of the same Form with a *Hoy*.

KEVELS, or *Cheviols*, are small Pieces of Timber nailed to the Inside of a Ship, unto which the Tacks and Sheets are belayed or fastened.

KEY, in Musick, is a certain Tone, whereto every Composition, whether it be long or short, ought to be fitted or design'd : And this Key is said to be either *Flat* or *Sharp*, not in respect of its own Nature, but with Relation to the *Flar* or *Sharp Third*, which is joined with it : See *Musick*, Vol. II.

KIDNEYS : see *Reins*.

KINGDOM, a Term used by the Chymists, who, according to their Cant in other things, call the Three Orders of Natural Bodies, *Animal*, *Vegetable*, and *Mineral*, by the Name of *Kingdom*.

Thus they would say, Those Bodies which belong to the *Animal Kingdom*, abound most in Volatile Salt.

KING'S-BENCH, is the Court or Judgment-Seat, where the King of England was sometimes wont to sit in his own Person ; and therefore it was moveable with the Court or King's Household, and called *Curia Domini Regis*, and *Aula Regia*, as *Gwin* reports in his Preface to his Reading, and that therein, and in the Court of Exchequer, which were the only Courts of the King till Henry the Third's Days, were handled all Matters of Justice, as well Civil as Criminal.

This Court of the *King's-Bench*, was wont in Ancient Times to be especially exercised in all Criminal Matters and Pleas of the Crown, leaving the handling of private Contracts and Civil Actions to the *Common-Pleas*, and other Courts.

KNAVE-LINE, is a Rope in a Ship, fastened to the Cross-Trees under the Main or Fore-Top, whence it comes down by the Ties to the Ramhead, and there 'tis reeved through a Piece of Wood of about two Foot long, and so is brought to the Ship's Side, and there haled up taught to the Rails.

Its Use is to keep the Ties and Hallyards from turning about one another, as they are apt to do when new and first used ; and therefore after they are a little used and stretched, this *Knave-Line* is taken away, of no further Use.

KNECK, in the Sea-Language, is the twisting of a Rope or Cable as it is veering out.

KNEES, are Pieces of Timber in a Ship bowing like a Knee, which are used to bind the Beams and Futtocks together, being bolted strongly into them both.

Hence such Timber as is useful for this Purpose, is called,

KNEE-TIMBER : Thus the Cut-water of a Ship, is called, *The Knee of the Head*.

KNETTELS ; so the Seamen call two Pieces of Spun-yarn put together untwisted.

KNIGHTS, a-board a Ship, are two Pieces of Timber, in each of which go four Shivers, three for

for the Halliards, and one for the Top-Ropes. They are usually shaped into the Form of some Head; one of them standeth aft the Main-mast, and therefore is called the *Main-Knight*; the other standeth abaft the Fore-mast on the second Deck; and this is called the *Fore-Knight*.

KNIGHT-SERVICE was a Tenure, whereby several Lands in this Nation were held of the King, which drew after it Homage, Escuage, Wardship, Marriage, &c. but taken away by 12 Car. II. cap. 24.

KNOTS; there are two sorts of Knots used at Sea, one they call a *Bowlin-Knot*, because by this Knot

the Bowlin Bridles are fastened to the Crengles: This is very fast, and will not slip.

The other is a *Wale-Knot*, which is a round Knob or Knot, made with 3 Strands of a Rope; this Knot serves for the *Top-sail-Sheets* and *Stoppers*.

The Divisions also of the Log-Line are called Knots: These are usually seven Fathom, or forty two Feet asunder, but they should be Fifty Feet; and then as many Knots as the Log-Line runs out in half a Minute, so many Miles doth the Ship sail in an Hour; supposing her to keep going at any equal Rate, and allowing for Yaws, Leeway, &c. See *Log*.

LAC

LABEL, is a long thin Brass Ruler, with a small Sight at one end, and a Center-hole at the other; commonly used with a Tangent-line on the Edge of a Circumferenter, to take Altitudes, &c.

LABIA LEPORINA, are such Lips, as by reason of their ill make will not come together, which some call *Rostra leporina*; we have Lips.

LABIAL Letters, are (by the Grammarians) accounted such, as in their Pronunciation require chiefly the Use of the Lips to form their Sound.

LABORANT, he that attends on and works under a Chymist, while he is about any Process or Experiment.

LABORALIS, in the Common Law, is a Writ that lies against such as having not whereof to live, do refuse to serve; or for him that refuseth to serve in Summer where he served in Winter.

LABORATORY, or *Elaboratory*, a Room fitted out purpose for Chymical Operations, and furnished with Variety of Furnaces and Instruments necessary to that Art.

LABYRINTH, is the Second (some say the Third) Cavity of the Ear, hollowed in the *Os Petrosum*; and is made of three winding semi-circular Pipes, which open by five Orifices into the *Vestibulum*.

LAC LUNÆ, or *Flores Argenti*, is the Chymists Word for a white porous friable Earth, insipid, but dissoluble in Water, which it will tinge with a milky Colour: It is a *Sublimate* from a Matter commonly found in Silver Mines, whence the Name.

LACERTUS: see *Brachium*.

LACHRYMALE Punctum, vel *Foramen*, is an Hole in the Nose, by which the Matter or Liquor of the Tears passes to the Nostrils. If this Hole grow hard and brawny, from an Ulcer in one of the Glandules at the Corners of the Eyes, thence arises a *Fistula Lachrymalis*.

LACHRYMÆ, are a Moisture which is separated by the Glandules of the Eye to moisten the Eyes; which if it be too much, so that it cannot be received by the *Punctum Lachrymale*, it falls from the Eyes in Drops, and is called Tears.

Whatever also is strained through, and drops out naturally, is let out by Incision, from any Part of a Plant, whether it be Gum, Resin, Oil, &c. is called *Lachryme*.

LACONICUM, *Caldarium* and *Assa*, or *Balneum acreum*, was formerly a Cellar made to provoke Sweat; which was done by an Hor Vapour, or a Dry Heat included therein. *Blanchard*.

LAM

LACTEAL Veins, or *Vessels*: see *Vasa Lactea*.

LACTUCIMINA, the same that *Apthe*.

LACTUMIÆ, the same that *Achores*.

LACUNAR, in Architecture, is an arched Roof or Ceiling, more-especially the Planking or Flooring above the *Portico's*.

LACUNÆ, are little Pores or Passages in the *Vagina* of the Womb, but no where greater than in the lower Part of the Urinary Passage: There flows a certain serous pituitous Matter out of these *Ductus's*, which lubricates the *Vagina*.

LADDERS in a Ship, are usually Three: The *Entring-Ladder* is in the *Waste*, and made of Wood. The Second is the *Gallery-Ladder*, made of Ropes, and hung over the Galleries and Stern of Ships, and are to enter by the Stern of the Ship, out of the Boat, when the Weather is foul, and the Sea high. The Third, viz. *Boltspirit-Ladders* are at the *Beak-Head* made fast over the Boltspirit, to get upon it; and are only used in great Ships.

LADLE, an Instrument to load great Guns with Powder. It ought to be so proportioned, that two Ladles-full may charge the Piece: Therefore their *Breadth* must be 2 Diameters of the Shot; and their *Length* for double-fortified Cannon 2 and $\frac{1}{2}$ of the Shot; for ordinary Cannon it must not exceed 2; but for Culverins and Demi-Culverins, it may be three Diameters of the Shot; and 3 and $\frac{1}{2}$ for lesser Pieces, in order to load at twice: If you would load at once, this *Length* of the Ladle must be doubled; and observe this, That a Ladle 9 Balls in Length, and 2 Balls in Breadth, will hold just the Weight of the Iron Shot in Powder.

LAMBITIVE, a pectoral Medicine, to be lick'd off the End of a piece of Licorice-stick, the same with *Eclegma*: which see.

LAMBOIDES, is the backward Suture of the Brain, so called, from its Likeness to the Letter Λ or *Lambda*.

LAMELLÆ, are the little thin Plates, constituted by a Net-work of very small Fibres, of which the *Shells* of Shell-fishes consist, or are composed.

LAMINÆ, the Plates or Tables of the Skull, being two in Number; whereof the outer is thicker and smoother; but the inner more hard, and furrowed on its inner Surface.

LAMPADIAS, a kind of bearded Comet, resembling a burning Lamp, being of several shapes; for sometimes its Flame or Blaze runs tapering upward like unto a Sword, and sometimes it is double or triple-pointed.

LANCETTE, is a Chyrurgeon's little Knife, straight-pointed, two-edged; used in opening Veins, cutting of Fistula's, opening of the Fundament, Yard, or Womb that is shut.

LAND-Fall, a Sea-Term, signifying to fall in with the Land: Thus when a Ship out at Sea, expects to see Land in a little time, and it so happens that she doth, they say, That they have made a good Land-fall.

LAND-layed; they say, The Land is layed, when a Ship is just got out of Sight of the Land.

LAND-lock'd: A Ship is said to ride Land-lock'd when she is at Anchor in such a Place where there is no Point open to the Sea; so that she is safe from the Violence of Winds and Tide.

LAND-shut-in, is when another Point of Land hinders the sight of that which a Ship came from; then they say, The Land is shut in.

LAND-To, is when a Ship lies so far off from the Shore, that she can but just ken Land; then she is said to lie Land-to.

LANGREL-Shot, is a sort of Shot used at Sea: It is made of two Bars of Iron, with a Joint in the middle; by which means it can be shortened, and so put the better into the Gun; and at each End there is an half Bullet, either of Lead or Iron: when 'tis discharged, it flies out at length, and is of use to cut the Enemies Rigging, &c.

LANIS *de crescentia Wallie traducendis absque Custuma*, &c. is a Writ that lieth to the Customer of a Port, for the permitting one to pass over Wools without Custom, because he hath paid Custom in Wales before.

LANNIERS, or *Lanniards*, in a Ship, are small Ropes reeved into the *Dead-mens-eyes*, of all the *Shrowds* and *Chains*: Their Use is to slacken, or set taught the *Shrowds*; The *Stays* also of all *Masts* are set taught by *Lanniers*: That Rope which fastens the *Stopper* of the *Halliards* to them, is also called a *Lannier*.

L'ANSPESEADE, is an inferior Officer subordinate to the Corporal, to assist him in his Duty, and supply his Place when he is absent: He is exempt usually from all common Duty, except the *Rounds*, and *Sentinels Perdue*.

LAPIDESCENT, that which can turn any Body into a stony Nature: Thus those Waters, which by having some stony Particles dissolved and swimming in them, do in their Course deposit them on the Leaves, Grasse, Sticks, &c. that they run over, and so produce what are called Petrifications; these are properly *Lapidescent Waters*.

LAPIS Infernalis: see *Infernal Stone*.

LAPIS Prunelle: see *Sal Prunelle*.

LAPIS Medicamentosus, is made of two Ounces of Colcothar; Litharge, Alom and Bole-armoniack, of each 4 Ounces, mingled and put into an unglazed Pan; and then good Vinegar is poured upon it, to cover it 2 Fingers Height: Cover it, and let it stand 2 Days in Digestion; then add 8 Ounces of Nitre, and 4 Ounces of Sal-armoniack; and setting the Pot over the Fire, evaporate all the Moisture; after which calcine the remaining Mass, and keep it for Use. 'Tis dissolved in Water, when used, and is a famed Styptick. *Colius* gives a Description of a *Lapis Medicamentosus*, but *Lemery* prefers this before it.

There is also a Stone called *Lapis Admirabilis*, whose Composition see in *Lemery*, ult. Edit. p. 429. Also another called *The Philosopher's Stone*, ibid.

LAQUEUS, in Chyrurgery, is a Band so tied, that if it be attracted, or pressed with Weight, it shuts up close: Its Use is to extend broken or dis-

jointed Bones, to keep them in their Places when they are set, and to bind the Parts, close together.

LARBOARD, the Left-hand side of a Ship, when you stand with your Face to the Head.

LARCENY, in Law, is a wrongful taking away another Man's Goods, with a Mind to steal them; and in respect of the Thing stolen, is of two sorts, viz. *Great*, which is called *Theft simple*, where the Things stolen exceed the Value of Twelve Pence, and that is *Felony*: and *Petis Larceny*, when the Goods stolen exceed not the Value of Twelve Pence.

LARGE: The Sea-men say, a Ship goes or fails Large, when she goes neither before the Wind, nor upon a Wind, but as it were quartering between both. Wherefore *Large*, *Quartering*, *Veering*, *Lasking*, or *Roamer*, are all of the same Signification.

LARMIER, a square Member in *Architecture*, which is placed on the *Cornice* below the *Cymatium*, and jets out farthest; being so called from its Use, which is to disperse the Water, and to cause it to fall at a Distance from the Wall, Drop by Drop, or as it were by Tears: for *Larme* in French signifies a Tear: see *Corona*.

LARYNGOTOMIA, the same with *Bronchotomia*.

LARYNX, is properly the Head or Top of the Wind-pipe, or *Aspera Arteria*; and it consists of Five Cartilages. The First Pair is called *Scutiform*, because something like a Shield, which constitutes the Protuberance in the Neck, called *Adam's Apple*: The Second Pair is called *Annular*, because it is round like a Ring: The Third and Fourth Cartilage some reckon but one; but if the Membrane be taken off, it appears to be Two, and is called *Guttulis* and *Glottis*: The Fifth is called *Epiglottis*, which covers the Opening of the Wind-pipe at the Top. Its Use is in the Formation of the Voice and Respiration.

LASH, the Sea Word for binding up to the Ship's side, the Muskets, Buts of Water or Beer, or Pieces of Timber to make *Fishes* or spare Top-Masts; or when any thing is thus fastened to the Ship, 'tis called *Lashing*.

But the *Lashers* are properly those Ropes only which bind fast the Tackles and the Breeches of the Ordinance, when they are haled or made fast within Board.

LASHED, a Sea-Term, signifying made fast: The Carpenter ought to take Care that there be spare Yards lashed fast to the Ship's sides; i. e. fastened there to use on Occasion.

LASKETS, or *Latches*, are small Lines like Loops, fastened by sewing into the *Bonnets* and *Drablers* of a Ship; in order to lace the *Bonnets* to the *Cowfles*, or the *Drablers* to the *Bonnets*.

LASKING, when a Ship sails neither by a Wind, nor directly before the Wind, she is said to go *Lasking*; which is much the same as *Veering*, or going with a Quarterly Wind.

LASSITUDE: see *Copus*.

LASSITUDO *Ulcerosa*, is a Symptom usually attending the cold Fit of an intermitting Fever, consisting in a Soreness and Weariness of all the Joints and Bones.

LATCHES, are those Parts of a Clock, which lock up and unlock the Work.

LATERAL Equation, in *Algebra*, is such an one which hath but one Root; whereas every Quadratick hath 2, every Cubick 3 Roots, &c. And such Equations can be determined and constructed by the Intersection of two Right Lines, which is a Composition of $1 + 1 = 2$. But a Quadratick cannot

cannot be determined or constructed without a straight Line and a Circle cutting each other: See *Wallis's Algebra*, p. 275. *Engl. Edit.*

LATION, is the Translation or Motion of a Body from one Place to another in a Right Line ; and so is much the same as *Local Motion*.

LATISSIMUS Dorsii, or *Anscalptor*, or *Tersor*, is a Muscle of the Arm, which receives its first Appellation from its large Dimensions, it with its Partner covering the whole Back; the latter from the Use that is sometimes made of it: Its thin, broad, tendinous Origination is continued from the Seven Inferior Spires of the *Vertebrae* of the *Thorax*, and all those of the Loins and Superior Parts of the *Os Sacrum*, and the Posterior Part of the *Os Ilium*; beginning to grow Carnous as it passes over the *Longissimus Dorsii* and *Sacrospinalis*; and in its Progress over the Curvated Part of the Ribs, it receives several *Fasciculi* of fleshy Fibres arising from thence, which by their Conjunction compose a thick Body, still lessening it self in its Dimensions, as it marches towards the *Axilla*; and running over the Inferior Angle of the *Scapula*, from whence sometimes does arise a fleshy Part of it, which I have observed (says M. *Comper*) in those Bodies in whom the *Teres Minor* was absent, is at last inserted, by a short, but flat strong Tendon, to the *Os Humeri*.

LATITAI, is a Writ whereby all Men in Personal Actions are called Originally to the *King's Bench*: And it hath this Name, as supposing that the Defendant doth lurk and lie hid; and therefore being served with this Writ, he must put in Security for his Appearance at the Day. And by this Writ, a Man being brought in, is committed to the Marshal of the *King's Bench*; in whose Custody when he is, he may be sued upon an Action in that Court.

LATITUDE of a Place, is an Arch of the Meridian of that Place, intercepted between its *Zenith* and the *Equator*: Or 'tis an Arch of the Meridian, intercepted between the *Pole* and the *Horizon*; and therefore called the *Poles Height*, &c. It's counted on the brazen Meridian on the Globes.

LATITUDE, in *Navigation*, is the Distance of a Ship from the Equinoctial, either North or South, and is counted on the Meridian: so that if a Ship sail towards the Equinoctial, she is said to *depress the Pole*; but if she sail from the Equinoctial, or from a lesser Latitude to a greater, she is said to *raise the Pole*: And whenever a Ship sails to or from the Equinoctial, either North or South, her Way gain'd thus is called her *Difference of Latitude*.

LATITUDE of a *Star* or *Planet*, is its Distance from the *Ecliptick*, being an Arch of a Circle of Longitude, reckoned from the *Ecliptick* towards its Poles.

LATITUDE *Heliocentrick* of a Planet : See *Heliocentrick*.

LATUS Rectum, a Term in Conicks, being the same with the Parameter; which see.

LATUS *Transversum* of the Hyperbola, is a Right Line lying between the Vertexes of the two *Opposite Sections*: Or that Part of the Common Axis which is between the Vertexes of the Upper and Lower Cone, as the Line *ED* in the following Figure; where also *dd* and *Ee* may be the *Parameters*, or *Latus Rectum*, belonging to the two opposite Sections *GLRO*, and *OEOR*.

To this *Latus Transversum* answers the longest Diameter in the *Ellipsis*, which *Apollonius* calls the *Transverse Axis* or Diameter.

LATUS *Primarium*, is a Right Line belonging to a Conick Section, drawn thro' the Vertex of the Section of the Cone, and within it; as the Line *EE* or *DD* in the preceding Figure.

LAVAMENTUM, the same with *Fobus*.

LAUDAUM, is meant only of a Medicine made of an *Opiate*, and that they call an *Opiate Laudanum*, from its excellent Qualities. 'Tis an Extract of the finer and purer Part of Opium, made with Water and Spirit of Wine, and then evaporated to its due Consistence: Of this there are many ways, but *Lemery's* seems the best: See his *Course of Chymistry*, last Edit, p. 618.

LAUNCH, in the Sea Phrase, is to put out: Thus they say, Launch a Ship out of the Dock, or out of the Key; Launch the Boat, Launch the David in or out; Launch our the Captain Bars. Also when they have hoisted up a Yard high enough, they say, in another Sense, Launch ho! that is, Hoist no more: Also in stowing any thing in the Hould of a Ship, they cry, Launch aft or Launch forward on: so when they are pumping, if the Pump sucks, they say Launch ho! that is, Pump no more.

LAWS of *Motion*: see *Motion*.

LAXATIVES, or *Loofening Medicines*, are those which, with their benign Particles, softning and scouring the Intestines, cleanse them of their Excrements.

LAY the Land, a Sea Phrase, which is used for sailing out of Sight of Land; for then they say, they have laid the Land: And if another Point of Land exclude the Sight of a former, they say, they have *sout* the first Land-in.

LEAP-YEAR, or *Bissextile*, is every fourth Year and so called from its *Leaping* a Day more that Year than in a Common Year: For in the Common Year any fixed Day of a Month changeth successively the Day of the Week; but in the *Leap-Year* it skips or *leaps* over one Day.

Note, The Common Year hath 365 Days in it, but the *Leap-Year* 366, and then *February* hath 29 Days, which in Common Years hath but 28.

To find the *Leap-Year* you have this Rule : 5

Divide by 4 ; what's left shall be,
For Leap-Year 0 ; for past, 1, 2, or 3.

H h h

Example:

Example.

In the Year 1701, what is it, a Common Year, or a Leap-Year.

4) 1701 (425

10

21

1 Remainder ; so that it is the First Year after the Leap-Year.

LEASE, in Law, signifies a Demise or Letting of Lands or Tenements, Right of Common, Rent, or any Hereditament unto another, for Term of Years or Life, for a Rent reserved ; and is either written, called a *Lease by Indenture*, or a *Lease Parol*. The Party that letteth this *Lease*, is called the *Lessor* ; and the Party to whom it is let, is the *Lessee* : And a *Lease* hath in it Six Points : 1. Words sufficient to import a Demise. 2. A *Lessee* named. 3. A Commencement from a Day certain. 4. A Term of Years. 5. A Determination. 6. A Reservation of Rent.

LEAVER : see *Lever*.

LEAVES, are the Notches of the Pinion of a Watch : see *Pinion*.

LEDGES in a Ship, are small Pieces of Timber lying athwart Ships, from the *Waste-Trees* to the *Roof-Trees*, which serve to bear up the *Nettings*, or the *Gratings* over the Half-Deck.

LEGACY, in Law, is a particular Thing given by a last Will and Testament : For if a Man transfer his whole Right or Estate upon another, that the *Civilians* call *Hereditary* ; and he to whom it is so transferred, they call *Heres* ; but in Common Law he is called *Heir* only, to whom all the Man's Lands and Hereditaments descend by Right of Blood : The former is *Heres factus*, the latter *Heres natus*.

LEE, a Word diversly used at Sea ; they mean generally by it, the Part opposite to the Wind : Thus the

LEE-Shore, is that on which the Wind blows ; and therefore to be under the Lee of the Shore, is to be close under the Weather-shore, or under Wind. When they say,

A-LEE the Helm, they mean, put the Helm to the Leeward side of the Ship. They say also, Take care of the

LEE-Latch, which is a Word of Command to the Man at the Helm, spoken by him that commands, or *Cons*, to take care that the Ship don't go to the Leeward of her Course : Wherefore they call a

LEEWARD Ship, one that is not fast by a Wind, or which doth not sail so near the Wind, nor make her Way so good as she should.

To lay a Ship by the Lee, or to come by the Lee, is to bring her so, that all her Sails may lie flat against her Masts and Shrouds, and that the Wind may come right upon her Broad-side. The way to do which, if all a Ship's Sails be abroad, is to bear up the Helm hard to Windward, to let rise the Fore-tack, veer the Main-sheet, and take in the Mizen-mast, or at least to peek it up ; which is called *Spelling the Mizen*.

LEE-FANG, is a Rope in a Ship, reeved into the *Crengles* of the Courses, when the Bottom of a Sail is to be haled in, that so the Bonnets may be laced on ; this Rope is also of use to take in the Sail,

LEET, and *Court-Leet*, is a Court out of the Sheriff's Turn, and inquires of all Offences under the Degree of High-Treason that are committed against the Crown and Dignity of the King. But those Offences which are to be punished with Loss of Life or Member, are only inquirable there, and to be certified over to the Justices of Assize.

LEETCH of a Sail, (aboard a Ship) signifies the outward Edge or Skirt of the Sail from the Earing to the Clew ; or rather the middle of the Sail between these two.

LEETCH-LINES, are small Ropes fastened to the Leetch of the Topails (only) and then reeved into a Block at the Yard, just by the Topail Ties. Their use is to hale in the Leetch of the Sail, when the Topails are to be taken in ; which is always first done, and then the Sail can be taken in with the greater Ease.

LEGAN : see *Flotson*.

LEGGS of the *Martnets*, is the Term for those small Ropes in a Ship, which are put thro' the Belt Ropes of the Main and Fore-sail, in the Leetch of each. They are above a Foot in Length, and at either End are spliced into themselves : They have also a small Eye, into which the *Martnets* are fastened by two Hitches, and the End is seized into the standing part of the *Martnets*.

LEGGS of a Triangle : When one side of a Triangle is taken as a Base, the other two are called *Leggs*.

LEGUMEN, in Botanicks, is that Species of Plants which we call Pulse ; and they are so named because they may be gathered by the Hand without cutting. Mr. Ray reckons all those Plants which have a *Papilionaceous*, or Butter-fly-like Flower, among the *Legumina*.

LEMMA, is a Term used chiefly by Geometrick Writers, and signifies a Proposition, which serves previously to prepare the way for the more easie Apprehension of the Demonstration of some Theorem, or for the Construction of some Problem. Thus to prove that a Pyramid is $\frac{1}{3}$ of a Prism or Parallelopiped of the same Base and Height with it, (the Demonstration of which, after *Euclid's* way, in Lines, is a little difficult to conceive) we may premise this Lemma ; which you will find proved under the Word *Progression*, That the Sum of a Series of the Squares of Numbers in Arithmetical Proportion, beginning from 0, and going on in the Natural Order ; as 0, 1, 4, 9, 16, 25, 36, &c. is always subtriple of the Sum of as many Terms equal to the greatest ; or, in other Words, is always $\frac{1}{3}$ of the greatest Term multiplied by the Number of the Terms.

Thus also to find the Inflection of a Curve Line, (if it hath any Inflection) this Lemma must be first premised, That a Tangent may be drawn to the given Curve in a given Point.

LENIENTIA, the same with *Laxantia*.

LENO and Linon, is that part of the Brain called *Torcular Herophili*, that Place where the third Cavity of the *Dura Meninx* is joined to the first, second, and fourth.

LENS, is a Term in Opticks for a small Convex, or Plano-Convex, a Concave, or Concavo-Convex Glass.

LENTA *Febris*, the slow or lingering Fever, is usually reckoned among the *Symptomatical*, and proceeds from some hidden Putrefaction sticking to some Bowel, so that its Substance is almost corrupted. Such a kind of Fever is often bred in the Consumption of the Lungs, and degenerates into an *Hætick*. *Blanchard*.

LENTI.

LENTIFORME *Prominences* : See *Corpora Striata*.

LENTIGINES, are what we call *Freckles*.

LEO, is the Fifth of the Twelve Signs of the *Zodiac*.

LEPIDOIDES, is the Scaly Suture of the Skull : See also *Mendosa*.

LEPRA *Arabum*, the same with *Elephantiasis Græcorum*.

LEPROSIE, is a dry Scab, whereby the Skin becomes scaly like Fish : It differs from *Leuce* and *Alphus*, in that a *Leprosie* is rough to the Touch, and causes an Itching ; for the Skin is the only Part affected, and therefore that being flead off, the Flesh underneath appears found and well.

LEPROSO *Amovendo*, is a Writ that lies for a Parish, to remove a Leper or Lazar, that thrusteth himself into the Company of his Neighbours, either in Church or in other Publick Meetings, to their Annoyance or Disturbance.

LEPTUNTICA, are attenuating cutting Medicines, which part or cut the crofs and viscous Humours with their acute Particles.

LEPUS, the *Hare*, a Southern Constellation, containing 13 Stars.

LESSER *Circles of the Sphere*, are those whose Planes do not pass through the Center of the Sphere ; and which do not divide the Globe into two equal Parts, but are parallel to *Greater Circles* : As the Tropicks and Polar Circles, and all Parallels of Declination and Altitude ; which latter being parallel to the Horizon, are called *Almacanters*.

LESSOR and *Lessee*, are Terms of the Common Law : The *Lessor*, is he that Leaseth our Lands or Tenements to another for Term of Life, for Years, or at Will : And the Person to whom such a Lease is made, is called the *Lessee*.

LETHARGUS, a *Lethargy*, is a Disease causing an heavy Sleep, like that Distemper called *Coma*, but accompanied with a Fever and a *Delirium* ; and is supposed to be an Heap of too much or incongruous moist Matter within the Pores of the *Cortical Substance* of the Brain. This Distemper does not seem to come of it self, but rather from the Demigration of Fevers.

LETTERS Patent, are Writings sealed with the Great Seal of *England*, whereby a Man is authorized to do or enjoy any thing that otherwise of himself he could not. And they are so termed of their Form, because they be open, with the Seal affixed, ready to be shewed for Confirmation of the Authority given by them. Common Persons may grant *Letters Patents* ; but they are rather call'd *Patents*, than *Letters Patents* to make *Denizens* ; yet for Difference sake, those granted by the King are called *Letters Patent Royal*.

LETTER of Attorney, is a Writing authorizing an *Attorney* ; that is, a Man appropriated to do a lawful Act in our stead : As a *Letter of Attorney* to give Seisin of Lands, to receive Debts, to sue a Third Person, &c.

LETT-FALL, the Word at Sea for putting out a Sail when the Yards are aloft, and the Sail is to come down from the Yard ; but when the Yards are stricken down, then the Sail is loosed below, before they hoist the Yard. Neither is it properly said of *Top-sails*, because they lie on the Top ; and therefore the Word for them is, *Heave out your Top-sails*. Nor can it be applied to the *Mizzen* ; for to it the Word is, *Strike the Mizzen*, and set it. So that in Strictness it belongs only to the *Main-sail*, *Fore-sail*, and *Sprit-sail*, when their Yards are hoisted up aloft.

LEVANT and *Couchant*, is when Cattel have been so long in another Man's Ground, that they have lain down, and are risen again to feed.

LEVARI Facias, is a Writ directed to the Sheriff, for levying of a Sum of Money upon Lands and Tenements of him that hath forfeited a Recognizance.

LEVARI Facias damna de disseisitoribus, is a Writ directed to the Sheriff, for the levying of Damages, wherein the *Disseisor* hath formerly been condemned to the *Disseissee*.

LEVARI Facias residuum debiti, is a Writ directed to the Sheriff, for the levying the Remnant of a Debt upon Lands and Tenements, or Chattels of the Debtor that hath in part satisfied before.

LEVARI Facias, quando vicecomes returnavit quod non habuit emptores, is a Writ commanding the Sheriff to sell the Goods of the Debtor which he hath already taken, and returned that he could not sell them, and as much more of the Debtor's Goods as will satisfy the whole Debt.

LEVATORES Ani, are Muscles, which arise fleshy from each side of the *Os Pubis*, internally within the *Pelvis*, as also from part of the *Os Ischium* and *Sacrum* : From these Places, like Lines drawn from a Circumference towards a Center, its Fibres descend over the *Musculi Mafsupiales* to their Implantation at the lower end of the *Intestinum Rectum* in the *Anus*. The Use of these Muscles is chiefly to suspend and draw the *Anus* upwards, lest the *Feces* should be burthenfom to the *Sphincter*.

LEVATOR Scapulae, is a Muscle of the Shoulder-Blade, by some called *Levator Patientie*, because we make use of it in large Inspirations, in order to expire ; as when we sigh (as they call it.) This lies immediately under the *Cucullaris*, arising by so many separate Originations from the Second, Third, Fourth, and Fifth Transverse Processes of the *Vertebrae* of the Neck ; which uniting into one large fleshy Body, descends obliquely to its Insertion at the superior Angle of the *Scapula* : Its Name declares its Office.

LEUCE, is a Cutaneous Disease, when the Hairs, Skin, and sometimes the Flesh underneath, turns white ; the Flesh being pricked with a Needle, is not sensible, nor emits Blood, but a Milky Humour. It differs from *Alphus*, in that it penetrates deeper, and changes the Skin, so that the Hairs are changed too.

LEUCOMA, is a White Scar in the Horny Tunick of the Eye ; the same with *Albugo*.

LEUCOPHLEGMATIA, is a pituitous Dropsy, or a Dropsy that seizes the whole Body ; which in the Beginning is called *Cachexia*, and differs from it only in Degree.

LEVEL of Carpenters, is an Instrument made of a long piece of Wood at bottom, and with an upright one to hold a Thread and Plummer, which plays about a perpendicular Line there drawn ; and when it falls exactly on it, then is the bottom piece in a true Level, or Horizontal Position.

LEVEL, is an Instrument made of Wood or Brass, with two Sights and a Glass, almost filled with coloured Spirit of Wine, but so as to leave room for a Bubble of Air to play up and down in it : It hath a Cover, divided into several equal Parts, whereby to adjust the Bubble ; with a Spring to fit it to the Three-legg'd Staff, and a long Screw, to rectify the Bubble by the Help of a Plummer that hangs on one of the Sights. Sometimes, instead of the long Screw and Spring, there is fitted a Rack, being two Semi-circles at Right Angles, with a Thread or Worm upon two endless Screws ; which,

with a Key, readily brings the Instrument to a true *Level*; and sometimes to help the Sight, there is added a *Telescope*. There also belongs to this Instrument two of more *Station-Staves*; and it is used by *Engineers, Surveyors, &c.* to find the true *Level* for conveying Water to supply Towns, making Rivers Navigable, draining Bogs, &c. See Vol. II.

LEVER, is the second *Mechanical Power*; and so considered, is only a *Balance* supported by a *Hypomochlion*; only the Center is not in the Middle; as it is in the common *Balance*, but near one End; for which Reason 'tis used to elevate or raise a great Weight; whence comes the Name *Lever*.

LEVIGATION, in Chymistry, is the *grinding* any hard Matter to a very fine, or as they say, an impalpable Powder upon a Marble, as the Painters grind their Colours.

LEVITY, is the Diminution or Want of Weight in any Body, when compared with another that is heavier; and in this Sense is opposed to *Gravity*. The Schools maintain there is no such thing as *Positive* or *Absolute Levity*; and this they would have to be the Cause of the Emergence of Bodies lighter in Specie than Water, up to the Surface of that Liquor. But besides that, the common Sense of Mankind discovers *Gravity* and *Levity* to be only Relative and Comparative Things; the Honourable Mr. Boyle hath by many Experiments shewn, That the rising of Bodies from the Bottom to the Surface of Water, if lighter specifically than it, is by no means solvable nor accountable by any such Notion as that of *Positive Levity*, but exactly agreeable to the Laws of the *Hydrostaticks*: See his *New Experiments about the Positive or Relative Levity of Bodies, and Hydrost. Paradoxes*.

LIBEL, signifies the Original Declaration of any Action in the Civil Law; as also a Criminous Report of any Man cast abroad, or otherwise unlawfully publish'd, and then called *Famofus Libellus*; and this is either *In Scriptis*, or *Sine Scriptis*: *In Scriptis*, is when an Epigram, or other Writing, is composed or publish'd to another's Disgrace, which may be done *Verbis aut Cantilenis*; as where this maliciously repeated or sung in the Prefence of others; or else *Traditione*, when the *Libel*, or any Copy of it, is delivered out to scandalize the Party. *Famofus Libellus sine Scriptis*, may be two-fold: 1. *Picturis*, as to paint the Party in a shameful and ignominious manner; Or, 2. *Signis*, as to fix a Gallows, or other ignominious Sign, at the Door of the Party, or elsewhere.

LIBELLO habendo: See *Copia Libelli deliberanda*.

LIBERA Chacea habenda, is a Writ Judicial, granted to a Man for a free Chace belonging to his Mannor, after he hath by a Jury proved it to belong to him.

LIBERTATE, is a Writ issuing out of the Chancery to the Treasurer, Chamberlains, or Barons of the Exchequer, or Clerks of the Hamper, &c. for the Payment of any Annual Pension, or other Sums granted under the Great Seal: Or sometimes to the Sheriff, &c. for the Delivery of any Lands or Goods taken upon Forfeits of Recognizance. It lies also to a Gaoler, for the Delivery of a Prisoner that hath put in Bail for his Appearance.

LIBERTATIBUS Allocandis, is a Writ that lies for a Citizen or Burgess of any City or Borough, that contrary to the *Liberities* of the City or Town whereof he is, is impeaded before the King's Justices, or Justices Errant, or Justice of the Forest, &c. to have his Privilege allowed.

LIBERTATIBUS Exigendis in Itinere, is a Writ

whereby the King willeth the Justices in Eyre to admit of an Attorney for the Defence of another Man's *Liberty* before them.

LIBERTY, is the Power a Man hath to do, or forbear doing, any particular Action, according as its Doing or Forbearance has the actual Preference in the Mind; which is the same thing as to say, according as he himself wills it.

LIBRA, one of the Twelve Signs of the *Zodiack*, being exactly opposite to *Aries*.

LIBRATION of the Moon, (see *Evection*) is of three Kinds:

1. Her *Libration in Longitude*; which is a Motion arising from the Plane of that Meridian of the Moon, (which is always, nearly, turned towards us) being directed not to the Earth, but towards the other Focus of the Moon's Elliptical Orbit; and so to an Eye on the Earth she seems to librate to and again in Longitude, or according to the Order of the Signs in the *Zodiack*. This *Libration* is of no Quantity twice in each Periodical Month; viz. when the Moon is in her Apogee, and in her Perigee; for the Plane of her Meridian abovementioned, is directed alike to both the Foci.

2. Her *Libration in Latitude*; which arises hence, That her Axis not being perpendicular to the Plane of her Orbit, but inclined to it, sometimes one of her Poles, and sometimes the other, will nod (as they call it) or dip a little towards the Earth; (as is the Case of the Poles of the Earth towards the Sun) and consequently she will appear to librate a little, and to shew sometimes more of her Spots, and sometimes less of them, towards each Pole: Which *Libration* depending on the Position of the Moon, in respect of the Nodes of her Orbit with the Ecliptick, (and her Axis being perpendicular nearly to the Plane of the Ecliptick) is very properly said to be in *Latitude*.

And this is completed in the Space of the Moon's Periodical Month; or rather while the Moon is returning again to the same Position, in respect of her Nodes.

3. There is also a *Third kind of Libration*, by which it happens, that though another Part of her is not really obverted to the Earth, as in the former *Librations*, yet another is illuminated by the Sun: For since her Axis is perpendicular nearly to the Plane of the Ecliptick, when the Moon is most Southerly, in respect of the Ecliptick North Pole; some Parts nearly adjacent to it will be illuminated by the Sun; while, on the contrary, the South Pole will be in darkness. In this Case therefore, if it happen that the Sun be in the same Line with the Moon's Southern Limit; then will she, as she proceeds from Conjunction with the Sun towards her ascending Node, appear to dip her Northern Polar Parts a little into the dark Hemisphere, and to raise her Southern Polar Parts as much into the Light; and the contrary to this will happen the next Fortnight, while the New Moon is descending from her Northern Limit; for then her Northern Polar Parts will appear to emerge out of Darkness, and the Southern Polar Parts to dip into it. And this *seeming Libration*, or rather these Effects of the former *Libration in Latitude*, depending upon the Light of the Sun, will be completed in her Synodical Month. Greg. Astron. Lib. 4. Sect. 10.

LICENSE to arise, is a Liberty given by the Court to a Tenant that is Efloined *de malo lecti* in a real Action: For the Law is, That in this Case he may not arise out of his Bed, or at least go out of his Chamber, until he have been viewed by Knights thereunto appointed, and have a Day assigned him

to appear : And the Reason of this is, That it may appear whether he caused himself to be Effoined deceitfully, or not ; and therefore if the Demondant can prove that he was teen abroad before the View or *License* of the Court, he shall be adjudged to be deceitfully Effoined, and to have made Default.

LICENTIA Surgendi, is a Writ whereby the Tenant Effoined *de malo lecti*, obtaineth Liberty to rise.

LICHEN, barbarously called by some *Serpigo* or *Zerma* : *Hallibabbus* calls it *Petigo* and *Sarpedo* ; the *Vulgar Voliaticita*. *Lichens* are certain Asperities of the Skin, and as it were Tumours, which itch much, and send forth Matter. The *Greeks* and *Arabians* have made two sorts of *Lichens* ; the one mild and gentle, the other fierce and cruel : And according to *Avicen*, some are moist ; which being rubbed, send forth a kind of Dew ; others are dry : And the Moist are more safe ; but the Dry is made of salt pituitous Matter, turn'd into Melancholy Blood. And again he writes, That one *Impetigo* brings off the Skin, by reason of its great Dryness, and another does not ; and that one is Ambulatory and Malignant, and another Fixed and Standing ; as also one is Old, another Fresh. Hence it appears, That the *Scabies* of *Corn*. *Celsus* was nothing but these *Lichens* of the *Greeks*, and the *Impetigo*, of the *Arabians*. It comes in any Part of the Body but especially in the Face and Chin, as *Galen* has it : For a *Lichen*, says he, is a most ungrateful Distemper in the Chin, because, it makes it itch exceedingly, and stretches out the Parts affected : It is not a little dangerous ; it spreads over the whole Face, and sometimes reaches the Eyes, and at last makes the Person affected extream filthy and loathsome. *Blanchard*.

LICHEN of the *Greeks*, is *Pliny's Impetigo*, or an Inequality of the Skin, extending it self to the neighbouring Parts, and accompanied with an extraordinary Itching, and dry Pimples. *Blanchard*.

LIE under the Sea : The Sailors say a Ship lies under the Sea, when her Helm being made fast *a-Lee*, she lies to *a-Hull*, that the Sea breaks upon her Bow, or her Broad-side.

LIEGE, is a Word borrowed from the *Feudists*, and hath two several Significations in the Common Law, sometimes being used for *Liege-Lord*, and sometimes for *Liege-Man*. *Liege-Lord*, is he that acknowledgeth no Superior ; *Liege-Man*, is he that oweth Allegiance to his *Liege-Lord*.

LIEN, the same with *Spleen* ; which see.

LIENTERIA, is a kind of Looseness, where the Meat or Aliment taken in, is sent out of the Body before it be altered, or at least before it be digested.

LIFE-RENT, in Law, is a Rent or Exhibition which a Man receives, either for Term of Life, or for Sustentation of Life.

LIFTING-PIECES, are Parts of a Clock which do lift up and unlock the Detents in the Clock-part.

LIFTS, are Ropes in a Ship belonging to the Yard-arms of all Yards : And their Use is to *Top the Yard-arms*, i. e. to make the Ends of the Yards hang higher or lower, as Occasion serves. The *Top-sail Lifts* do serve as *Sheats* for the Top-gallant Yards, as well as for *Lifts* to the Top-sail Yards. The Haling of these Ropes is called *Topping the Lifts* : Thus they say, *Top a Starboard*, or *Top a Port* ; i. e. hale upon the *Starboard* or *Larboard-Lift*.

The *Lifts* for the Sprit-sail Yard, they call *Standing-Lifts*.

LIGAMENTUM : A *Ligament* is a solid and very fibrous Part of an Animal Body, proceeding almost from Matter like a *Cartilage*, different in Size, Number and Situation, broad and round, cold ; as it comes near the Constitution of a Membrane or a *Cartilage*, drier or moister, harder or softer, more or less, tough and flexible. Its Use is to connect the Parts, especially Bones, that they may better perform their Motions. Those which tie the Bones together are wholly insensible, and the others have but a dull Sense.

LIGAMENTUM Ciliare : See *Ciliare Ligamentum*.

LIGEANCY, is such a Duty or Fealty as no Man may owe to more than one Lord ; and therefore it is most commonly used for the Duty and Allegiance which every good Subject owes to his *Liege-Lord* the King.

Ligeantia, says my Lord *Coke*, est duplex, sicut subditus tenetur Regi ad Obedientiam, ita Rex tenetur subdito ad Protectionem : And in another Place, Duplex est Ligamen inter Regem & populum, &c. Vid. 7 Rep. *Calvin's Case*.— Which Passages some will have to be an express Authority in Law, to prove the Original Contract between the King of England and the People.

LIGHT, is used to signify Three Things :

1. That Sensation which arises in us from the View of any Luminous Object, as the Sun, a Star, or a Candle.

2. *Light* signifies the Cause of that Sensation in us, as it is an Action or Property existing in the Luminous Body.

3. By this Word some also understand the Action of the Medium interposed between us and the Luminous Object ; and others, That Train of Rays, which coming forth from thence, pervades the Medium before it can come to affect our Eyes.

Light is undoubtedly produced by Motion, but yet 'tis not every Motion that will produce *Light*. The Learned Dr. H. in his *Micrography*, P. 55. judges the Motion that produces *Light* ought to have these Requisites : 1. That it be exceeding quick, like the Motions of Fermentation and Putrefaction ; (as you see in shining Pickles and rotten Wood.) 2. It must be a Vibrative Motion, and also have its Vibrations exceeding short : This he concludes from the shining of Diamonds, when chafed or rubbed.

As to the Trajection of *Light* through the Medium, the most freely that can be, he well observes,

1. That the Medium must be susceptible and impartible of this Motion. 2. That the Parts of it must be Homogeneous. 3. That their Constitution be such, that *Light* may be propagated through them as soon as possible : Though he asserts, That it can by no Means be Instantaneous ; and seems (so long ago) fully satisfied, That *Light* requires much the same Time for its Trajection, as Mr. *Romer* found it afterwards to do by the Eclipses of *Jupiter's* Satellites : See *Philos. Trans.* N. 136. P. 198.

The Incomparable Sir *Isaac Newton* allows, with other Astronomers, about 10 Minutes of an Hour for the Motion of a Ray of *Light* from the Sun to the Earth. *Princip.* P. 231.

He found also, by plain and repeated Experiments, That the Rays of *Light* being in the Air, and passing near or through the Edges of any opacous or transparent Body, (such as Pieces of Gold or Silver Coin, or square Pieces of those Metals ; the

the Edges of Knives, or of broken Glafs, &c.) are always bent or incurvated towards such Bodies, as if they were attracted by them; and of these, those Rays which pass nearest the Edges, are most incurvated.

And from hence it will follow, That the Refraction of the Rays of *Light*, (especially of those which fall near the Edges of Bodies) is not made just at the Point of Incidence, but a little before the Rays enter into the denser Medium, and a little after they are gotten within it.

The same Person found also by curious Experiments made with *Prisms*, That the vividly coloured Image, transmitted through a Hole, in a darkened Room, opposite to the Sun-beams, and cast on a white Wall, was five times as long as it was broad: This strange Disproportion between the Length and Breadth of the coloured Spectrum put him upon several Thoughts; but at last he thought of this *Experimentum Crucis*: He took two Boards, and placed one close behind the Prism at the Window, so that the *Light* passing through a small Hole purposely made in it, might fall on another Board placed nearer the Wall, at about 12 Foot Distance from the former; and having also a small Hole in it too, for some of the incident *Light* to pass thro'. Behind this Board he placed a second Prism, that the Rays passing through it and the two Holes in the Boards, might be again refracted before it came to the Wall. Then he turned the first Prism at the Window slowly about its Axis, so as to make the several Parts of the Image cast on the second Board successively pass through the Hole in it, that so he might observe to what Places on the Wall the second Prism would refract them. And then he saw plainly, by the Variation of those Places, that the *Light* tending to that End of the Image towards which the Refraction of the first Prism was made, did in the second Prism suffer a Refraction considerably, the *Light* tending to the other End. And so the true Cause of the Length of that Image was detected to be no other, than that *Light* consists of Rays differently refrangible; which, without respect to any Difference in their Incidence, were according to their Degrees of Refrangibility transmitted towards divers Parts of the Wall. From whence he justly concluded, That *Light* it self was an Heterogeneous Mixture of differently Refrangible Rays. *Philosophical Transactions*, N. 80.

He demonstrates also, That since *Light* is always propagated in Right Lines, it cannot possibly consist in Action only, (*Prop. 41, 42. Lib. Princip. Phil. Mathem.*) as the *Cartesians* do assert.

In another Place of the *Transactions* he gives the following Definitions and Propositions.

DEFINITIONS.

1. *Homogeneous, Similar, or Uniform Light*, is that whose Rays are equally refrangible.

2. *Heterogeneous Light*, is that whose Rays are unequally refrangible.

Note, There are but Three Affections of *Light* in which he observed its Rays to differ; viz. *Refrangibility, Reflexibility, and Colour*: And those Rays which agree in *Refrangibility*, agree also in the other two; and therefore may well be defined *Homogeneous*, especially since Men usually call those things *Homogeneous*, which are so in all other Qualities that come under their Knowledge; though in other Qualities their Knowledge extends not to, there may possibly be some *Heterogeneity*.

3. Those Colours he calls *Simple or Homogeneous*, which are exhibited by *Homogeneous Light*.

4. And those Compound or *Heterogeneous*, which are exhibited by *Heterogeneous Light*.

5. Different Colours he calls not only the more eminent Species, Red, Yellow, Green, Blue, Purple, but all other the minutest Gradations; much after the same manner, that not only the more eminent Degree in Musick, but all the least Gradations are esteem'd different Sounds.

PROPOSITIONS.

1. The Sun's *Light* consists of Rays differing by indefinite Degrees of Refrangibility.

2. Rays which differ in Refrangibility, when parted from one another, do proportionably differ in the Colours which they exhibit. These two Propositions are Matter of Fact.

3. There are as many Simple or Homogeneous Colours, as Degrees of Refrangibility; for to every Degree of Refrangibility belongs a different Colour, by *Prop. 2*. And that Colour is Simple, by *Def. 1*, and 3.

4. Whiteness, in all respects like that of the Sun's immediate *Light*, and of the usual Objects of our Senses, cannot be compounded of two simple Colours alone; for such a Composition must be made by Rays that have only two Degrees of Refrangibility, by *Def. 1*, and 3. And therefore it cannot be like that of the Sun's *Light*, by *Prop. 1*. Nor for the same Reason, like that of ordinary White Objects.

5. Whiteness, in all respects like that of the Sun's immediate *Light*, cannot be compounded of Simple Colours, without an indefinite Variety of them: For to such a Composition there are required Rays endowed with all the indefinite Degrees of Refrangibility, by *Prop. 1*. And those infer as many Simple Colours, by *Def. 1*, and 3, and *Prop. 2*, and 3.

6. The Rays of *Light* do not act on one another, in passing through the same Medium.

7. The Rays of *Light* suffer not any Change of their Qualities from Refraction.

8. Nor afterwards from the adjacent quiet Medium. These two Propositions are manifest de facto in *Homogeneous Light*, whose Colour and Refrangibility is not at all changeable, either by Refraction, or by Contamination of the quiet Medium.

And as for *Heterogeneous Light*, it is but an Aggregate of several sorts of *Homogeneous Light*; no one sort of which suffers any more Alteration than if it were alone, because the Rays act not upon one another, by *Prop. 6*. and therefore the Aggregate can suffer none.

9. There can no *Homogeneous Colours* be reduced out of *Light* by Refraction, which are not commixt in it before; because, by *Prop. 7*, and 8. Refraction can change not the Qualities of the Rays, but only separates those which have divers Qualities, by means of their different Refrangibility.

10. The Sun's *Light* is an Aggregate of an indefinite Variety of *Homogeneous Colours*, by *Prop. 1*, 3, and 9. And hence it is, that *Homogeneous Colours* may be called Primitive or Original.

That *Light* is a Body, *M. Molyneux*, in his *Dioptricks*, proves from the various Properties of it; As,

1. By the Affection of its being Refracted, 'tis manifest, that *Light*, in its Passage through this and other Diaphanous Body, does find a different Resistance. Now 'tis unconceivable how any thing but Body should suffer Resistance; but we may conceive

ceive the Resistance that *Light* suffers in its Passage through different Diaphanous Bodies to proceed from the Medium hindering the *Diffusion* or *Distribution* of *Light* through more of the Parts of this Medium, and consequently it may be said to be *less illuminable*: For from the Nature of it, *Light* endeavours to *diffuse* it self: And the contrary, by how much *Light* does more equally or uniformly affect the Parts of the Medium, which it enlightens; or by how much it communicates its *Energy* to more of the *Particles* of the enlightened *Space*, that Medium may be said to be by so much the more *illuminable*, or *less to resist* the Progress of *Light*. Whence it is, that by how much the affected Parts of the Medium are *more solia* and *small*, and admit between them the *less Space* for any other *Heterogeneous* Matter that suffers not by *Light*, by so much the Medium is said to be more enlightened.

And 'tis certain, That *Resistance* must proceed from the *Contact* of two *Bodies*; and *Contact*, either *Active* or *Passive*, belongs only to *Body*.

The Second Property that confirms *Light* to be a *Body*, and a *Body* moved: or thrust forward, is, That it requires *Time* to pass from one Place to another, and does it not in an *Instant*, but is only of all *Motions* the *quickest*: For Mr. *Romer* has demonstrated, beyond all Contradiction, from the Observations of the *Immersions* and *Emersions* of the *Satellites* of *Jupiter*, That *Light* requires the *Time* of one *Second* to move the *Space* of 3000 *Leagues*, or 9000 *Miles*, which is near the *Earth's Diameter*; as may be seen in the *Journal des Savans*, 1676. Decemb. 7. *Philosophical Transactions*, Num. 136. Or Sir *Isaac Newton's Philos. Natur. Math. Lib. 1. Schol. Prop. 96.* where 'tis asserted, That *Light* requires about 10 Minutes *Time* to come from the *Sun* to the *Earth*: And 'tis most evident, without this Allowance for the *Time* spent in *Light's* Motion, the Appearances of the *Satellites*, *Eclipses*, and *Emersions*, are not to be explicated by any *Excentricity*, or other Hypothesis.

A Third Proof that *Light* is a *Body*, is, That it cannot by any Art or Contrivance whatsoever, be *increas'd* or *diminish'd*; that is to say, we cannot magnify (for Instance) the *Light* of the *Sun*, or a *Candle*, no more than we can magnify a Cubick Inch of *Gold*, or make it more than a Cubick Inch: For whenever we see *Light* increased, 'tis by robbing some other Part of the Medium of its *Light*, or by bringing the *Light* that naturally should have been diffused through some other Part, to the more enlightened Place: Thus, for Instance, in a Burning-Glass, by which the *Light* of the *Sun* is highly increased in its *Focus*, or Burning-Point, we are first to consider, That in this *Focus* the Image of the *Sun* is projected, as being the *distinct* Base of the Glass: And Secondly. We may observe all round about this bright Spot of the *Sun's* Image, there is cast the strong Shadow of the whole Breadth of the Burning-Glass: For all the Rays from the *Sun*, that would have fallen on this broad shaded Space, are now brought together, and crowded close in this bright Spot, there raising a vigorous *Light* and violent Heat.

This is abundantly confirmed by an easy Experiment: For cover all the Burning-Glass, except one small round Space in its Middle, just the Bigness of the bright burning Spot in its *Focus*; and though there be a shaded Space round the bright Speck, as before, yet we shall not be sensible of any Increase either of *Light* or Heat; which plainly shews, That this Increase of *Light* (when the Glass is all bare (proceeds from the crowding together of those

Rays that would have fallen on the rest of the Glass, and which (were not the Glass interposed) would have fallen on the shaded Space round about the bright Speck.

There seems but one Objection against what is here laid down; and that is, That *Light* is increased by Reflexion, without depriving any Place of the *Light* it would otherwise receive; or without bringing to the enlightened Part any *Light* that would otherwise escape it, or never come at it. But if we consider the Matter more attentively, we shall find it otherwise: For suppose an Hole of a Foot Square in the Side of a Chamber, and that a Candle were placed close to, and just before the Middle of this Hole; there is but half this Candle that now enlightens this Room, the other half of its Rays proceeding directly out at the Hole: Let now a Looking-Glass be placed so, as just to fill up this Hole; the Rays which before would have gone out at the Hole, are now reflected into the Room; so that the Hemisphere without the Chamber, which was enlightened whilst the Hole continued open, is now robbed of its *Light*; and all this *Light* is now reflected into its Room, whereby the *averse* Side of the Flame is made to enlighten, as well as the Side directly exposed to the Chamber. What is said of this Case, may be accommodated to all: For so a Looking-Glass lying horizontally, and reflecting the Sun-beams to the Ceiling of the Room, does plainly hinder the direct Progress of the Rays to some other Part, and consequently robs that Part of its *Light*. This is evident, by supposing an Hole behind the Glass, as in the former Case.

From whence 'tis manifest, how vainly they attempt, who offer at increasing *Light* uniformly, that is, equally throughout the whole Sphere of a Luminous Body, or Radiating Point: Such are the Pretences of those that would persuade the World of Contrivances for making the small Flame of a Lamp enlighten strongly a whole Chappel, Hall, or Court, by being hung up in the midst thereof: For these things are impossible to be effected in Nature, and they had as well pretend to create *Light*; for there is no other way of increasing it, unless by robbing another Place of its *Light*, and then 'tis not uniformly increased. We have a very sensible Instance of this in the new-invented Lanthorns, now much used in London, which, by the Convex-Glasses in their Sides, do strongly throw those Rays along the Walks of the Passengers, which, would otherwise (were the Glasses away, and the round Holes left open) be spent on Parts of the Streets not frequented; whereby the untrodden Parts of the Streets are robbed of their *Light*, more strongly to supply and enlighten the Paths where the *Light* is requisite.

The Intenfness of *Light* (as also of Heat) is always proportionable to the Density of the Rays that produce it: And that Density always is in all Places, or at all Distances from the Center of Radiation, as the Squares of such Distances reciprocally: See *Quality*.

In the French Memoirs of the Royal Academy of Sciences, there is an Account of a New Theory of *Light*, which is started by M. *Malebranche*: He thinks *Light* and Colours do arise from Vibrations of the insensible Parts of Bodies, as Sounds do: And therefore, according to the Degree of the Rapidity of the Motion of the Parts of a Luminous Body, it will appear enlightened more or less; and in lesser Degrees of such vibrating Motion, it will appear not Luminous, but of such and such Colours: see Vol. II.

LIKE *Quantities*, in *Algebra*, are such as are expressed by the same Letters equally repeated in each Quantity. Thus $2b$ and $3b$, and $9ff$ and $3ff$, are like *Quantities*; but $2b$ and $3bb$, and $9ff$ and $3fff$, are unlike ones; because the Quantities have not every where the same Dimensions; nor are the Letters equally repeated.

LIKE *Signs*, in *Algebra*, are when both are Affirmative, or both Negative; but if one be Affirmative, and the other Negative, they are unlike *Signs*. Thus $+64d$ and $+5d$ have like *Signs*; but $9ff$ and $-7ff$ have unlike *Signs*.

LIKE *Figures*, in *Geometry*, are such as have their Angles equal, and the Sides about these equal Angles proportional.

LIKE *Arks*, in the Projection of the Sphere in *Plano*, are Parts of Lesser Circles, containing an equal Number of Degrees with the corresponding Arks of Greater ones.

LIKE *Solid Figures*, in *Geometry*, are such as are contained under like Planes, equal in Number.

LIMBER *Holes*, in a Ship, are little square Holes cut in the Bottom of all her Ground-timber and Hooks, about 3 or 4 Inches square: Their Use is to let the Water to the Well of the Pump, which else would rest between those Timbers where the Keel-Rode runs.

LIMB, signifies the outermost Border or graduated Edge of an *Astrolabe*, or the like Mathematical Instrument; or the Circumference of the primitive Circle in any Projection of the Sphere in *Plano*: Also the outermost Border of the Sun's or Moon's Disk in an Eclipse of either Luminary.

LIMIT of a Planet, is the greatest Heliocentrick Latitude; which see.

LIMITATION of *Affize*, is a certain Time set down by Statute, wherein a Man must alledge himself, or his Ancestor, to have been seized of Lands, sued for by a Writ of *Affize*.

LIMITED *Problem*, (for so I translate Mr. Ozanam's Word *Ordonne*) signifies a Problem that hath but one only Solution, or which can be done but one only way; as to make a Circle pass thro' 3 Points given, not lying in a Right Line; to describe an Equilateral Triangle on a Line given.

LINCH *Pins*, are those Pins that keep on the Trucks or Wheels on the Carriage of a Piece of Ordnance.

LINCTUS, the same with *Eclegma*; which see.

LINE: A Line in *Geometry*, is a Quantity extended in Length only, and is supposed to have no Breadth or Thickness. It is made by the Motion of a Point; as, if the Point *A* be moved towards *B*,

it will by its Motion trace out or describe a Line; which, if it go the nearest way between *A* and *B*, will be a Right or Straight Line, whose Definition therefore will be the nearest or shortest Distance between any two Points. But if the Point go any way about, as in any of the Lines *ACB*, then it will trace out either a Crooked Line, as the upper *ACB*; or else two or more Straight ones, as in the lower *ACB*.

From which Genesis or Production of a Line, several Consequences will fairly follow; some of which are needless Propositions in *Euclid*.

1. Two Right Lines cannot include a Space; but if drawn from the same Point to the same Point, will always be coincident; and drawn any how else, can only meet and make an Angle, but can never bound or terminate a Space. *Axiom*. 14. 1 *Euclid*.

2. In any Triangle, as *ACB*, any two sides, as *AC* and *CB* taken together, are longer than the third *AB*; because *AB* is the shortest Distance between the two Points *A* and *B*. 20. 1 *Euclid*.

3. A Tangent (or Line touching the Circumference of a Circle) can touch it but in one Point; and consequently will be all of it without the Circle. 16. 3. *Euclid*.

4. A Right Line drawn between any two Points in the Circumference of a Circle, falls all within the Circle. 2. 3. *Euclid*.

LINE of Measures, so Mr. Oughtred calls the Diameter of the primitive Circle in the Projection of the Sphere in *Plano*; or that Line in which the Diameter of any Circle to be projected falls.

LINE of Numbers, is a Line so called by its Inventor Mr. Gunter, and therefore frequently called Gunter's Line. This is usually placed on a Ruler, or the Back of a Sector; and running parallel with it, you have the Artificial Lines, as we usually call them.

LINES and their Properties; see Vol. II.

The Second Book of *Euclid* treats mostly of Lines, and of the Effects of their being divided, and then multiplied into one another; as also do the first Six Propositions of Book the 13th. The former of which you have here very briefly demonstrated Algebraically.

1. If there be two Lines z and x ; one of which, as z , is divided into any Number of Parts, as into $a + c + i + o$, the Rectangle under the two whole Lines zx , is equal to the Sum of all the Rectangles made by x multiplied into the Parts of z .

$$\begin{array}{c} z | \frac{a}{\quad} | \frac{c}{\quad} | \frac{i}{\quad} | \frac{o}{\quad} | \\ x | \frac{a}{\quad} | \frac{c}{\quad} | \frac{i}{\quad} | \frac{o}{\quad} | \end{array}$$

That is $zx = xa + xc + xi + xo$. This is to plain, it needs no Proof.

2. If a Right Line, as z , be divided into two Parts $a + c$, the Rectangles made by the whole Line, and both its Parts are equal to the Square of the whole Line: see Fig. 2.

That is, $za + zc = zz$.

For $za = aa + ac$.

And $zc = ac + cc$.

Therefore $zz = aa + zc + cc$. Q. E. D.

3. Let the Line z be cut into $a + c$; then shall the Rectangle under the whole Line (z) and the Part (a) be equal to the Square of that Part a , together with the Rectangle made by the two Parts a and c .

That is, $za = aa + ac$.

$$z \frac{a}{\quad} \frac{c}{\quad}$$

For $z = a + c$

And $a + c \times a = aa + ac$. Q. E. D.

4. The Square of any Line, as z , divided into any two Parts a and c , is equal to both the Squares of those Parts together, with the Rectangles made out of those Parts.

That is, $zz = aa + 2ac + cc$.

z ———

Multiply $a + e$ by it self, and the Thing is plain.

$$\begin{array}{r} a + e \\ a + e \\ \hline aa + ee \\ + ae + ee \\ \hline aa + 2ae + ee \end{array}$$

COROLLARIES.

Hence 'tis plain, that the Square of any Line is equal to four times the Square of its half. For suppose Z to be bisected, then each Part will be a ; and multiplying $a + a$ by it self, the thing will plainly appear.

A horizontal line labeled Z at the left end. It is divided into two equal segments, each labeled 'a'.

$$\begin{array}{r} a + a \\ a + a \\ \hline aa + aa + aa + aa = 4aa \end{array}$$

5. If a Line be divided into two Parts equally, and into two other Parts unequally, the Rectangle under the unequal Parts, together with the Square of the intermediate Part, the Difference between the equal and unequal Parts, is equal to the Square of half that Line.

Let the whole Line be $2a$, then each Part will be a ; let the lesser unequal Part be e , then the greater unequal Part will be $2a - e$; which multiplied by e , produces $2ae - ee$: To which adding the Square of the Difference, or intermediate Part $a - e$, which is $aa - 2ae + ee$, the Sum will be only aa , the Square of half the Line.

6. If a Line be bisected, and then another Right Line be added to it, the Rectangle or Product of the whole augmented Line multiplied by the Part added, together with the Square of the half Line, is equal to the Square of the half Line, and part added, as one Line.

Let the first Line be $2a$, and the Part added e , then the whole will be $2a + e$; which multiplied by e , produces $2ae + ee$, and the Square of half the Line a being added to it, it will be $2ae + e + aa$, which is equal to the Square of $a + e$, by Prop. 4.

7. If a Quantity or Line be divided any how into two Parts, the Square of the whole added to the Square of one of the Parts, shall be equal to two Rectangles contained under the whole Line and that Part, added to the Square of the other Part.

Let a be one Part, and e the other; the Square of the whole, and if the lesser Part e , makes $aa + 2ae + 2ee$. Then if the whole $a + e$ be multiplied twice by e , it will produce $2ae + 2ee$; and if to this be added the Square of the other Part aa , the Sum will be

$$aa + 2ae + 2ee, \text{ equal to the former.}$$

8. If a Line cut any how into two Parts, the Quadruple Rectangle under the whole Line and one of the Parts, added to the Square of the other Part, is equal to the Square of the whole, and the other Part added to it, as if it were but one Line.

Let the whole Line be $a + e$, then four times that multiplied by e (or the Quadruple Rectangle under that and e) will be $4ae + 4ee$; to which adding the Square of the other Part aa , the Sum will be $aa + 4ae + 4ee$.

And if you square $a + e$, which expresses the whole Line, with e added to it, the Product will be the former Sum of $aa + 4ae + 4ee$.

9. If a Line be bisected, and also cut into two other unequal Parts, the Sum of the Squares of the unequal Parts will be double to the Sum of the Squares of the half Line, and of the Difference between the two unequal Parts.

Let the whole Line be $2a$, and the Difference between the equal and unequal Parts b ; then the greater unequal Part will be $a + b$, and the lesser $a - b$: The Sum of the Squares of the unequal Parts will be $2aa + 2bb$, which is double to the Square of half the Line added to the Square of the Difference, Q. E. D.

10. If a Line be bisected, and then another Line added to it; the Square of the whole increased Line, together with the Square of the Part added, is double the Sum of the Squares of the half Line, and of the half Line and Part added, taken as one Line.

Let the whole Line be $2a$, and the Part added e ; then the whole increased Line will be $2a + e$; and the half Line and Part added, will be $a + e$. The Sum of the Squares of $2a + e$, and of e , is $4aa + 4ae + 2ee$; which is plainly double to aa , and $aa + 2ae - ee$ added together. Q. E. D.

LINE, in Fortification, is that which is drawn from one Point to another, in delineating a Plane upon

upon Paper. But in the Field it is sometimes taken for a Ditch bordered with its Parapet, and sometimes for a Row of *Gabions*, or Sacks of Earth, extended in Length on the Ground, to serve as a shelter against the Enemies Fire. Thus they say, when the Trenches were carried on within 30 Paces of the *Glacis*, we drew two Lines, one on the Right Hand, the other on the Left, for a Place of Arms.

LINE Capital, is that which is drawn from the Angle of the Gorge to the Angle of the Bastion.

LINE Cogitrel, is that which is drawn from the Angle of the Center to that of the Bastion.

LINE of Defence, is that which represents the Course of the Bullet of any sort of Fire-Arms, more especially of a Musquet-Ball, according to the Situation which it ought to have to defend the Face of the Bastion.

LINE of Defence Fix'd or Fichant, is that which is drawn from the Angle of the Curtain to the flank'd Angle of the opposite Bastions; nevertheless without touching the Face of the Bastion. This must never exceed 800 Feet, which they reckon the Distance a Musquet-Ball will do Execution.

LINE of Defence Razant, is that which being drawn from a certain Point of its Curtain, Raseth the Face of the opposite Bastion. This is called also the Line of Defence Stringent or Flanking.

LINE of Approach, or of Attack, signifies the Work which the Besiegers carry on under Cover, to gain the Moat, and the Body of the Place.

LINE of Circumvallation, is a Line or Trench cut by the Besiegers within Cannon shot of the place, which rangeth round their Camp, and secures its Quarters against the Relief of the Besieged.

LINE of Contravallation, is a Ditch border'd with a Parapet, which serves to cover the Besiegers on the side of the place, and to stop the Sallies of the Garrison.

LINES within side, are the Moats towards the place, to prevent the like Sallies.

LINES without side, are the Moats towards the Field, to hinder Relief.

LINES of Communication, are those that run from one Work to another. But the Line of Communication, more especially so called, is a continued Trench with which a Circumvallation or Contravallation is surrounded, and which maintains a Communication with all its Forts, Redoubts, and Tenables.

LINE of the Base, is a Right Line which joins the points of the two nearest Bastions.

To **LINE a Work**, is to strengthen a Rampart with a firm Wall, or to encompass a Parapet or Moat with good Turf, &c.

LINEA Apfidum, or the Line of the Apfes, in the Old Astronomy, is a Line passing through the Center of the World, and the Center of the Excentrick; and whose two Ends are, one the *Apogee*, the other the *Perigee* of the Planet. That part of this Line which lies between the Center of the World and that of the Excentrick, is called the *Excentricity*.

LINE of Greatest or Least Longitude of a Planet, is that part of the *Linea Apfidum* reaching from the Center of the World to the *Apogee* or *Perigee* of the Planet. But the

LINE of Mean Longitude, is one drawn through the Center of the World at Right Angles to the *Linea Apfidum*, and is there a new Diameter of the Excentrick or Deferent; and its Extreame Points are called the *Mean Longitudes*.

LINE of the mean Motion of the Sun, in the Old Astronomy, is a Right Line drawn from the Center of the World as far as to the Zodiack of the *Primum Mobile*, and parallel to a Right Line drawn

from the Center of the Excentrick to the Center of the Sun; Which latter Line they call also the

LINE of the mean Motion of the Sun in the Excentrick, to distinguish it from the former; which is the Line of mean Motion in the Zodiack of the *Primum Mobile*.

LINE of the Sun's True Motion, is a Line drawn from the Center of the World to the Center of the Sun, and produced as far as the Zodiack of the *Primum Mobile*.

LINE Horizontal, is a Right Line parallel to the Horizon.

—In **Dialling**, it is the common Section of the Horizon and the Dial-Plane.

—In **Perspective**, it is the common Section of the Horizontal Plane, and that of the Draught or Representation, and which passes through the principal Point.

LINE Geometrical, in Perspective, is a Right Line drawn any how on the Geometrical Plane.

LINE Terrestrial, in Perspective, is a Right Line, wherein the Geometrical Plane, and that of the Picture or Draught intersect one another.

LINE of the Front, in Perspective, is any Right Line parallel to the Terrestrial Line.

LINE Vertical, in Perspective, is the common Section of the Vertical and of the Draught.

LINE of Station, in Perspective, according to some Writers, in the common Section of the Vertical and Geometrical Planes. Others, as *Lamy*, mean by it the perpendicular Height of the Eye above the Geometrical Plane. Others, a Line drawn on that Plane, and perpendicular to the Line, expressing the Height of the Eye.

LINE Objective, in Perspective, is the Line of an Object, from whence the Appearance is sought for in the Draught or Picture.

LINE of Gravitation, of any heavy Body, is a Line drawn through its Center of Gravity, and according to which it tends downwards.

LINE of Direction, of any Body in Motion, is that according to which it moves, or which directs and determines its Motion.

LINE of the swiftest Descent of a heavy Body: See the *Cycloid*.

LINE of the Anomaly of a Planet, in the Ptolemaick System, a Right Line drawn from the Center of the Excentrick to the Center of the Planet.

LINE of the Apogee of a Planet, in the Old Astronomy, is a Right Line drawn from the Center of the World, through the point of the *Apogee*, as far as the Zodiack of the *Primum Mobile*.

LINE of the Nodes of a Planet, in the New Astronomy, is a Right Line from the Planet to the Sun, being the common Intersection of the Plane of the Planets Orbit with that of the Ecliptick.

LINE Synodical, in reference to some Theories of the Moon, is a Right Line supposed to be drawn through the Centers of the Earth and Sun: And if it be produced quite thro' the Orbits, 'tis called the

LINE of the True Syzygies. But a Right Line imagined to pass through the Earth's Center, and the mean Place of the Sun is called the

LINE of the Mean Syzygies.

LINE Horary, or the *Hour-lines*, in Dialling, are the common Intersections of the Hour-Circles of the Sphere, with the Plane of the Dial.

LINE Subsylar, is that Line on which the Style or Cock of the Dial is Erected, and is the Representation of such an Hour-Circle as is perpendicular to the Plane of that Dial.

LINE Equinoctial, in Dialling, is the common Intersection of the Equinoctial, and the Plane of the Dial.

L I N E S

LINES, in the Art of War, signify the Position of an Army ranged in Order of Battel, extending themselves to such a length, or as far as the Ground will allow, to prevent flanking. Armies do usually place themselves in three Lines: The first of which is the *Van*, or *Advanc'd Guards*; the second the *Main Body*; the third the *Rear-Guard*, or *Reserve*. There is left the Distance of about 150 Paces between the two first Lines, and about double that Distance between the second and last. To

LINE Hedges, is to plant Musqueteers all along them under their Covert, to fire upon an Enemy that comes open, or for a Defence against Horse.

LINEA Alba, is a Concourse of the Tendons of the Muscles of the *Abdomen*, excepting the Tendons of the straight ones; for the Tendons of the oblique Muscles unite, and meet so on both Sides, that they make a kind of Tunick that covers the *Abdomen*, as if they were all but one Tendon. It is white, and not fleshy, proceeding from the *Cartilago Eniformis* to the *Os Pubis*; and is narrower below the Navel than above.

LINEAR Problem, in Mathematicks, is such an one as can be solved Geometrically by the Interfection of two Right Lines; as to measure an inaccessible Height by the means of two unequal Sticks or Staves. This is also called a *simple Problem*, and is capable but of one Solution.

LINEAR Numbers, are such as have relation to Length only; as (*v. gr.*) such as represent one side of a plane Figure: And if the plane Figure be a Square, the *Linear Number* is called a *Root*.

LINEs of Chords, Sines, Tangents, Secants, Versed Sines, &c. See *Scale*.

LINED Moat, a Term in Fortification: See *Moat*.

LINGOT, the Term in Chymistry for the *Molds* they make to cast melted Metals, or the *Regulus* of *Antimony*, &c. into.

LINGUA, the Tongue, is an oblong, broad, thick Member, and thicker at the Root, and thinner and sharper at the End; of a moderate Bigness, that it may move more quickly. In the exterior or upper Part of the Tongue there are a great many little Bodies, which break out from the Surface of the Tongue, and bending a little, incline backwards towards the Root, so that they look like a Comb to card Wool. These Cartilaginous Bodies, in an Ox especially, seem to resemble the Figure of a Boar's Tooth. In the lower Part they have a certain Cavity. They are made of a thick tenacious fibrous Matter, which seems like a Heap of little Rods: About the Sides of the Tongue they grow smaller and smaller, so that they almost disappear; and certain Membranous Bodies are placed at their Basis, which appear at first of a Conical Figure, and then by and by of a more obtuse one, and of a pappy Substance. All the little Protuberances are clothed with the Membranes of the Tongue: They are firmly implanted in a certain tenacious Tunick of the Tongue, there being under them a crass, viscous or nervous Substance, especially in those Places where there are remarkable Pits in the Tongue disposed in like Order and Manner; so that in the inner Part of the Tongue there are a great many of them, which are firmly implanted in a kind of viscous Body. When the Membrane that covers the whole Tongue is taken off, there appears a certain Glutinous Substance; then a Nervous Pappy Body, something Yellow, which spreads like the Membrane, and discovers several remarkable

Nervous Protuberances, dispos'd and order'd in a wonderful Order. The next Things that appear are like Nipples, in greater abundance than those before-mentioned, and of another Order; for as many little Protuberances as cover the Outside of the Tongue, so many Nervous Nipples of this sort are found within. These proceed from the common pappy Substance, grow tolerably high, and shoot out further into Nervous Sprouts from the Top of them; about which you discover innumerable little Protuberances proceeding from the Stock, and of an equal Height, only slenderer, like a Cone, and which go within their proper Cavities, ready made in the crass viscous Substance before-mentioned, and at last end toward the outermost Membrane. Furthermore, the Substance of the Tongue is Muscliculous: The Central Parts of the Tongue consist of several sorts of Fibres, long, transverse and oblique, which being mutually interwoven with one another, look like a Coverlid or Blanket. It owes its Motion to peculiar Muscles of its own, where-with it is contracted and abbreviated. The Pairs of Muscles are the *Syloglossum*, *Basioglossum*, *Genioglossum*, *Ceratoglossum* and *Myloglossum*; which see. *Blanchard*.

LINGUALIS, is taken by some to be a large and fleshy Muscle arising from the Basis of the *Os Hyoides*, and runs forward to the Tip of the Tongue; and *Spigelius* gives it this Use, That its transverse Fibres do thicken, and as it were constrict the Tongue, and dilate it by its oblique Fibres, and bring it towards the Palate by its right Fibres: But it is disputable whether it be a Muscle or not.

LINTER: See *Scapha*.

LINUM Vivum: See *Asbestine Cloth*.

LIONCELES, the Herald's Term for *Lions*, when there is more than two of them born in any Coat of Arms, and no Ordinary between them; and 'tis all one as a small or young Lion.

LIPOTHYMIA, or *Liposchia*, is a swooning or fainting away, being an imperfect *Syncope*; which see.

LIQUIDS, are such Bodies as have all the Properties of *Fluidity* (see that Word); and withal, have their Particles so formed, figured or disposed, that they do adhere to the Surfaces of such Bodies as are immersed in them, which we call *wetting*: And this Property of Liquid Bodies is sometimes called *Humidity* or *Moisture*.

LIQUOR of Fix'd Nitre: See *Fix'd Nitre*.

LIST, in Architecture, is a straight upright Ring, which runs round the lower Part of any of the Columns just above the *Tore*, and next to the Shaft or Body of the Pillar.

LISTEL, a small Band, or a kind of a Rule in the Mouldings of Architecture: Also the Space between the Channellings of Pillars.

LITERAL Algebra: See *Algebra*.

LITHARGE, what, and how made, see *Purification of Silver*.

LITHIASIS, the Breeding of the Stone in the Kidneys or Bladder.

LITHONTRIPTICKS, are Medicines which break the Stone, either in the Bladder or the Kidneys.

LITHOTOMIA, is the Grand Operation of cutting the Stone out of the Bladder; and is thus described by *Blanchard*. The Operator lays the sick Person upon a soft Pillow, in the Bosom or Lap of some strong Man, after he has leapt three or four times from on high, then he ties the Hands on

each side fast to the Sole of the Foot, and two People standing on each side hold the Knees as open as possible. After this, the Operator moistening one Finger of his Left-Hand, or if Necessity require the two foremost, with Oyl of White Roses, thrusts them up into the Fundament, and with his Right-Hand presses the Upper Parts of the Secrets lightly, that by this means the Stone may be brought to the *Perineum*; which when he has forced thither, with his Fingers, he cuts with a two-edged Knife, proportionably to the Bigness of the Stone, in the Left Side, betwixt the Testicles and the Fundament, near to the Suture of the *Perineum*, bringing the Stone towards the Knife: And if the Stone come not out, either of its own Accord, or by thrusting of the Fingers, he draws it out with the *Forceps*; i. e. a pair of Pincers, or some such Instrument of Art. The Stone being drawn out, and all the Bands being loosed, he closes the Wound duly, applies Remedies, stops the Blood, and takes Care that the Wound be closed up, lest the Urine should continually drop through. This Way is called *Apparatus minor*, and is used especially in Boys, though it be frequently practised too in Adult Persons in these Countries. This we in England call *Cutting upon the Gripe*, and is the Method that our *Suters* always cut by: But in the *Apparatus major*, or the greater Operation, which we call *Cutting upon the Staff*, the Patient, bound as before, is set upon a Table, and held there; then the Chyrurgeon thrusts in his Instrument, called *Itinerarium*, by the Urinary Passage into the Bladder, as far as the very Stone; and cutting an Hole, as before, he puts another Instrument called *Conductor*, into the hollow Part of the *Itinerarium*, through the Wound; then the *Itinerarium* being taken out of the Urinary Passage, he puts in the Instrument called *Forceps* (a sort of Pincers) or any other fit to pull out the Stone through the Wound before made, that he may lay hold of the Stone, and bring it out: This being done, the Wound is bound up, and consolidated, as 'tis in Children; only if it be large, it is stitched up, and an Instrument of Silver applied to it for Two or Three Days, which is useful to let out concremented Blood, Phlegm, and Gravelly Urine. There is yet another Way of taking out the Stone, to wit, By making a Hole in the *Abdomen*, by which the Stone is taken out of the Bottom of the Bladder; and in this way no dribbling of Urine need to be feared. *Blanchard*.

LITHOTOMIST, is a Chyrurgeon who is skilful in cutting out the Stone of the Bladder.

LITOTES, or *Diminutio*, is a Trope in Rhetorick, by which we speak less than we think: As when we say, *I cannot commend you*; it implies a secret Reprehension for something committed that hinders us.

LITTORAL Shells, are with the Writers of Natural History, such Sea-shells as are always found near the Shores, and never far off in the Deep: But such as are found there in the Bottom of the Sea, remote from the Shore, they call *Epeiridior* and *Pelagie*.

LIVER of Antimony: See *Crocus Metallorum*.

LIVERY hath Three Significations: In one it is used for a Suit of Cloth or Stuff that a Gentleman giveth in Coats, Cloaks, Hats, or Gowns, with Cognisance, or without, to his Servants or Followers. In the other, it signifies a Delivery

of Possession to those Tenants which held of the King in *Capite*, or Knight's Service; for the King, by his Prerogative, hath *primier Seisin* of all Lands and Tenements to holden of him. In the Third Signification, *Livery* is the Writ which lies for the Heir to obtain the Possession of Seisin of his Land at the King's Hands.

LIVERY of Seisin, is a Delivery of Possession of Lands or Tenements, or rather Things Corporeal, unto one that hath Right, or a Probability of Right to them. This is a Ceremony in the Common Law, used in Conveyance of Lands or Tenements, &c. where an Estate in Fee-simple, Fee-tail, or a Free-hold, shall pass; and is a Testimonial of the willing departing of him who makes the *Livery*, from the Thing whereof *Livery* is made; and the Receiving of the *Livery* is a willing Acceptance of the other Party. And it was invented, that the Common People might have Knowledge of the Passing or Alteration of Estates from Man to Man, that thereby they might be the better able to try in whom the Right of Possession of Lands and Tenements were, if they should be impannelled in Juries, or otherwise have to do concerning the same. Of this *Livery* there be two kinds, viz. a *Livery in Deed*, and a *Livery in Law*: A *Livery in Deed*, is when the Feoffor taketh the Ring of the Door, or Turf or Twig of the Land, and delivereth the same to the Feoffee in the Name of the *Seisin* of the Land. A *Livery in Law*, is when the Feoffor saith to the Feoffee, being in View of the House or Land, *I give to you yonder Land, to you and your Heirs; and therefore enter into the same, and take Possession thereof accordingly*: And the Feoffee doth accordingly, in the Life of the Feoffor, enter: This is a good Feoffment.

LIVIDUS: See *Pectineus*.

LIXIVIOUS, or *Lixivate Salts*, are the fix'd Salts of Plants, &c. They are drawn by *Calcination* of the Plant, and then making a Lye or Lixivium of the Ashes and Water; whence this Name. See *Salts*.

Mr. Boyle saith, The distinguishing Mark of *Lixivious Salts*, whereby they differ from Urinous ones, is, That they will turn a Solution of Sublimate in Common Water, into a Yellow Colour: See *Experiments on Colours*.

LIZIERE, a Term in Fortification; the same with *Berne*; which see.

LOADSTONE: See *Magnet*.

LOBE, a Word used mostly by Anatomists for the Division of the Lungs into several Parts, which they call *Lobes*: And by Botanists, for the Division or Parts of the Bulk of Seeds, which usually consist of two Parts or Lobes; as is very conspicuous in Beans.

LOBUS Auris, is the lower Part or Tip of the Ear.

LOCAL, is whatever is supposed to be tied or annexed to any particular Place: Thus in Law, they say the Thing is *Local*, and annexed to the Free-hold.

And an Action of Trespas for Battery, &c. is *Transitory*, not *Local*; that is, it is not needful that the Place where the Battery was committed, should be set down as material in the Declaration; or if it be set down, the Defendant cannot traverse it, by saying he did not commit the Battery in the Place mentioned in the Declaration, and so avoid the Action.

LOCAL

LOCAL Medicaments, are those which are applied outwardly, as Plasters, Ointments, Salves, &c. These are also frequently called *Topicks*.

LOCAL Problem, in Mathematicks, is such an one as is capable of an infinite Number of different Solutions: so that the Point which is to resolve the Problem, may be indifferently taken within a certain Extent; as suppose any where in such a Line, within such a Plane Figure, &c. which is called a *Geometrick Place*, and the Problem is said to be a *Local* or *Indetermined* one. And this *Local Problem* may be either *Simple*, when the Point sought is in a Right Line; *Plane*, when the Point sought is in the Circumference of a Circle; *Solid*, when the Point required is in the Circumference of a Conick Section; or, lastly, *Surfsolid*, when the Point is in the Perimeter of a Line of the *second Gender*, as the Geometers call it.

LOCH, or *Loboch*, the same with *Elegma*.

LOCHIA, are the Natural Evacuations of Women in Child-bed, after the Birth of the *Fœtus*, and the Exclusion of the Membranes call'd *Secundina*, or the After-birth.

LOCKER, in a Ship, is a kind of Box or Chest made along the side of a Ship, to put or stow any thing in.

LOCKING-WHEEL, see *Count-Wheel*, a Term in Watch-work.

LOCK-SPIT, a Term in Fortification, signifying the small Cut or Trench made with a Spade, to mark out the first Lines of any Work that is to be made.

LOCULAMENTUM, in Botanicks, is a little distinct Cell or Partition within the common *Capsula seminalis* of any Plant; as those within the Seeds of Poppies, &c. by which one Parcel of the Seeds is kept distinct from another.

LOCUS, or the Place of any Body, is rightly, by Mr. *Newton*, distinguished into *Absolute* and *Relative*: And so ought *Space* to be accounted; for the

LOCUS Absolutus, or *Primarius* of any Body, is that Part of the absolute and immovable Space, or extended Capacity, to receive all Bodies which this individual one takes up: But the

LOCUS Relativus, or *Secundarius*, is that apparent and sensible Place in which a Body is determined to be placed in by our selves, and with relation to other adjoining or contiguous Bodies.

LOCUS Appareus, a Term in Opticks: See *Apparent Place of any Object*. 'Tis also in Astronomy, that Place in which any Planet or Star appears, when viewed from an Eye at the sensible Horizon.

LOCUSTÆ, are the Beards and pendulous Seeds of Oats, and of the *Gramina paniculata*; to which the Botanists gave this Name from their Figure, which something resembles that of a Locust.

LODGMET, in Military Affairs, is sometimes an Incampment made by an Army; or oftner, it is a Retrenchment dug for a Covert or Shelter, when the Counterscarp, or some other Post, is gain'd. It is also taken for the Place where the Soldiers quarter among the Burghers, either in Huts, Baraques, or Tents.

LODGMET of an Attack, is a Work cast up by the Besiegers, during their Approaches in a dangerous Post, where it is absolutely necessary to secure themselves against the Enemy's Fire; as in a *Covert-way*, in a *Breach*, in the Bottom of the Moat, or elsewhere. This Lodgment consists of all the

Materials that are capable to make Resistance, viz: *Barrels and Gabions* of Earth, *Pallisadoes*, *Woolpacks*, *Mantelets*, *Faggots*, &c.

LOG, and *Log-line*: The *Log* aboard a Ship, is a Piece of Board or Wood about 7 or 8 Inches long; of a Triangular Figure, and with as much Lead cast into it at one End, as will serve to make it swim upright in the Water; at the other End of which is fasten'd a small long Line, called The

LOG-LINE; which is wound about a Reel for that Purpose, fix'd in the Gallery of the Ship. This Line, for about 10 Fathom from the Log, hath, or ought to have, no Knots or Divisions; because so much should be allowed for the Log's being clear out of the Eddy of the Ship's Wake before they turn up the Glass: But then the Knots or Divisions begin; and ought to be at least 50 Foot from one another; tho' the common erroneous Practice at Sea, is to have them but at 7 Fathom, or 42 Foot Distance.

The Use of this *Log* and *Line* is to keep an Account, and make an Estimate of the Ship's Way; for as many Knots as run out in half a Minute of Time (which they measure by a Half-minute Glass) so many Miles do they account the Ship to sail in an Hour; or so many Leagues and Miles doth she run in a Watch: as, if there be veered out 4 Knots in half a Minute, the Ship runs 4 Miles an Hour, or 5 Leagues and 1 Mile in a Watch.

The Practice of heaving the *Log*, is first to let it down into the Water, and then to let it run away so far, as to be out of the Eddy of the Ship's Wake; and then one having an Half-minute Glass in his Hand, turns it up just when the first Knot runs off the Reel (tho' some turn up the Glass just when the Log touches the Water) and then the Line running easily off, when the Glass is out, he cries, *Stop!* The other stops the Reel; and then they count the Knots run out, and if they can be so exact, as to account the odd Feet, which the Line shall run out above any Knot, they ought to account 5 Feet for a Tenth part of a Mile more: And thus, if 3 Knots 45 Feet run out in an half Minute, the Ship goes at the rate of 3 Miles 9 Tenths in an Hour.

Now tho' this at best be but a precarious way, 'tis however the most exact of any in use, and much better than that of the *Spaniards* and *Portuguese*, who guess at the Ship's Way by the running of the Froth or Water by the Ship's side; or than that of the *Dutch*, who use to heave over a Chip into the Sea, and so to number how many Paces they can walk on the Deck, while the Chip swims or passes between any two Marks or Bolt-heads on the side. And the Ground and Reason of this Practice of keeping an Account of a Ship's sailing by the *Log*, is this:

1. That 5 of our *English* Feet make a Pace, and 1000 of such Paces a Mile, and 60 of such Miles a Degree, and consequently a Degree would contain 300000 Feet. But this is erroneous on all Accounts; for there are both 1006 Paces in a Mile, and 72 such Miles in a Degree.

2. But then this hath been corrected by Mr. *Norwood*, in his *Seaman's Practice*; who, by most exactly measuring the Distance of two Places under the same Meridian, and finding also the Latitudes of those two Places by most accurate Instruments and Observations, he found, That to a Degree of a Great Circle on the Earth there must be 367200 *English* Feet: And this hath been in a good measure confirmed by the *French* Observations and Measurements, who found a Degree to contain 365184 Feet. And yet Mr. *Norwood* considering that the Ships

Ship's Way is really more than what is found by the Log, and also knowing that 'tis better and safer to have the Reckoning to be something before the Ship, and probably also because 'tis a round Number; cast away the 7200 odd Feet, and suppose a Degree to contain just 360000 Feet. Then will a Minute of a Degree contain 6000 such Feet; and that is to be reckoned for the true *Sea Mile*, 60 of which make a Degree: And since 5280 Feet are a Statute Mile, there will be 68 $\frac{1}{3}$ such Miles in a Degree; and of the *Italian Miles*, of 5000 Feet, 72, or 24 Leagues in a Degree. And after this way of accounting, the whole Circumference of our Globe will be 8640 Leagues, or 25920 Miles; which is 120 Leagues, or 360 Miles less than the *French* make it: And yet this is probably less than the Truth, and in Fact less than Mr. *Norwood's* Account.

Now to apply all this to the Estimation of a Ship's Way by the Log: If it be considered that an half Minute is the 120th part of an Hour, 'tis plain the Distance between Knot and Knot in the *Log-line*, must be also the 120th part of a Minute of a Degree of a great Circle on the Earth; or 120th part of a true Sea Mile or Minute, which is before shewed to contain 6000 Feet: And therefore the Distance between the Knots must be 50 Foot; (for 50 multiplied by 120, produces 6000) because as 30 Seconds is to an Hour, or 3600 Seconds is to a Day; so is 50 Feet to 6000 Feet. Wherefore as many times 50 Feet as a Ship sails in half a Minute, so many Miles must she go in an Hour, supposing her to keep on at the same Rate. To try which, in long Voyages to the *East-Indies*, &c. the Log is heaved every Hour; but in shorter Voyages they content themselves with doing it but every two Hours; tho' always the oftener 'tis done, the better.

And from hence plainly appears the gross Error of having but 42 Feet or 7 Fathom between Knot and Knot, which is the common Division of the *Log-line* at Sea. Indeed, being sensible their Divisions are too short, they lessen their Half-minute Glafs proportionably, as having that made of only 24 or 25 Seconds. But this is nothing but correcting one Blunder or Error by another; and shews plainly that the Common Sailors will not go out of their way, tho' they are sure they are in the wrong.

Commonly in the Steerage, or some such convenient Part of the Ship, hangs up a Board called the

LOG-BOARD; which is a Table divided into Five Columns, and ought to be of the following Form, or one like it.

This *Log-Board's* Account ought daily at Noon (when if possible, let there be an Observation of the Latitude) to be entered into the *Log-Book* or *Traverse-Book*, ruled and columned just as the *Log-Board* is; from whence it may be transcribed into the Journals, and how much way the Ship hath gained in her Course, estimated daily.

To measure whether the Half-minute Glafs be true, or to make one upon Occasion, when you can get ashore, you may use this Method:

Fasten a moderately heavy Plummot or Weight at the End of a small String, which hang up against a Wall by a small Pin or Wire, &c. and let its Length from the Pin where it hangs, to the Center of the Plummot or Weight, be just 39 Inches $\frac{1}{4}$. Then draw by the Lines hanging still, a Perpendicular on the Wall behind, with a Pencil or some such thing: And taking the Plummot in your Hand, move the Pendulum from the Perpendicular either way 6 or 7 Inches, and then let it swing freely by

Hour of the Day.	Ships Course.	Log-lines run		Winds, Weather, Accidents, &c.

the Wall; after which take your Half-minute Glafs, and turn it up just when you see the String come right against the Perpendicular on the Wall, and then count the Swings of the Pendulum from its passing by the Perpendicular; and if your Glafs is out, just when it hath made 30 Swings, it is right, else not; for this Pendulum swings exactly Seconds.

LOGARITHMS, which Captain *Halley* very well defines to be the Indexes of the Ratio's of Numbers one to another, were first invented by my Lord *Neper*, a Scotch Baron; and afterwards completed by Mr. *Henry Briggs*, Savilian Professor of Geometry at Oxford.

1. *Logarithms* are a Series of Artificial Numbers (invented for the Ease and Expedition of Calculation) proceeding in an Arithmetical Proportion, as the Numbers they answer to do in a Geometrical one: As for Example,

1, 2, 4, 8, 16, 32, 64, 128, 256, are Numbers proceeding from Unity, in a Geometrical Proportion continued. Now if over these you place a Series of Numbers (beginning with 0) in an Arithmetical Proportion, they will stand thus:

0 1 2 3 4 5 6 7 8 9
1. 2. 4. 8. 16. 32. 64. 128. 256. 512, &c.

And the Numbers above, beginning with (0); and Arithmetically Proportional, are called *Logarithms*.

2. The Addition and Subtraction of *Logarithms* answers to the Multiplication and Division of the Numbers they answer to. Thus the *Logarithm* 2 added to 4, makes the *Logarithm* of 6, whose corresponding Number is 64. (the Product of the Number 4 multiplied into 16). Also the *Logarithm* 5 subtracted from 9, leaves the *Logarithm* of 4, whose Number is 16, (equal to 512 divided by 32).

And the Case would be the same if any other Rank of Numbers in an Arithmetical Proportion were

were made to answer to the Numbers below. And therefore there may be many sorts of *Logarithms*, as indeed there are.

And thus also will Extraction of Roots be performed by bisecting the *Logarithms* of any Numbers for the Square Root, and trisecting them for the Cube: As for Instance,

To extract the Square Root of 256, divide its *Logarithm* 8 by 2, and it will quote 4; which *Logarithmick* Number 4, hath for its absolute Number 16, and therefore 16 is the Square Root of 256.

To extract the Cube Root of 64, divide its *Logarithm* 6 by 3, and the Quote will be 2, which is the *Logarithm* of 4, the Cube Root of 64.

3. To apply this Matter for the making of a Canon or Table of *Logarithms*, that should answer to Common Numbers in their natural Order, the Inventors proceeded in this Method:

They pitched on those which are naturally Geometrically proportional; as

1, 10, 100, 1000, 10000, 100000, 1000000, 10000000, &c.

And to these they fitted not the single *Logarithms*, 0, 1, 2, 3, &c. as in our Instance, Numb. 1. above, but those augmented with many Cyphers, in order to fit proper *Logarithms* for all intermediate Numbers between 1 and 10, 10 and 100, 100 and 1000, &c. They made therefore 0000000 to be the *Logarithm* of 1, and 10000000 to be the *Logarithm* of 10; also 20000000 they put for the *Logarithm* of 100, and 30000000 for the *Logarithm* of 1000, making still the Index or Characteristick of the *Logarithm* to be one less than the Number of Places in the Absolute Number, because they appointed 0000000 as the *Logarithm* of 1.

5. But then the greatest Difficulty and Pains was yet to come, which was to find *Logarithms* for all the intermediate Numbers corresponding with those appointed for 1, 10, 100, 1000, &c. which with most indefatigable Pains and Care they thus effected. In order (i. e.) to get the *Logarithm* of 9, they found a middle Proportional between the absolute Numbers 1 and 10, encreased with seven Cyphers each: Then that Number not being exactly the absolute Number 9, but bigger or lesser than 9, (with seven Cyphers added to it) they accordingly found out new Geometrical mean Proportionals between that Number and 10, if it were less; and between that and the next less than it, as soon as it came to be bigger, &c. till at last, after a prodigious Number of Trials, viz. 25. they came to the absolute Number 8, 9999998, which approacheth very near to 9, 0000000. And in order to find the *Logarithm* of this Number 8, 9999998, they found an Arithmetical mean Proportional between the *Logarithm* of 0 and 10 (i. e. between 0000000 and 10000000). And then another between that so found, and 10000000 again; and so on, 'till at last they came to 0, 9542450. the exact *Logarithm* of 9.

They were forced to proceed after the same manner also to gain the *Logarithm* of 5; but then their Work grew something easier, and more expeditious.

1. For since by dividing 10 by 5, the Quotient is 2; therefore the *Logarithm* of 5, subtracted from the *Logarithm* of 10, must give the *Logarithm* of 2.

2. And as 10, multiplied by 2, gives 20; therefore the *Logarithm* of 9 being divided by 2, or halved, must give the *Logarithm* of 3.

3. Since the Square Root of 9 is 3; therefore the *Logarithm* of 9 being divided by 2, or halved, must give the *Logarithm* of 3.

4. By subtracting the *Logarithm* of any one known Number, from that of another; you have the *Logarithm* of the Quotient of the former Number dividing the latter.

And after this or the like manner they proceeded till they had compleated the Canon of *Logarithms* to Numbers reaching to 10000.

If you would see an easie and expeditious way of making several sorts of *Logarithms* to a large Radius, consult Capt. Edm. Halley's *Discourse in Phil. Trans.* N. 216. Where from the pure Consideration of Numbers, and withal by the Help of Sir Is. Newton's Method of finding the *Uncie* of the Numbers of a Binominal Power, he shews how to find readily the *Logarithms* of all Numbers to above 30 Places; and he gives there several *Series* for this Purpose; some Universal, and some appropriated to peculiar sorts of *Logarithms*.

Nicholas Mercator also did a good while since make some Improvements in this Affair, of which you have Dr. Wallis's Thoughts in *Phil. Trans.* N. 38.

And John Gregory hath also shew'd a way to make *Logarithms* to 25 Places, by means of the *Hyperbola*.

For the Characteristick of a *Logarithm*, see in Index.

The Use of the Table of *Logarithms*.

1. To find a *Logarithm*.

N. B. I here describe only the Common Canon of *Logarithms* contrived by Mr. Briggs, and published in Sir Jonas Moore's *Mathematicks*, and in most Books of *Trigonometry*, *Navigation*, &c.

1. If the Number, whose *Logarithm* you would find, be under 100, you have it always in the first Page: Thus the *Logarithm* of 55 is 1.740363.

2. If the Number consists of three Places, that is, a Number under 1000, look for it in the Table under N. and the *Logarithm* is found in the Column under 0. Thus the *Logarithm* of 216 is 2.334454.

3. If the Number be of four Places, and under 10000, seek the three first Figures under N. as before, and the last Figure on the Top; under which, in that Column lineally against the first three Figures, you have the *Logarithm* required: Thus the *Logarithm* of 3583 is 3.554247, and 358 under N. against which, in the Column under 3, stands your *Logarithm*.

4. If the Number be above 10000, and under 100000, you must find it by the Difference and Table of Parts Proportional: Thus, if the *Logarithm* of 35786 be required, first seek the *Logarithm* of the former four Figures 3578, which will be 3.553649; and the common Difference under D. is 121: With this Difference enter the Table of Parts proportional, and find 121 in the first Column under 3: and then lineally against that Number, and under 6, the last Figure of the Number 35786, found at the Head of the seventh Column, you will find 72; which being added to the *Logarithm* of 3578, viz. 553649, makes 4.553721, the *Logarithm* of 35786; and the Index must be 4, because the Absolute Number consists of five Places.

5. If the Number be above 100000, and under 1000000, as suppose 357865; then find (as before) the *Logarithm* of the first five Figures, viz. 35786, and 'twill be found to be (omitting the Characteristick

stick 4) 553721 : After this, multiply the remaining Figure (5) of the given Number, by the common Difference 70, (found under D.) and 'twill produce 350 ; then cut off (6) the last Figure of the Product, and add the remaining (35) to the Logarithm 553721 aforesaid, the Sum is 553756 ; to which prefix the proper Characteristick (5) because the Number given hath six Places, and 5.553756 is the Logarithm required for 357865.

If the Number be above 1000000, and under 10000000 ; find the Logarithm of the first five Figures (as before) and multiply the common Difference by the two remaining Figures ; from which Product cut off the two last Figures, and add the other (as before) prefixing 6 for a Characteristick, &c.

7. And so for any other greater Number proportionably ; only be sure to cut off from the Sum so many Figures as you multiply the common Difference by ; and add the Remainder to the Logarithm, and prefix the Characteristick proper, that is, a Figure of one place less than the absolute Number, whose Logarithm is required.

2. Next I will shew the Way of finding the Number answering to a Logarithm given.

Omitting the Characteristick, seek in the Table for that Logarithm, which is equal or next less to the Logarithm given, the Absolute Number in the Column under N, with that on the Top over the Logarithm, is the Number desired, which must be ordered according to the Characteristick.

Thus, to find what Number answers to the Logarithm 3.544821 ; omitting the Index 3, I find 544821 to answer to 3506, which the Index 3 shews to be all Integers ; but if the Index had been 1, then the Number would have been 35.06, that is, 35 Integers and .06 hundred Parts.

But if the Logarithm be not exactly to be found in the Tables, and five places be required, find the Number to four places (as before) noting the common Difference under D, then take the Difference betwixt the Logarithm given, and the Logarithm found in the Table less than it ; seek the common Difference in the Table of proportional Parts under D, and in that Line find out the Difference of the Logarithms, and at the Top just about it you have the fifth Figure : Thus, if the Logarithm required had been 2.343612, the Logarithm next less is 543571, answering to 3496 ; the common Difference is 124, the Difference of the Logarithms is 41, which, in the Table of proportional Parts against 124, gives 3 ; so that the Absolute Number is 34963 : And because the Index is 2, the Number will be 349 Integers, and $\frac{13}{100}$ Parts, or 349.63.

To find the Number of a Logarithm, whose Index is 5 or more.

Suppose 4 to be the Characteristick, and find (by the foregoing Directions) the Logarithm as near as you can (so it be but less) ; then subtract this Logarithm from the Logarithm given ; and to the Right Hand of the Remainder, if the Index be 5, set 0 ; if the Index be 6, set 00 ; if 7, set 000 ; and so on proportionally : This done, divide the Sum by the common Difference, and the Quotient gives the Figure or Figures to be placed on the Right Hand of the Number answering to the first found Logarithm.

Example.

Let 6.64876 be the Logarithm given : Suppose 6 to be 4, the nearest Logarithm less will be 4.648974, whose Absolute Number is 44563. Subtract 4.648974 from the given Logarithm, the Remainder is 2 ; to the Right Hand of which set 00, (because the Characteristick was 6) the Sum is 200 ; which divide by the common Difference 97, the Quotient is 2, (and an inconsiderable Fraction, which you may omit) which 2 set on the Right Hand of 44563, it makes 445632 ; but since the Index is 6, the Number must have 7 places ; therefore set 0 on the Right again, and it makes 4456320, which is the Number nearly corresponding to the Logarithm 6.648976.

Addition, Subtraction, Multiplication, and Division in Logarithms.

3. In the Addition of two or more Logarithms together, observe these Rules :

1. If the Indices be Integers, add them as is usual in common Arithmetick.

2. If the Indices be some Integers, and some the Indices of Parts or Fractions, they will be unlike ; and therefore if when added, their Sum be 10, or above, cast away 10, the Remainder is the Index of Integers ; if under 10, Decimal Parts : Thus,

2.057821	2.237242
7.583210	9.875062
	8.698971
9.641031	0.811275

3. If the Indices be all Decimals, and when added, make a Sum under 10, then add 10 to the Sum ; if just 10, then add Unity ; as above 10, cast 10 away, and the Index thus gotten is always Decimal Parts : Thus,

9.397941	8.698972
9.875062	9.875061
9.273002	8.574033

4. Subtraction of Logarithms.

1. If the Indices be Integers, then proceed as usually.

2. If the Indices be either of them, or both, Decimal Parts, observe whether the Index of the upper Quantity be a smaller Number than that of the subtrahend or the lower ; if it be, add 10 to it : And if the upper be of a greater Value than the lower, (that is, a bigger Index by Place) then the Remainder will be Integers ; if not, Decimal Parts.

Examples.

2.033421	9.875062	9.875062	1.235781
9.875062	2.033421	8.574031	3.572141
2.158359	7.841641	1.301031	7.663640

5. The Logarithm of a Fraction is thus found.

Subtract the Logarithm of the Denominator from the Logarithm of the Numerator, the Remainder gives the Logarithm of the Fraction ; as of $\frac{3}{4}$, the Logarithm of 4 is 0.602060, out of the Logarithm of 3, 0.477121, the Difference 9.875061 is the Logarithm of $\frac{3}{4}$, or 75.

6. To Multiply a Logarithm.

If the Index be Negative, observe, That in multiplying the Figure next the Index, the Tens to be carried in Mind are Affirmative, and are to be deducted out of the Product of the Negative Indices : Thus,

$$\begin{array}{r} 2.543211 \\ 3 \\ \hline 5.629633 \end{array} \quad \begin{array}{r} 1.987214 \\ 5 \\ \hline 1.936070 \end{array}$$

7. To Divide a Logarithm, having a Negative or Fractional Index.

Observe whether the Divisor will evenly divide the Index, then there is no Difficulty ; but if it do not evenly divide the Index, add to the Index so many Units, till it may be evenly divided, setting the Quotient down for a new Index, augmenting the next Figure by so many times 10 as you added to the first.

$$\begin{array}{r} 3) 5.321412 \\ 2.440470 \\ \hline \end{array} \quad \begin{array}{r} 2) 5.61228 \\ 3.80614 \\ \hline \end{array}$$

8. Multiplication of Numbers by the Logarithms.

Add the *Logarithms* of the Numbers together, and the Sum is the *Logarithm* of the Product required.

Multiplicand,	32	1.505150	5.12	0.709265
Multiplier,	52	1.71003	1.55	0.899497
	1664	3.221153	7.936	0.899497

9. Division of Numbers by Logarithms.

This is done only by subtracting the *Logarithm* of the Divisor from the *Logarithm* of the Dividend ; and the Remainder will be the *Logarithm* of the Quotient.

Dividend	7286	3.862489	.5512	9.654369
Divisor	32	1.505150	.0315	8.498311
Quotient	227.8	2.357359	1.432	1.156058

10. Extraction of Square, Cube, &c. Roots by Logarithms.

To extract the Square Root of any Number, is to divide the *Logarithm* of that Number by 2, for the Cube Root by 3. &c. That is, in general, divide the *Logarithm* of the Number, by the Index of the Power.

Number	75832	Log. 4.879852	
Square Root,	275.37	2) 2.439926	{ for the Square R.
Cube Root,	42.327	3) 1.626614	{ for the Cube Root.

11. To find a Mean Proportional betwixt two given Numbers by Logarithms.

Half the Sum of their *Logarithms*, gives the *Logarithm* of the Mean Proportional betwixt them.

$$\begin{array}{r} \text{The Numbers are, } \begin{cases} 9 & 0.954242 \\ 16 & 1.204120 \end{cases} \\ \hline \text{Sum, } 2.158362 \end{array}$$

$$\text{Mean Proportional, } 12 \quad S = 1.079181.$$

To find any Number of Mean Proportionals betwixt any two Numbers.

Take the Difference of the *Logarithms* of the two given Numbers, which divide by a Number more by one than the Number of Means desired ; and this *Logarithmerick* Quotient added to the *Logarithm* of the least, gives the *Logarithm* of the first Mean next it ; and then added to the last Sum, finds the next, &c.

As suppose it were required to find 3 Mean Proportionals between 4 and 64 ; the *Logarithm* of 4, is 0.602060 ; of 64, is 1.806180 ; their Difference, 1.204120 divided by 4, (i. e. 3 + 1) gives 0.301030 ; which added to the *Logarithm* of 4, makes 0.903090, the *Logarithm* of 8, the first Mean ; and again, added to the last Sum, gives 1.204120, the *Logarithm* of 16 ; and again added, gives the *Logarithm* of 32 ; which are the three Means betwixt 4 and 64.

LOGARITHMICK-LINE of *Pardie*, is a Curve which discovers perfectly all the Mysteries of *Logarithms*, with several other very excellent Properties and Uses ; and is thus delineated.

Let the Right Line *AE* be divided into the equal Parts *AB, BC, CD, DE, &c.* from the Points *A, B, C, D, E, &c.* let the Lines *Aa, Bb, Cc, Dd, and Ee*, be drawn all perpendicular to *AE*, and consequently parallel to one another.

And let them all be in a Geometrical Progression ; as let *Aa* be 1, *Bb* be 10, *Cc* 100, *Dd* 1003, *Ee* 10000, &c. Then shall we have two Progressions of Lines, Arithmetical and Geometrical : For the Lines *AB, AC, AD, AE*, are in Arithmetical Progression, or as 1, 2, 3, 4, 5, &c. and so do represent the *Logarithms* to which the Geometrical Lines *Aa, Bb, Cc, &c.* do correspond.

Let each of the equal Parts *ED, DC, CB, &c.* be divided equally again in *F, G, H* ; and let the Parallels *Ff, Gg, &c.* be drawn, and be Mean Proportionals between the collateral ones ; that is, *Ee : Ff :: Ff : Dd :: Dd : Gg, &c.*

K k k

Let

Let there also be more Mean Proportionals drawn from the Middle of each Subdivision $EF, ED, DG, &c.$ and so on, till these parallel Lines growing very numerous, have at last but a very small Distance from each other: Then imagine a Curve Line drawn through all the Extremities of these parallel Lines, as $e o u d g b a$, and this is called the *Logarithmical Line*.

If this Figure were drawn on a very large Table, and with all requisite Exactness, each Part, $AB, BC, &c.$ might be divided not only into an 100 or 1000, but even into 10000, 100000 equal Parts, and more: So that AB being 100000, AC would be 200000, AD 300000, $&c.$ as must always be in an Arithmetick Progression.

The Line Ee being supposed to contain 10000 Parts, let us imagine through each of those Divisions a Parallel to be drawn to the Line AE , cutting the Curve in so many Points, *v. gr.* let the Line io be drawn through the Division 9900 of the Line Ee , and which cuts the Curve in the Point o . Let there be also supposed the Parallel Oo , cutting the Line AE in the Division 39963; then any one may know that 399563 is the *Logarithm* of the Number 9900. In like manner, if Su passed through the Division 9000 of the Line Ee , the Line Vu were drawn cutting AE in 395424, then would that Line uV be the *Logarithm* of 9000, $&c.$

So that by this means a Table of *Logarithms* from 1 to 10000, may easily be made; and farther, by producing the Line AE .

Note. To obtain all the *Logarithms* from 1 to 10000, 'twill be enough to seek the *Logarithms* from 1000 to 10000; that is, (having drawn the Parallel de) to take the *Logarithms* of all the Divisions from e to e ; which *Logarithms* are all contained between E and D : For by this you will have the *Logarithms* of all the Parts that are between e and E , and whose *Logarithms* lie between D and A . For Example; Since Oo is 9900 Parts, and its *Logarithm* 399563, the same Number may be taken for the *Logarithm* of 990, which is Nn : As also of the Number Ty 99, changing only the first Figure 3; because, according to the Composition of this Line, ON or Ny , ought to be equal to ED or DC ; as any one may easily prove: So that ON or Ny , will contain 100000. And because AO is 399563, subtracting ON 100000, there will rest 199563 for Ay . And after the same manner, having Ay 395424 for the *Logarithm* of Vv , which is 9000, you may have also 095424 for the *Logarithm* of Xx , which is 9; or 195424 for the *Logarithm* of 90; or 295424 for the *Logarithm* of 900.

All this may be reduced to Practice for Calculation, without actually drawing these Figures, but only imagining them to be drawn: For by the Rules of Common Arithmetick, we may find out Ff , the Mean Proportional between dD and Ff , or between Ff and Ee , $&c.$ But what we have here explain'd, is sufficient to gain the Knowledge of the Nature and Composition of the *Logarithms*.

Though indeed there will not arise such Advantage for making *Logarithms* by this Observation, as it may at first Sight seem to promise; because there are 9000 Numbers between 1000 and 10000, whose *Logarithms* must be found also; and but 900 between 100 and 1000, and but 90 between 10 and 100, and but 9 between 10 and so in all 999, which is not the Ninth Part of the former.

In *Phil. Trans.* N. 245, is a Quadrature of that Part of the Space contained between any two Ordinates of the Curve and this *Alciffa*, by Mr. John Craig; and Dr. Barrow, in his *Lectiōes*, hath carried the Matter farther: See in *Philosophical Transactions*, N. 38. An Account of a very short Way of making *Logarithms*, contrived by Nicholas Mercator, with Dr. Wallis's Thoughts upon it, and Additions to it.

Mr. James Gregory also, in his *Vera Quadratura Circuli & Hyperbola*, Printed at Padua, A. D. 1667. applies the Quadrature of the Hyperbola to the making of *Logarithms*, and computes the *Logarithm* of 10 to 25 Places.

But our Learned Capt. Halley, in *Phil. Trans.* N. 216, gives a Way from the bare Consideration of Numbers only; and withal, by the Help of Sir Isaac Newton's admirable Invention, to find the *Uncie* of the Members of any Power, (which you have under the Word *Uncie*) most compendiously to find the *Logarithms* of all Numbers to above 30 Places, with more Ease and Expedition than was ever done before: And he gives there several *Series* for this Purpose, some universal, some applicable to one sort of *Logarithms*, and some to another.

LOGARITHMETICK Curves, is the same with *Pardie's Logarithmetick Line* above described.

LOGICK, is the Art of right Thinking, or using our Rational Faculty aright: And the Power or Force of Reason, unassisted by Art, is called *Natural Logick*.

Logick is derived from those Reflections which Men have made on the Four Principal Operations of the Mind, *viz.* *Apprehension, Judgement, Discourse, and Method or Disposition*; which see.

The Business of *Logick* is chiefly to teach us how to make proper Animadversions on the Operations of our Minds; and from its true Use we gain these Three Advantages.

First, We are thereby assured that we make a right Use of our Reason: For the Consideration of Rules, begets in us a more fervent Application and attentive Industry of the Mind.

Secondly, That thereby we more easily detect and explain the Errors and Defects which we meet with in the Operations of the Mind: For oftentimes it falls out, that we discover by the meer Light of Nature the Faults of Ratiocination; yet are not able to give a Reason why it is false: Thus they who know not what belongs to Painting, may take Exceptions at the Defects of a Picture, tho' they are not able to tell the Reason why they find fault.

Thirdly, That we are brought to a more accurate Knowledge of the Nature of our Understanding by these Reflections upon the Operations of the Mind, which, if we look no farther than meer Speculation, is to be prefer'd before the Knowledge of all Corporeal Things.

LOGISTICAL Arithmetick, was formerly the Arithmetick of Sexagesimal Fractions, and used by Astronomers in their Calculations. I suppose it was so called from a Greek Treatise of one *Barlaamus Monetias*, who wrote about Sexagesimal Multiplication very accurately, and entituled his Book, *λογιστική*. This Author *Vossius*, in his Book *de Scientiis Mathematicis*, places about the Year 1350, but mistakes it for a Treatise of Algebra.

Thus also *Shakerly*, in *Tabule Britannicæ*, hath a Table of *Logarithms* adapted to Sexagesimal Fractions, which therefore he calls *Logistical Logarithms*; and the Expeditious Arithmetick of them, which is by this Means obtained, and by which all the

the Trouble of Multiplication and Division is saved, he calls *Logistical Arithmetick*; though some by **LOGISTICKS**, will understand the first General Rules in *Algebra of Addition, Subtraction, &c.*

LOHOCH, or *Loch*, the same with *Eclegma*.

LONCHITES, or *Hastiformis*, a Species of Corners resembling a Lance or Spear: Its Head is of an Elliptick Form, and its Tail or Stream of Rays very long, thin, and pointed at the End.

LONG Accent, in Grammar, shews that the Voice is to stop upon the Vowel that has that Mark, and it is expressed thus, (-).

LONG-BOAT, is the largest and strongest Boat belonging to a Ship, that can be hoisted aboard of her: Its Use is to bring any Goods, Provision, &c. to or from the Ship; or, on Occasion, to land Men any where; and particularly to weigh the Anchor; for which End she hath a *David* to be set over her Head, with a *Shiver* in it, in which the *Buoy-rope* runs, to weigh the Anchor. She hath Mast, Sail, and Oars, as other Boats, as also her *Tiller* to the Rudder, which answers to the *Helm* of a Ship.

LANGANON, the last Gut: See *Intestinum rectum*.

LONGIMETRY, is the Art of measuring Lengths or Distances: Or to take the Distances of *Trees, Steeples, or Towers, &c.* either one or many together; for which Purpose the *Theodolite* is reckoned to be the best Instrument, whereof we'll give the following Instances.

To Measure one single Distance.

As suppose you stand at *A*, and would know the Distance to the Tree at *C*.

1. Set your Instrument at *A*, laying the *Index* with *Sights*, on the North and South Diameter, and turn it about till through the *Sights* you see the Tree at *C*, there fix your Instrument fast.

2. Then from *A*, measure any Number of Feet, Yards, or the like, any way; as to *B* 100 Foot, and set up a Mark at *B*.

3. Take the Angle *BAC*, 120 deg. 10 min. which set down.

4. Set a Mark at *A*, and remove your Instrument to *B*, and take the Angle *ABC* 50 Degrees.

Now you have an *Oblique Angled Triangle*, where-in there is given the Angles *BAC* 120 deg. 10 min. *ABC* 50 deg. and the Distance *AB* 100 Foot, and consequently the Angle *C* 9 deg. 50 min. (being the Complement of the other two, to 180 deg.)

$$\text{Then } S. B C A : A B :: S. C B A : A C$$

$$9^{\circ} 50' : 100 :: 50^{\circ} 00' : 448, 6$$

$$\text{And } S. C B A : C A :: S. \text{compl. } C A B : C B$$

$$50^{\circ} 00' : 448, 6 :: 59^{\circ} 50' : 506, 2$$

So the Distance from *C* to *A* is 448, 6 Foot and from *C* to *B* 506, 2 Foot;

How to take the Distances of divers Things remote from you; as, Churches, Towers, Ships at Sea, or such like; and to make a Map of the same.

Suppose that the Points *A, B, C, D, E* and *F*, were Houses, Churches, Towers, or the like, and that it was required to make a Draught of them, representing their Situation and true Distance one from another.

Let your Stations be *S* and *N*. Set your Instrument at *N*, and turn it about upon the Socket till the Needle hang directly over the *Meridian Line* of the *Chard* in the Bottom of the Box, the North end of the Needle over the *Flower-de-lis*; then skrew your Instrument fast.

Then turn the *Index* about, till through the *Sights* you see *A*, and note what Degree the *Index* cuts, which suppose to be 60. Then turn the *Index* about till you see *B*, and mark what Degrees is cut by the *Index*; as 74 deg. 30 min. Do thus with all the rest, be there never so many.

Also measure the Distance between *N* your first Station, and *S* the second Station; which is 220 Perches: And bring your Instrument from *N* to *S*, where it must be set up, laying the *Index* upon the North and South Diameter: Turn it about till you see the first Station *N*, then fix it.

And turn the *Index* about, till thro' the *Sights* you see *A*, and note what Degrees the *Index* cutteth; as 31 deg. 30 min. Then turn the *Index* about to *B, C, D, &c.* noting the Degrees cut by the *Index* at every moving, and set them down in a Table ruled for that Purpose, thus,

	At the first Station the Index cut.		At the second Station the Index cut.		Stationary Distance is 220 Perches.
	D.	M.	D.	M.	
A	60	00	31	30	Stationary Distance is 220 Perches.
B	74	30	38	40	
C	84	30	43	20	
D	104	50	54	00	
E	117	00	68	10	
F	145	10	97	00	

How to Protract these Observations.

1. Draw a Line at Length, as *OP*; whereon take any Point, as *N*, for your first Station: Apply the Center of your Protractor to *N*, and its Diameter upon the Line *OP*.

2. Having your Table of Observations before you, prick off the Degrees observed, along the Limb of your Protractor; and draw the obscure Lines *NA*, *NB*, *NC*, &c.

3. From some Scale of equal Parts (answerable to the Bigness you intend your Plot) take off 220 Perches, and set them from *N* to *S*.

4. Apply the Center of the Protractor to *S*, and its Diameter upon *OP*, and prick off your Observations at the second Station; and draw the obscure Lines *SA*, *SB*, *SC*, &c. (from *S*, through the several Marks made on the Paper) cutting the Lines drawn before, *NA*, *NB*, *NC*, &c. in the Points, *A*, *B*, *C*, *D*, &c. which Points shall represent the several Ships, as they lie at Anchor; or the several Towers, or remarkable Places to be plotted.

To make a Scale to measure any Distance upon this Plot.

Let a Line be so divided, that the Distance *NS* may be 220 Parts thereof, as the Line *LM*; for the Distance *NS*, set upon this Scale, will reach from 200 to 20 on the small Divisions.

And the Scale being thus Divided and Numbred, you may measure any Distance upon the Plot.

To measure any Distance, thus laid down, by Trigonometrical Calculation.

The Visual Lines made at both Stations, by their Intersections, do constitute several Right-lined Triangles; in either of which you will have enough given to find whatsoever Distance you shall require; as suppose the Distance *NA* were required.

In the Right-lined Triangle *ANS*, you have given; the Angle *ANS*, 120 deg. (being the Complement of 60 deg. the Angle observed at *A*, to 180 Degrees) The Angle *NSA* 31 deg. 30 min. being the Complement of the other two, to 180 Degrees.

Therefore, as *S, NAS : NS :: S, NSA : NA*.

To find *AS*, say,
As, *S, NAS : NS :: S, ANS : AS*.

By the same Method any other Distance may be found: And in this manner may the Maps or Plots of all eminent Places in Cities, Towns, &c. be taken.

LONGISSIMUS Pollicis: See *Flexor tertii Internodii*.

LONGISSIMUS Femoris; vid. *Sartorius*.

LONGITUDE of a Place, is an Ark of the Equator intercepted between the Meridian of that Place, and the first Meridian: Or 'tis more truly the Difference, either East or West, between the Meridians of any two Places, counted on the Equator.

LONGITUDE in the Heavens, is an Ark of the Ecliptick, counted from the beginning of *Aries*, to the place where the Stars Circle of Longitude crosses the Ecliptick: So that, 'tis much the same as the Stars Place in the Ecliptick, reckoned from the beginning of *Aries*; which how to find: See, *Place of the Sun or Star*.

LONGITUDE of the Sun or Star from the next Equinoctial Point, is the Number of Degrees and Minutes they are from the beginning of *Aries* or *Libra*, either before or after them; which can never be more than 180 Degrees.

LONGITUDE in Navigation, is also the Distance of a Ship or Place, East or West from another (counted in proper Degrees); but if in Leagues or Miles, or Degrees of the Meridian, and not in those proper to the Parallel of Latitude, it's commonly called *Departure*.

LONGITUDE in Drolling. The Ark of the Equinoctial, intercepted between the Subtilar Line of the Dial and the true Meridian, is called the Planets Difference of Longitude.

To find the Longitude and Latitude of any Star by the Globe.

Bring the Solstitial Colure to the Brafs Meridian, and there fix the Globe; then will the Pole of the Ecliptick be just under 23 deg. 30 Min. accounted from the Pole above the Horizon, stand on the same Meridian: There skrew the Quadrant of Altitude, and then bring its graduated Edge to the Star, and there stay it; and so the Quadrant will cut the Ecliptick in the Star's Longitude, as also its Latitude on the Quadrant, reckoned from the Ecliptick.

LONGITUDE of Motion, is a Term used by Dr. Wallis in his *Mechanicks*, and others, for the Measure of Motion estimated according to the Line of Direction; so that 'tis the Distance or Length which the Center of any moving Body runs through, as it moves on in a Right Line.

And he calls the Measure of any Motion estimated according to the Right Line, or Line of Direction of the *Vis Motrix*, the *Altitude* of it.

LONGUS a Muscle of the *Cubiti*, which helps to extend the Arm forwards.

LONGUS, a Muscle of the *Radius*, serving to turn the Palm of the Hand upwards.

LONGUS, a Muscle of the *Tarsus* so called: See *Peroneus Primus*.

LONGUS Colli, is a Muscle of the Neck which arises partly tendinous, but chiefly fleshy, from the fore-part of the Five Vertebrae of the Thorax; and being dilated in its Middle to a fleshy Belly, is inserted to the fore-part of all the Vertebrae of the Neck: This with its Partner acting, bends the Neck right forward. Between this and the *Scalenus* lies the *Rectus Internus Major*.

LOOF, or as they usually pronounce it, *Luff*, is a Term used in Conding of a Ship: Thus *Loof up*,

is to bid the Steers-man keep nearer to the Wind. To *Loof into an Harboir*, is to Sail into it, close by the Wind. To *spring the Luff*, is when a Ship, that before was going *large* before the Wind, is brought close, or, as they say, *claps* close by the Wind. When a Ship sails upon a Wind, as they say, that is, on a Quarter-Wind, the Word of him that cons to the Steers-man, is, *Luff! Keep your Luff! Veer no more! Keep her to! Touch the Wind! Have a care of the Lee-latch*: All which Words signifie much the same thing, and bid the Man at Helm to keep the Ship near the Wind. But on the contrary, if the Ship is to go more *Large*, or Right before the Wind, the Word is, *Ease the Helm! No near! Bear up!*

Steady, is a Word common to both these ways of Sailing, either on a *Wind*, or *Large*, and signifies, that the Man at Helm should keep the Ship straight to her Course, and not let her go in and out, or make *Tawes*, as they call it.

LOOF-HOOK, is a Tackle aboard a Ship, with two Hooks to it, one of which is to hitch into the *Crengle* of the Main and Fore-fail, and the other is to hitch into a certain *Strap*, which is spliced into the *Cheffe-tree*, and so down the Sail. Its Use is to succour the *Tackles* in a large Sail, that all the Strefs may not bear upon the *Tack*. Sometimes also 'tis used when the *Tack* is to be seized the furer.

LOOF of a Ship, is that part of her *a-loft*, which lies just before the *Cheffe-trees*; and hence the Guns that lie here are called her *Loof-Pieces*.

LOOF-TACKLE, or *Luff-Tackle*, is a small Tackle in a Ship, serving to lift all small Weights in or out of a Ship.

LOOME: If a Ship appears big at Sea, when seen at a Distance, they say, she *loomes*, or appears a great Sail.

LOOME-GALE, is a gentle, easie Gale or Wind, in which a Ship can carry her Top-sails *a-trip*: see *Trip*.

LORIDOIDES, the same with *Lepoides*.

LORD, by the Writers of the Law, is divided into *Lord Paramount* and *Lord Mesne*.

Lord Mesne, is he that is Owner of a Mannor, and by Virtue thereof hath Tenants holding of him in Fee, and by a Copy of Court-Roll, and yet holdeth himself of a superior Lord, called *Lord Paramount*. Also he is called *Lord in Gros*, that is, a Lord having no Mannor, as the King in respect of his Crown: And there is a Case wherein a Private Man is *Lord in Gros*; as when a Man makes a Gift in Tail of all the Land he hath, to hold of him, and dieth, his Heir hath but a *Seigniori in Gros*.

LORDOSIS, by some Writers, is the Term for the bending of the Back-bone forwards in Children, &c.

LOTION, a Term used by some Chymists and Pharmacal Writers, signifying only the washing of any Medicine in Water. Some also call Remedies which are between a *Fomentation* and a *Bath*, and which are used to wash the Head, or any Part affected, by this Name of *Lotion*.

LOWER Flank, or *Retir'd Flank*; see *Flank*. A Term in Fortification.

LOXODROMIQUES, is the Art or Way of oblique Sailing by the *Rhumb*, which always makes an equal Angle with every Meridian; i. e. when you sail, neither directly under the Equator, nor under one and the same Meridian, but obliquely or across them. Hence the Table of Rhumbs, or the Traverse-Table of Miles, with the Difference of Longitudes and Latitudes, by which the Sailor may practically find his Course, Distance, Latitude or

Longitude, is by Sir J. Moore, and others, called by this Name of *Loxodromiques*; and such Tables as serve truly and expeditiously to find the several Requisites, or resolve the Cases of Sailing, are called *Loxodromical Tables*.

LOZENGE, is that Figure in Heraldry which the Geometers call a *Rhombus*, i. e. a Parallelogram, whose Angles are oblique, but Sides all equal; and the Distance between the two obtuse Angles always equal to the Length of one of the Sides. Thus,

In which it differs from the *Fusil*; which see.

In this Figure all unmarried Gentlemen and Widows do bear their Coats of Arms; because, as some say, 'twas the Figure of the *Amazonian Shield*; or, as others, because

'tis the Ancient Figure of the *Spindle*.

LUCIDA Corona, a Fixed Star of the Second Magnitude, in the *Northern Garland*; whose Longitude is 217 deg. 38 min. Latitude 44 deg. 23 min. Right Ascension 230 deg. 12 min.

LUCIDA Hydra: see *Cor Hydra*.

LUCIDA Lyra, a bright Star of the first Magnitude, in the Constellation *Lyra*; whose Longitude is 10 deg. 43 min. Latitude 61 deg. 47 min. Right Ascension 276 deg. 27 min. and Declination 38 deg. 30 min.

LUCIFEROUS, that which brings Light; a Word used by my Lord Bacon, and some other Naturalists, for such Experiments in Philosophy as do not so much enrich a Man, as inform and enlighten his Mind about some Physiologial Truth, or Speculation in Physicks.

LUES Veneræ, *Morbus Gallicus*, the *French Pox*, is a malignant and contagious Distemper, communicated from one to another by Coition, or other impure Contact; proceeding from virulent Matter, and accompanied with many ill Symptoms, such as *Gonorrhæa*'s, with the Falling-off of the Hair, Spots, Swellings, Ulcers, Pains in the Bones, &c.

LUES Deificæ: see *Caducus Morbus*.

LUFF, a Sea Term; the same with *Loof*: Which see.

LUMBAGO, is a Pain in the Muscles of the Loins, which *Blanchard* takes to be clogged with *Scorbutick Matter*; so that the Patient is forced to stand upright, being not able to sit down without great Pain.

LUMBALIS Musculi: see *Psoas Magnus*.

LUMBARIS Vena, a Vein arising from the descending Trunk of the *Cava*, and is not always one, but often two or three on each side, which they divide into the *Lumbaris Superior* and *Inferior*; they are bestowed on Muscles of the Loins, and on the *Peritoneum*.

LUMBARIE Arteries, are by some said to come from the *Aorta*, unto all the Parts of the Loins, and to the Marrow of the Back-bone; sending as many Branches to its joints, as there are Holes in it.

LUMBRICAL Muscles, are with some Anatomists, those Four Muscles which serve to move the Fingers or Toes, and are so called from their Worm-like Form.

LUMBRICALES, seu *Vermiculares*, are Muscles of the Fingers, so called from their Figure, being not much unlike the common Earth-Worms; they are also called *Flexores primi internodii digitorum*, from their Use. Those probably perform those minute Motions of the Fingers, when the second and third Internodes are curvated by the two last-treated

of Muscles; and therefore used in playing on Musical Instruments, and may be thence named *Musculi Fidiinales*.

LUMBRICALIS Pedis, is a Muscle of the lesser Toes, springing from the internal Part of the *Os Calcis*; and becoming tendinous, joyns with the Tendons of the *Perforans* in the middle of the Sole of the Foot; then dividing it self into Four (as it were) distinct fleshy Muscles, they all become tendinous at their Insertions to the internal Parts of each lesser Toe, laterally, next the Great Toe.

LUMINARIES. The Sun and Moon are so called by way of Eminence, for their extraordinary Lustre, and the great Proportion of Light that they afford us.

LUNA Cornea, is a tough insipid Mass, almost like Horn, made by pouring warily on Chrystals of Silver (which Chrystals were made by dissolving that Metal in good Aqua-fortis or Spirit of Nitre) either Spirit of Salt, or a strong Brine made of common Salt and Water. The Mixture is dried, and then brought to Fusion in a Crucible, or a Glass Phial; where, after it hath been kept a little while so, it turns into this Shape, which the Chymists call *Cornea Lune*.

In which Process, 'tis very remarkable, that tho' a Solution of Silver be commonly one of the worst of Bitters, and Spirit of Salt have a very fowre and acid Taste, yet the Union of these together, produces a Body perfectly insipid; which plainly shews that Tastes depend on Mechanical Principles, and are various, according to the various Textures of Bodies.

LUNARY Months, are either *Periodical*, *Synodical*, or *Illuminative*; which see in their proper Places.

LUNAR Cycle: see *Cycle of the Moon*.

LUNATIONS of the Moon, are the Times between one New Moon and another: And this is greater than the Periodical Month by two Days and five Hours; and is called the *Synodical Month*, consisting of 29 Days, 12 Hours, and $\frac{1}{2}$ of an Hour.

LUNES, or *Lunule*, in Geometry, are Figures in the Form of a Crescent or Half-moon, made by the Arks of two intersecting Circles; as in the following Figures the Space *L* is called a *Lune*.

PROPOSITION I.

1. The Quadrature of Hippocrates his Lunes.

I say, The Triangle *T*, is equal to the two Lunes *L* 1, and *L* 2.

DEMONSTRATION.

The Semi-circle on *BC*, is equal to the Semi-circles on *BA* and *CA*.

And the Segments, *S* 1 and *S* 2, are common to all the three Semi-circles: Which being taken from the greater Semi-circle, they leave the Triangle *T*, and taken from the two lesser Semi-circles, they leave the two Lunes, *L* 1 and *L* 2.

Therefore the Triangle *T* = to both the Lunes *L* 1, & *L* 2.

2. Otherwise in a Quadrant,

I say, The Triangle *T*, is equal to the Lune *L*.

DEMONSTRATION.

The Triangle *T* being Quadrantal and Isoscelar, it must be that $ABq = 2BCq$.

But $2BC = \frac{1}{2}$ Square of $2BC = \frac{1}{2}$ the Square of the Diameter of the greater Circle; that is, the Square of the Diameter of the greater Circle, is double the Square of the Diameter of the lesser Circle *AB*,

Therefore the Semi-circle on $2BC =$ twice the Semi-circle *BAC*; and consequently the Quadrant *ABC* = Semi-circle *BAC*.

Take therefore from each the common Segment *S*, and there remains the Lune *L* = to the Triangle *T*. Q. E. D.

3. To square the Half of the Lune *L*.

'Tis certain, that a Right Line drawn from *C* thro' the Center of the lesser Circle, must divide both Triangle, Segment and Lune into two equal Parts, and consequently $\frac{1}{2}T = \frac{1}{2}L$: And thus the Half-Lune is squared.

4. To square any Part less or greater than Half the Lune.

Let there be a Quadrant, as before, *BAC*, and a Lune, as *L*: 'Tis required to find the Segment of the Lune *BED*, made by the Line *EC* drawn to the Center of the greater Circle; which *Pardie* saith, is as difficult as squaring the Circle. Lib. 6. Art. 64.

Slack'd-lime, of each an Ounce; Potters-Earth, or Powder of Pots, half an Ounce. Make a moist Paste of these with Whites of Eggs, well beaten before with a little Water, and this will stop exceeding close. N. B. This may be very well used to stop the Cracks that will often happen in Glass Vessels; and there must be three Lays of the Paste bound on with Paper.

Mr. Boyle recommends on Experience for this last Purpose, the following Composition, viz. Good Quick-lime and Scrapings of Cheese pounded in a Mortar, with as much Water as will just bring the Mixture to a soft Paste; then spread it on a piece of Cloth, and apply it, as Occasion requires.

LUXATION, a Term in Chyrurgery, is the Dislocation, displacing, or putting any Bone or Joint out of its place.

LUXATOR Externus, a Muscle so called: See *Externus Auris*.

LYCANTHROPIA, *Rabies Hydrophobica*, a Madness proceeding from the Bite of a mad Wolf, wherein Men imitate the howling of Wolves. *Blanchard*.

LYGMOS, the Hickets, is a convulsive Motion of the Nerves, which spread up and down the Gullet, returning after short Intermiſſions: It proceeds

from some troublesome Matter [that vellicates the *Oesophagus*. *Blanchard*.

LYMPHA, is a clear limpid Humour, consisting of the Nervous Juice and of Blood, which being continually separated by the Glandules, is at last discharged into the Blood again by Vessels peculiar to it. The *Lympha* comes not immediately from the Blood, or Nervous Juice, as some think, but it is the Superfluity of each; which was more than enough for the Nourishment of a Part, like the Marrow in Bones. It is taken sometimes for that Water which flows from the pricking of Nerves, and other Wounds; and which does not really flow from the Nerves themselves, but from the Lymphatick Vessels which are cut and wounded. *Blanchard*.

LYMPHATICK Vessels: see *Venæ Lymphaticæ*.

LYMPHEDUCTS, the same with *Lymphatick Vessels*.

LYNX, the same with *Lygmus*.

LYPYRIA, is the Term some Writers give to a kind of Fever attended with an *Erysipelas*, or Choleric Inflammation of the Stomach and Guts; and tho' the inward Parts of the Body feel very hot, yet the outward ones are very cold. *Blanchard*.

LYRA, the *Harp*, a Constellation in the Northern Hemisphere, consisting of 13 Stars.

MACHINE, or *Engine*, in Mechanicks, is whatsoever hath Force sufficient either to raise or stop the Motion of a Body. These *Machines* are either *Simple* or *Compound*.

Simple Machines, are commonly reckoned to be Six in Number, viz. the *Balance*, *Leaver*, *Pulley*, *Wheel*, *Wedge* and *Screw*. To these might be added the *Inclined Plane*, since 'tis certain that the heaviest Bodies may be lifted up by the means thereof, which otherwise could scarce be moved.

Compound Machines, or *Engines*, are innumerable; in regard that they may be made out of the *Simple*, almost after an infinite manner.

MACHINA Boyleana, Mr. Boyle's Air-pump; which see. So called from that Noble Gentleman, being the first Inventor of that Engine.

MACROCOSM, is the whole Universe, in Contradistinction to *Microcosm*; which some will have to express the Lesser World, or the Body of Man.

MACULA Eptica, is a Spot of a brown or of a sad yellow Colour, about an Hand's Breadth broad, chiefly seizing upon the Groins, the Breast and Back, nay, sometimes it covers the whole Body; is attended with a certain slight Asperity of the Skin, which lets fall Scales, or a sort of Dendrieff from it, which yet do not stick all together, but are disseminated here and there, and sometimes disappear, sometimes break out again. *Blanchard*.

MACULÆ Solares; see *Spots in the Sun*.

MACULA Volatica, is a red or purple Spot here and there in the Skin; which, if it touch any Orifice in the Body, as the Mouth, Nostrils, Eyes, Ears, &c. and pierce so far, it becomes mortal: It is often fatal to Children. *Blanchard*.

MADRIER, in Fortification, is a thick Plank arm'd with Plates of Iron, and having a Concavity sufficient to receive the Mouth of the Petard when charged, with which it is applied against a Gate, or any thing else that you design to break down. This Term is also appropriated to certain flat Beacons, which are fix'd at the Bottom of a Moat, to support a Wall. There are also *Madriers* lined with Tin, which are cover'd with Earth, to serve as a Defence against artificial Fires.

MAGDALEONES, are Pieces of Plaister made up in Form of a Cylinder, or long Roll.

MAGICK Square, is when Numbers in Arithmetick Proportion are disposed into such parallel and equal Ranks, as that the Sums of each Row, as well diagonally, as laterally, shall be all equal.

5	10	3
4	6	8
9	2	7

Thus these Nine Numbers, 2, 3, 4, 5, 6, 7, 8, 9 and 10, being disposed into this Square Form, they do every way, directly and diagonally, make Eighteen.

MAGICK-Lantern, a little Optick Machine; by the means of which are represented on a Wall, in the Dark, many Phantasms and terrible Apparitions, which are taken for the Effect of *Magick*, by those that are ignorant of the Secret. This

Machine is compos'd of a Concave Speculum, reflecting the Light of a Candle, which passeth through the little Hole of a Tube, at whose End there is fasten'd another Glas: Between these two are successively placed many small Glasses, painted with different Figures, of which the most formidable are always chosen; and such as are most capable of terrifying the Spectators; so that all these Figures may be represented at large on the opposite Wall.

A Convex Glas will do the Thing as well as a Concave one. See the Theory of it fully explained in M. Molyneux his Excellent *Dioptr. Nova*, Prop. 89. p. 183. They are sold by all Perspective-makers, and particularly by Mr. John Marshall, at the Archimedes on Ludgate-hill, London; and Mr. Yarwell in the same Street.

MAGISTERY, a Word used by the Chymists; sometimes for very fine Powders, made by Solution and Precipitation of the Matter; as *Magistry of Bismuth*, *Lead*, &c. And sometimes 'tis made to signify *Resins* and *Resinous Extracts*. Thus the *Resins* of Jalap, Scammony, &c. are called *Magisteries*.

Mr. Boyle takes the true Notion of a *Magistry* to be a Preparation of Body (not an Analysis of it, for the Principles are not separated) whereby the whole, or very near the whole of it, by some Additament, is turned into a Body of a different kind; as when Iron or Copper is turned into Chrystals of Mars or Venus, &c.

The Canting Alchymists talk also of the *Magistry* of the *Philosopher's Stone*, which will be worth enquiring into, when they will tell us what the Stone it self is. For an Instance how they are made, I will mention two or three.

Magistry of Bismuth, is made by dissolving the Bismuth in Spirit of Nitre, and pouring upon it Salt-water, which will precipitate the *Magistry* to the bottom in a white Powder.

Magistry of Lead, is made by dissolving *Saccharum Saturni* in distilled Vinegar; and then precipitating it with Oyl of Tartar, made *per deliquium*.

Magistry or *Resine of Scammony*, *Jalap*, *Turbith*, &c. is made by a Dissolution of the Matter in Spirit of Wine; and then precipitating it by common Water, or Water impregnated with a little Alum. And after these manners are most other *Magisteries* made.

MAGISTERY of Tartar. See *Tartar Vitriolac*.

MAGMA, signifies the Dregs that are left after the straining of Juices.

MAGNA Assisa eligenda, is a Writ directed to the Sheriff, to summon four Lawful Knights before the Justices of Assize, there upon their Oath to chuse twelve Knights of the Vicinage, &c. to pass upon the Great Assize between A. Plaintiff, and B Defendant, &c.

MAGNA Charta, was granted the Ninth Year of Henry the Third, and confirmed by Edward the First. The Reason why it is termed *Magna Charta*, was either for that it contain'd the Sum

of all the Liberties of England, or else because there was another Charter, called *Charta de Foresta*, establish'd with it, which was the less of the two; or because it contained more than many other Charters, or more than that of King Henry the First, or of the great and remarkable Solemnity in the denouncing Excommunication, and direful Anathema's against the Infringers of it. *Holinshed* tells us, That King John, to appease his Barons, yielded to Laws or Articles of Government, much like to this Great Charter; but we have now no ancient Law written than this, which was thought to be so beneficial to the Subject, and a Law of so great Equity, in comparison of those which were formerly in use, that King Henry for the granting of it, had the Fifteenth Penny of all the moveable Goods, of both Temporality and Spirituality.

MAGNESIA Opalina, is a kind of *Crocus Metallorum*, or Liver of Antimony, but of a redder or more Opaline Colour than the common one. 'Tis made after the common manner, with equal Parts of Antimony, Salt-peter, and Sea Salt decrepitated. 'Tis less Emericke than the common one, because the Sea Salt fixes some of the active Sulphurs of the Antimony, and locks them up.

MAGNET, or Loadstone, is a Fossile approaching to the Nature of Iron-Oar, and endowed with the Property of attracting Iron, and of both pointing it self, and also inabling a Needle touch'd upon it, and then poised, to point towards the Poles of the World.

MAGNET. *Sturnius* in his *Epistola Inviatoria* Dat. Aitof. 1682. observes, That the attractive Quality of the Magnet hath been taken Notice of beyond all History: But that it was our Countryman Roger Bacon, who first discovered the Verity of it, or its Property of pointing towards the Pole, and this about 400 Years since. The Italians first discovered, that it would communicate this Virtue to Steel or Iron. The various Declination of the Needle, under different Meridians, was first discovered by *Sebastian Cabott*; and its Inclination to the nearer Pole by our Countryman *Robert Norman*. The Variation of the Declination, so that 'tis not always the same in one and the same place, he observes, was taken Notice of but a few Years before, by *Hewelius*, *Auzout*, *Petit*, *Volkamer* and others.

The Properties, or Phænomena, of this Wonderful Stone, as they have been discovered by Gilbert, Kircher, Cabeus, Des Cartes, and others, are these:

1. That in every Magnet there are two Poles, one pointing North, the other South; and if a Stone be cut or broken into never so many pieces, there are these two Poles in each piece.

2. That these Poles in divers Parts of the Globe, are diversely inclined towards the Earth's Centre.

3. That these Poles, tho' contrary to one another, do help mutually toward the Magnet's Attraction and Suspension of Iron.

4. If two Magnets are Spherical, one will turn or conform it self to the other, so as either of them would do to the Earth; and that after they have so conformed or turned themselves, they endeavour to approach to join each other; but if placed in a contrary Position, they avoid each other.

5. If a Magnet be cut thro' the Axis, the Parts or Segments of the Stone, which before were joined, will now avoid and fly each other.

6. If the Magnet be cut by a Section perpendicular to its Axis, the two Points which before were conjoined, will become contrary Poles, one in one, the other in the other Segment.

7. Iron receives Virtue from the Magnet by Application to it, or barely from an Approach near it, though it doth not touch it; and the Iron receives this Virtue variously, according to the Parts of the Stone 'tis made to touch, or made approach to.

8. If an Oblong piece of Iron be any how applied to the Stone, it receives Virtue from it only as to its Length.

9. The Magnet loses none of its own Virtue by communicating any to the Iron, and this Virtue it can communicate to Iron very speedily; tho' the longer the Iron touches or joins the Stone, the longer will its communicated Virtue hold; and a better Magnet will communicate more of it and sooner, than one not so good.

10. That Steel receives Virtue from the Magnet better than Iron.

11. A Needle touch'd by a Magnet, will turn its Ends the same way towards the Poles of the World, as the Magnet will do it.

12. That neither Loadstone nor Needles touch'd by it, do conform their Poles exactly to those of the World, but have usually some Variation from them: And this Variation is different in divers Places, and at divers Times, in the same Place.

13. That a Loadstone will take up much more Iron when arm'd or cap'd, than it can alone: And that tho' an Iron Ring or Key be suspended by the Loadstone, yet the Magnetical Particles do not hinder that Ring or Key from turning round any way either to the Right or Left.

14. That the Force of a Loadstone may be variously increased or lessened, by the various Application of Iron, or another Loadstone to it.

15. That a strong Magnet, at the least Distance from a lesser or a weaker, cannot draw to it a piece of Iron adhering actually to such lesser or weaker Stone; but if it come to touch it, it can draw it from the other: But a weaker Magnet, or even a little piece of Iron, can draw away or separate a piece of Iron contiguous to a greater or stronger Loadstone.

16. That in our North Parts of the World, the South Pole of a Loadstone will raise up more Iron than the North Pole.

17. That a Plate of Iron only, but no other Body interposed, can impede the Operation of the Loadstone, either as to its Attractive or Directive Quality. Mr. Boyle found it true in Glasses sealed Hermetically; and Glass is a Body as impervious as most are, to any Effluvia.

18. That the Power or Virtue of a Loadstone may be impaired by lying long in a wrong Position, as also by Rust, Wet, &c. and may be quite destroyed by Fire.

EXPERIMENTS of the Nature and Properties of the MAGNET.

1. Mr. Boyle found, that by heating a Magnet red hot, it could be speedily deprived of its Attractive Quality.

2. If a Loadstone be heated red hot, and then cooled either with its South Pole to the North, in a Horizontal Position, or with its South Pole downwards in a Perpendicular one, it will change its Polarity, the South Pole becoming the Northern one, and *vice versa*.

3. By applying the Poles of a very small Fragment of a Loadstone, to the opposite vigorous ones of a good larger Magnet, Mr. Boyle found he could speedily change the Poles of the Fragment; but he could not effect it in a Fragment that was considerably bigger, tho' he tried many Hours.

4. He observed, That well-temper'd and harden'd Iron Tools, when heated by Attrition, Turning, Filing, &c. they would, while warm, attract thin Filings, or Chips of Iron and Steel, but not when cold. Yet I remember once to have seen my self, and tried, that a Piece of a File, which was in the Hands of Mr. Yarwell the Spectacle-maker, did retain such an Attractive Quality, that it would take up, and keep suspended, the Key of a Cabinet, or *Escrivoire*, and needed no Attrition to excite this Magnetical Virtue.

5. The Iron Bars of Windows, which have long stood in an erect Position, do grow permanently Magnetical, the lower Ends of such Bars being the North Poles, and the upper the Southern: For according to the Laws of *Magnetism*, we find the lower Ends of such Bars will drive away the North End of a poised Needle, and will attract the Southern; which shews, that by the continual Passage of the Subtile Magnetical Particles thro' them, they are turned into a kind of Magnet themselves.

6. If a Bar of Iron that hath not long stood in an erected Posture, be only held Perpendicularly, its lower End will be the North Pole, and attract the South Point of a Touch'd Needle: But then this Virtue is transient, and will shift as you invert the Bar, for the other End when held lowermost, will presently become the North Pole; wherefore, in order to render the Quality of Verticity permanent in an Iron Bar, it must remain a long time in a proper Position. But the Fire will produce this Effect in a very short time; for as it will immediately deprive a Loadstone of its Attractive Power, or change its Poles, (as in *Exper. 1. 2.*) so it will as soon give a Verticity to a Bar of Iron, if being heated red hot, it be cooled in an erect Position, or directly North and South. Nay, it hath been observed often, that even Tongs and Fire-forks, by being often heated, and then set to cool in a Position near to erect, have gained this Magnetical Property.

The Reason of which very different Effects of the Fire on a Magnet, and on Iron, Mr. Boyle, with his usual Modesty, suggests to be this: That the peculiar Texture or Constitution by which a Magnet differs from common Iron Ore, being accurate and fine, is spoiled by the rude and violent Attacks of the Fire: But this mighty Agent, by working upon Iron, softens and opens the Pores of the Metal (which is harder than Iron Ore); so that it becomes capable of being pervaded by the Magnetical Particles, and by that means gains a Vertical Quality.

7. Mr. Boyle found that by heating a Piece of English Oker red hot, and placing it to cool in a proper Posture, it plainly gained a Magnetick Power.

8. The same Noble Gentleman found, that an excellent Loadstone of his own, having lain almost a Year in an inconvenient Posture, had its Virtue so impaired, that he at first thought some Body had got at it, and spoiled it by Fire.

9. If a Needle be well touch'd on a good Loadstone, 'tis known it will, when duly poised, point North and South; but if it have one contrary Touch of the same Stone, it will immediately be deprived of that Faculty; and by another such Touch, it will have its Poles quite changed; so that the End which before pointed North, shall now point Southward.

10. Dr. Power and Mr. Boyle both tried, that after a red-hot Iron had gain'd a Verticity, by being well heated and cooled North and South; and then also hammer'd at the Ends, this Virtue would immediately be destroyed by two or three Blows of a strong Hammer smartly given about the middle of it.

11. Mr. Boyle found by drawing the Back of a Knife, or long Piece of Steel Wire, &c. over the Pole of a Loadstone leisurely, once or divers times, beginning the Motion from the Equator or middle of the Stone, towards the Pole, the Knife or Wire will accordingly attract one End of a poised Magnetical Needle; but if you take another Knife or Wire, and thrust it leisurely over the Pole, from the Pole towards the Equator or middle of the Equator, this Knife shall expel or drive away the same End of the Needle, which the former Knife would attract: Which Experiment makes it very probable, that the Operation of the Magnet depends on the Flux of some fine Particles, which go out at one Pole, then round about, and in again at the other.

12. Because it is one of the Universal Laws of Nature, That *Action and Reaction are always equal*: Therefore 'tis plain, the Iron must attract the Magnet, as much as that doth the Iron: And so you may easily experiment it to be in Fact, if you place a Magnet or Piece of Iron on a Piece of Cork, so as that it may swim freely in the Water; for then you will see, that which soever you hold in your Hand, will draw the other towards it.

From all which Experiments, 'tis plain (as Mr. Boyle concludes) That *Magnetism doth much depend upon Mechanical Principles*. As also, That there is such a Thing as the *Magnetism of the Earth*; or that there are *Magnetical Particles*, which continually are passing from Pole to Pole; but Sir Isaac Newton demonstrates, that Gravity is a very different Thing from Magnetism; since the former is always as the Quantity of Matter attracted, but Magnetism by no means so.

Mr. Joblot, Professor of the Mathematicks in the French Academy of Painting, &c. hath found out (as it is said) a Method of making Artificial Magnets.

MAGNETISM, or *Magnetical Attraction*, or, as some are pleas'd to call it, *Coition*; is effected (say they) by the *Effluvia* of each Body, which drive away the Air between the Iron and the Stone; so that an Union of the Stone and the Iron is occasion'd by the joint Protrusion or Pulsion of the Air behind each.

But this Opinion is plainly refuted by Mr. Boyle's Experiment of a Loadstone's being equally Vigorous and Attractive in the exhausted Receiver, as in the open Air.

MAGNETICAL Amplitude, is an Arch of the Horizon, contain'd between the Sun at his Rising or Setting; and the East and West Point of the Compaſs: Or it is the different Riſing or Setting of the Sun from the Eaſt or Weſt Pointes of the Compaſs; and is found by obſerving the Sun at his Riſing or Setting, by an *Amplitude Compaſs*.

MAGNETICAL Azimuth, is an Arch of the Horizon, contained between the Sun's *Azimuth Circle*, and the *Magnetical Meridian*: Or it is the apparent Diſtance of the Sun from the North or South Point of the Compaſs; and may be found by obſerving the Sun with an *Azimuth Compaſs*, when he is about 10 or 15 Degrees high, either in the Forenoon or Afternoon.

MAGNETICAL Meridian; See *Meridian*.

MAGNIFIE, is a Word uſed chiefly in reference to *Microscopes*; which are uſually ſaid to *magnifie* Objects, or to make them appear bigger than they really are.

But in reality, *Microscopes* do not, nor can at all *magnifie* any Object, but only ſhew more of it to the Eye than before was taken Notice of; as will be apparent from the following Conſiderations.

For, Firſt, 'Tis clear that the Images of all Objects which are represented or pictured on the *Retina* in the Bottom of our Eyes, (and by which way all Viſion is made) thoſe Images, I ſay, muſt of neceſſity be very ſmall, in Proportion to the Objects themſelves; as is demonſtrable to any one's Reaſon, that will conſider the Smallneſs of the *Fundus Oculi*; and to his Senſes, that will but take the Pains to try the *Carteſian* Experiment, of putting a Bullock's Eye in the Hole of a darkned Room. (Vid. *Cart. Diopt.* cap. 5.) Now there being no Reaſon to ſuppoſe, that the bare Communication of that Picture to the Brain by the Optick Nerve, or Animal Spirits, can *magnifie* it again, ſo as to equal it with the Objects themſelves; it muſt and doth follow, that we always have Things represented to us leſs than they are, in the common way of Viſion.

2. At any conſiderable Diſtance we ſee but very little of the Object we behold, in Compariſon of what evades our Sight; and the nearer we come to it, the more ſtill we diſcover of it; and whenever we look in groſs upon an Object, our Eye cannot take Notice of many minute Differences, which, when we come to obſerve them ſingly, do yet very plainly appear; and after the neareſt View we can make with our bare Eye, very many Parts will yet remain undiscoverable to us: So that all that the *Microscope* doth, is (by taking off the Circular Radiation of Light) to direct our Eye to contemplate theſe minute Parts diſtinctly, ſingly, or by themſelves, which before we could either but confuſedly, or not at all, diſcern; and which now appearing (our Eyes thus armed with a Glaſs) very plain to us, make us attribute a new Magnitude to the Body we look on, becauſe we cannot imagine it can have thoſe Parts (which we now ſo diſtinctly ſee, and which before we could not ſee) unleſs its viſible Parts lie farther aſunder from each other than they did before, to make Room for theſe new to come between them.

3. But 'tis yet farther plain, that 'tis impoſſible any Glaſs can *magnifie* an Object, or make it

bigger to us than it really is in it ſelf: For to do this, muſt be to give it new Parts, and to remove the viſible Parts it hath already to a greater Diſtance from each other; both which are utterly impoſſible.

4. If you make a very ſmall Hole in a Piece of Tin or Braſs, and look thro' it on any Object, it will make it appear much bigger than before, and ſo much bigger as the Hole is leſſer; which plainly proves, that the Reaſon of any Object's appearing bigger thro' a *Microscope* is, as before, only bringing the Object nearer to the Eye, and letting ſome Parts of it be ſeen, which before were not diſcoverable by the bare Eye.

MAIM, or *Mayhim*, in Common Law, ſignifies a Corporeal Hurt, by which a Man loſeth the Uſe of any Member that is or might be of any Defence to him in Battel. But the cutting off an Ear, or Noſe, the breaking of the hinder Teeth, or ſuch like, is no *Maim*; and rather a Deformity of the Body, than diminiſhing of Strength: Yet cutting off a Noſe, or cutting or diſabling any Limb or Member, is Felony without Benefit of the Clergy.

Maim is commonly tryed by the Juſtices inſpecting the Party; and if they doubt whether it be a *Maim*, or not, they uſe to take the Opinion of ſome able Surgeon.

MAIN-Maſt of a Ship, is a long, large, and round Piece of Timber, ſtanding upright in her Middle or Waſt, on which is born her *Main-Yard*, and *Main-Sail*. Its Length is uſually $2\frac{1}{2}$ of the Length of the Mid-ſhip Beam.

MAIN-TOP-Maſt, is one half of the Length of the *Main-maſt*; and the *Top-gallant-maſt* half the Length of the *Main-top-maſt*.

MAINOUR, *Manour*, or *Meinour*, in a Legal Senſe, ſignifieth a Thing that a Thief taketh away, or ſtealeth: As to be taken with the *Mainour*, is to be taken with the Thing ſtollen about him.

MAINPERNABLE, is he that may be let to Bail. See the Statute of *Weſtm. 1. cap. 15.* made Anno 3. E. 1. what Perſons be *mainpernable*, and what not.

MAINPERNORS, are thoſe Perſons to whom a Perſon is delivered out of Cuſtody or Priſon, and they become Security for him, either for Appearance, or Satisfaction. They are called *Manu captores*, becauſe they do as it were *manu capere & ducere captivum à cuſtodia vel priſona*: And the Priſoner is ſaid to be delivered to *Bail*, from the Words of the *Bail-piece*, viz. *A. B. &c. traditur in Ballium J. D. & R. R. &c.*

MAINPRISE, in our Law, ſignifies the taking or receiving a Man into Friendly Cuſtody, that otherwiſe is or might be committed to Priſon, upon Security given for his Forth-coming at a Day aſſigned: And they that thus undertake for any, are called *Mainperners*, (which ſee) becauſe they receive him into their Hands; whence alſo comes the Word *Mainpernable*, denoting him that may be thus bail'd: For in many Caſes a Man is not *mainpernable*; whereof ſee *Bro. Tit. mainpriſe per totum*; and *F. N. B. fol. 249.* When *Mainpriſes* may be granted, and when not, ſee *Crompt. Juſtice of Peace*, fol. 136, and 141. And the *Mirror of Juſtices* ſays, That *Pledges* be thoſe that Bail or Redeem any Thing but the Body of the Man; but *Mainperners* are thoſe that free the Body of a Man; and therefore that *Pledges* belong properly

to real and mix'd Actions, and *Mainpernors* to personal.

MAINTAINOR, is he that supports or seconds a Cause depending in Suit between others, either by disbursing Money, or making Friends for either Party, towards his Help.

MAINTENANCE, is a Law-Term, signifying the Act of a *Maintainer*, when he seconds a Cause depending between others: And when it is accounted *Maintenance*, and when not, see *Broke Tit. Maintenance*. The Writ that lies against a Man for this Offence, is also called *Maintenance*.

MAJOR-General, is an Officer in an Army, that receives the General's Orders, and delivers them out to the Majors of the Brigades, with whom he consults what Troops are to mount the Guard, what to go out upon Parties, what to form Detachments, or to be sent on Convoys, &c. 'Tis his Business also to view the Ground to incamp on, and he is next subordinate to the General and Lieutenant-General.

MAJOR of a Brigade, either of Horse or Foot, is he that receives Orders, and the Word, from the Major-General, and gives them to the particular Majors of each Regiment. And the

MAJOR of a Regiment, is an Officer whose Business it is to convey all Orders to the Regiment; to draw it up, and to exercise it; to see it march in good Order, to look to its Quarters, and to rally it, if it happen to be broken in an Engagement, &c. He is the only Officer in a Regiment of Foot, that is allowed to be on Horseback in Time of Service; but he is mounted, that he may speedily get from Place to Place, as Occasion serves. There is also in a Garrison an Officer next to the Deputy-Governor, which is called the *Town*.

MAJOR; He ought to understand Fortification, and hath Charge of the Guards, Rounds, Parroilles and Sentinels.

MAJUS-Fus, is a Writ or Proceeding in some Customary Manors, in order to a Tryal of Right of Land.

MAKE; a Word frequently used by Lawyers, signifying, to Perform or Execute: As, to *make his Law*, is to perform that Law which he hath formerly bound himself to; that is, to clear himself of an Action commenced against him by his Oath, and the Oaths of his Neighbours. To *make Services or Customs*, is nothing else but to perform them; and to *make Oath*, is to take Oath.

MALACIA, is a depraved Appetite, which covets those Things which are not fit to be eaten; also a Tenderness of Body. *Blanchard*.

MALACTICA, or *Emollientia*, are Things which soften the Parts by a moderate Heat and Moisture, by dissolving some of them, and dissipating others. *Blanchard*.

MALAGMA, the same with *Cataplasin*; also 'tis used in the same Sense as *Malactica*.

MALIGNUS Morbus, a malignant Disease, is that which rages more vehemently and continues longer than its Nature usually permits it to do; as a Pestilential Fever, &c.

MALLEABLE, that which will bear being hammered, and spread, being beaten. This Quality belongs in the highest Degree to Gold, which is the most *ductile* or *malleable* of any Metal whatever. Mr. Boyle reckons the Qualifications requisite to Malleableness, to be, Having the Corpuscles, or Particles of such an adapted Size, Shape, and

Figure, whether hooked, branched, &c. that they can take fast hold of one another, and stick so close, as to make the Body spread easily under the Hammer, and not break nor crack.

MALLEUS, is one of the Four little Bones in the Ear.

MALLEOLUS, or *Malleus Pedis*, is Two-fold: *External*, which is the lower Process at the Foot of the Bone of the Leg, called *Fibula*; or *Internal*, which is the lower Process of the Bone of the Leg, called *Tibia*: These make up or form the Ankle.

Malleolus is also used as a Term in Botany, for a Sprout that grows out of a Branch which grew out its self but the Year before. *Columella*.

MALTHACODE, is a Medicine softened with Wax. *Blanchard*.

MALUM Mortuum, the Dead Discase, is a sort of Scab; so called, because it makes the Body appear black and mortified. It is in Colour black, and inclining to blue, and appears with a Crusty sort of Pimples, unseemly, and filthy, but without sending out Matter, or giving the Patient Pain. It infects the Hips and Legs especially. *Blanchard*.

MAMILLARY Artery, or the *Mammaria*, is a Branch of the Arteries which supplies the Breasts, and issues out of the adjoining Trunk of the *Aorta*, as some say; but more properly it ought to be said to come from the superior Part of the Subclavian Branch of the Ascending Trunk of the *Aorta*.

MAMMA, *Mammilla*, *Uber*, the Breasts, Dugs, &c. The *Grammarians* call the inner Part *Uvera*, and the outward Protuberances *Mamme*. The Substance of the Breasts is a white and soft Body, consisting internally of a Congeries of Conglomerated Glandules, by the means whereof the Milk is separated from the Arterious Blood, and is conveyed out by very little Pipes, which pass thro' the Nipples.

MAMMARY Vessels, are the Arteries and Veins that run through the Muscles and Glands of the Breasts.

MAMMIFORMES Processus, are the two Apophyses of the Bone of the back-part of the Skull.

MANDAMUS, is a Writ that lieth after the Year and Day; whereas in the mean Time the Writ called *Diem clausit extremum* hath not been sent out to the Escheator for the same Purpose to which it should have been sent forth. See *Diem clausit extremum*.

Mandamus is also a Charge to the Sheriff, to take into the King's Hands all the Lands and Tenements of the King's Widow, that against her Oath formerly given, marryeth without the King's Consent.

MANDATE, is a Commandment of the King, or his Justices, to have any thing done for Dispatch of Justice; whereof you shall see Diversity in the Table of the *Registar Judicial verbo Mandatum*.

MANDATARY, in Law, is he to whom a Charge or Commandment is given: Also he that obtains a Benefice by *Mandamus*.

MANDIBULA, or rather *Maxilla*, the Jaw; is either *Upper* or *Lower*. The *Upper Mandible* consists of Twelve Bones, on each Side Six. The First is at the external Corner of the Eye, which joyned with the Fore-process of the Bone of the Temples, produces the *Jugal Bone*. The Second constitutes

constitutes the inner Corner of the Eye, has a large Passage in it, by which the super-abundant Moisture of the Eye descends to the Nostrils. The Third is within the Circle of the Eye, interposed betwixt the other two. The Fourth, the greatest of all, forms the greatest Part of the Cheeks and the Palate, and is elaborately contrived with proper Cavities for the Reception of the Teeth. The Fifth helps to make the Nose. The Sixth, with another Bone along with it, terminates the Extremity of the Palate. And all those are joyned rather by a plain Line, than by Sutures. The Lower Jaw, at riper Years, grows into one continued Bone, extreme hard and thick, and consequently very strong: It has two Processes, one Acute, called *Corone*; the other in the Form of a little Head, called *Condylus*. It has two Holes within, and as many without, which make way for the Nerves: The Under Teeth are implanted in it, and is joyned with the inner side of the Bone of the Temples, called *Os petrosum*. To these Twelve Bones, *Colubus* and *Laurentius* are for adding a Thirteenth, which, they say, lies between the innermost Space and the *Os sphaeroides*, dividing the most inward Part of the Nostrils into two Parts, like a *Septum*; and therefore they call it *Vomer*. To these *B. Vesalius* would have the *Ossa spongiosa*, which are in the innermost Cavity of the Nose, to be added also.

MANGER in a Ship, is a Circular Place made with Planks fastened on the Deck, right under the *Hawfs*, being about a Foot and half in Height: The Use of which is to catch and receive the Sea-water, beating in at the *Hawfs* in a Strefs of Weather.

MANIA, a sort of Madness, is a Deprivation of Imagination and Judgment, with great Rage and Anger, but without a Fever; altho' a Fever may be joyned with a *Mania* proceeding from some other Cause.

MANICA *Hypocratis*, or *Hypocrates his Sleeve*, is a Woollen Sack or Bag, in Form of a Pyramid; wherewith *Aromatick* Wines, Medicines, and many other Liquors are streined. 'Tis so called by the Chymists.

MANIPULUS, is a Dry Measure, usual with Physicians in their Prescriptions: For it is a determinate Quantity, to wit, as much as can be held in one Hand, meant for the most part of Herbs.

Fasciculus is a different Quantity from

Manipulus, an Handful; for it properly signifies an Armful.

MANNER, a Word now much in Use, which we have borrowed from the French *Maniere*. In Painting, it signifies the Usage, Way, Mode, or *Manner* any Painter hath acquired, not only in the Management of his Hand or Pencil, but also as to his Observance of the Three principal Parts of Painting, *Invention*, *Design*, and *Colour*: And according as any one hath gotten a Habit or peculiar Way of Painting, we say, He has such a *Manner*. If it be agreeable to the Rules of this Art, Natural, Strong, Easy, and Duly Proportioned, we say, 'Tis a *Good manner*; and if the contrary, A *Bad manner*. If he imitate any famous Ancient Painter, as *Mich. Angelo*, *Raphael*, &c. we say, He *paints after their manner*. So 'tis also in Sculpture; and now adays in *Singing*, or *Playing* on any Instrument: When we would express our Approbation of any one's Way of *Singing* or *Playing*, we say, He *hath a very Good manner*.

MANNOPUS, a Term in the Common Law, signifying Goods taken in the Hand of an apprehended Thief.

MANOR, was a Noble sort of Fee granted partly to Tenants for certain Services to be performed, and partly reserved to the Use of the Family, with Jurisdiction over his Tenants for their Farms: The whole Fee was termed a *Lordship*, of Old a *Barony*; from whence the Court, that is always an Appendant to the *Manor*, is called, The *Court-Baron*. Now a *Manor* rather signifies the Jurisdiction and Royalty incorporeal, than the Land or Site: For a Man may have a *Manor in gross*, that is, the Right and Interest of a Court-Baron, with the Perquisites thereunto belonging; and another, or others, have every Foot of the Land. But at this Day a *Manor* cannot be made, because a *Court-Baron* cannot now be made, and a *Manor* cannot be without a *Court-Baron*.

MAN-SLAUGHTER, is the unlawful Killing of a Man, without prepened Malice: As when Two, that formerly meant no Harm one to another, meet together, and upon some sudden Occasion falling out, the one killeth the other. It differeth from *Murder*, because it is not done with foregoing Malice; and from *Chance-medley*, because it hath a present Intent to kill. And this is Felony, but admitted to the Benefit of the Clergy for the first Time.

MANTELETS, in Fortification, are a kind of movable Pent-houses, and are made of Pieces of Timber saw'd into Planks; which being about three Inches thick, are nail'd one over another to the Height of almost six Foot. They are generally cased with Tin, and set upon little Wheels, so that in a Siege they may be driven before the Pioneers, and serve as Blinds, to shelter them from the Enemies Small-shot. There are also other Sorts of *Mantelets*, cover'd on the Top, whereof the Miners make use to approach the Walls of a Town or Castle.

MANTLE, in *Heraldry*, is that Appearance of the Foldings of Cloth, Flourishing or Drapery, that is, in any Achievement, drawn about a Coat of Arms: 'Tis supposed to have formerly been the Representation of a Mantle of State in Blazon; 'tis always said to be doubled, *i. e.* Lined throughout with one of the Furs, as Ermin, Pean, Very, &c.

MANUCAPTIO, is a Writ that lies for a Man, who taken upon Suspicion of Felony, and offering sufficient Bail for his Appearance, cannot be admitted thereto by the Sheriff, or other having Power to let to *Mainprize*.

MANUS Christi, is a sort of Refined Sugar, so called, because it is put into Cordials for very weak People. *Blanchard*.

MANUTENENTIA, is a Writ used in case of Maintenance. See *Maintenance*.

MAP, is a Description of the Earth, or some particular Part thereof, projected upon a plain Superficies; describing the Form of Countries, Rivers, Situation of Cities, Hills, Woods, and other Remarks.

MARASMODES, is the Term for a Fever, which at last ends in a Consumption.

MARCHASITE, is the General Term for a Mineral Body, having in it some Metalline Parts; tho' many of them hold but a very little Quantity of Metal. See *Fossils*.

MARINE Barometer. See *Barometer*.

MARISCA, the same that *Ficus*.

MARI-

MARITAGIO *amisso per defaultam*, is a Writ for the Tenant in *Frank-marriage*, to recover Lands, &c. whereof he is divorced by another.

MARITAGIO *Forisfacto*. See *Forfeiture of Marriage*.

MARLINE, is a small Line made of Hemp untwisted, that it may be the more gentle and pliable; its use is to *seize* the ends of Ropes from *farcing out*: They use it also to seize the Straps at the Arle (as they call it) or lower end of the Block. *Marling a Sail*; is, when being so ript out of the *Bolt Rope*, that it cannot be sewed in again, the Sail is fasten'd by *Marline*, put thro' the Eye-let Holes made in it for that Purpose unto the *Bolt Rope*.

MARLINE Spikes, are small Spikes of Iron made for the Splicing together of small Ropes; and also to open the Bolt Ropes when the Sails are sewed into them. They are only a kind of small *Fidd*; which see.

MARMORATA *Aurium*, Ear-wax, is a certain Excrement of the Ear, laid there in the Auditory Passage from the Openings of the Arteries, or Sweat out from the Cartilages.

MARROW. See *Medulla*.

MARSHAL: There be with us divers Officers of this Name; as *Lord or Earl Marshal of England*, whose Office consists chiefly in Matters of War and Arms, as well with us as in other Countries. Also, the *Marshal of the King's House*, whose special Authority is in the King's Palace to hear and determine all Pleas of the Crown, and to punish Faults committed within the Verge, and to hear and judge of Suits between those of the King's Household, &c. There be several other Officers of this Name, as *Marshal of the Justices in Eyre*; *Marshal of the King's Bench*, who hath the Custody of the King's Bench Prison in *Southwark*: *Marshal of the King's Hall*, whose Office is, when the Tables are prepared, to call out both those of the Household, and Strangers, according to their Worth, and decently to place them, &c. Also *Marshal of the Exchequer*, to whom the Court committeth the Custody of the King's Debtors during the Term-time, for securing the Debts: He also assigneth Sheriffs, Elcheators, Customers, and Collectors their Auditors, before whom they shall account.

MARSHALSEA, is the Court or Seat of the *Marshal of the King's Household*, who formerly perhaps used to sit there in Judgment, or keep his Prison; and is now allowed for the Prison in *Southwark*.

MARSUPIALIS *feu Bursalis*, is a Muscle of the Thigh, so called from its Tendons running through (as it were) a second fleshy Beginning of it self, which Duplication represents a Purse: It is also called *Obturator Internus*; it ariseth broad and fleshy, from that part of the *Os Ilium*, *Iscium*, *Pubis*, and Ligament that is extended in the Great Foramen of the two last named Bones internally, and marches tranversely in the *Sinus* of the *Iscium*, (fenced on each side by two Processes, the one Acute and the other Obtuse) where it is externally fleshy, but internally it hath three, sometimes four Tendons passing in so many distinct Furrows in the said *Sinus*, like so many Cords in a Quadruple Pulley, where it meets with the other fleshy beginning, commonly called its *Marsupium*, arising from the above-mentioned Acute and Obtuse Processes, which joining with the said Tendons at their united Insertion to the Superior part of the Root of the

great *Trochanter*, near the Implantation of the *Pyriformis*: When this Muscle acteth, its Insertion is directed towards that part of the *Iscium*, over which its Tendons run after the manner of a Pulley, and the *Os Femoris* is thereby turned outwards.

MARTIAL *Regulus of Antimony*. See *Regulus*. When any Particles are said to be of a *Martial Nature* in Chymistry or Natural Philosophy, 'tis meant, that they partake of the Nature of Iron or Steel. The Chymists calling Iron, *Mars*.

MARTIAL Law, is the Law of War, depending upon the King's Pleasure, or his Lieutenant: For the King in time of Peace, never makes any Laws, but by common Consent in Parliament, yet in War he useth absolute Power, inasmuch, that his Word is a Law; but even this Power hath of late Years been invested in the King, or his Generals of the Army by Act of Parliament, and under particular Restrictions too. Read the new Acts of Parliament for punishing Mutineers and Deserters, &c.

MARTLET, the Term in Heraldry for a Pidgeon, with its Feet erased or torn off; 'tis also the Difference, or mark of Distinction in an Escutcheon for the fourth Brother or Family.

MARTNETS in a Ship, are small Lines fastened to the *Leetch* of the Sail, being Reeved thro' a Block on the Topmast-head, and so they come down by the Mast to the Deck. Those *Martnets* which belong to the Top-sails are fastened (after the same way) to the Heads of the Top-gallant Masts, but their *Fall* comes down no farther than the Top, when it is haled: The Word is *Top the Martnets*; i. e. Haul them up. Their design is, in furling the Sail, to bring that part of the *Leetch* which is next the *Yard Arm*, close up to the Yard, that so the Sail may furl up the Closer.

MARS, the Name of one of the Planets which moves round the Sun in an Orbit between that of the Earth and *Jupiter*.

To view this Planet, there requires a good Telescope, with small Apertures on the Object-glass, or else his Glairy Light makes but a confused Appearance.

This Planet as (well as the rest) borrows its Light from the Sun; and has its Increase and Decrease of Light like the Moon; and it may be seen almost bisected when in his Quadratures with the Sun, or in his *Perigaeon*, but never corniculated or falcated as the other Inferiors.

March 10. 1665. Dr. Hook observed this Planet, with a 36 Foot Tube, and saw its Body as large very near as the Moon at Full; and in it he observed several Spots, and particularly a Triangular one; which having a Motion, he concluded the Planet to have a turbinated Motion round its Centre.

In the Year 1666, *February* the 6th in the Morning, Mr. Cassini with a 16 Foot Telescope, observed two dark Spots in the first Face of *Mars*, moving from 11 at Night until break of Day.

February the 24th in the Evening, he saw two other Spots in the other Face of this Planet, like those of the first, but much bigger: And continuing the Observations, he found the Spots of these two Faces to turn by little and little from East to West, and to return at the Space of 24 Hours, 40 Minutes, to the same situation, where in they were seen at first.

Whence he concluded, That the Revolution of this Planet round its Axis, is perform'd in the space

space of 24 Hours; 40 Minutes, or thereabouts.

The Distance of *Mars* from the Sun, is about one and an half of that of the Earth from the Sun; and therefore to an Eye placed in *Mars*, the Diameter of the Sun would appear by one and an half less than it doth to us, and consequently his Light and Heat will be but half of what it is here on our Earth; but this admits of a sensible Variation, because of the great Eccentricity of *Mars* his Orbit; yet not so great as in *Mercury*.

Mars his Year is almost twice as long as ours, and his *Natural Day* a little greater than ours; but his *Artificial Day*, or the Time in which the Sun appears above his Horizon (besides the Twilight before Sun-rise, and after Sun-set, according to the daily Height of the Atmosphere) is almost every where equal to his Night; and consequently, in one and the same place on his Surface, there can be but little Variety of Seasons as to Summer and Winter, &c. the Reason of which is, That the Axis of the Diurnal Revolution of this Planet, is nearly at Right Angles with the Plane of the Orbit. But Places situate in divers Latitudes, or at divers Distances from his Equator, will have very different Degrees of Heat, by reason of the different Inclination of the Sun's Rays to the Horizon; as is the Case of our Earth when the Sun is in the Equinoxes.

And from hence the Learned Dr. Gregory, in his *Astronom. Phys. & Geometr.* p. 473. conjectures very probably, That the *Fascia* of this Planet do arise: which are certain *Swathes* or *Fillets* which appear in *Mars*, and are posited parallel to his Equator. For since there is always in the same Climate (*here*) nearly the same Degree of Heat, 'tis likely, that these Spots in *Mars* owing their Original to Heat and Cold, (as in our Earth Clouds and Snow do) may be extended in the said Climates in Parallels to the Equator, or to the Circle of *Mars* his Diurnal Revolution, and so form the *Fascia*. And the same is true of *Jupiter*, which, as well as *Mars*, hath a perpetual Equinox.

That *Mars* hath an Atmosphere, like ours, is argued from the Phenomena of the Fixed Star's appearing obscur'd, and, as it were, extinct, when they are seen just by the Body of *Mars*: And if so, a Spectator in *Mars* will hardly ever see *Mercury*, unless it may be in the Sun, when that Planet passes over his Disk like a Spot, as he doth sometimes to us.

To an Eye in *Mars*, *Venus* will appear about as far from the Sun, as *Mercury* doth from him with us; and the Earth, as far as *Venus* appears to us, to be from the Sun. And when the Earth, being seen from *Mars*, appears in Conjunction with, and very near to the Sun, the *Martial* Spectator will see that which *Cassini* once or twice saw in *Venus*, viz. the lower Planet (or the Earth) appear horned or falcated; and its Satellite, the Moon of the same Figure, and at its greatest Distance, not above 15 minutes of a Degree from the Earth. *Greg. Astronom.*

MARSHAILING a Coat of Arms (in Heraldry) signifies the due and proper joining of several Coats of Arms in one and the same Shield or Escutcheon, together with their Ornaments, Parts and Appurtenances.

MASCLE, a Term in Heraldry for a Bearing of this Figure: Gules a Chevron Ermin between three *Masles* Argent, by the Name of Bellgrave. *Guillim* saith, the *Masle* represents the Mesh of a Net, and is an honourable Bearing. A *Masle* differs from a *Lozenge*, only by being voided.

MASSE: This Word is used by the Natural Philosophers to express the Quantity of Matter in any Body, and this Sir *Isaac Newton* saith, he found by most accurate Experiments on *Pendulums*, to be always proportionable to the Weight of Bodies, which is a good Argument to prove the Necessity of allowing a Diffeminate Vacuum.

MASSETERS, in Anatomy, are short, thick Tendinous Muscles of the Lower Jaw, produced forwards from the *O. Primum* of the Upper Jaw, and backwards from the *Jugal Bone*; they are connected to the Lower Jaw. They assist the *Temporales* to move it to the Right-side, Left-side, and forward, according to the various Disposition of the *Fibres*.

MASTER of the Rolls, is an Assistant to the Lord Chancellor, or Lord Keeper of the Great Seal of England, in the High Court of Chancery, and in his Absence, hears the Causes there, and giveth Orders. He is by some called *Clerk of the Rolls*. And he has the disposing of the Offices of the Six Clerks, Clerks of the Petty Bag, Examiners of the Court, and Clerks of the Chapel.

MASTERS of the Chancery, are Assistants in Chancery to the Lord Chancellor, or Lord Keeper of the Great Seal, in Matters of Judgment. Of these there are some Ordinary, some Extraordinary; of Ordinary there are Twelve, (whereof the *Master of the Rolls* is accounted one) whereof some sit in Court every Day in each Term, and have referred to them (at the Lord Chancellor, Lord Keeper, or Master of the Rolls Discretion) Interlocutory Orders for stating Accounts, computing Damages, and the like; taking of Oaths, Affidavits, and Acknowledgments of Deeds and Recognizances. The Extraordinary do act in all the Country Ten Miles from London, by taking Recognizances and Affidavits, Acknowledgment of Deeds, &c. for the Ease of the Subject.

MASTICATION, or Chewing, is an Action; whereby we break and divide the Meat into small Pieces with our Teeth, and mix it with the Spit or *Saliva*, in order to its being the more easily fermented, digested, and turned into Chyle in the Stomach.

MASTICATORIES, are Medicines which are designed to provoke Spitting. By some they are called *Apoplegmatics*.

MASTOIDEI, in Anatomy, is the same with *Mammillares*, and are such Processes any where, as are like Breasts or Dugs, which from a broad Basis, end in an obuse Top, and are shaped like the Teats in a Cows-Udder.

This Name is given by some Writers to those Muscles which bend the Head proceeding from the Neck-bone and the Breast-bone, terminating in the Process *Mammiformis*. These Muscles arise partly tendinous, and partly fleshy, from the Upper Part of the *O. Pectoris*, near half the Clavicle;

vicle; with two seemingly distinct Originations. Mr. Cowper saith, When either of these Muscles act, they turn the Face to the contrary side. The *Process*, or *Apophysis* of the *Os Temporale*, which is in Shape something like the Teats of a Cow, is called by this Name; and so are the Processes of the *Olfactory Nerves*.

MASTS of a Ship, are the Main-mast, Main-top-mast, Main-top-gallant-mast, Fore-mast, Fore-top-mast, Fore-top-gallant-mast, Mizzen-mast, and Mizzen-top-mast; amongst which, may also be reckoned her Bolt-sprit; all which see.

For the Proportion of Masts, Sir H. Manwaring gives these Rules. Whatever the Breadth of a Ship be in Feet, multiply $\frac{1}{4}$ of that Breadth by 30, the Product is the Length of her Main-mast in Yards. Thus if a Ship be 30 Foot at the *Midship-Beam*, $\frac{1}{4}$ of 30 is 24: Therefore that Ship's Main-mast must be 24 Yards, or 72 Feet in Length. Then for its Bigness, he allows an Inch to every Yard in Length; and therefore this Main-mast must be 24 Inches thro' or thick.

The Fore-mast of a Ship must be $\frac{2}{3}$ of the Length of the Main-mast, that is in this case, 19 Yards $\frac{2}{3}$, or 57 Feet $\frac{2}{3}$. Thick or through, it must be near 20 Inches.

The Bolt-sprit or Bow-sprit, is always the same Length and Bigness with the Fore-mast. And the Mizzen-mast must be just half the Length of the Main-mast, and half as thick.

MATER Dura, called also *Dura Meninx*, is a Membrane which sticks close to the Skull within, in some places, and mediately covers both the Brain and *Cerebellum*; it has four Cavities, which supply the Place of the Veins, and come together betwixt the Brain and *Cerebellum*, which Conjunction is called *Torcular*.

MATER Tenuis, or *Pia Meninx*, is a Membrane which immediately cloaths the Brain and *Cerebellum*; is extremely full of Sanguinary Vessels, and is design'd, as some think, to keep in the Spirits generated in the Brain and *Cerebellum*, that they fly not away.

MATERIA Medica, is whatever is used in the Art of Medicine for the Prevention or Cure of Diseases, whether collected or prepared from Plants, Animals, Minerals, &c. by Chymistry or Pharmacy.

MATHEMATICKS, originally signifies any Discipline or Learning (*μαθηματικα*) but now, 'tis properly that Science which teaches or contemplates whatever is capable of being numbered or measured, as it is computable or measurable.

And that Part of *Mathematicks* which relates to Number only, is call'd *Arithmetick*: That which relates to Measure in general, whether Length, Breadth, Motion, Force, &c. is called *Geometry*.

Mathematicks may be reckon'd either,

1. *Pure, Simple, or Abstracted*, which considers abstracted Quantity, without any relation to Matter, or Sensible Objects. Or,

2. *Mixt Mathematicks*, which is interwoven every where with Physical Considerations.

Mathematicks also are divided into

Speculative, which proposes only the simple Knowledge of the Thing propos'd, and the bare Contemplation of Truth or Falshood: And

Practical, which teaches how to demonstrate something useful, or to perform something that shall be propos'd for the Benefit and Advantage of Mankind.

MATHEMATICAL Horizon, is the same with *True Horizon*. See *Horizon*.

MATRASS, or *Bolt-head*, is a long frait-necked Vessel of Glas, frequently used by the Chymists in Distillations; and when they are fitted to the Nose of an Alembick, they are called *Receivers*, because they Receive the Matter which the Fire forces over the Helm or Head of the Still. They are of this Figure. And when one of these is by its Neck lured well into the Neck of another, they call it a Double Vessel, which is used for the Circulation of Spirits, and for the Opening or Subtilizing of any Body by a long Digestion.

MATRIX, the same that *Uterus*. **MATRIX** of a Tree or Plant, is the same with what the Botanists call *Cor*; which see.

MATTER, or *Body*, is an impenetrable, divisible, and passive Substance, extending into Length, Breadth and Thickness. This, when consider'd in general, remains the same in all the various Motions, Configurations and Changes of Natural Bodies, being capable of putting on all manner of Forms, and of moving according to all manner of Directions and Degrees of Velocity.

The Quantity of Matter in any Body, is its Measure, arising from the joint Consideration of the *Magnitude* and *Density* of that Body: As if any Body be twice as *dense* as another, and take up *twice the Space*, 'twill be four times as great. This Quantity of Matter is best discoverable by *Weight*, to which 'tis always proportionable; as the Excellent Sir *Isaac Newton*, by most accurate Observations on Pendulums, found true by Experience.

Dr. Woodward, in his *Essay towards a Natural History of the Earth*, Part 5, asserts Matter to be originally and really very different; being at its first Creation divided into several *Ranks, Sets or Kinds of Corpuscles*: That all the *Corpuscles* which are of the same *Kind or Set*, agree in every thing, and are most exactly like unto one another in all respects. But those that are of *different Kinds*, differ from one another every way, as well in *Matter or Substance*, in *Specifick Gravity*, in *Hardness*, in *Flexibility*, and in several other ways, as in *Bigness* and *Figure*. And he supposes, that from the various *Composures and Combinations* of these *Corpuscles* together, happen all the Varieties of the Bodies formed out of them; and all their Differences in Colour and outward Appearance, in Taste, in Smell, in Hardness, in Specifick Gravity, and in all other respects.

MATTER in Deed, and *Matter of Record*, are Terms in Law, which are said to differ thus: *Matter in Deed*, seems to be nothing else but a Truth to be proved, tho' not by any Record; and *Matter of Record* is that which may be proved by some Record. For Example: If a Man be sued to an *Exigent*, during the Time he was in the King's Wars; this is *Matter in Deed*, and not *Matter of Record*: And therefore he that will alledge this for himself, must come before the *scire facias*, before Execution be awarded against him; for after that, nothing will serve but *Matter of Record*; that is, some Error in the Process appearing upon Record.

MATTS on Board a Ship, are a kind of broad thick Clouts, wove out of spun Yarn, Sinner, or Thrums; and are used to preserve the Main and Fore-Yards from galling against the Masts at the Tyes, and at the Gunnel of the Loof: Also they serve to keep the Clew of the Sail from galling there; as also to save the Clews of the Fore-sail from doing so at the Beak-head and Bolt-sprit.

MATURITY, the just Ripeness of any Fruit; and by Analogy, the Arrival of any thing to its just Degree of Perfection.

MATURATION, is the Action of growing Ripe, or the Tendency of any Fruits towards Maturity or Ripeness.

MAUNCH: The Figure of an Ancient Sleeve of a Coat, is so called by the Heralds, and is born in many Gentlemen's Escutcheons; as in the Earl of Huntington's, in those of the Coniers, &c.

MAXILLA Superior, the Upper Jaw-bone: This constitutes the inferior and lateral Parts of the Orbit of the Eye, and comprehends also the Bones of the Nostrials, Palate, and Upper Row of Teeth. It hath, according to *Diemerbrook*, Twelve Bones belonging to it, Six on each side. The First is called the *Os Jugale*, and is of a Triangular Form, and posited at the External Angle of the Eye. The Second is called the *Foramen lacrymale*, and is a thin pellucid small Bone, placed in the Internal Angle of the Eye, and gives a Passage to that Liquor which makes the Tears. 'Tis near this *Foramen* that the *Abscesses*, which the *Greeks* call *Ægileps*, and we *Fistula lacrymalis*, usually happens. The Third is a thin pellucid Bone, placed between the two former, and within the Orbit of the Eye, and which is continued with the fungous Bones of the Nostrials. The Fourth is a large Bone, constituting the greatest Part of the Cheek and Palate, and receiving into it the Upper Teeth by their proper Cavens: It hath an eminent conspicuous *Foramen*, or Hole, placed under the Orbit of the Eye, and transmitting to the Face a Branch of the Third Pair of Nerves. It hath also another *Foramen* at the hinder part of the *Dentes incisivi*; and then there go up two *Foramina*, with a Bony Partition between them, one to each Nostril. The Fifth is a thin, hard, small, oblong Bone, approaching to a square Figure; and this, with its Partner on the other side, continues the Bridge, or protuberant Bone of the Nose. The Sixth Bone forms, with its Fellow, the Bony Part of the Palate, or Roof of the Mouth. *Fallopian*, *Columbus*, and some others, add to these a Thirteenth Bone, which they call *Vomer*, and place it between the Palate and *Os spheroides*; and will have it like a kind of *Septum*, to divide the Lower Parts of the Nostrials. And *Vesalius* reckons the Two *Ossa spongiosa* among these Bones of the Superior Maxilla.

MAXILLA Inferior, is the Lower or Moveable Jaw: This contains all the Lower Teeth. It hath two Processes on each side; of which, the Foremost is thin and large, and ends in a kind of Point, to which the Tendon of the Temporal Muscle is firmly knit, and this is called *Corona*: The other is obtuse, and lies more backwards, and is join'd by a Cartilage to the Neck; and its Part, by which it adheres, they call *Condylus*: It hath Four *Foramina* design'd to transmit the aforesaid Processes.

MAXIMIS and *Minimis*. The Mathematicians call that Method whereby a Problem is resolv'd, which requires the greatest or least Quantity attainable in that Case, *Methodus de Maximis & Minimis*.

Of this see *Hon. Faber*. at the End of his *Synopsis Geometrica*, where you have a great Variety of Problems of this kind. See also *Ozanam's* Preface to his *Dictionnaire Mathematique*; the *Marquess d'Hospital* his *Analyse des Infiniment Petits*, Sect. 3, &c. In the *Acta Erud. Lips.* A. D. 1683. p. 122. there is also a Method of determining *Maxima & Minima*, by one *D. T.* chiefly applicable to the Drawing of Tangents to Curves: And in the same Book, and for the Year 1684. p. 467. you have a Method of the famous *Mr. Leibnitz*, for the same Purpose, according to his *Calculus Differentialis*. See also the Seventh Book of *M. De La Hire's* *Conick Sections*, in Latin & Chap. 7. of *Niewentijt's* *Analysis Infinitorum*. There is also printed in the First Volume of *Des Cartes's* *Geometry*, a Method of *Huddes*, for finding the *Maxima & Minima*, p. 137.

The following Account of this Method, was communicated to me by *Mr. Humphrey Ditton*, a Person very Skilful in these Matters; and now Master of the New Mathematical School in *Christi's Hospital*.

PROBLEM.

To determine any Flowing Quantity in an Equation propos'd, to an Extreme Value.

Tho' there are various excellent Methods for the doing of this, yet there is nothing that seems so clear and natural, and is really so general, so quick and easie, as that which the Doctrine of Fluxions furnishes us withal.

To solve the Problem in any Case that can be propos'd, is only to make a just Application of this General Rule, viz.

Having put the Equation into Fluxions, let the Fluxion of that Quantity (whose Extreme Value is sought) be suppos'd = 0; by which means all those Members of the Equation in which it is found, will vanish, and the remaining ones will give the Determination of the Maximum or Minimum desired.

DEMONSTRATION.

Every Maximum or Minimum is in its own Nature a Stable Quantity: To determine therefore any Flowing Quantity to a Maximum or Minimum, is to make it (instead of a Flowing) a Permanent one; but the Fluxion of a Permanent Quantity is equal to Nothing. From whence the Reason of the Rule is sufficiently clear.

Let us illustrate this by some Examples. *Ex. gr.*

Suppose $bbx - yyyx + cyy - d^2 = 0$, where y and x are Flowing Quantities, and y is to be determined to an Extreme Value. Then

$$bbx - 2yyx - yyy + cyy + cxy = 0,$$

and making $y = 0$, $bbx - yyy + cyy = 0$, and $y - cy = b$, from which Quadratick Equation y may be determin'd.

Let

from thence the Lines FC , FE , FG be drawn to the Curve.

Let $AF = n$, AB , AD , $AH = x$, $HF = n + x$, BF , $FD = n - x$, ED , BC , $GH = y$, FC , FE , $FG = z$. The Point F being taken any where at liberty, 'tis evident, that when any Line, as FC , FG , &c. is coincident with FE , which I imagine to be a *Normal* to the Curve in the Point E , from the same Point F ; that then the intercepted Line, FB , FH , &c. is coincident with the *Subnormal* FD , and consequently upon the determining of an *Extremum*, the Invention of a *Tangent* naturally follows.

To form the General Equation that is to serve in this Business, we have, from the Rectangular Triangle FBC , $z^2 = n^2 - 2nx + x^2 + y^2$; or on the other side F , from the Triangle GHE , $z^2 = x^2 - 2nx + n^2 + y^2$; or for an *Extremum*, $2xx - 2nx + 2yy = 0$:

In which Equation, if in the room of $2yy$ we substitute its Value from the Equation of the Curve, the *Subnormal* will be discovered.

Ex. gr. Suppose the Curve were an *Hyper-*

bola, then $2yy = rx + \frac{2rxx}{q}$: Therefore

$$2xx - 2nx + rx + \frac{2rxx}{q} = 0, \text{ and } 2nx = 2xx + rx + \frac{2rxx}{q}$$

$$\text{and } n = x + \frac{r}{2}$$

$$\frac{rx}{q} = FA, \text{ wherefore } FD \text{ (the } \textit{Subnormal})$$

$$= \frac{r}{2} \frac{rx}{q} \text{ Q. E. I.}$$

Suppose the Curve a Circle, in which Case $2yy = 2rx - 2xx$; then proceeding as before, we have $2nx = 2rx$, and $n = r$, and therefore $FD = r - x$; which shews that F is ever in this Curve, the Centre it self. In the

Common *Parabola*, $rx = 2yy$, and therefore $n = \frac{r}{2} + x$, and so $FD = \frac{r}{2}$. But 'tis not only in these Conick Sections, but in any other Curve whatsoever, that from this general Equation by a due Substitution of the Value of $2yy$, the *Tangent*, or (which is all one in effect) the *Subnormal* will be discovered.

MEAN Axis, in *Opticks*. See *Axis*.

MEAN Diameter, in *Gauging*, is a Geometrical Mean between the Diameters at Head and Bung in any clofe Cask.

MEAN and Extream Proportion. See *Extream and Mean Proportion*.

MEAN in *Law*, signifies the Middle between two *Extreams*, and that either in Time or in Dignity. As in the First, His Action was *Mean* betwixt the Disselin made to him and his Recovery, that is in the *Interim*, (or, as we say, in the *mean time*.) Of the Second, there is *Lord-mean* or *mesne*, and *Tenant-mean*. See *Mesue*.

MEAN Motion, or *mean Longitude* of the Sun, in the *Ptolemaick Hypothesis*, is an Ark of the *Ecliptick*, reckon'd from the Beginning of *Aries* to the Line of the Sun's *Mean Motion*, accounting according to the Order of the Signs. And 'tis also not unusual to call the

MEAN Motion of the Sun, in the Old Astronomy, the Distance (accounted on in the *Ecliptick*, from the Beginning of *Aries*) of the Sun from the Line of his *Mean Motion*. See *Line of the Sun's Mean Motion*.

MEAN or *middle Proportional*, between any two Lines or Numbers, is that which hath the same *Proportion* to a third Term that the first bears to it.

Thus 8 is a *mean Proportional*, between 2 and 32, because $2 : 8 :: 8 : 32$. And the three Numbers in this Case are thus expressed $2.8.32 ::$ That is, Two, Eight, and Thirty two, are in *Continual Proportion*; for the same *Proportion* is continued from the Middle or Second Term to the Third, as was between the First and Second: Therefore 'tis the very same thing as if the middle Term had been put down twice. Now, because when Four Numbers are *Proportional*, the Rectangle of the middle Terms is equal to that of the *Extreams*, it must be so here: But here the two middle Terms being the same Number, they will make a Square; so that when Three Numbers are in *continual Proportion*, the Square of the middle Term is equal to the Rectangle of the *Extreams*; and that middle Term is call'd a *mean Proportional* between the other two.

PROPOSITION.

In a Right angled Triangle

The Perpendicular (ad) is a *mean Proportional* between the Segments of the Hypotenuse (bd and dc .)

That is, as $bd : ad :: ad : dc$; and therefore the Square of ad is equal to the Rectangle between bd and dc .

For the Triangles cda and adb , being similar, 'twill be as $cd : da :: da : db$: and consequently $\square da = \square bdc$.

PROBLEM.

To find a Mean Proportional to Two Given Lines, A and B.

Put A and B both into one Line, then bisect the whole Line; make the Point of Bisection the Centre of a Semi-circle, and then erect the Line PP perpendicular to the Two given Lines, at their Point

For $B : P :: P : A$, by the last Proposition.

Multiply the Numbers into one another, and extract the Square Root of the Product : Of which see more under *Logarithms*, and the *Use of Logarithms*, Numb. 11. and 12.

This famous Problem (which is the same as the *Duplication of the Cube*) may be resolved and demonstrated by means of the Conchoid of *Nicomedes*; and would be Geometrical, if that were a Geometrical Curve.

DEMONSTRATION.

$$b \quad eb \quad :: \quad c. \quad \frac{ebc}{b} \text{ Or } e c$$

Wherefore $ec = CK$. Also $MA. AD :: SC. CK$
 $b. \frac{e \cdot b}{2} :: 2c. ec.$

(Because if you halve one Consequent, you must double the other Antecedent.) And $S.C. CK :: FH.HK$ (because CH is parallel to SF) Wherefore $MA.AD :: FH.HK$. HK is equal to AD or $\frac{1}{2}eb$ (as was taken above) wherefore FH must be equal to MA or b . And consequently $MD = FK$ (for both in this Notation are $b + \frac{1}{2}eb$) And the Square of each will be $bb + ebb + \frac{1}{4}eebb$, that is $= FE + \square EK$, (by 47 *e* 1. *Eucl.*) And to these Equal Quantities adding the Squares of DX and EC , each of which is $\frac{1}{2}ee$. Their Sum, *viz.* $\square MD + \square DX$ (*i.e.*

\square M X) will be $bb + ebb + \frac{1}{2}ecbb + \frac{1}{2}cc$,
 which also is equal to the Sum of these \square EF +
 \square EC (i. e. \square FC, which was = to A D +
 \square XE by the Construction + \square EK = $\frac{1}{2}ecbb$
 + $\frac{1}{2}cc + ecc + ecc$; that is equal to \square XK.
 Wherefore since the Squares are equal, the Roots
 or Line M X and X K must be equal to each
 other.

Now if from those equal Sums $bb + ebb + \frac{1}{4}eebb + \frac{1}{4}cc$, and $\frac{1}{4}eebb + \frac{1}{4}cc + ecc + eecc$, you take away what is common to both, *viz.* $\frac{1}{4}eebb + \frac{1}{4}cc$, there will remain $bb + ebb = ecc + eecc$: Which will be found to be also, singly taken, equal to each other; because the Part taken away bb , will be to the other Part taken away ecc : as the Remainder ebb , is to the Remainder $eecc$; and both must be as their Wholes were, *i.e.* equal: Wherefore $bb = ecc$, and $ebb = eecc$. Which latter Equation resolved into Proportionals will stand thus, as $eb.b : ec.c :: ec.c : CK$; or as $A.B : C.K :: C.K : M.A$. And if you resolve the former Equation, it will be as $ec.c : b.c :: b.c : CK$. That is $C.K : M.A :: M.A : B.C$. Which is in plain Words the Proposition, *viz.* that $C.K$ and $M.A$ are Two Mean Proportionals between $A.B$ and $B.C$. Q. *E.D.*

On which *Demonstration* is founded the Mechanical Way of *Eutocius*, *Lib. 2. De Sph. and Cyli.* for finding Two Mean Proportionals; which is thus:

Join the Given Lines A B and B C in a Right Angle, as before, and compleat the Rectangle, drawing the Diagonal to find the Point X, and producing B A and B C both ways towards M and K; for then fix a Ruler on the Centre L, and then return it forward and backward, till you find by the Compasses M X and X K are equal; and then A M and G K are the Lines sought.

Another Method for which, *Euclides* also mentions, which seems more practical; which is, To make a Semi-circle on A C the Diagonal of the Rectangle, then the Moveable Ruler is placed forwards and backwards till M (by the Compasses) be found equal to N K, and that will give the Points M and K, and consequently the Lines A M and C K required;

How to find Two *Mean Proportionals* by help of
of the *Cissoid* of *Diocles*; and by Two Parabolas,
(which was *Menecemus* his way) see *Sturmius Mathesis*
Enucleata, Book 2. Prop. 21. *Consect. & Scholium*.
Des Cartes doth the same Thing by help of
One Parabola only, see his *Geometrie*, p. 91. and
as many as you please by help of a Curve Line
generated after a peculiar way, which see in p
67, 68. of his *Geometrie*. Much more of this Na-
ture you have in *Slusius's Meisobolium*.

MEASURE, in Musick, is a Quantity of the Length and Shortness of Time, either with respect to Natural Sounds, pronounced by the Voice; or Artificial, drawn out of Musical Instruments: Which

Which Measure is adjusted in Variety of Notes, by a constant Motion of the Hand or Foot, down or up, successively and equally divided; so that every Down and Up is called a *Time* or *Measure*, whereby the Length of a *Semi-breve* is measured, which is therefore termed, The *Measure-Note*, or *Time-Note*.

MEASURES. I thought it would be a very Acceptable Thing to the Reader, to see in one View, an Account of the Ancient and Present Measures of several Parts of the World: Which therefore I have here given him, as I occasionally collected them from the Best Authors.

A TABLE of the Foreign Measures, Carefully Compared with the English.

	Suppose an English Foot divided into 1000 Equal Parts, those here mentioned are in Proportion to it, as follows.	The English Foot divided into Inches and Decimal Parts of an Inch.
London ————— Foot	1.000	0.12.0
Paris ————— the Royal Foot	1.068	1.00.8
Amsterdam ————— Foot	.942	0.11.3
Brill ————— Foot	1.103	1.01.2
Antwerp ————— Foot	.946	0.11.3
Dort ————— Foot	1.184	0.02.2
Rynland or Leyden ————— Foot	1.033	1.00.4
Lorain ————— Foot	.958	0.11.4
Mecblin ————— Foot	.919	0.11.0
Middleburg ————— Foot	.991	0.11.9
Stratsbourg ————— Foot	.920	0.11.0
Bremen ————— Foot	.964	0.11.6
Cologn ————— Foot	.954	0.11.4
Frankford ad Manam ————— Foot	.948	0.11.4
Spanish ————— Foot	1.001	1.00.0
Toledo ————— Foot	.899	0.10.7
Roman ————— Foot	.967	0.11.6
On the Monument of $\left\{ \begin{array}{l} \text{Cestucius} \\ \text{Statilius} \end{array} \right\}$ —————	.972	0.11.7
Bononia ————— Foot	1.204	1.02.4
Mantua ————— Foot	1.569	1.06.8
Venice ————— Foot	1.162	1.01.9
Dantzick ————— Foot	.944	0.11.3

<i>Log</i> , $\frac{1}{72}$ of an <i>Epha</i> —————	24.25	0	0	24.2
To which add the <i>Syrian Metretes</i> , or <i>Congius Romanus</i> ————— }	207.06		7	$\frac{1}{8}$

The Grecian Long Measures.

Schoenes. This some will have to contain 60, some 30, others 32, and others 40 Furlongs.

Parasang, is the same with the Hebrew *Parasang*.

Dolich. This some will have to contain 24 Furlongs; but the common Account is 12.

Hippicon, containing 4 Furlongs.

Dialulus, Two Furlongs.

Plethron. This some make an Acre, as *Plutarch*; others $\frac{1}{2}$ of a Furlong, or 100 Feet, as *Suidas*; others 10000 Feet, as *Hesychius*; and some make it 100 Furlongs. But *Suidas* seems rightest in stating it 100 Foot.

Pygon. This *Hesychius* supposes the Length from the Elbow to the Fingers Bent, which some call *Palmipes*; that is, a Foot and a Palm, or 20 Fingers Breadth.

Pygme, is the Length from the Elbow to the End of the Hand, when the Fist is closed, and is two Inches shorter than the *Pygon*.

Orthodoron. Some make this a Palm, others a Span; but 'tis shorter by a Finger's Breadth than the Span, or Greater Palm.

Lichas, is usually reckon'd the Length or Span between the End of the Thumb and of the Forefinger, when both are separated and extended; and therefore is less than the *Orthodoron* by a Finger's Breadth. Some will have it the same with *Dichas*, which *Comper*, in his Dictionary, says, is but 3 Fingers Breadth; but the former Account seems rightest.

Palest, the same with *Doron*, is the Lesser Palm; being 4 Fingers Breadth, or 3 Inches English.

But there is great Uncertainty in these Accounts!

The Measures of Capacity, were,

1. The *Kypsele*. This *Scapula* reckons a Corn-measure, and is supposed to contain 6 Attick *Medimnoi*.

2. *Medimnos*, both Attick and Georgick, contained 48 Chænicæ, or 72 Sextaries. But because the Georgick Chænix was larger than the Attick, there must be some Difference between them.

3. *Metretes*. Some render this by *Cadus*, and some by *Amphora*; the latter is wrong, for the *Amphora* is another Measure. This *Legat*, and some others, will have equal to the Attick *Medimnos*. This was not the Syrian *Metretes*, mentioned *Jobn* 2. 6. for that was the same with the *Congius Romanus*.

4. *Amphora*, or *Amphoreus*. This was a Georgick Measure, and was half the *Medimnos* or *Metretes* *Georgicus*, as say some; others (as *Schrevelius*) will have it an Attick Measure, and to contain 3 Urns.

5. *Modion* was not what we call a Bushel, but a Measure much less. *Alsted* computes it to contain 8 Attick Chænicæ, or 12 Sextaries; Others make it hold 16 Sextaries; and others a Pint less than our Peck.

6. *Chous*, *Chus* and *Choas*, was of two sorts: the Attick held 6 Attick Sextaries, and the Georgick Chous 9 Georgick Sextaries.

7. *Chenix*. This some take for the Measure of Servants Food for one Day. The Attick Chænix, 'tis probable, held about one Attick Sextary and an half; and the Georgick 2 and $\frac{1}{2}$ of such. Others say, that the latter held but barely 2 Attick Sextaries. Some also mention a *Bilibral*, *Quadrilibral*, and *Quinquelibral* *Chenix*. So that 'tis hard to determine any thing certain, as to these Matters!

8. *Sextarius*, or *Xesta*. This some make 2 Kotyles, or $\frac{1}{2}$ of the Attick Chous. This Measure, say some Authors, would hold 20 Ounces of Water, others 24: Others are so exact as to tell you, that it held exactly 13 Ounces 7 Pennyweights and 18 Grains, *Troy*: Some say it held a Pint and an half of our Measure; and others will have it but half a Pint.

9. *Kotyle Attick*, is the Half Sextary. Some make this equal to the Roman *Hemina*; and then the Roman and the Attick Sextaries will be the same. This the Romans wrote *Cotyle*.

10. *Tetacton*. This was a Liquid Measure, being a fourth Part of the Attick Sextary, and therefore called also *Quartarius*. But the Georgick Sextary contained $2\frac{2}{3}$ of the Georgick Tetacton.
11. *Oxybaph*. This in the Attick Measure was the Twelfth Part of the *Chenix*; but in the Georgick the Eighth.
12. *Kyath*, in Latin *Cyathus*: One and half of this was an *Oxybaph*.
13. *Coucha* was the Half of a *Kyath*.
14. *Mystrum*, the Half of the *Coucha*.
15. *Cheme*. One *Mystrum* contained $2\frac{1}{3}$ of the *Cheme*.

A TABLE of Grecian Exotick Measures, compared with the Attick.

1. *Achana Persica*. This, according to *Hefschius*, was a Corn-measure, and contained 7 Kypseles, and 3 Medimni.
2. The Syrian *Metretes*: Which our very learned Dr. *Cumberland*, Bishop of *Peterburgh*, hath proved to be the same with the *Congius Romanus*, and holds of our Measure 7 Pints, and $\frac{2}{3}$ or 207.06 solid Inches. This is what we translate (but wrongly) a *Firkin*, *John 2. 6.*
3. *Artaba Persica*. This, from the Authority of *Herodotus*, *Lib. 1. Pag. 49.* may be concluded to hold 3 Chænices more than the Attick Medimnus. *St. Jerom*, on *Isaiah*, *Chap. 5.* saith, that this Measure held 20 *Modii*.
4. *Kyprus*, or *Cyprus*, was the same with the Attick Medimnus.
5. *Artaba Egyptica*. This *Epiphanius* makes the same with the Attick Medimnus; as also was, saith he, the Median *Artaba*: But *Famius* and *Legat* make it but $3\frac{1}{3}$ *Modii*.
- Medimnus Kyprius*, $\left\{ \begin{array}{l} \text{Saluminea,} \\ \text{Papho,} \end{array} \right\}$ contained $\left\{ \begin{array}{l} 5 \text{ Modii.} \\ 4 \text{ Modii, and 1 Chous;} \end{array} \right.$
7. *Collathum Syrium*, was the same Measure with the Pontick Modius, and was double to the Common Modius. And the like Quantity did the
8. *Ponticus Cyprus* contain also, as *Epiphanius* saith.
9. *Subitha Syria*, held 22 Attick Sextaries.
10. *Mares Ponticus*, held (according to *Epiphanius*) 20 Alexandrian Sextaries; which how much different from the Attick I know not.
11. *Kopinus*. This was a Boetick, both Liquid and Dry; and *Legat* saith it held 3 *Congii*.
12. *Modius Cyprius*, is a Measure containing 17 Attick Sextaries.
13. $\left\{ \begin{array}{l} \text{Kamsaces,} \\ \text{Tetarpe Laconices,} \end{array} \right\}$ each a Measure of twelve Sextaries.
14. *Dadix*, a Boetick Measure, containing six Chænices.
15. *Aphin*, an Egyptian Measure of 4 Chænices: And of the same Measure doth *Hefschius* make the *Topium* to be; but he tells us not where the *Topium* was used.
16. *Caphira*, a Persian Measure of two Attick Chænices. To this was the *Mares* equal; and some say was a Measure used in *Boetia*.
17. *Inion*. This with the Egyptians, saith *Legat*, was the Word for the Sextary; and, according to *Epiphanius*, held just two Pound of Oyl.
18. *Elenius*, the same with the *Tetarton*, or one Quarter of a Sextary.
19. *Gabenon*, the same with the *Oxybath* or *Aretabule*.
20. *Alabastron* was a Measure containing a Pound of Oyl.

A TABLE of English Long Measures.

inch	Palm		Span		Foot		Cubit		Yard		Ell		Pace		Fath.		Pole		Furl.		Mile.

A TABLE of *Square Measures.*

[illegible]

Dry Measures of Capacity, are rais'd from the Gallon containing 8 Pints, which should be contained in $272\frac{1}{4}$ Cubick Inches, and should hold of pure Running or Rain-Water, 9 Pound, 13 Ounces, 12 Drams and $\frac{1}{2}$, *Averdupois* Weight: so that to have a true Gallon for *Dry Measure*, you must make a Cubick Vessel that shall have all the Sides 6 Inches, and $\frac{4}{5}\frac{8}{10}$ Parts of an Inch square. Or if you would weigh with *Averdupois* Weight, 9 Pound, 13 Ounces, and 12 $\frac{1}{2}$ Drams of clean Running Water.

A TABLE of *Dry Measures.*

Pints		8		Gallons															
16		2		Pecks															
64		8		4		Bushels													
128		16		8		2		Strikes											
256		32		16		4		2		Carnock or Coom									
512		64		32		8		4		2		Seem or Quarter							
3072		384		102		48		24		12		6		Way					
5120		640		320		80		40		20		10		12		Last

14 3		7 lb		14		56		1 C.		2 C.		4 C.		24 C.		40 C.		Averd.	

Liquid Measure, is either of *Wine, Ale, or Beer.*

The *Wine Gallon* contains 231 Cubical Inches, and should hold of pure Running Water 8 Pound, 1 Ounce, 11 Drams *Averdupois*; or 9 Pound, 10 Ounces, 1 $\frac{1}{4}$ Penny-weight, *Troy*; or a Cubick Vessel of 6 Inches, and 1300 Parts every way.

A TABLE for *Wine-Measure, Honey, Oyl, &c.*

						Galls.	Pints
						18	8
						Rundl.	
						18	144
						Barrels	
						$1\frac{3}{4}$	$31\frac{1}{2}$

						$1\frac{1}{3}$	$2\frac{2}{3}$
						$4\frac{1}{2}$	84
						$1\frac{1}{2}$	726
						Butt or Pipe	
						$1\frac{1}{2}$	2
						3	4
						6	8
						14	252
						2016	

The Beer or Ale Gallon holds 282 solid Inches, and weighs of pure Water 13 Pound, 3 Ounces $1\frac{4}{16}$ parts, *Averdupois*; therefore the Cubick Vessel ought to be 6 Inches, and 5500 parts of an Inch each way, to find this Gallon.

A solid Foot contains 1728 solid Inches; that is, 6.128 Gallons; and a *Hogshead* contains 10.287 solid Feet; or if in round Numbers you allow 10 Feet to be in a *Hogshead*; then the *Butt* will contain 20, and the *Tun* 40 Feet.

A TABLE for Beer Measure.

			Gallons.	Pints.

			Gallons.	Pints.
		<i>Firkins.</i>	9	64
<i>Kilderkins.</i>	2		18	128
<i>Barrels.</i>	2	4	36	256
<i>Hogsheads.</i>	2	4	72	512

A Degree, or $\frac{1}{360}$ part of the Circuit of the Earth, according to

Dr. Bernard, is $\begin{cases} 73\frac{1}{4} \text{ English Miles, of 5000 Foot in a Mile.} \\ 67\frac{1}{4} \text{ Catholick Miles.} \\ 66\frac{1}{2} \text{ Arabick Miles.} \end{cases}$

Mr. Norwood, $69\frac{1}{2}$ English Miles, or 367200 Feet.

Mr. Ricard, ————— 36584 Feet.

MEATUS Auditorius, the Auditory Passage, begins from the *Concha* and winds towards the inward part of the Ear, and is clothed with a thin Skin as far as the brim of the *Tympanum*, or Drum of the Ear: Its use is to receive the Sound, and to convey it easily, but yet ruly and so effectually to the *Tympanum*; within this Cavity is the *Ear-wax*, or *Cerumen*.

MEATUS Urinarius. See *Urethra*.

MECHANICKS, Dr. Wallis defines to be the Geometry of Motion; and is a Mathematical Science which shews the Effects of Powers, or moving Forces, so far as they are applied to Engines; and demonstrates the Laws of Motion, &c.

'Tis also commonly taken for those Handy-crafts, which require as well the Labour of the Hands, as the Study of the Brain.

The Principle on which all Mechanick Power depends, will be easily understood by the Resolution of this Problem.

Any Body as A, with its Celerity C, being given; and also another Body as B: 'Tis required to find the Velocity necessary, to make the Moment, or quantity of Motion in B, to be equal to the Moment of A, the given Body.

Now since the Moment of any Body is equal to the Rectangle under the Celerity and the Quantity of Matter; as you will find in the *Laws of Motion*, (see the Word *Motion*;) You need only make as B to A::fo is C to a fourth Term, which will be c, the Celerity proper to B, so that its Moment shall be equal to that of A.

And from hence it follows, That any Body, though never so small, may have a Moment equal to that of any other Body, tho' never so great, which shall be moved with any given Celerity.

Wherefore in any Machine or Engine, if the Velocity of the Power, be made to the Velocity of the Weight:: reciprocally as the Weight is to the Power; then shall the Power always sustain or move the weight.

If Qp be drawn Perpendicular to the Thread Np , so as to cut the Plane pG , in a Line Parallel to the Horizon: And if the Weight p be supposed to lie only on the two Planes pQ , and pG , the Weight will press these Planes Perpendicularly with the Forces pH , and HN : That is, it will press the Plane pQ , with Np ; and the Plane pG , with HN .

Wherefore, if Qp be supposed to be taken away, so that the Weight p may stretch the Thread Np ; then, because the Thread now sustaining the Weight, supplies the Place of the Plane pQ , the Thread will be stretch'd by the Force Np , which before pressed on the Plane pQ .

Wherefore the Tension of this Oblique String, to the Tension of the other Perpendicular one Np : is as pN is to pH .

And consequently, if the Weight p , be to the Weight A : in a Ratio, compounded of the reciprocal Ratio of the least Distances of the Threads AM , and pN , from the Centre of the Wheel, and of the direct Ratio of pH , to pN , the Weight will be in *Equilibrio*, as any one may soon try.

Hence 'tis plain, that the Weight p lying on those two Oblique Planes, is in the Nature of a Wedge within the Parts of a Cloven Body; and consequently the Forces of the Wedge and Beetle may from hence also be known.

For the Force with which the Weight p presses the Plane pQ , is to the force with which either by its own Gravity, or by the stroke of the Beetle it is impelled according to the Line Hp in that Plane, :: as pN , is to pH , and to the Force with which it presses the other Plane pG : as pN . NH .

And since the Screw is nothing but a Wedge forced by a Leaver, its Power or Force may by this Method be easily calculated.

Wherefore (adds the Excellent Author :) This Corollary is of most Extensive Use, since all Mechanicks depend upon it.

MECHANICK Powers, (as they call them) are Six, viz. The Balance, the Leaver, the Wheel, the Pulley, the Wedge, and the Screw; to some or other of which, the force of all Mechanical Inventions, must necessarily be reduced. See those words.

MECHANICAL Philosophy, is the same with the *Corpuscular*, which endeavours to explicate the Phenomena of Nature from Mechanical Principles; i. e. from the Motion, Rest, Figure, Position, Magnitude, &c. of the Minute Particles of Matter. And these Principles are frequently called

MECHANICAL Causes: And also the

MECHANICAL Affections of Matter.

MECHANICAL Solution of a Problem in Mathematics, is either when the Thing is done by repeated Tryals, or when the Lines made use of to solve it are not truly Geometrical. Thus the Method of *Nicomedes*; *Erastosthenes*, *Pappus* and *Vieta*, for finding two mean Proportionals; and that of *Nicomemus* and *Dionysius*, for dividing an Angle into any Parts assigned, by means of the *Quadratrix*, is *Mechanical*: Because the former is done by repeated Tryals, and the latter by the means of a Curve that is not truly Geometrical.

MECONIUM, properly is an Opiate, or the condensed Juice of Poppies. Also the Excrements of a *Fetus*, which stick to the Intestines after

the Birth, are improperly so called; from the Blackness of their Colour, like to that of Poppy Juice.

The *Opium* which we have in England, France, &c. is only a *Meconium* made by expressing the Juice of the Oriental Poppies, which is thickened a little by Evaporation, and then wraps up in Leaves to be sold here: But the *Turks*, &c. keep the Tears of their Poppies, or the true *Opium* to themselves, and will not vend them abroad.

MEDALLIONS, are large Medals Coined, not as Current Money, but on some special extraordinary Occasion.

MEDALS, are Pieces of Metal like Money, Stamp'd or Coined upon some Extraordinary Occasion, to perpetuate the Memory of some great and Eminent Person, or of some considerable Victory, or other Publick Benefit to a Nation, or People.

They divide *Medals* into *Ancient* and *Modern*; and they account *Ancient*, all such as were Coined between the Third and Ninth Age of Christ. The *Modern* are such as have been made within these last 3 or 400 Years.

Of the *Ancient Medals*, the most *Ancient* are the *Greek*; and the *Consular Medals*, are the most *Ancient* of the *Latin* ones.

MEDIANA Vena, is the Middle Vein in the bending of the Cubit, betwixt the Cephalick and Basilick; it is safely opened, because there's neither Nerve nor Artery under it.

MEDIAL Alligation. See *Alligation Medial*.

MEDIASTINUM, is a doubling of the *Pleura*, or Membrane clothing the internal Parts of the *Thorax*, Ribs, &c. and it divides the Lungs and other *Viscera* of the Breast, into two parts. It proceeds from the *Vertebres* of the Back, and going on forward, reaches the Breast-bone, and there makes an eminent Partition in the very middle of the *Thorax*.

MEDIASTINA, is a Branch of the *Subclaval Veins*, which ordinarily comes from the Trunk of the *Cava*; it goes to the *Mediastinum* and *Thymus*.

MEDIATION, according to some Writers of Arithmetick, is Division by 2, or taking the half of any Number or Quantity. This is called also *Bipartition*; and in Reference to Lines, usually *Bisection*.

MEDIATUS Lingue, or *Party-Jury*, is a Jury Impanelled upon any Cause, wherein a Stranger is Party, whereof the one half consists of Denizens, the other of Strangers, and is used in Pleas, where one Party is a Denizen, and the other a Stranger.

MEDICINE, or as 'tis commonly called *Physick*, is an Art assistant to Nature, and designed for the preserving of Health in Humane Bodies, as much as is possible, by the Use of convenient Remedies. *Sennertus* and others, divide it into five parts.

1. *Physiologia*, which treats of an Human Constitution, as it is found and well; to which belongs *Anatomy* too.

2. *Pathologia*, which treats of the Preternatural Constitution of our Bodies.

3. *Semiotica*, which treats of the Signs of Health and Diseases.

4. *Hygiena*, which delivers Rules for the Regimen to be observed in the Preservation of Health.

5. *Therapeutica*, which teaches the Management of

of *Diet*; and comprehends *Chirurgery*, and the Art of *Medicine*, properly so called.

The general Division of *Physick* is only into two Parts; the *Theory* and the *Practick*: An accurate Skill in both which, are necessary to make a Man a good Physician.

MEDIO *Acquittando*, is a Writ Judicial, to distrain a Lord for the acquitting a Mean Lord from a Rent, which he formerly acknowledged in Court, not to belong to him.

MEDIUM in Natural Philosophy, signifies that peculiar Constitution of any Space or Region through which Bodies move. Thus the *Aether* is supposed by some to be the Medium in which the Planets and Heavenly Bodies move. The *Air* is the Medium in which all *Meteors* are generated and move; and by the means of which it is that all Land Animals, as Insects, Birds, Beasts, and Men, can Breathe and Live. But water is the Medium in which Fishes Live and Move. And whatever Density, or Tenacity there is in the Parts of this *Fluid Medium*, whereby Bodies moving in it are hindered or stopped, so that the Motion becomes slower, or is made in part to cease, is called the *Resistance of the Medium*. And Sir Isaac Newton hath proved, That this Resistance of the Medium to the Motion of Bodies, is always as the Square of the Velocity of the moving Body. *Princip. Philos. Math. p. 245.* See *Resistance of the Medium*.

MEDIUS Venter, See *Thorax*.

MEDULLA Cerebri is the white soft part of the Brain, covered on the outside with the Cortical Substance, which is of a more dark or ashy-colour: It is called also the *Corpus callosum*, and is an Union or Conjunction of both sides of the Brain into one. *Willis* observed, That this Part consisted of an Innumerable Number of *Seriae*, or *Fibrae*, tending length-wise: And *Malpighius* asserts, That by the help of a Microscope they appear so visible as to look something like the Teeth of an Ivory Comb.

MEDULLA oblongata, is that part of the Brain within the Skull, which is the beginning of the Spinal Marrow; it is about 3 or 4 Inches in length within the Skull, and then it descends to the *Os Sacrum*, thro' the Hole of the hinder part of the Head and the Vertebrae: It sends out ten pair of Nerves to the Chest, the Abdomen, and the Limbs. It is call'd also the *Common Sensory*, because the Original of the Nerves being there, it is the common Place or Recepracle of all that comes to the Brain by the external Senses.

MEDULLA Ossium, Marrow in the Bones, is a soft fat substance plac'd in the Cavities, or Porosities of the Bones; it is kept in a Membrane, and is quite destitute of all Sense; it is red in the greater Cavities, white in the less, and soft and succulent in spongy Bones.

MEDULLA Spinalis, or the Spinal Marrow, is the Continuation of the *Medulla Oblongata* without the Skull; and which passing thro' all the Vertebrae of the Back, ends at last at the *Os Sacrum*; it is a kind of Coagmentation of Nerves, sending out thirty pair of Nerves on each side, to the Limbs, to the great Cavities, and other parts of the Body. If it be wash'd with a convenient Liquor, it will sever into a great many little Fibres, which also are very conspicuous in its Original, the *Medulla Oblongata*.

MEDULLA of a Plant, or rather Tree, is the same with *Corv*; which see.

MEDULLARY Oil, is the finer and more subtil part of the Marrow of the Bones; which passes into them not by Ducts (saith Dr. *Havers*) but by small Pores formed into the Vesicles or Glandules (which are conglomerated into distinct Lobules contained in several Membranes, or Bags, and these Bags are contained in one common Membrane investing the whole Marrow: And all these Vesicles, Bags, and Coat or Membrane are propagated from the outward Coat of the Arteries) by which it passes from one to another, till it arrives at the sides or extreem parts of the Bone.

That part of it which is supplied to the Interstices of the Joints, passes into them by Passages, penetrating thro' the Bone into those Cavities, and formed for this end.

The Use of this Oil is either common to all the Bones, whose Temper it preserves and keeps them from being too brittle: Or more peculiar for the Joints; where it is very serviceable,

1. To lubricate the Extremities of the Bones, that they may move the more easily and freely.

2. To keep the ends of the Articulated Bones from too great an Incalcescence or Heat.

3. It preserves the Joints also from wearing by Attrition, or grating one against another. And

4. It preserves the Ligaments of the Joints from Driness and Rigidity; and lubricates those parts of them also that slide upon the Bones, and it keeps the Cartilages which are join'd to any of the Bones in a flexible Condition.

MELA is a Chirurgeons Instrument, called also *Speculum*, the Vulgar call it *Tenta*, a *Tent*, from trying. It is made for the most part of Silver, or Ivory, and its Use is to probe Ulcers, or to draw a Stone out of the Yard, &c. It is of different Shapes, according as it is differently designed to be used.

MELANAGOGUES are Medicines that expel black Choler, or Melancholy, as the Ancients us'd to express themselves.

MELANCHOLY, is a Doating, without a Fever or Raving; or a *Delirium* proceeding from a kind of Sadness of the Patient, whereby the Animal Spirits seem to be moved more slowly than they were wont. *Blanchard*.

MELICERIA, called also *Hydaribrus*, and *Ischor*, and sometimes *Hydrops Articularis*, is a Tumor shut up within a Tunick, proceeding from Matter like Honey, without Pain, round, yielding if pressed, but quickly returning again. It seems to proceed from the Lymphatick Particles which do not circulate right; and which, when the Moisture is evaporated, leave a honeyish kind of Substance. *Blanchard*.

MELICRATUM, is a Drink made one part of Honey, and eight parts of Rain Water.

MELIUS inquirendo, is a Writ that lieth for a second Inquiry of what Lands and Tenements a Man died seized, where Partiality was suspected upon the Writ of *Diem clausit extremum*.

MELOPES, *Vibices*, *Enchymoma*, *Sugillationes*, all signifie the same thing; and are red Spots (like those which remain in the Skin after bearing) in Malignant and Pestilential Fevers. *Blanchard*.

MELOS, a Disease of the Eye, when there is so great an Irruption of the *Uvea* Tunicle; that it seems like an Apple. *Blanchard*.

MEMBRANA, is a nervous, fibrous, broad, plain, white, and dilatible Substance, which covers

vers the Bowels, the great Cavities of the Body, the Muscles, &c. and is endowed with an exquisite Sense.

MEMBRANA Musculorum Communis, the Common Membrane, or Covering of the Muscles, is spread over all the Body, except the Skull, and is knit by Fibres something loosely to the *Membrana Carnosa*, lying above it; and to the proper Membrane of each Muscle which lies under it; it is very thin, but strong, of a whitish Colour, and almost transparent. It serves not only as a common Bag to the Muscles, and helps to keep them in their proper Places; but also to moisten them, and to besmear their Tendons with a Mucilaginous Liquor, which lubricates them, and forwards their Motion and Action.

MEMBRANA Adiposa. See *Adiposa Membrana*.

MEMBRANA Carnosa, the same that *Panniculus Carnosus*.

MEMBRANA Nistitans. See *Nistitans*.

MEMBRANA Urinaria, the same with *Allantois*.

MEMBRANOSUS, is a Muscle of the Leg, so called from the large Membranous Expansion it is Continuous with, inclosing all the Muscles of the *Tibia* and *Tarsus*; whence it is also called *Fascia lata*: It hath an acute fleshy Beginning from the Fore-part of the Spine of the *Os Ilium*, between the Origination of the *Sartorius* and Tendinous Beginning of the *Gluteus Magnus*; and being dilated to a fleshy Belly, which fills the Interstice made by the first of the two last-named Muscles and Upper part of the *Rectus* and Fore-part of the *Gluteus Medius*, in its Oblique Descent becomes Tendinous, four Fingers Breadth below the great *Trochanter*, whence it passes directly over the *Vastus Externus* to its proper Termination, at the superior *Appendix* of the *Fibula*; but in its Progress thither, it is conjoined with the Tendinous Expansion of the *Gluteus Magnus*, which ariseth from the Spine of the *Ilium*, covering the external Part of the *Gluteus Medius*, and all the external Muscles of the *Tibia*, as well as those of the Thigh-bone; and descending over the *Patella*, comprehends the Muscles of the *Tarsus*, and joins with the *Ligamentum Annulare*, which retains the Tendons of the Toes and Feet: When this Muscle acteth, the Leg and Thigh are drawn outwards.

MEMBRED: In Heraldry those Birds which are either whole-footed, or which have no Tallons, are termed by this Word *Membred*.

MEMORY, is that Faculty of the Soul, which repeats Things perceived by former Sensations; or is the calling to mind of known and past Things; as when we conceive Heat or Light, Yellow or Sweet, &c. the Object being removed; and is as it were the Store house of our *Ideas*.

MENDOSA Sutura, or *Squammea*, is a scaly Connexion of the Bones of the Skull; as may be seen in the Bone of the Temples, and the Bone of the Fore-part of the Head.

MENINGES, are the thin Skins that inwrap the Brain, and which are called *Matres* by the *Arabians*; as if all the Membranes of the Body were propagated by and from them. They lie immediately within the Skull, and are Two in Number; viz. the *Dura mater*, or *Crassa meninx*; and the *Pia mater*, or *Tenuis meninx*; which see.

MENINGOPHYLAX, is that which preserves the *Meninx* or Membrane of the Head, as thin Gold or Silver Plates, which are applied when the Skull is opened. *Blanchard*.

MENINX, see *Mater dura & tenuis*.

MENISCUS Glasses, are those which are Convex on one side, and Concave on the other.

For finding the *Focus* of a *Meniscus*, the Rule is this:

As the Difference of the Semi-diameters of the Convexity and Concavity, to the Semi-diameter of the Concavity; so is the Diameter of the Convexity to the Focal Length.

MENOPEGIA, is a sharp Pain in the Head, affecting one single Place.

MENSTRUUM, the Chymical Word for a Dissolving Liquor. They gave it this Name, because some Chymists pretend that the complete Dissolution of a Mixt cannot be done in less Time than 40 Days; which Period they call the *Philosophical Month*.

And from hence the Word *Menstruum* hath come to be the general Term for any Dissolvent; and any Liquor which will exactly dissolve all the Parts of any Body, is called a proper *Menstruum* for that Body: As *Aqua Regalis* is for Gold; *Aqua Fortis*, or Spirit of Nitre, for most other Metals; *Common Water* for Salt, or Sugar, &c.

And here it may not be amiss to give a Solution of one Difficulty, viz. Why great Lumps or Fragments of Gold, &c. will readily descend to the Bottom of the Glass, and yet when they come to be cut or divided into very small Particles or Atoms, tho' of the same specifick Gravity with those greater Lumps, yet these shall swim, and be suspended in the *Menstruum*.

In order to the accounting for which, we may first consider, That the Parts of no Fluid can be so easily separable, but that they will a little resist or retard the Descent of any heavy Body through them; and this Resistance is (*ceteris paribus*) still proportionable to the Surface of the descending Bodies. But the Surfaces of Bodies do by no means increase or decrease in the same Proportion as their Solidities do: For the Solidity increases as the Cube, but the Surface only as the Square of the Diameter. Wherefore 'tis plain very small Bodies will have much larger Surfaces, in Proportion to their Solid Content, than larger Bodies will; and consequently, when they grow exceeding small, may easily be conceived to be buoyed up by the Fluid.

Indeed it doth sometimes happen that a *Menstruum* will dissolve and keep suspended in it, without letting them emerge to the Top, the Parts of a Body lighter in *Specie* than it; as when Camphire is dissolved into a Liquor, and that Liquor well mingled with Oyl of Vitriol; which is an Effect not agreeable to the Laws of *Hydrostaticks*: But then it may be consider'd, that there may be some such peculiar Texture in the Parts of the Camphire, as may make them so joyn or adhere to the Parts of the Oyl, as that, tho' heavier, yet they shall not be impelled up to the Surface, at least for a Time: Which we see is the Case, in some measure, of an accurate and well-proportioned Mixture of Oyl and Water.

Mr. Boyle mentions a *Menstruum* which he extracted from Bread alone, that would work on Bodies more compact than many hard Minerals, nay, even on Glass it self, and do many things that *Aqua Fortis* could not do. It was thus made: Cut Brown Household-Bread, either of Wheat or

Rye,

Rye, (though the Rye is best) into Slices ; and when they are a little dried, fill with them a Glas Retort, and draw off in a Sand-Furnace by Degrees of Fire, what will come over. Separate the Oyl from the Liquor in the Receiver by a Tunnel, or a Filtre, and in a gentle Heat free the Spirit from some of its Phlegm, (though this is not always necessary). With this, he saith, he drew Tinctures not only from Crude Corals, but even from the *Lapis Hematites*, and *Granates*, unpowdered ; nay, also from Diamonds and Rubies. Yet by no means was this so Corrosive a Liquor as *Aqua Fortis*, or as the other Acid Menstruums.

From hence therefore we may learn to suspend our Assent as to that bold Assertion of some Physicians and Naturalists, That 'tis impossible any Medicine can be found out, that shall dissolve the Stone in the Bladder or Kidneys, but what must also corrode and destroy the Vessels through which it passes in the Body. For there are many Menstruums effectually Corrosive, that will not work at all on some Bodies ; which yet other Things, though of no such Corrosive Nature to the Tongue or the Touch, will readily dissolve. Thus Quicksilver will dissolve Gold, though there be no sensible Appearance of any Corrosiveness in the Mercury, either to the Finger, or even to the Tongue ; and yet neither *Aqua Fortis*, nor Oyl of Vitriol, nor Spirit of Nitre, will touch this Metal, though they are some of the most Corrosive Menstruums in Nature. Cold Water will dissolve the White of an Egg ; which the purest Spirit of Wine will not divide, but coagulate ; as will also the Acid Liquors, Spirit of Salt, and Oyl of Vitriol. Thus also Common Oyl will dissolve Brimstone, though it appear so soft and smooth upon the Tongue, and will not dissolve so much as an Egg-shell ; and yet that General Dissolvent, *Aqua Fortis*, will not touch Brimstone. Many more Instances of this Nature might be given ; by which it appears, that Menstruums do not operate by virtue of any manifest Quality, such as Heat, Moisture, or even Acidity it self, but rather by some mechanical and peculiar Fitness that there is between the Shape, Bulk, Solidity, &c. of the Corpuscles both of it and the Body to be dissolved.

MENSTRUUM Peracutum, is a Menstruum mentioned by Mr. Boyle, and made by drawing off Spirit of Nitre several times from Butter of Antimony. He saith, That by the Help of this, he was able, without a very violent Fire, and in a few Hours, to elevate a good Quantity of Crude Gold ;

MENSURABILITY, is an Aptitude in a Body, whereby it may be apply'd or conform'd to a certain Measure.

MENSURATION, or *Measuring*, is to find the Superficial Area, or Solid Content, of all Surfaces and Bodies. The Rules to do which, as exactly as is possible, you will find under the Names of the several Figures and Solids.

MEPHITICAL Exhalations, are poisonous or noxious ones, issuing out of the Earth. These the *Latins* used to call *Mephites* ; whence comes the *Italian Mofeta*, which is the Term they have for the famous *Grotta de Cani*, near *Pizzoli*, about two Miles from *Naples*, which is so called, because its poisonous Streams will kill Dogs, (and no doubt any other Animals) if held long over, and within the Stench of the Streams.

MERCATOR'S Chart, or *Projection*, is a Projection of the Face of the Earth in *Plano* ; wherein the Degrees upon the Meridian increase towards the Poles in the same Proportion that the parallel Circles decrease towards them.

'Tis called *Mercator's Chart*, or *Projection*, because *Mercator* was the first that published Charts so made : Tho' our Country-man Mr. *Wright* was really the first that made the Tables for this *Projection*.

Though the *Plain Chart* be very easie and useful in short Voyages, and will serve in the longest Voyages, if you sail Home in or near the opposite Rhumb you went by ; as the Ancients, who being Coasters, did before the Use of the Compass : Yet so far as few Places, or indeed none but such as lie under the same Meridian, or under the Equinoctial, can therein be expressed according to their true Situation and Distance one from another ; but if they be laid down true by the Course and Distance, the Difference of Longitude will be false ; if they be laid down by the Course and Difference of Longitude, then will the Distance and Difference be more than it should be ; and if they be laid down by their Distance and Difference of Longitude, (which in many Cases is impossible) then the Difference of Latitude will always be too little, and the Rhumb too wide from the Meridian ; and if they be laid down by their Latitudes and Separation, then the Course will be wide, and the Distance too much, &c.

And since that the Places in particular *Maps* or *Charts* being laid down in some, one way, and in others another, and these Pieces many times tack'd together, without due Consideration of the differing Methods, Places have been laid down by : This, I say, being so, the *Geography* and *Hydrography* of the World is so corrupted, that too many Descriptions of the Whole, or of the large Parts of it, are enormously Erroneous, and the Shape of the Land much distorted. It were to be wished therefore, that the World would not put over-much Value on, but wean it self from the Use of the *Plain Chart* ; and by making the *True Chart* easie and Familiar, bring it in Respect and Use.

It was the great Study of our Predecessors, to contrive such a *Chart in Plano*, with strait Lines, on which all or any Parts of the World might be truly set down, according to their Longitudes, Latitudes, Bearings or Distances.

A Way was hinted for this near Two thousand Years since by *Ptolemy*, and a General Map according thereto, made in the preceding Age by one *Mercator* ; but the Thing demonstrated, and a Ready Way shew'd of describing it, was not 'till Mr. *Wright* taught to enlarge the *Meridian Line* by the continual Addition of Secants ; so that all the Degrees of Longitude might be proportional to those of Latitude, as on the Globe : Which he has done after such an Excellent Manner, that in many Respects, it is far more convenient for the Navigator's Use, than the Globe it self ; and will truly shew the Course and Distance from Place to Place, which way soever a Ship sail forth, or return.

PROBLEMS.

1. To find the Meridional Miles, answering to any Difference of Latitude.

First, By the Table of Meridional Parts, which are printed in most Books of Navigation,

Find the Degrees of either Latitude over-head, and the Minutes in the Left-hand Column downwards; and in the Angle of meeting are the Parts for that Latitude.

Thus also find out the Parts for the other; then, if both Latitudes be of the same Name, that is, both North, or both South, subtract these one from the other; and that Remainder contains the Meridional Miles sought. If of different Name, add them together; as in Example 2.

Example.

Required to find the Meridional Miles between Latitude $43^{\circ} 15'$ North, and $50^{\circ} 20'$ N.

Latitude $50^{\circ} 20'$ ———— 35057 } Mer. Pt.
Latitude $43^{\circ} 15'$ ———— 28837

Merid. Difference of Lat. — 6220

Example 2.

Let one Lat. be $20^{\circ} 19' S.$ — 12423 } Mer. Pt.
The other Lat. $18^{\circ} 53' N.$ — 11541

Merid. Difference of Lat. — 23963 Sum.

PROBLEM II.

2. To find the Meridional Difference of Latitude by the Table of Artificial Tangents.

The Logarithmick Tangents above 45 Degrees, accounting every 30 Minutes to be one Degree, and every Minute to be two Minutes of the Meridian Line, are in the same Ratio with the Meridional Parts, made by the continual Addition of Natural Secants.

Therefore, Take half of each of the Given Latitudes, and to each half add 45° , looking the Tangents of their Arches in the Table of Logarithmick Tangents; the Difference of these Tangents divide by 1263, the Quotient will be the Meridional Miles or Minutes.

Example 1.

Lat. $50^{\circ} 20'$, its $\frac{1}{2}$ — $25^{\circ} 10'$; which added to 45° , makes $70^{\circ} 10'$, whose Tangent is ———— 4428786

$\frac{1}{2}$ Lat. $43^{\circ} 14'$, is $21^{\circ} 37'$; which added to 45° , makes $66^{\circ} 37'$, whose Tangent is, omitting the Index, ———— 3642940

1263) 785846 (622 = Merid. Diff.
280
278
260

Example 2.

The $\frac{1}{2}$ of Lat. $20^{\circ} 19' S.$ is $10^{\circ} 18'$, which added to 45° , make $55^{\circ} 8'$, whose Tangent is ———— 1570607

$\frac{1}{2}$ Lat. $18^{\circ} 53' N.$ is $9^{\circ} 26'$, which added to 45° , makes $54^{\circ} 26'$, its Tangent is ———— 1457970

Distance, what?

As the Sine of the Course : Rad :: Diff. Lat. : Diff.
 and 36° 44' : S. 90° 00' :: 1965 : 3285.

Departure, what?

Radius : Mer. Diff. Lat. :: T. Course : Diff. Long.
 T. 45 : 2429 min :: T. 53° 16' : 3255 min.

Operation by the *Logarithms*.

To the Log. Mer. Diff. Lat. 2429 — 3.38542
 Add the Tangt. of the Course, 53° 16' — 10.12712

Sum = Log. Diff. Longitude, 3255. 3.51254

By *Gunter's Scale*.

The Extent from T. 45° } on the Line of
 to the Tangent of 53° 16' } Tangents.
 Reaches from - - - 2429 } on the Line of
 to - - - - - 3255 } Numbers.

PROBLEM V.

5. The *Latitude* and *Distance* being given, *Course*, *Departure*, and *Difference of Longitude* are required?

Example.

Sailing North-Eastward from *Antego* 3285 min: and by Observation finding my Latitude to be 50 deg. 10 min. North; What's the *Course*, *Departure* and *Difference of Longitude*?

From 50° 10' N. } Lat. { observ. } M.Pt. { 3490
 Subst. 17 25 N. } Lat. { *Antego* } 1061

32 45 = 1965 = Diff. Lat. M. Diff. Lat. 2429

Course, what?

Distance : Diff. Lat. :: Radius : Co-Sine Course,
 3285 : 1965 :: S. 90° 00' : S. 36° 44'

Operation by *Logarithms*.

To the Arithmetical Complement of the Log. of } 3285 — 6.48341
 the Distance - - - }
 Add the Log. of the Diff. Lat. 1965 — 3.29336

Sum = Co-Sine of the Course, 36° 44' — 9.77677

By *Gunter's Scale*.

The Extent from Distance 3285 } on Line of
 to the Diff. Lat. - - - 1965 } Numbers.
 Reaches from S. of Radius, 90° 00' } on Line of
 to the S. Compl. of Course 36 44 } Sines.

Then the { *Departure* } is found by Prob. I. II.
 { *Diff. Longit.* }

PROBLEM VI.

6. The *Latitude* and *Departure* given, *Required* the *Course*, *Distance*, and *Difference of Longitude*.

Example.

A Ship from Latitude 50° 10' N. and Longitude 00° 00' runs South-Westerly 'till her *Departure* be 2633 Miles, and the observed Latitude 17° 25' North; I demand the *Course*, *Distance* and *Difference of Longitude*?

Diff. Lat. : *Departure* :: Radius : T. Course. 1965
 : 2633 :: T. 45° 00' : T. 53° 16'

Operation

Operation of the Logarithms.

To Ar. Co. Log. of Diff. Lat. 1965—6 70664
Add the Log. of Departure 2633—3.42048

Sum = T. of the Course — 53° 16'—10.12712

By Gunter's Scale.

The Extent from Diff. Lat. 1965 { On Line of
to the Departure 2633 } Numbers.
Reach. from T. of Radius, 45° 00' { On Line of
To the T. of the Course 53 16 } Tangents.

Then { Distance
Differ. Longit. } is found by *Prob. I. II.*

P R O B L E M VII.

7. *One Latitude, Course and Distance given; the Difference of Latitude, and Difference of Longitude required.*

Example.

A Ship from 50° 10' N. Latitude, and 00° 00' Longitude, runs with a Course 16° 32' S. westerly 3285 Miles: What is the Difference of Latitude, and Difference of Longitude?

For the *Difference of Latitude*, say,

Radius : Co-Sine Course :: Distance : Differ. Lat.
S. 90° 00' : S. 36° 44' :: 3284 m : 1965.

Operation by the Logarithms.

To the 7, of the Course 53° 16'—9.77676
And the Logar. Distance 32 85 —3.51659

Run = Log. Diff. Lat. 19 65 —3.29335

By Gunter's Scale.

The Extent from S. Radius, 90° 00' { On Line of
To the S. Compli. Course 36 44 } Sines.
Reaches from the Distance 32 85 { On Line of
To the Differ. Latitude 19 65 } Numbers.
From 50° 10' = Departed { Lat. Mer. Pts. { 3490
Subst. 32. 45 = Differ. } 1061

Rem. 17. 25 = Present } Mer. Diff. Lat. = 2429

Diff. Long. find by *Prob. 2.* in 3255 = 54° 15' W.

From 54° 15' = Difference
Subst. 00 00 = Departed } Longitude.

Rem. = 54° 15' W. Present

P R O B L E M VIII.

8. *One Latitude, Departure and Course given: Required Distance, Difference of Latitude, and Difference of Longitude.*

Example.

Sailing South 53° 16' West, from Latitude 5° 10' North, Longitude 00° 00', till my Departure be 2633 Miles: What's my Distance, Latitude and Longitude?

Distance { by C. 6. of *Plain Sail*. is { 3285
Diff. Lat. { 1965 = 3245

From 50° 10' N. = Departed
Subst. 32 45 N. = Difference } L.M.P. { 3490
Rem. = 17 25 = 1985 X Pref. } M.D. Lat. 2429

For the *Difference of Longitudes*, say,

Proper Diff. Lat. M.R. Diff. Lat. : Depart. D. Long.
1965 m : 2429 m :: 2633 : 3255

Operation by Logarithms.

To Ar. co. Log. Diff. Lat. 1965 —6.70663
Add the Log. { Mer. Diff. Lat. 2429 —3.38542
Departure 2632 —3.42049

Sum = Log. Diff. Long. 3255 = 54° 15' 3.51254

By Gunter's Scale.

The Extent from Diff. Lat. 1965 }
To the Mer. Differ. Lat. 2429 } on Line of Num.
Reaches from Departure 2633 }
To the Differ. of Long. 3255 }

From 00° 00' = Departed
Subtract 54 15 = Difference } Longitude.
Rem. = 54 15 W. = Present.

P R O B L E M IX.

9. *One Latitude, Distance and Departure given: The Course, Difference of Latitude, and Difference of Longitude required.*

Example.

From Latitude 50° 10' N. and Longitude 00° 00', Sailing South Westward 3285 m. until the Departure be 2633 m: I demand the Course sail'd, Latitude and Longitude.

By C. 4. of *Plain Sailing* { Course = 53° 16' W.
Diff. L. = 1965

By *Prob. 6.* Present Latitude = 17° 45' N.
And Meridian Differ. Latitude = 2429

Difference } Long. by *Prob. 6.* is { 3255 = 54° 15'
Present } 54 16

P R O B L E M X.

10. *One Latitude, Course and Difference of Longitude given: The Difference, Latitude, Distance and Departure required.*

Example.

From Latitude 53° 10' N. sailing South 53° 16' Westerly, till I am in the Longitude 54° 45' W. What's my Distance, Departure and Difference of Latitude?

From 00° 00' N. Departed
Subtract 54 15 W. Present } Longitude.
Rem. = 54 15 = 3255 = Differ.
O o o 2

For

For the Meridian Difference of Latitude, say,

Radius : c T. Course :: Diff. Long. : Mer. Diff. Lat.
T. 45° : T. 36° 44' :: 3255 : 2429 m.

Operation by the *Logarithms*.

To the c T. Course — 36° 44' — 9.87290
Add Log. Diff. Longit. 3255 m. — 3.51255

Sum Rad. = Log. Mer. Diff. Lat. 2529 m. 3.38545

By *Gunter's Scale*.

The Extent from T. Radius 45° } on Line of Tan.
To T. Compl. Course — 36° 44' }
Reaches from Diff. Long. 3255 } on Line of Num.
To Merid. Differ. Latit. 2429 }

From 3490 } Parts in Dep. } 50° 10'
Subst. 2429 } Mer. Difference } Lat. North.
Rem. 1061 } Parts in pref. } 17 25
Then find the Distance and Departure, by
Case 2. Plain Sailing.

PROBLEM XI.

11. The Difference, Longitude and Distance of two Places in the same Latitude being given, to find the Latitude.

Example.

Two Ships in the Equator 400 Miles from one another; one fails North, the other South alike Distances, till they are 150 Miles asunder: What Latitude are they in?

Proportion.

Differ. Long. : Radius :: Distance : S. Latit.
400 : S. 90° 00' :: 150 M. : S. 22° 01'

Operation by the *Logarithms*.

To the Ar. co. Log. Diff. Long. 400 — 7.39794
Add Logarith. of the Distance 150 — 2.17600

Sum = S. Latitude — 67° 59' — 9.57394

By *Gunter's Scale*.

The Extent from Differ. Long. 400 } on Line of
To the Distance 150 } Numbers.
Reaches from S. Radius 90° 00' } on Line of
To S. Compleat Latitude 67 59 } Sines.

PROBLEM XII.

12. The Differences of Longitude between two Places of the same Latitude, being given: To find their Distance.

Example.

The Distance between *Martinico*, and *Cape Verde*, is required.

From 54° 50' } = Long. { *Martin.* } L. 14° 50'
Subst. 11 30 } { *C. Verde.* } North.

Rem. = 43 20 = 2600 Miles = Differ. Long.

Radius : Diff. Long. :: S. Latit. : Distance.

Operation by the *Logarithms*.

To Log. Differ. Longitude 2600 — 3.41497
Add the S. Latitude 14° 50' — 9.91528

Sum — Rad = Log. Distance 2513 — 2.40025

By *Gunter's Scale*.

The Extent from S. Rad. 90° 00' } on Line of
To the S. Com. Latitude 75 10 } Sines.
Reaches from Differ. Longit. 2600 } on Line of
To the Distance — 2513 } Numbers.

PROBLEM XIII.

13. The Distance between two Places in the same Parallel given: Required, To find the Difference of Longitude.

Example.

Sailing from *Cape Verde*, in Latitude 14° 50' North to an Island 2513 Miles West: I demand the Longitude of the Island.

c S. Lat : Distance :: Radius : Diff. Long.
S. 75° 10 : 2513 :: S. 90° 00' : 2600 Miles

Operation by the *Logarithms*.

To ar. co. S. Latitude 14° 50' — 6.01472
Add Log. of the Distance 2513 — 3.40025

Sum = Log. Diff. Long. 2600 Miles — 3.41797

By *Gunter's Scale*.

The Ext. from S. Compl. Lat 75° 10' } on Line of
To the Sine of the Radius — 90 00 } Sines.
Reaches from Distance — 2513 } on Line of
To the Difference of Longitude — 2600 } Numbers.

To 2600 | = 43° 20' = Diff. Long. in D. and M.
Add 60 | 11 30 = Long of *Cape Verde*.

Sum = 54. 50 = Longitude of the Place the Ship is in.

That the *Meridian Line* in *Mercator's Chart*, is a Scale of *Logarithmick Tangents* of the half Complements of the Latitude: The incomparable *Mr. Halley* demonstrates thus.

Supposing P the Pole.
B D the Equinoctial.
P C, P c, &c. Co-Latitudes.
B c c, C P a Rhumb Line.

1. The Lines PB , Pc , PC , are the Tangents of half the Co-Latitudes in the Stereographick Projection, (by Prob. 1. in *Spherick Projection*.)

2. The Difference of Longitudes, or Angles at the Pole (BPC , &c.) between them, are Logarithms of the Ratios of those Tangents one to another, (by the known Property of *Proportional Spirals*.) But the *Nautical Meridian Line*, is no other than a Table of Longitudes, answering to each Minute of Latitude on the Rhumb Line, making an Angle of 45 Degrees with the Meridian: Wherefore the Meridian Line is no other than a Scale of Logarithmick Tangents, of the half Complements of the Latitudes. *Q. E. D.*

Whence he deduces the following

COROLLARIES.

1. Because that in every Point of any Rhumb Line, the Difference of Latitude is to the Departure as the Radius to the Tangent of the Angle that Rhumb Line makes with the Meridian; and those equal Departures are every where to the Difference of Longitude, as the Radius to the Secant of the Latitude: It follows, that the Differences of Longitude are on any Rhumb, Logarithms of the same Tangents, but of a different Species; being proportioned to one another, as are the Tangents of the Angles made with the Meridian.

2. Hence any Scale of Logarithmick Tangents is a Table of the Differences of Longitude, to several Latitudes, upon some determinate Rhumb or other: And therefore, as the Tangent of the Angle of such Rhumb, to the Tangent of any other Rhumb; so the Differences of the Logarithms of any two Tangents, to the Difference of Longitude on the proposed Rhumb, intercepted between the two Latitudes, of whose half Complements you took the Logarithmick Tangents.

MERCATOR'S Sailing, is the Art of finding on a Plane the Motion of a Ship upon any assign'd Course, true in Longitude, Latitude and Distance; the Meridians being all parallel, and the Parallels of Latitude Strait Lines. The Way to do this, you have before in *Mercator's Chart*.

MERCURY, according to the Chymists, is the Third of their *Hypoastatical Principles*; and is the same with what we call Spirit; which see.

MERCURIES of Metals, are Things much boasted of by the Chymists; but they deliver the Processes of making them so obscurely, that we have just Reason to believe they had no Mind to be disproved by being understood.

Yet Mr. Boyle tells us expressly, that he shewed a certain Chymist of his Acquaintance a Way

to draw a true Running Mercury, or Quick-silver, from Antimony; and that it succeeded well.

MERCURIUS Dulcis, or Sweet Sublimate of Mercury, by the Chymists sometimes called *Aquila alba*, is thus made. Sixteen Ounces of Sublimate Corrosive being powder'd in a Glass, or Marble Mortar, for it must never be done in a Metalline one) is mixed by little and little with Twelve Ounces of Mercury revived from Cinnabar, (or pure Mercury): The Mixture is stirred about with a Wooden Pestle, till all the Crude Mercury disappear; then it is put into a Matraass, two Thirds of which remain empty: The Vessel is heated in Sand, gently at first, but afterward the Fire is increased to the Third Degree. In four or five Hours the Sublimate will stick to the Top and Neck of the Glass: Fling away all that is not White, and then powder that, and sublimate it again, and a Third time, if you would have it very white. Thus is the strongest Poison, perhaps in Nature, corrected into a very gentle and useful Medicine, by adding more Mercury to it. The Reason of which seems to be, That by these New Sublimations, the Corroding Acids of the Sublimate have their Points broken, and perhaps some of them loaded with the Addition of more Mercury, and so can't act with the same deleterious Force as they did before.

MERCURIUS Vita. See *Algorot*.

MERCURY. According to *M. Cassini*, the greatest Distance of Mercury from the Earth is 32704, the mean Distance 22000, and the least Distance 11256 Semi-diameters of the Earth: Therefore his mean Distance will be about 88000000 English Miles; and the Diameter of Mercury is $\frac{2}{3}$ of the Diameter of the Earth, and therefore the Globe of Mercury must be $\frac{2}{3}$ of that of the Earth.

Mr. Azout pretends to prove, That tho' Mercury be so near the Sun, the Light there is not capable of burning any Objects. But Sir Isaac Newton makes the Heat of Mercury so great, as to be Seven times as much as the Heat of our Summer Sun; which he found by Experiments designedly made by the Thermoscope, is enough to make Water boil. And therefore if Bodies will not be there enkindled by such a Degree of Heat, it must be because their Degree of Density is proportionably greater than that of such kinds of Bodies on our Earth: Wherefore undoubtedly this Fiery Planet is uninhabitable by such Creatures as live on our Earth.

Capt. Halley, in his Observation of Mercury seen in the Sun, A. D. 1677, at St. Helena, saith, That this Planet may be seen Nine times in the Sun, near the Ascending Node, A. D. 1710, 1723, 1736, 1743, 1756, 1769, 1776, 1782, 1789, in October; and Four times near the other Node, in the Month of April, A. D. 1707, 1753, 1786, 1799; all within this Century.

Dr. Gregory, in his Comparative Astronomy, at the End of his *Astron. Phys. & Geom. Elementa*, considers what *Phænomena* in the Heavens would appear to an Eye placed in this Planet Mercury, viz.

2. That the Diameter of the Sun seen from thence, would be treble of what it is seen from the Earth, because that Planet is thrice as near to it as we are; and consequently the Sun's Disk to an Eye there, will be Seven times as great as what

it appears to us ; and all other things consider'd, the Light and Heat in *Mercury* will be septuple of ours, at some times : But these Qualities will be much intended and remitted, according to the diverse Distance of *Mercury* from the Sun ; for his Orbit is the most Excentrick of any of the Planets.

2. The Gravity of *Mercury* towards the Sun will be seven times greater than in the Earth. The Density of *Mercury*, and consequently the Gravity of Bodies placed on its Surface, towards its Centre, cannot so accurately be determin'd, as the Gravity of the Planet towards the Sun : But however, in *Prop. 49. Lib. 3. Schol.* he shews a Way to guess Analogically at it. And no doubt this Planet is much denser than the Earth, because of the Over-proportion of Heat there.

3. It doth not yet appear by Observations, whether *Mercury* revolves round his Axis, or not, and consequently what the Length of his Day is ; but 'tis probable he hath such a Motion as well as the other Planets, but his Year is scarce equal to a Quarter of ours. What Variety of Seasons and Weather *Mercury* is subject to, is uncertain ; because the Inclination of his Axis, on which he revolves about himself, to the Plane of the Orbit, which he describes round the Sun, is unknown.

4. To an Eye placed in *Mercury*, and looking towards the Sun, the Solar Spots (if at any time such there are) will appear to traverse his Disk sometimes in a Right-Line, from East to West ; and sometimes their Path will appear Elliptical, bending sometimes one way, and sometimes another. And the whole Variety of this Appearance will be absolv'd in a Year's Time, in which the Path of the Solar Spots will appear to be twice Rectilinear : But indeed the Path of these Spots will be almost continually in a Right Line, because *Mercury* never much declines from the Plane of the Sun's Equator.

5. The other Five Planets being above *Mercury*, their Phenomena will be much the same as to an Eye at the Earth : So that *Venus* and our Earth, when in Opposition to the Sun, will shine with a full Orb, and consequently afford a great Light to this Planet at Night. But the Superior Planets will not afford him so much Light as they do us.

6. The Sun's and the other Planets Places, and the Phenomena of Comets are found the same Way in *Mercury*, and after the same manner, and will appear as they do to us on the Earth.

MERIDIAN, is a great Circle passing through the Poles of the World, and both Zenith and Nadir, crosseth the Equinoctial at Right Angles, and divideth the Sphere into two equal Parts, one East, the other West ; and has its Poles in the East and West Points of the Horizon. 'Tis call'd *Meridian*, because when the Sun cometh to the South Part of this Circle, 'tis then *Meridies*, Mid-day, or High-noon ; and then the Sun hath his greatest Altitude for that Day, which therefore is called the *Meridian Altitude*.

These *Meridians* are various, and change according to the Longitudes of Places ; so that they may be said to be infinite in Number, for that all Places from East to West have their several *Meridians* : But there is (or should be) one Fix'd, which is called the *First Meridian*.

MERIDIAN on the Globe or Sphere, is represented by the Brazen Circle, in which the Globe hangs and turns. 'Tis divided into Four 90's or 360 Degrees, beginning at the Equinoctial.

On it, each way from the Equinoctial, on the *Celestial Globe*, is counted the South and North Declination of the Sun or Stars : And on the *Terrestrial Globe*, the Latitude of Places North or South. Which is all one with the Elevation or Height of the Pole above the Horizon ; and the Complement of the Latitude or Poles Height is equal to the Height of the Equinoctial above the Horizon.

There are two Points of this Circle, which are called the Poles of the World ; and a Diameter continu'd from thence through the Centre of either Globes, is called the Axis of the Earth or Heavens, on which they are supposed to turn round.

On the *Terrestrial Globes* there are usually 36 *Meridians* drawn, one through every Tenth Degree of the Equator, or through every Tenth Degree of Longitude.

The Uses of this Circle, are,

1. To set the Globes to any particular Latitude.
2. To shew the Sun's or a Star's Declination, Right Ascension, or greatest Altitude, &c.

PROBLEM.

To find the Sun's Meridian Altitude or Depresson at Night by the Globes.

Bring the Sun's Place to the *Meridian* above the Horizon, for his *Noon-Altitude* ; which will shew the Degrees of it, counted from the Horizon. For his *Midnight-Depresson* below the North Point of the Horizon, you must bring the opposite Point to the Sun's present Place, as before to the *Meridian* ; and the Degrees there intercepted between that Point and the Horizon, are his *Midnight-Depresson*.

MERIDIAN Line, on a Dial, is a Right Line arising from the Interfection of the Meridian of the Place with the Plane of the Dial. This is the Line of 12 a Clock, and from hence the Division of the Hour Lines begins.

To draw a True Meridian Line upon an Horizontal Plane.

First, Get a plain thick Board, of a Foot Square, or more ; then upon one of the Edges or Corners, as near as may be, fasten a strong Iron Pin, about 10 or 11 Inches long, and make it so fast, that it will not shake or yield in the least : It matters not whether it be perpendicular or not.

Set this Board horizontally in your Garden with Earth or Sand upon the Ground, or elsewhere about 9 a Clock ; (the best Time is, when the Sun is near the Solstice, suppose about the 10th of June) see where the Head of this Iron Pin (which must be sharp at the top) giveth its Shadow upon the Board, mark that Place : Then take a Wooden Ruler, sharp also at one end, and lay it so upon the sharp end of the Iron Pin, that the sharp end of the Ruler may touch the Mark ; then carrying it steady, make the Segment of a Circle towards the North. Come again about 3 a Clock in the Afternoon, and mark where the Shadow of the top of the Iron Pin is, in that Segment again. Then draw a Line from those two Marks, which will be East and West, and the Perpendicular to that Line will be a *Meridian* ; and if you halve that Line, the Perpendicular will go through the Centre of the whole Circle : For that Segment is part

part of the Basis of a Cone, whose Vertex is the Top of the Iron Pin.

But because the Sun may be under a Cloud, when you come at Three a Clock, you may make three or four more Segments, and use them as you used this.

This Method would be very exact, if the Sun moved as the Fixed-Stars do; but because the Sun hath a proper Motion, as a Planet, there will be some inconsiderable Error, which yet may be corrected; For seeing the Sun in one Minute of an Hour moveth as much by his daily Motion, as he loseth in 6 Hours by his proper Motion; you shall add as much in the way which the Shadow goes in the last Mark, as that Shadow moveth in one Minute, which you may measure by your Pulse or Pendulum; so the last Point will not be taken just in the Segment, but a little without it.

Under the Word *Pole-Star*, you have another good Method for drawing a true *Meridian Line*.

Mr. Stephen Gray, in *Philos. Transact.* N^o 260, gives a New Method of drawing a True *Meridian Line* by the *Pole-Star*; as also, How to find the Hour by the same. Thus,

Take the Gnomon of an Horizontal Dial for the Latitude of the Place, and to the Hypothense fix two Sights, whose Centres may be parallel to the same: Let the Eye-sight be a small Hole; but the other's Diameter must be equal to the Tangent of the double Distance of the North-Star from the Pole, the Distance of the Sights being made *Radius*. Let the Stile be rivetted to the End of a straight Ruler; then when you would make use of it, lay the Ruler on an Horizontal Plane, so that the End to which the Ruler is fix'd, may hang over: Then look through the Eye-sight, moving the Instrument 'till you see the North Star appear to touch the Circumference of the Hole in the other Sight, on the same Hand with the Girdle of *Cassiopeia*; or on the opposite side to that, whereon the Star in the Great Bear's Rump is at that Time: Then draw a Line by the Edge of the Ruler, and 'twill be a True *Meridian Line*, as is very easie to demonstrate.

In *Philos. Transf.* N^o 270, he improves this Method, and describes an Instrument, whereby he not only draws a True *Meridian*, but finds the Hour and Minute of the Day or Night, by the Help of the *Pole-Star*, exactly. His Instrument he thus describes:

Let there be taken a Telescope, of about 16 Foot, or longer, if you please; in the Plane of its Focus, place a Ring of Brass at Right Angles to the Glass, the Diameter of the inward Circle being equal to the double Tangent of the *Pole-Star's* Distance from the Pole; the Focal Length of the Object-Glass being made *Radius*, as was said in the Description of the *Meridian Instrument*. Let the Ring be divided into 24 Hours, with their Minutes, numbred from the Right Hand towards the Left, as in our common Nocturnals: The Eye-Glass must be equal in its Diameter to the Horary Ring. But this perhaps will be thought too chargeable, especially for such large Telescopes as he speaks of; wherefore he gives this Contrivance: The Eye-Glass must lie in a broad Index, towards one End; this is to turn on a Centre-pin that lies in the Centre of the Glass, and consequently over the Centre of the Horary Ring, from which it must be equal to the Distance of the Focus of the Eye-Glass; then let the

Tube be elevated to the Height of the Pole, and directed to the *Pole-Star*, 'till by turning the Index about, you can perceive the Star to touch the Horary Ring on that side the Star in which the Great Bear's Rump lies, or on the opposite to that in the Hip of *Cassiopeia*: But on the contrary, had not the Glass inverted the Object, then bring one of the Twelves to be in a Perpendicular to the other; by a plain Line; so will the Star stand at its Horary Distance from the *Meridian*: Or if the Latitude of the Place be unknown, by the Right Ascension of the Sun and Star, the Time of its coming to the *Meridian* will be easily obtain'd, then the Hour of the Night found, will as easily give the Star's Horary Distance from the *Meridian*. Then elevate the Tube towards the Star, bringing the *Meridian*, or 12 and 12, into the Plane of the Perpendicular; turn the Glass about, 'till you see the *Pole-star* stand at its Horary Distance from the *Meridian*; so will the Instrument, when fix'd, shew the Horary Distance throughout the whole Day, or as long as it remains in this Position, by the apparent Motion of the Star in the Ring.

The best Time to fix the Instrument, will be when this, or any of the other two Stars above-mention'd; are about 6 Hours from the *Meridian*.

Note, That the Latitude of the Place is now given with the utmost Preciseness; for the Axis of the Glass lies now in the Axis of the World; and if one of the sides of the Tubes be parallel thereto, as it ought to be, at the upper End hang a Line or Plumbet, from the Point of Suspension; find another Point equal in Distance to the Length of the Line, or a Knot towards the lower End, the Distance from this Knot to the former Point will be but the Chord of the Latitude; and if from the same Edge of the Index another Line and Plumbet be hung towards the lower End of the Tube, these two Lines, when at rest, will be in the Plane of the *Meridian*.

This Instrument may be made to shew the Hour with as much Facility as a Clock or Sun-Dial, if the Horary Ring be made to move within a larger fixed one; and the outward Circle of the former be divided into the Days of the Month, respect being had to the Right Ascension of the Sun and Star; Then bringing the two opposite Points in the fixed Circle, to the Perpendicular, which is done at the fixing of the Instrument, move the Circle 'till the Day of the Month come to any of these, and the Ring is rectified for that Day; and if the Air be clear, you'll see the Star stand at the true Time of the Day or Night.

It may be objected, That in few Years, by the Annual Increase of its Declination, the *Pole-star* will, by moving in a lesser Circle, be brought too far from the Edge of the Ring, that the exact Hour and Minute cannot well be distinguished. But this Inconveniency, when it is one, may be remedied several ways; either by making a lesser Ring, or by extending a fine Thread of Silk cross the Ring, 'till it cuts the Star, and at the same time it gives the Hour; or, which will yet make this Instrument commodious for other Purposes, there may be made an Index to move on the Centre of the Hour-wheel, which being brought to cut the Star with the Edge that proceeds from the Centre, it will at the same time cut the Hour. And you need not be solicitous about the exact Diameter of the Ring, provided

it do but a little exceed the Distance of the Pole-Star from the Pole; the Focal Length of the Glass being made Radius.

Our most Accurate and Judicious Astronomer, Mr. John Flamsteed, has discovered, That there is a Parallax of the Earth's Annual Orbit at the Pole-star, of about 40 or 45 Seconds; whereby the Diameter of the Star's Parallel is greater in June than in December, by about one Minute two Seconds; which he has evinced from 7 Years successive Observations: Whereby the Earth's Annual Motion is indubitably demonstrated, as appears from his Learned Letter to Dr. Wallis on that Subject.

Now if on the Edge of this Index there be drawn a Scale of Degrees, Minutes and Seconds, to the Radius of the Glass, we shall not only have a very Accurate Instrument for the Hour, but be furnished with one whereby we shall see the Truth of the Earth's Motion confirmed by the Accels and Recess of our Star towards and from the Pole, according to the Earth's Place in the Ecliptick, as that learned Person above-mentioned has discover'd; and that not only when the Star transits the Meridian, but in a clear Air at any Time of the Day: One shall likewise observe that Annual Increase of the Pole-stars Declination, caused by the Profection of the Equinox.

Moreover, he, from his own Observation, assures us, That the Pole-star may be seen in the Day-time with a Telescope of 16 Foot; of which he gives particular Instances: As, On the 26th of April, 1701, with such a Telescope he saw the Pole-star from four a Clock in the Morning, 'till seven; and could have seen it longer, had not Clouds interpos'd. Also, On the 1st of May, he did not look for the Star 'till the Sun had been up more than half an Hour, viz. at Five in the Morning, yet soon found it; and saw it afterwards at Pleasure, 'till half an Hour after Nine the same Morning. So that 'tis not to be doubted, but this Star may be seen in a Clear Day throughout the Year.

The Declination of the Pole-star for the Year 1700, is $87^{\circ} 42' 51''$ by Riccioli's his Catalogue of Fixed Stars, in the Appendix to Mr. Edward Sherburn's *Sphere of Manilius*, &c. Hence its Distance from the Pole at that Time might be assumed $2^{\circ} 17'$ the Focal Length of the Object-glass being 15 Foot 6 Inches; so that the Diameter should be 14 Inches and $\frac{84}{100}$ Parts of an Inch, which is the natural Tangent of the former Ark $2^{\circ} 17'$ doubled; a Circle large enough to be divided into Minutes and Halves, which will be so magnified by the Eye-glass, that 'twill be easie to distinguish the Time to a few Seconds.

'Tis true, there is some Difficulty in fixing up this Instrument; and when it is so, to keep it from varying from its due Position; but yet 'tis not insuperable. And for small Instruments, of about 2 or 3 Foot long, there cannot be a more accurate, facile, and expeditious Way than this for drawing a Meridian Line.

Now whether the many Benefits that may accrue to Astronomy, do not make the larger one worthy of the Charge and Trouble that may be in completing it, he leaves to the Consideration of the Learned.

MERIDIAN *Magnetical*, is a great Circle passing thro' or by the magnetical Poles; to which Meridians, the Compass (if not otherwise hindred) hath respect.

MERIDIONAL *Distance*, in Navigation, is the same with the Departure, Easting or Westing, of the Difference of Longitude between the Meridian under which the Ship now is, and any other Meridian she was before under.

MERIDIONAL *Parts*, Miles, or Minutes, in Navigation, are the Parts by which the Meridians in Mr. Wright's Chart (commonly, though falsely, called *Mercator's*) do increase as the Parallels of Latitude decrease: And the Co-sine of the Latitude of any Place being equal to the Radius or Semi-diameter of that Parallel, therefore in the True Sea Chart, or Nautical Planisphere, this Radius being the Radius of the Equinoctial, or whole Sine of 90° ; the Meridional Parts at each Degree of Latitude must increase, as the Secants of the Ark contained between that Latitude and the Equinoctial do decrease. The Tables therefore of Meridional Parts, which you have in Books of Navigation, are made by a continual Addition of Secants: They are calculated in some Books (as in Sir Jonas Moor's Tables) for every Degree and Minute of Latitude; and these will serve either to make or graduate a *Mercator's Chart*, or to work the *Mercator's Sailing*. To use them, you must enter the Table with the Degree of Latitude at the Head, and with the Minute on the first Column towards the Left Hand; and in the Angle of Meeting you will have the Meridional Parts.

Having the Latitudes of two Places, to find the Meridional Miles or Minutes between them, consider whether the Places be one under the Equinoctial and the other wide thereof; or the one on the one side of the Equinoctial, and the other on the other; or whether they both lie on the same side: For, according to these Positions, there's a Threefold Case.

1. When one Place lieth under the Equinoctial, then the Meridional Minutes that are found next under the Degree of Latitude the other Place lieth in, is the Meridional Difference of Latitude, or Latitude enlarged.

2. When one Place hath North Latitude, and the other South, add the Meridional Minutes belonging to each Latitude together, and the Sum is the Meridional Minutes between them.

3. When both Places are towards one Pole, then subtract the Meridional Parts answering to the lesser Latitude, out of those for the greater, and the Remainder will be the Meridional Minutes required.

Examples of these Cases will make them more plain, which shall be these:

Example I.

To find the Meridional Parts or Minutes between the Equinoctial and Latitude $43^{\circ} 11'$.

In the Column under 43, and right against 11 Minutes in the Left Hand Column stands 2878.2, the Meridional Parts required.

Example

Example II.

Let it be required to find the Meridional Parts between $25^{\circ} 13'$ South Latitude, and $51^{\circ} 30'$ North.

Under 51° and against $30'$ is ——— 3616.8
Under 25° and against $13'$ is ——— 1564.3

The Merid. Parts between the two, are ——— 5181.1

Example III.

To find the Meridional Minutes between the Latitude's $32^{\circ} 15'$ North, and $53^{\circ} 23'$ North.

Under 53° and against $23'$ is ——— 3802.2
Under 32° and against $15'$ is ——— 2046.1

The Meridional Parts between the Latitudes proposed, are ——— 1756.1

MERLON, in Fortification, is that Part of the Paraper which lies betwixt two Embrasures, being from 8 to 9 Foot long on the side of the Cannon, and 6 on the side of the Field; as also 6 Foot high, and 18 thick.

MESARAICK Veins, arise from, or are rather enclosed in the Mesentery, being Branches of the Vena Porta.

MESARÆUM, the same with Mesenterium; whence its Vessels are called as well Mesaraick as Mesenterick.

MESENTERY, is the Membrane of the Peritoneum doubled, enriched with Glandules, Nerves, Arteries, Veins, Chyliferous and Lymphatick Vessels: It is in the middle of the Abdomen, and contains the Intestines in a wonderful manner. It has a great Glandule in the middle, called Pancreas Asellus; about which are several other less Glandules, to which the Milky Vessels of the first Rank tend, from the Intestines and Lymphatick Vessels, from the Liver and other Parts: From these Glandules again the Milky Vessels of the second Rank ascend to the Vessel that carries the Mass of Chyle, and discharge themselves into it. Blanchard.

MESENTERICK Arteries: The Upper of which is said to distribute it self among the small Guts; and the Under one to go to the lower Part of the Mesentery.

MESN, or Mesn, a Term in Law, signifying him that is Lord of a Manor, and so hath Tenants holding of him; yet himself holds of a Superior Lord. It signifies also a Writ, which lieth where there is Lord, Mesn and Tenant: The Tenant holdeth of the Mesn by the same Services whereby the Mesn holdeth of the Lord; and the Tenant of the Mesn is distrain'd by the Superior Lord, for that his Service or Rent which is due to the Mesn.

MESOCOLON, is that Part of the Mesentery which is continued to the Great Guts, lying in the midst of the Gut Colon, whereto it is joined in its whole Course, and in its lowest Border sticks to a Part of the Rectum.

MESOLABIUM, in Mathematicks, is an Instrument for finding Mean Proportionals.

MESOPLEURII, are the Intercoastal Muscles, Twenty two on each side; Eleven External, and as many Internal.

METACARPUS, and Metacarpium, is the Back of the Hand, made of Four oblong little Bones, which expand the Palm of the Hand, and they are called *Post-brachialia*.

METACARPUS, is a Bone of the Arm, made up of Four Bones which are annexed to the Four Fingers; that which sustains the Fore-finger is the biggest and longest. They are round and long, a little convex and round towards the Back of the Hand, and concave and plain towards the Palm: They are hollow in the middle, and full of Marrow; they touch one another only at their Extremities, leaving Spaces in their middle, in which lie the *Musculi interossei*. In the upper end there is a Sinus, which receives the Bones of the Wrist, and their lower Extremity is round, and is received into the Sinus of the first Bones of the Fingers.

METACONDYLI, are the utmost Bones of the Fingers.

METALS and Minerals. The Excellent Promoter of all useful Learning, Bishop Wilkins, in his Real Character, gives the following Table of Metals.

Metal is a Mineral, for the most part of a Hard Consistence, Close, Ductile, and Fusile; and may be distinguished into

I. Perfect.

And this is either, { Natural, or
Fabricitious.

II. Imperfect.

With Reference to { Metalline Kinds, or,
Recrementitious Parts.

First, Natural Metals are such as of themselves grow in the Earth, without any kind of Mixture or other help by the Art of Men. And these are either,

i. More Rare and Precious: Of a

Yellowish Colour, most heavy; not growing in particular Mines, where it is debased with any drossie Mixture, but found pure either in small Sands, or rocky Branches; and this is Gold.

Whitish Colour, next in Value to Gold, not subject to Rust, yielding (when struck) a pleasant Sound; as Silver.

2. Of a Middle Value, and of a

Whitish Colour, and more soft Consistence, as Tin: Or of a Reddish Colour, as Copper.

3. Of a Baser Value, and more Common,

are

Lead, which is of a yet softer Consistence, a darkish Colour, and not Sonorous.

Iron, which is of an hard Consistence, and of a rusty dark Colour too.

Secondly, *Facitious Metals*, are such as are made by the Art of Man: Of which some are made of

Copper, and *Lapis Calaminaris*, as *Brass*. Some of
Tin, *Lead*, and *Tin-Glass*, as *Pewter*. Or of
Iron depurated, by frequent heating, and beating, and boiling with Salts; as *Steel*.

Thirdly, *Imperfect Kinds* of Metal, are either

Fluid, as *Mercury* or *Quicksilver*: Or,
Solid and *Consistent*. And some of these are used for

Purging, and chiefly upwards, as *Antimony*.

Some are used for making of
Pewter, being of a shining brittle Substance, as *Bismuth* or *Tin-Glass*. Others are used for making of

Solder, as *Spelter*, *Zink*, or *Spalt*. And some are made use for

Painting, as *Cinnabar*, *Vermilion*, and *Black Lead*.

Fourthly, *Recrementitious Parts* of Metals, are such as are cast off either in the *Preparation* of them by

Melting; as *Litarge*, which is a kind of Scum arising from the Purification of Silver from *Lead*; and *Spedium* and *Pomphelix*, which fly out from *Copper* when it is in Fusion, and either fall down again to the Ground, as the former, or adhere to the Roof or Walls, as the latter: Or else they come from the Metal by

Beating or *Hammering*, as the *Scoria*, or *Scales*; or arise from

Corruption either in the general way, as *Rust*, or after a particular manner, as in the making of *Verdigrease* and *Ceruse*; one from *Copper*, or *Brass*, and the other from *Lead*.

But notwithstanding this Scheme be a good general Summary; yet a good Discourse on this Subject is very much wanting; and indeed, to do it well, will be a very difficult Task: Because in the *Mineral Kingdom* (as Dr. Woodward observes in his Excellent Natural History of the Earth, Part 4.) there is nothing *Regular*, *Constant*, or *Certain*: Neither *Colour*, *Figure*, nor their *Place* or *Situation* in the Earth, are to be trusted to, or relied upon, so as positively to make any Judgment from thence.

A common *Marchasite*, or *Pyrites*, shall have the Colour and Brightness of Gold or Silver, and yet afford nothing but a little Sulphur and Vitriol; whilst another Body, having only the Resemblance of a Pebble or a Stone, shall have a plentiful Admixture of a valuable Metal in it.

Nothing is more common than to find the same Metal shot also into very different Forms and Figures; as well as to find different kinds of Metal of the same Form and Figure: And a Body which hath the shape and appearance of a Diamond, may prove upon Examination, to be nothing but Crystals or *Selenites*; nay, perhaps only common Salt, or Alum, naturally Crystallized, or shot into that Form.

So also as to their Place in the Earth, there is the same Uncertainty: Sometimes we find them in the Perpendicular Fissures, or Intervals of the *Strata*; sometimes interperfed in the Bodies of the *Strata*, and sometimes in both: Only indeed in the Gems there is this Difference, That the *Topazes*, *Amethysts*, *Emeralds*, &c. which grow in the Fissures, are ordinarily Crystallized or shot into Angular Figures, whereas those found in the *Strata*, are in rude Lumps, only like so many Yellow, Purple, or Green Pebbles; not but that even these that are thus lodged in the *Strata* are also sometimes found Crystallized, and in the Forms of *Cubes*, *Rhombi*, &c. but then those found in the *Strata*, are easily distinguished from the other, because they are without their *Roof*, (as the Jewellers call it) or the Abruptness at their Ends, whereby the others adhere to the Stone or Sides of the Intervals, which Abruptness is occasioned by their being broken off from thence: And those which are found inclosed in solid Stone, Marble, &c. being difficultly separable from the Stony Matter which adheres to them on all sides, have commonly some of that Matter sticking to them on all their sides; whereby they are distinguished from those found in the *Perpendicular Intervals*, they adhering only by one End, as was above observed.

The same Metals are also placed indifferently in all kind of Terrestrial Matter, or in *Strata* of very different Natures. They are frequently also variously intermixed one with another; so that 'tis a rare thing to find any of them Pure and Simple, but Copper and Iron shall be in the same *Mass*, Gold and Copper, Silver and Lead, Tin and Lead; yea, sometimes all the Six together in one and the same Lump.

'Tis the same thing with *Minerals*; and *Minerals* and Metals are very often Blended and Intermixed together.

Now the Knowledge of this may be of good use to undeceive those, who by reading of some Authors, are persuaded, That all things relating to Metals and Minerals, are transacted by Nature, in a most regular and Accurate Order, whereas indeed there is nothing like that; and the only standing Test, and distinguishing Characteristick of any Metal or Mineral, must be sought for in the Constituent Matter of it, and it must first be brought down to that, before any certain Judgment can be given of it.

Those Metals and Minerals which are repositied in the Bodies of the *Strata*, are either found there in Grains, or small Particles, or else amassed into Balls, Lumps, or Nodules; which Nodules are either of an irregular and uncertain Figure; as the common *Pyrites*, *Flints*, *Agates*, *Onyxes*, *Pebbles*, *Cornelians*, *Jaspers*, &c. or else they are of a Figure somewhat regular and observable; as the *Belemnites*, the several sorts of *Mineral Coral*, the *Stelechites*, the *Lapis Mucetoides*, vulgarly called, *Fungites*: The *Astroites*, or *Starry Stone*; as well that sort with the prominent, as that with the Concave Stars: The *Selenites*, the Echinated Crystalline Balls, with many more Analogous Bodies.

Those which are contained in the Perpendicular Intervals of the *Strata*, are either such as are there gathered into a Rude Heap, without any particular Form or Order, lying included within the two opposite Walls or Sides of the said Intervals,

vals, which, according to their Quantity, they wholly, or partly fill.

In such manner is *Sparr*, and other Minerals usually found; as also the common Ores of Lead, Tin, Iron, and other Metals: or else such as are distinguishable by being of some observable Figure; as the *Sparry Striae* or *Icecydes*, called *Stalactites*, or rather *Stagonites*; the Native *Saline Icecydes*, or *Sal Stalactitum*; the *Vitriolum Stalactitum Nativum*; the *Vitriolum Capillare*; the *Alumen Stalactitum* and *Capillare*; *Minera Ferri Stalactica*, which when several of the *Cylindrick Striae* are contiguous, growing together, as it were, in one Sheaf, is called *Brush Iron Ore*; the *Argentum Arborescens* and *Capillare*. To these add also the crystallized Ores and Minerals, viz. the Tin, and mundick Grains, the Iron Rhombs, crystallized Nitre, Salt, Alum, Vitriol and Sulphur: Of which sort also are the Gems or Stones that are here fluit into Cubes, into Pyramidical Forms, or into Angulated Columns, consisting of six Sides, and mucronated or terminating in a Point; being either *Opake* or *Pellucid*, or but partly so, and coloured Black, White, Grey, Red, Purple, Blue, Yellow or Green; v. gr. *Crystal*, the *Pseude-Adamantes*, the *Cornish* and *Bristol-Stones*, *Crystallized Sparrs*, the *Iris*, the *Amethyst*, the *Sapphire*, the *Topaz*, the *Emerald*, &c.

As to the Origin and Production of Metals and Minerals, the Doctor from the Light his Observations have given him, comes to these Conclusions.

1. That the far greatest Part of our Metals and Minerals, viz. all such as are now found in the *Strata*, do owe their present Frame and Order to the *Universal Deluge*, when the *Strata* of Stone, Earth, Marble, &c. themselves were also formed. At which Time also were all metallick and mineral Nodules whatsoever formed; as well those in rude Lumps, such as the common *Pyrites*, *Flints*, *Pebbles*, *Agates*, *Onyxes*, *Jaspers*, *Cornelions*, &c. as those of a more observable Figure and regular Shape; as the *Selenites*, *Belemnites*, *Stelechites*, mineral Coral.

2. That the metallick and mineral Matter, now found in the perpendicular Intervals or Fissures of the several *Strata*, of which the Body of the Earth is composed, was all of it originally, and at the Time of the Deluge, lodged in the Bodies of those *Strata*, that it was educed thence, and transmitted into these Intervals since that Time; the Intervals themselves not existing 'till the *Strata* were formed, and afterwards broken, to let the Water from off the Earth. See Part 2. *Consect.* 3, 6, and Part 3. *sect.* 2. of his *Natural History of the Earth*.

But he supposes, that the Water which is continually ascending from the Abyss, towards the Surface of the Globe (see *Abyss*, and the Word *spring*) continually pervading the Bodies of the *Strata*, detaches out of their Pores and Interstices, such metallick and mineral Corpuscles, as lie loose in its way (and which are withal so small as to be capable of passing thro' those Interstices) forcing them along with it to the perpendicular Intervals; where having more Room, and a freer Passage than before, it deserts them and leaves them in those Intervals; and that this way all the mineral and metallick Metals now found in these Places, were brought thither, and there do still grow and increase.

But that these in the *Strata* do not, nor cannot grow, but on the contrary, are continually lessened and diminished, by so much as hath been conveyed into their perpendicular Intervals, and hath been brought forth on the Surface of the Earth by Springs, Rivers, and Exhalations from the Abyss, ever since the Deluge.

The Doctor supposes also, That the *Bitumen*, which is found in Lumps, or coagulated Masses, in some Springs; and which in others is found floating on the Surface of the Water in the Form of an Oyl (called by Naturalists, *Naphtha* and *Petroleum*): That the Salt wherewith the *Saline* or Salt Springs abound, the Vitriol, Alum, Nitre, Sulphur, Sparr, and other Minerals, wherewith the *Acidule*, or medicinal Springs are impregnated; all these Minerals, he saith, were first lodged in the *strata* of Stone, Coal, Earth, &c. and have since been educed thence, and conveyed into those Springs, by the Water pervading those *Strata* in its Passage from the Abyss towards the said Springs. See a much larger Account of this Matter under the Word *Fossils*.

METAL, a Word frequently used about a Piece of Ordnance, or great Gun: The Outside or Surface of her is called, The *Superficies of her Metals*: When the Mouth of a great Gun lies lower than her Breech, they say, She *lies under Metal*; but if she lies truly level, point-blank, or right with the Mark, they say, She *lies right with her Metal*.

METALLURGY, is the Working or Operation upon Metals, in order to render them most fine, hard, bright, beautiful, serviceable or useful to Mankind.

METAPEDIUM, the same in the Foot that *Metacarpus* is in the Hand.

METAPHOR, a Trope in *Rhetorick*, by which we put a strange and remote Word for a proper Word, by reason of its Resemblance with the Thing of which we speak: As a King is called the Head of his Kingdom, because he commands the Members of the Politick Body, as the Head does the Natural Body.

METAPHRENUM, is that Part of the Back, which comes after the *Diaphragm*. *Blanchard*.

METAPTOSIS, is the degenerating of one Disease into another, as of a *Quartan Ague*, into a *Tertian*; and on the contrary, of an *Apoplexy* into a *Palsie*, &c.

METASTASIS, is when a Disease goes from one Part to another; which happens to Apoplectick People, when the Matter which affects the Brain is translated to the Nerves.

METATARSUS, is composed of five little Bones, connected to those of the first Part of the Foot, which immediately succeeds the Leg.

METEORS, (according to the *Cartesians*) are certain various Impressions made upon the Elements, exhibiting them in different Forms, and are called *Meteors* from their Elevation; because for the most part, they appear to be high in the Air; and they are either Fiery, Airy, or Watery.

Fiery Meteors, are such as consist of a fat, sulphurous kindled Smoke, whereof there are several Kinds; as *Ignis Fatuus*, *Trabs*, *Ignis Pyramidalis*, *Draco Volans*, *Capra Saltans*, *Thunder* and *Lightning*, &c.

Airy Meteors, are such as consist of flatuous and spirituous Exhalations, as *Winds*, &c.

Watery Meteors consist of Vapours, or Watery Particles, by the Action of Heat separated from each other, and variously modified, as *Rain, Dew, &c.*

Dr. Woodward, in his *Natural History of the Earth*, p. 208. supposes the Matter of *Meteors* to be in good measure of a mineral Nature; and that the mineral Particles contained in the *Strata* of the Earth, are raised up by the Subterranean Heat or Fire, along with the Vapours ascending from the Abyss, and pervading those *Strata*, and especially at such times as the Sun's Power is so great, as to penetrate the exterior Parts of the Earth, and therefore help to mount them up into the Atmosphere. These Sulphureous, Nitrous, and other light and active mineral Particles do form *Meteors* in the Air, and particularly are the Cause of *Thunder and Lightning, &c.* and other Fiery Compositions there.

METHOD, or *Disposition*, is that Action of the Mind, by which we range various Ideas, Judgments and Ratiocinations upon one and the same Subject, in that Order which is most proper for its Explanation; and a right Method of Enquiry after Truth, or the Prosecution of any Demonstration, will be found to consist also in a regular Train of Arguments and Consequences rightly disposed in their just and natural Order. If you will believe *Des Cartes*, he saith, in his Book *De Methodo*, That he was able to master the greatest Depths in *Geometry*, by only observing constantly these four following Rules in his Studies.

First, Never to admit any thing for Truth, and to treasure it up in the Mind as such, unless we be demonstratively assured, that it is such.

Secondly, To divide the Difficulties of the Problem, or Matter inquired after, into such a proper Number of Parts, as is most convenient for its Resolution.

Thirdly, To observe exact Order and Method in our Thoughts and Inquiries, so as to begin with the plainest and easiest Things first, and then to proceed on gradually to Things more and more difficult.

Fourthly, To be sure not to slip, over-look, or omit any thing, either in the Difficulties to be solved, or in the means of Inquiry.

These are indeed very good Rules, and I question not were very serviceable to him in his *Geometrical Inquiries*; but the Sight of our Country-man *Harriot's Algebra*, did him as much Service as all of them.

In *Mathematical Inquiries*, there are Two general Methods commonly made use of, the *Analytical*, and the *Synthetical*; which see: And to which may be added, the *Zetical* and *Poristical* Methods; which you will find under those Words.

METONICK Year, or *Period*, is the Space of 19 Years; in which time, the *Lunations* return, and happen as they were before; 'tis sometimes called, *The Great Metonick Year*, and is the same with the *Cycle of the Moon*.

METONYMY, or *Transnominatio*, (a Figure or Trope in *Rhetoric*) is the putting of one Name for another, or expressing a Thing by an-

other Name, than which properly belongs to it; as if we should say, *All the World reads Cicero*; *Cæsar ravaged the Gauls*: it would be plain, what we intended, viz. That the *World* reads *Cicero's Works*; *Cæsar's Army ravaged the Gauls*.

METOPA, in Architecture, is the Interval or Space between every Triglyph in the Frize of the *Dorick Order*. The Ancients used to adorn these Parts with Carved Works or Paintings, representing the Heads of Oxen, Vessels, Basons, and divers other Instruments that were used in their Sacrifices.

METRECHYTA, is an Instrument where-with Liquors are injected into the Womb.

MIASMA, is a contagious Infection in the Blood and Spirits, as in the *Plague, &c.*

MICROCOUSTICKS, the same with *Microphones*.

MICROCOSM; The Body of a Man is called the *Little World*, as a kind of Compendium of the Greater.

MICROMETER, is an Instrument made of Brads, being a Movement with a Plate, or Face, divided like a Clock or Watch, with an Index or Hand, which (being turned) moves two sliding Plates of Brads with Hairs, and counts on the Plate the Revolves or Turns of the endless Screw. This Instrument is fitted to a large Telescope, and used in *Astronomy*, to find the Diameters of the Stars, or Planets.

The Description of this Instrument of Mr. Townley, improved by Dr. Hook, you may see more at large in *Philos. Transact.* N. 29. and the Uses in N. 25. See Vol. II.

MICROPHONES, are Instruments contrived to magnifie small Sounds, as *Microscopes* do small Objects.

MICROSCOPE, is an Optical Instrument, which by extremely magnifying (as they say) any Object, helps us to discover the minute Particles of which Bodies are composed, and the curious Frame and Contexture of them.

To make very small single Eye-glasses for Microscopes.

Get some very small Silver-wire, and double it up and down like a Skein of Thread, in order to make a Wick (for a Lamp) of a moderate size; then fill a Lamp with *Spirit of Wine*, well dephlegmated, and use the Silver-wire instead of a Cotton-wick: Then having ready some fine Glafs beaten, powdered, and sifted very small, and well washed and dried, take some of it on the Point of a Silver Needle filed very small, and wetted a little with Spittle, and holding it in the Flame of the Lamp, turn it about 'till it melt, (as it will soon do) into a fine round Globule: You must hold it in the Flame no longer than 'till it come to its round Figure, lest you burn it: The only Difficulty is in giving it that Roundness exactly, but Practice will soon learn you the Knack of it; they must be cleaned afterwards by rubbing them a while on soft Leather. *Philos. Transact.* N. 141.

Those *Microscopes* that are made with single Convex Glasses, must have the Object placed in one Focus of the Glafs (or rather a little nearer), and the Eye must be in the other Focus on the other side.

These

JOHN MARSHALL'S New Invented DOUBLE MICROSCOPE, For Viewing the CIRCULATION of the BLOOD

Made & Sold by him at the Archimedes &
Golden Spectacles in Ludgate Street.

These kind of *Microscopes*, when the Glasses are well made, do magnifie exceedingly: Such are our very Famous Mr. *Mellen's* Glasses, which, I believe, are the best of any in the World of this kind: And such are those of Mr. *Lewenboeck of Delft* in *Holland*, by which so many great Discoveries have been made.

But there is more than one great Inconvenience in these Glasses, *viz.* To magnifie much, the Object must be so near, that it must almost touch the Glass; 'tis also very difficult to fit the Object true to the Glass, and when fitted, to fix it so; and but a very small Part of the Object can be seen at a time. But then they being contrived to carry in the Pocket, are very ready, and will be of vast Use on many Occasions.

The best Glasses of this kind that ever I saw, are made by the above-mentioned Mr. *Mellen*, who formerly lived in *Abchurch-Lane*.

In *Philos. Transact.* N. 42. is an Account of a *Microscope* of *Eustach. Divini* (which is also treated of by *Faber* in his *Opticks*, (*Prop. 46.*) and which I have in some measure experimented my self to be a very good Method of disposing the Glasses. He uses, instead of a common double Convex Eye-glass, two Plane Convex ones, which are so placed as to touch one another in the middle of their Convex Surface; by which means the Glass will take in more of any Object, will represent it flat, and not crooked, and will magnifie also (as they call it) very much. This Glass had four several Lengths (made by Draws); at the least Length, which was 16 Inches, it magnified Lines 41 times bigger than they appear to the naked Eye; at the second Length 90 times; at the third Length 111 times; at the fourth Length 143.

As to the Method of making the same Glass magnifie differently, at different Lengths, Mr. *Marshall* hath brought it to bear very well in his small Pocket *Microscopes*; and this I take to be a good Improvement, which he hath added to the Glasses of *Campani*, which are made after that manner, but with only one Degree of magnifying with one and the same Glass.

In *Philos. Transact.* N. 221. there is an Account of several Microscopical Experiments, by one Mr. *Stephen Gray*; where he speaks of making *Microscopes* with a Globule of Water only, put into an Hole made in a small Brafs Plate, which I my self have often tried; and were it not for the trembling Motion of the Fluid, it would do very well.

He saith also, That by applying a small Globule of Pepper-water, &c. to his bare Eye, (*i. e.* by fixing it on the Surface of his Eye) he could in a darkened Room, by Candle-light or Moon-light, or by looking thro' a small Hole in a piece of Paper, discern the *Animalcula* which were in it, exceedingly magnified; and oftentimes, when the Drop of the Fluid was round and well defined, very distinct and plain.

In N. 232. Mr. *Gray* gives a farther Improvement of his *Water Microscope*.

A Description of Mr. Marshall's Double Microscope.

This Microscope consists of Three Glasses;

The Eye-Glass *W.*

The Middle-Glass *A.*

And the Object-Glass *C.*

B. Is the Cover or Lid, to keep out Dust from the Eye-glass *W.*

X. Is the Place for the Eye.

W. A Screw where the Eye-glass lies.

A 1. A Screw where the Middle-Glass lies.

A 2. The Draw.

C. The Object-Glass fix'd in a Brafs Button, to screw on or off, as Occasion serves.

Z. The Frame or Basis on which the *Microscope* stands firm.

T. A small Drawer in the Frame or Basis, with a Ledge or Till in it, having six Partitions to hold so many several Object-Glasses, one magnifying more than another, and fixed in Brafs Cells ready to screw on at *C*, and marked 1, 2, 3, 4, 5, 6. These Partitions are also marked

1, 2, 3, 4, 5, 6. The other part of the Drawer serves to hold the Object-plate (*a*); a Pair of small Nippers (*b*), to take up or handle any Object conveniently; another Object-plate (*d*), having one side White, and the other Black, to fix your Objects upon, as Black upon White, and White Objects on Black.

L. M. A Brafs Ball and Socket, on which the whole Body of the *Microscope* is moveable, so as to lie in any Position for the Light.

K. O. A square Brafs Pillar on which the *Microscope* is moveable up and down, by means of the Collar *E*, into which the Arm *D* (holding the *Microscope*) is continued.

G. Another Brafs Collar sliding up and down on the Pillar *K. O.* having a small Screw *H*, by which it is, as Occasion serves, fix'd fast to the said Pillar, at any Height.

I. A large Brafs Nut, in whose Centre is a Female Screw, fitted to the Male Screw *F*, which is fix'd in the Collar *E*: By the turning of which Nut *I*, (the Collar *G* being first fix'd to the Pillar by the Screw *H*) the *Microscope* is rais'd up or down on the Pillar, and made to come nearer, or go farther from the Object: And which is also a very great Advantage, the Axis of the *Microscope* is always kept perpendicular to that Point of the Object, over which it was first placed; so that here is not the Inconvenience which occurs in other Glasses, of often losing the Sight of the Object, by screwing the Glass higher or lower.

Q. A Glass Object-Plate fix'd in a Brafs Frame; whose Arm *N. N.* is fix'd to the Pillar by means of the Nut *O*. The Arm *N. N.* hath in it a Slit, by which 'tis easily put on, or taken off the Pillar, and by which it may be fix'd upon it at any Distance.

P. A small Fish lying on the Glass-Plate, that the Circulation of the Blood may be seen in part of the Tail-fin, at (*c*).

R. A Convex-Glass, by whose Help a bright Spot of Light is brought from a Candle at *S*, standing on the Ground while the *Microscope* stands on the Edge of a Table or Stool; which Spot of Light (*c*) serves to render the Circulation more conspicuous.

V. A Lead Coffin to be put on the Fish, to hinder it from springing away, and moving his Tail out of the Light.

1, 2, 3, 4, 5, 6, Are Marks on the Pillar *K. O.* which shew you the Distance that the Object-Glass must be from the Object you look upon,

according

according as the Object Glasses you make use of, magnifie more or less. Thus, for Instance, If you use the Object-Glass, 5 or 6, (either of which will shew the Circulation of the Blood) you must fix the upper Edge of the Collar E, at the Mark 5 or 6 on the Pillar. And then will the Microscope be very near its exact Distance from the Object; so that by a small Turn or two of the Nut I, either way, you may soon exactly fit it to your own Eye, and place the Object in its true distinct Basis.

By this Microscope, Liquors also may be very commodiously examined; for if you place a small Drop of any Liquor on the Glass-plate just in the middle of the Spot of Light (c), the Parts of it will become very visible, and its *Athimacula*, if it have any, will be discovered. And thus may the Eels in Vinegar, the small Creatures in Black Pepper-water, or in Waters where Wheat, Barley, &c. have been infused, the Eels and other small living Creatures in Puddle-water, be as plainly seen as by almost any other Microscope.

And one Thing I ought not to omit to speak on this Occasion; which is, That I have often with this Glass, seen the Circulation of the Blood in the Fins of the Tail of Tadpoles; and indeed more conspicuously here than in any other Creature: For the Fins grow all round the Tail, and coming but a little way out beyond the Body of it, both the Ejaculation of the Blood out by the Arteries, and its Return again by the Veins, is much quicker than in the Tails of Fishes; and abundance more Streams, Turns and Windings of the moving Blood are here visible, than I could ever see in any other Animal. To which I may add, That the Creature will live a good while out of the Water, and will lie very still.

The Object and the Image in the distinct Base being reciprocal (as Mr. *Molineux* shews, p. 102. of his *Dioptricks*), the Image there may be formed larger than the Object, on which depends the Doctrine of the *Double Microscope*.

Which Instrument I believe, was first contrived, at least fitted for Use and Observation by Dr. *Hook*, F. R. S. and a Description of it is published in his *Micrographia*.

Since that, Mr. *John Maskeal*, at the *Archimedes* in *Ludgate-street*, hath brought it to a very good Degree of Perfection: And I take his *Double Microscope* here described, in all Respects, to be the most useful, handy, and ready Instrument of this kind.

I have had *Mellen's* Glasses, and seen *Lewenhoeck's* and *Campani's*, but I would sooner have the *Double Microscope* than any of them, and the Price is much easier.

MILIARIS Herpes. See *Herpes*.

MILKY-WAY, or *Via Lactea*, the *Galaxy*, is a broad white Path or Track, encompassing the whole Heavens, and extending it self in some Places with a double Path, but for the most Part with a single one. Some of the Antients, as *Aristotle*, &c. imagin'd that this Path consisted only of a certain Exhalation hanging in the Air; but by the Telecopical Observations of this Age, it hath been discovered to consist of an innumerable Quantity of Fixed Stars, different in Situation and Magnitude; from the confused Mixture of whole

Light, its white Colour is supposed to be occasioned. It passes through the Constellations of *Cassiopeia*, *Cygnus*, *Aquila*, *Perseus*, *Andromeda*, Part of *Ophiucus*, and *Gemini*, in the Northern Hemisphere; and in the Southern, it takes in Part of *Scorpio*, *Sagittarius*, *Centaurus*, the *Argo Navis*, and the *Ara*.

Metrodorus, and some *Pythagoreans*, thought the Sun had once gone in this Track, instead of the Ecliptick; and consequently, that its Whiteness proceeds from the Remains of his Light. As the *Galaxy* is composed of an Infinity of small Stars, so it hath usually been the Region in which new Stars have appeared: As the new Star in *Cassiopeia*, which was first seen A. D. 1572. that in the Breast of the *swan*, and another in the Knee of *Serpentarius*; and several others, which have appeared for a while, and then become invisible again.

MILITARY Architecture, the same with *Fortification*.

MILITARY Execution, is delivering a Country up to be ravaged and destroyed by the Soldiers, when it refuses to pay Contribution, &c.

MIMOSÆ Plantæ, the same with *Sensitive*; which see.

MINE, in Fortification, is a Hole dug or made by a Pioneer under the Rampart, or under the Face of the Bastion, whereto there are several oblique and winding Passages: When it is finished, divers Barrels of Powder are placed therein, together with a Train or *Saucidge*; and the Quantity of Powder is proportioned to the Height and Weight of the Body which is to be blown up. There are also *Mines* sprung in the Field, which are called *Fougades*.

The Ally or Passage of a *Mine* is usually about four Foot square; at the end of which is the *Chamber of the Mine*, as they call it. The farther it is carried on, the more it is subject to be discovered by the Enemy; therefore 'tis best not to aim at Mining too far, and to make a new one where the former takes no Effect.

MINE-DIAL, is a Box and Needle, with a Brafs Ring divided into 360 Degrees, with several *Dyals* graduated thereon; generally thus made for the Use of Miners.

MINERALS, are hard Bodies dug out of the Earth or Mines (whence the Name) being in part of a Metalline, and in part of a Stony Substance, and sometimes with some Salt and Sulphur intermixed with the other. Of these see a large Account under the more general Word *Fossils*. See also *Stones* and *Minerals*.

MINIM, a Term in Musick; see *Notes* and *Time*.

MINIMA Naturalia, are such Particles of Matter, which tho' they have each a determinate Shape and Bulk, yet are too minute to be singly sensible. These are supposed to be intire, and undivided, and to be perfectly solid; and are the same with what in another Word are called *Atoms*, because of their supposed Indivisibility.

MINIMENTS, or rather *Muniments*, in Law, are the Evidences or Writings, whereby a Man is enabled to defend the Title of his Estate. And some say this Word *Miniments* includes all manner of Evidences.

MINION, a sort of Cannon, is either *Large* or *Ordinary*.

The

The *Large Minion*, or one of the longest Size, has its Bore $3\frac{1}{4}$ Inch Diameter, and is 1000 Pound weight: its Load is $3\frac{1}{2}$ Pound of Powder; its Shot 3 Inches Diameter, and $3\frac{1}{2}$ Pound weight; its Length is 8 Foot, and its level Range 125 Paces.

The *Ordinary Minion*, its Bore is 3 Inches in Diameter, and weighs about 800 or 750 Pound weight: It's 7 Foot long; its Load 2 Pound and a half of Powder; its Shot near 3 Inches Diameter, and weighs 3 Pounds 4 Ounces; and it shoots point-black 120 Paces.

MINIUM, or *Red-lead*, is the common Calx of Lead calcined for 3 or 4 Hours in a Reverberatory Furnace, till it turn to a Red Colour.

MINOR, a Term in Law, signifying one in Nonage, Minority, or under Age: But more properly an Heir Male or Female, before they come to the Age of One and twenty: during which Minority their Actions are invalid, &c. Yet a *Minor* may present, as Patron to an Ecclesiastical Benefice.

MINUTE, is the 60th Part of a *Degree* or *Hour*; so that every Hour, or Degree of any great Circle, is divided into 60 Minutes, every Minute into 60 Seconds, each Second into 60 Thirds, &c.

MISADVENTURE, or *Misaventure*, in Law, has a special Signification, for the killing of a Man, partly by Negligence, and partly by Chance. As if a Man, thinking no Harm, carelessly throws a Stone, or shooteth an Arrow, &c. wherewith he killeth another: In this Case he commits not Felony, but only loseth his Goods, and hath Pardon of Courfe for his Life. Some between *Aventure* and *Misaventure* make this Distinction, That *Aventure* is meer Chance: As if a Man, being upon or near the Water, be taken with some sudden Sicknes, and so falls in, and is drown'd; or into the Fire, and be burn'd to Death. *Misaventure*, they say, is where a Man cometh to his Death by some untoward Violence; as the Fall of a Tree, the Running of a Cart-wheel, the Stroke of a Horse, or the like.

MISE, in Law, hath several Significations: As first, a Gift or Customary Present which the People of *Wales* give to every new King or Prince at their Entrance into that Principality. Sometimes *Mises* are taken for Taxes or Tollages, Anno 25. E. 1. 5. Sometimes for Costs and Expences; as *pro Misis & Custagiis*, for Costs and Charges ordinarily used in the Entries of Judgment in Personal Actions.

Mise is also a Term of Art, appropriated to a *Writ of Right*; so called, because both Parties have put themselves upon the meer Right, to be tried by the *Grand Assise*, or by *Battel*. So that which in all other Actions is called an *Issue*, in a *Writ of Right* is called a *Mise*; unless a Collateral Point be tried, and there it is called an *Issue*. To join the *Mise* upon the *Meer*, signifies; to join the *Mise* upon the *Clear Right*; which is to join upon this Point, Whether hath more Right, the Tenant or Demandant?

MISERERE Mei, or *Chordaplus*, is a most vehement Pain in the Guts, proceeding from an Inflammation of them, or Involution, and the Peristaltick Motion inverted; whence the Excrements are discharged by the Mouth. It is called also *Volvulus*.

MISERICORDIA in Law, is used for an Arbitrary Amerciament imposed on any for an Of-

fence; for where the Plaintiff or Defendant in any Action is amerced, the Entry is *Ideo in Misericordia*. It is called *Misericordia*, because it ought to be very moderate, and rather less than the Offence. Therefore if a Man be unreasonably amerced in a Court, not of Record, as in the *Court-Baron*, &c. there is a *Writ* called *Moderata Misericordia*, directed to the Lord or his Bailiff, commanding them that they take moderate Amerciaments. Sometimes *Misericordia* is to be quit and discharged of all manner of Amerciaments, that a Man may fall into in the Forest.

MISPRISION, a Term in Law, signifying Neglect or Oversight. As for Example:

Misprison of Treason or *Felony*, is a Neglect or Light account shewed of *Treason* or *Felony* committed, by not revealing it when we know it to be committed; or by letting any Person committed for *Treason* or *Felony*, or Suspicion of either, to go, before he be Indicted. *Misprison of Treason*, is the Concealment, or not disclosing of known *Treason*: For which, the Offenders are to suffer Imprisonment during the King's Pleasure; lose their Goods, and the Profits of their Lands, during their Lives. *Misprison of Felony*, is only Finable by the Justices before whom the Party is attained: But Justices of the *Common-Pleas* have Power to assess Fines and Amerciaments upon Persons offending by *Misprisions*, Contempts, or Neglects, for not doing, or misdoing any thing in or concerning Fines. *Misprison of Clerks*, is a Neglect of Clerks in writing, or keeping Records. By the *Misprison of Clerks*, no Procefs shall be annulled or discontinued: And Justices of Assize shall amend the Defaults of Clerks *misprising* of a Syllable, or Letter, in writing.

MISSEN-Mast of a Ship is a round and long piece of Timber, standing in her Stern or sternmost Part. Some great Ships require two; then the next the Main-mast, is the *Main-missen*; and that next the Poop, the *Bonaventure-missen*. But when at Sea, they use the Word *Missen* alone, they always mean the Sail, and not the Mast. And to the Sail these several Terms of Art following belong: *Set the Missen*; i. e. Set the *Missen-sail* right, as the ought to stand. *Change the Missen*; i. e. Bring the *Missen-yard* over to the other side of the Mast. *Peek the Missen*; i. e. Put the *Missen-yard* right up and down the Mast. *Spell the Missen*, i. e. Let go the Sheer; and withal, *Peek up the Yard*. The Use of this *Missen* is to keep a Ship close to a Wind: Wherefore, if a Ship be apt to *Gripe* too much (as they call it) they use no *Missen*. A *Missen* is made use of often when a Ship rides at Anchor, to back her a-Stern, so that she may not foul her Anchor on the turning of the Tide. Sometimes also they *Lie a-Try* with their *Missen* only. The Length of the *Missen* is the same with the Height of the Main-top-mast from the Quarter-deck, and the *Missen-top-mast* half that.

MISSES. See *Mise*.

MITTELLA, is the Surgeons Term for the Swath that holds up the Arm when it is hurt or wounded.

MITTENDO *manuscriptum pedis finis*, is a *Writ* Judicial, directed to the Treasurer and Chamberlain of the *Exchequer*, to search and transmit the Foot of a Fine, acknowledged before Justices in *Eyre*, into the *Common-Pleas*, &c.

MITTIMUS, is a *Writ* by which Records are transferred from one Court to another, sometimes immediately:

immediately : As, out of the *King's-Bench* into the *Exchequer* ; and sometimes by a *Certiorari*, into the *Chancery* ; and from thence, by a *Mittimus*, into another Court. This Word is also used for the Precept that is directed by a Justice of Peace to a Gaoler, for the receiving and safe-keeping a Felon, or other Offender, by him committed to the Gaol.

MITRALES, are two Valves at the Orifice of the *Vena pulmonaris*, in the Left Ventricle of the Heart ; and are so called, because, when they are joined together, they something resemble a Mitre : They are broader than the other Valves ; they are situated so as to look inwards, and do very little differ in Bigness and Form from the *Tricuspid* in the right Ventricle. Their Use is to hinder the Reflux of the Blood brought into the Left Ventricle of the Heart by the *Vena pulmonaris*, back towards the Lungs again.

MIVA, in Pharmacy, is the Fleesh or Pulp of a Quince boiled up with Sugar into a thick Consistence.

MIXT, *i. e.* a *Mixt Body* : By which in Chymistry and Natural Philosophy, is understood a Body not mixt or compounded by Art, but by Nature ; such as Minerals, Vegetables and Animals, from whom by Chymistry different Substances can be separated.

MIXT Figures in Geometry. See *Figuræ*.

MIXT Number, is one that is part Integer or whole Number, and part Fraction ; as, $4\frac{1}{2}$, $10\frac{1}{3}$, &c.

MIXT Reason or Proportion, is when the Sum of the Antecedent and Consequent is compared with the Difference between Antecedent and Consequent : As, if $\frac{3}{a} : \frac{4}{b} :: \frac{12}{c} : \frac{16}{d}$ Then

$$\frac{7}{a+b} : \frac{1}{a} :: \frac{28}{c+d} : \frac{4}{c+d}$$

MOAT, in Fortification, is a hollow Space or Ditch dug round a Town or Fortrefs which is to be defended ; whereof the Length and Breadth often depends upon the Nature of the Soil, according as it is Marshy or Rocky. But *Moats* in general may be from 16 to 22 Fathom broad, and from 15 to 25 Foot deep.

Dry Moat, is that which is destitute of Water, and ought to be deeper than one that is full of Water.

Lined Moat, is that whose Scarp and Counter-scarp are cas'd with a Wall of Masons-Work lying in *Talus* or a-slope.

Flat-bottom'd Moat, is that which hath no sloaping, its Corners being somewhat rounded. All Moats must be well flanked, and in general so wide, as that no Ladder, Tree, &c. can reach across it. If the Ditch be dry, or has but little Water, there is usually another small Trench cut quite along the middle of it.

MODEL in Architecture. See *Module*.

MODERATA Misericordia, is a Writ for him that is amerced in a Court Baron, or other being not of Record, for any Transgression or Offence beyond the Quality of a Fault. It is directed to the Lord of the Court, or his Bayliff, commanding them to take a moderate Amercement of the Party, and is founded upon *Magna Charta*, cap. 14. *Quod nullus liber homo amercietur nisi secundum qualitatem delicti*, &c.

MODES in Musick. See *Mood*.

MODILLONS, or *Modillions*, in Architecture,

are little Brackets which are often set under the Cornices, more-especially in the *Corinthian* and *Composite* Order, and serve to support the Projection of the *Larmier* or *Drip*. The Word comes from the Italian *Modiglione*, signifying a little Model or Measure ; but this Part must be distinguished from the great Model, which is the Diameter of the Pillar : For as the Proportion of an Edifice in general depends on the Diameter of the Pillar, so the Size and Number of the *Modillions*, as also the Interval between them ought to have due Relation to the whole Fabrick.

MODIOLUS, *Trepanum*, or *Anabaptisum*, is an Instrument which they use in profound Corruptions, Contusions, Cuts, and Fractures of the Bones of the Head, not to be applied ; unless, 1. The Chips and Prominences of the Bones prick. 2. When the Upper Table is entire, but depressed ; and the Lower broken. 3. When the extravasated Blood would choke a Man with Corruption. The manner of *Trepanning*, or opening the Skull, is thus : When the Hairs are shaven off, the Skin is to be cut to the *Pericranium*, avoiding, as carefully as may be, the Muscles of the Temples, and the Sutures of the Skull ; and for this time the Wound is to be bound up, unless there be so little Blood spilt, that the Membrane, called *Pericranium*, may at the same time be pulled off from the Skull. Then after a few Hours you may stop the Ears of the Patient, take one of these Instruments, called a *Masculine Modiolus*, whose Point is to be fixed in the Skull, but so far off the Fracture, that it touch it not, much less the Suture, with its Teeth ; tho' some Surgeons never avoid the Sutures, and assure us that they have perforated them as successfully as any other Part : Then hold the Instrument fast with the Left Hand, and turn it round with the Right, till you have cut a pretty deep Hole : After this take a *Feminine Modiolus*, (which has no Point in the middle) and turn it round, as before. In the mean time take away the Dust or Chips that proceed from the Perforation, and moisten the Instrument in Oil and Water, to make it cool and slippery. The Blood that appears, will shew that you are now gone as deep as the second Table, *i. e.* beyond the Skull, to the *Meninges* ; and then you must press very gently, lest the Membrane of the Brain be unadvisedly hurt. When the Bone begins to wag, put something in betwixt the sides of the Wound ; loosen it, and rake it out with a pair of Surgeon's Pincers. *Blanchard*.

MODO & Forma, are Words of Art in Prols and Pleadings ; and namely, in the Answer of the Defendant ; whereby he denieth himself to have done the Thing laid to his Charge, *Modo & forma declarata* : It signifies as much as that Clause in the Civil Law, *negat allegata prout allegantur, esse vera* ; where *modo & forma* are of the Substance of the Issue, and were but Words of course.

MODULE, or *Model*, in Architecture, is a certain Measure invented by *Vignola*, and made use of to regulate the Proportion of the whole Building. It is generally half the Diameter of a Pillar at the lower end, in the *Tuscan* and in the *Doric* Order ; but in others, the whole Diameter. This Diameter is divided into 12 equal Parts ; and into 18 for the *Ionick*, *Corinthian*, and *Composite* Orders. And this *Module* or *Model* is a kind of Universal Measure, which helps us

to get rid of the great Uncertainties there are in the Feet and Inches of divers Nations, and at divers Times.

MODUS Decimendi, is when either Land, a Sum of Money, or Yearly Pension, is given to the Parson, &c. by Composition, as Satisfaction for his Tythes in kind.

MOINEAU, is a Name the French, and some Modern Writers of Fortification, give to a little *Plat-Bastion*, which is raised before a Curtain that is too long, and which hath two other Bastions at the ends of it; for they being out of Musket-shot one of the other, must be defended by some such thing as this *Moineau* or *Plat-Bastion*. Sometimes the *Moineau* joins to the Curtain, and sometimes is disjoined from it by a Moat.

MOLA Genu, Patella, or Rotula, is a round and broad Bone, placed at the jointing of the Thigh and Leg, to preserve the Knee from slipping out, and to defend the Juncture from External Injuries.

MOLA Carneæ, is a Fleishy and sometimes a Spongy Substance, without Bones or Bowels: It is often black, like concreted Blood; and sometimes extream hard; preternaturally brought into the World instead of a *Fœtus*.

MOLARES, or Maxillares Dentes. See *Dentes*.

MOLINE. The Heralds Term for one of their Croffes of this Figure. The *Field Azure*, a *Crofs Moline*, or, by the Name of *Molineux*. *Guillim* saith this Crofs representeth a Mill-Rind, or the Form of the Ink of a Mill.

MOLOSSUS, is the Foot of a Latin Verse, consisting of Three Syllables, when they are all long.

MOMENTS, are sometimes taken for the least and most insensible Parts of Time; as when we say, such a thing was done in a Moment.

In Mathematics, *Moments* are such indeterminate and instable Parts of Quantity, as are supposed to be in perpetual Flux, i. e. either continually decreasing or increasing; which latter are taken for Affirmative and Positive Moments, and the former for Negative or Subtractive ones; And these continually increasing or decreasing Particles are supposed to be infinitely small; for as soon as ever they come to be of any finite Magnitude, they cease to be *Moments*. *Moments* therefore are to be look'd upon as the generative Principles of finite Magnitudes; and are here supposed to have no Magnitude, but to be *Inceptive* only of it, to use Dr. Wallis his Word.

And because 'tis the same thing, if in the room of these Moments, the Velocities of their Increases or Decreases be made use of, or the finite Quantities proportionable to such Velocities; this Method of proceeding, which considers the Motions, Changings, or Fluxions of Quantities, hath come to be called *Fluxions*.

Moments also in a Physical Sense, as they are used in reference to the Laws of Motion, signifie the *Quantities of Motion* in any moving Bodies; and sometimes, simply, the Motion it self; and they define it to be the *Vis insita*, or Power by which any moving Bodies do continually change their Places,

And in comparing the Motions of Bodies, the *Ratio* of these Moments is always compounded of the Quantity of Matter in, and the Celerity of the moving Body: So that the *Moment* of any moving Body may be considered as a *Rectangle* under the *Quantity of Matter* into the *Celerity*. And since 'tis certain that all equal Rectangles have their Sides reciprocally proportionable, (14. *2. 6. Eucl.*) therefore if the *Moments* of any Moveables are equal, the Quantity of Matter in one, to that of the other, will be reciprocally: as the Celerity of the Latter to the Celerity of the Former: And *vice versa*, if the Quantities of Matter are reciprocally proportionable to the Celerities, the *Moments* or Quantities of Motion in each will be equal:

The *Moment* of any moving Body may be considered also as the Aggregate or Sum of all the Moments of the Parts of that Body; and therefore where the Magnitudes and Number of any Particles are the same, and where they are moved with the same Celerity, there will be the same *Moments* of the Wholes.

MONADES. See *Digits*.

MONKS-Seam. So the Sailors call sewing the Edges or Selvages of the Sails together, one over another; and 'tis sew'd on both sides, to make it the stronger.

MONOCHORD, a kind of Instrument anciently of singular Use for the Regulating of Sounds; but some appropriate the Name of *Monochord* to an Instrument that hath only one single String, as the *Trumpet Marine*.

The Ancients made use of the *Monochord* to determine the Proportion of Sounds to one another: When the *Chord* was divided into two equal Parts, so that the Terms were as 1 and 1, they called them *Unisons*; but if they were as 2 to 1, they called them *Octaves* or *Diapasons*; when they were as 3 to 2, they called them *Fifths*, or *Diapentes*; if they were as 4 to 3, they called them *Fourths*, or *Diatesserons*; if the Terms were as 5 to 4, they call it *Diton*, or a *Tierce major*; but if the Terms were as 6 to 5, then they called it a *Demi-diton*, or a *Tierce minor*; and lastly, if the Terms were as 24 to 25, they called it a *Demiton* or *Dieze*.

The *Monochord* being thus divided, was properly that which they called a *System*, of which there were many kinds, according to the different Divisions of the *Monochord*.

MONOCOLUM, is the Gut *Cæcum*.

MONOPETALOUS Flowers, (in Botany) are such, as, tho' they may be seemingly cut into four or five small *Petala* or Leaves, are yet all of one piece, and which falling off all together, have their Flower in one piece. See *Petala*.

MONOPOLY, in Law, is a Grant to any Person or Persons, of or for the sole buying, selling, making, working, or using any Commodity.

MONOTRIGLYPH, a Term in Architecture, signifying the Space of one *Triglyph* between two *Pilasters*, or two *Columns*.

MONSTRANS De droit, in a Legal Sense, signifies a Suit in *Chancery*, for the Subject to be restored to Lands and Tenements, which he shews to be his Right, tho' by Office found to be in the Possession of another lately dead; by which Office the King is entituled to a *Chatrel*, Free-hold, or Inheritance in the said Lands.

MONSTRANS *De faits ou Records, shewing of Deeds or Records*, is thus : Upon an Action of Debt brought upon an Obligation, after the Plaintiff hath declared, he ought to shew his Obligation ; and so it is of *Records*. And the Difference between *Monstrans de faits* and *Oyer de faits*, is this : He that pleads the *Deed or Records*, or declares upon it, ought to shew the same ; and the other, against whom such *Deed or Record* is pleaded, may demand *Oyer* of the same.

MONSTRAVERUNT, is a Writ that lies for the Tenants in *Ancient Demesne*, being distrained for the Payment of any Toll or Imposition, contrary to their Liberty which they do or should enjoy.

MONT *Pagnotte*, or the *Post of the Invulnerable*, is an Eminence chosen out of Cannon-shot of a Place besieged ; where curious and wary Persons place themselves to see the Attack and the manner of the Siege.

MONTH, properly speaking, is the Time in which the Moon runs through the Zodiack, and therefore is accounted by the Motion of the Moon ; and therefore the Lunar Month is either *Periodical*, which is the Time of the Moon's Motion from any one Point of the Zodiack to the same again, and is something less than 27 Days and 8 Hours ; or else *Synodical*, which is the Time between New Moon and New Moon, and is something more than 29 Days and an half.

There is also a *Solar Month*, which is the Time that the Sun takes up in running through one of the Signs of the Zodiack, and is almost 30 Days and half.

And both these *Solar* and *Lunar Months* are either *Astronomical*, like those above-mentioned ; or *Civil*, which are various, according to the Usage of accounting in different Places, Cities and Nations.

The *Egyptians* accounted by *Solar Months*, each of 30 Days ; and to compleat their Year, after 12 such Months, they added 5 Days, which the odd Hours made up.

But most of the Ancient Nations accounted by the *Lunar Synodical Month* ; as the *Jews*, *Greeks*, and the *Romans*, till *J. Cesar's* Time ; and as the *Mahometans* do to this Day. And because these Months did not contain an exact Number of Days, to adapt them to *Civil* Computation, they accounted alternately one Month to have 30, and the next 31 Days ; and by this means they made two such *Civil Months* to be equal to two *Lunar* ones of 29 Days and half ; and they brought it to pass, that the New Month, for a Run of many Years, did not much deviate from the First Day of the *Civil Month*.

MOODS in *Grammar*, determine the Signification of *Verbs*, as to the Manner and Circumstances of the Affirmation ; and are in Number Six, viz. The *Indicative*, the *Imperative*, the *Optative*, the *Subjunctive*, and the *Infinitive Mood* ; which see.

MOOD in *Musick*, signifies certain Proportions of the Time, or Measure of Notes. These *Moods* or *Modes* of measuring Notes, were formerly Four in Number, viz.

1. *The Perfect of the More*, in which a *Large* contain'd three *Longs*, a *Long* three *Breves*, a *Breve* three *Semi-breves*, and a *Semi-breve* three *Minims*.

2. *The Perfect of the Less*, wherein a *Large* comprehended two *Longs*, a *Long* two *Breves*, a *Breve* three *Semi-breves*, and a *Semi-breve* two *Minims*.

3. *The Imperfect of the More*, in which a *Large* contained two *Longs*, a *Long* two *Breves*, a *Breve* two *Semi-breves*, and a *Semi-breve* three *Minims*.

4. *The Imperfect of the Less*, is the same with that which we call the *Common Mood*, the other three being now altogether out of Use ; altho' the Measure of our *Common Triple-time* is the same with the *Mood Imperfect of the More*, except that we reckon but two *Minims* to a *Semi-breve*, which in that *Mood* comprehend three.

In our *Common Mood*, two *Longs* make one *Large*, two *Breves* a *Long*, two *Semi-breves* a *Breve*, &c. proceeding in the same Order to the last or shortest Note : So that a *Large* contains two *Longs*, four *Breves*, eight *Semi-breves*, sixteen *Minims*, thirty two *Crotchets*, sixty four *Quavers*, &c.

Besides these *Moods of Time*, Five others relating to Tune, were in Use among the Ancient *Grecians*, which were termed *Tones* or *Tunes* by the *Latins* ; the Design of either being to shew in what Key a Song was set, and how the different Keys had relation one to another.

These sorts of *Moods* were distinguish'd by the Names of the several Provinces of *Greece*, where they were first invented ; as the *Doric*, *Lydian*, *Ionick*, *Phrygian*, and *Eolick*.

Doric Mood consisted of slow-tun'd Notes, and was proper for the exciting Persons to Sobriety and Piety.

Lydian Mood was likewise used in Solemn Grave Musick ; and the Descant or Composition was of slow Time, adapted to Sacred Hymns or Anthems.

Ionick Mood was for more light and soft Musick ; such as pleasant amorous Songs, *Sarabands*, *Corants*, *Jiggs*, &c.

Phrygian Mood was a Warlike kind of Musick, fit for Trumpets, Hautboys, and other Instruments of the like Nature ; whereby the Minds of Men were animated to undertake Military Achievements, or Martial Exercises.

Eolick Mood, being of a more airy, soft, and delightful Sound, such as our *Madrigals*, served to allay the Passions by the means of its grateful Variety and melodious Harmony.

These *Moods* or *Tones* were distinguished into *Authentick* and *Playal*, with respect to the dividing of the *Octave* into its Fifth and Fourth : The Former was when the Fifth Possessed the Lower Place, according to the Harmonical Division of an *Octave* ; and the other was when it stood in the Upper Place, according to the Arithmetical Division of the same *Octave*.

MOON. The Periodical Revolution of the Moon, in reference to the Fixed Stars, is 27 Days, 7 Hours, 43 Minutes : And in the same Space of Time, by a strange Correspondence and Harmony of the two Motions, it revolves the same way about its own Axis ; whereby (one Motion as much converting it to, as the other turns it from the Earth) the same side is always exposed to our Sight. See Vol. II.

The Librations of the Moon's Body, which occasion that the same Hemisphere exactly is not always exposed to our Sight, arise from the Eccentricity of the Moon's Orbit, from the Perturbations by the Sun's Attraction, and from the Obliquity of the Axis of the Diurnal Rotation of the Moon's own Orbit ; without the Knowledge of which Circumstances, her *Phænomena* were inexplicable, but by the Consideration of them are very demonstrable.

The mean Horary Motion of the Moon, in respect of the Fixed Stars, is 32 minutes, 56 seconds, 27 thirds, 12 fourths and an half.

The Moon is distant from the Earth, according to most Astronomers, 59 ; according to *Vindeline*, 60 ; *Copernicus* 60 $\frac{1}{2}$; *Kircher*, 62 $\frac{1}{2}$; and according to *Tycho*, 56 $\frac{1}{2}$ Semi-diameters of the Earth. Sir *Isaac Newton* thinks the Distance ought to be esteemed about 61 : Therefore the mean Distance may be reckoned 60. But if the Earth and Moon move both round the Sun, with their common Centre of Gravity, that admirable Astronomer demonstrates, that the Distance between the Centres of the Earth and Moon, will 'be 60 $\frac{1}{2}$ of the Earth's Semi-diameter, *Prop.* 60. *Lib.* 1. *Princip.*

She is nearer the Earth at her *Syzygy*, than in the Quadrature, by $\frac{1}{2}$ Part of the Distance.

According to *M. Cassini*, the Moon's greatest Distance from the Earth is 61, the mean Distance 56, and the least Distance 52 Semi-diameters of the Earth.

The Power of the Moon's Influence as to the Tides, is to that of the Sun as 6 $\frac{1}{2}$ to one. Sir *Isaac Newton*.

As to the Inequality of the Moon's Motion, (which proceeds from the Action of the Sun, disturbing the Motion of the Secondary Planets) she moves swifter, and describes (by a Radius drawn from it to the Earth) a greater Area in proportion to the Time, hath an Orbit less curved, and by that means comes nearer to the Earth in her *Syzygies* or Conjunctions, than in the Quadratures, unless the Motion of her Eccentricity hinder it : Which Eccentricity is greatest, when the Apogee of the Moon happens in the Conjunctions ; and is least, when the Apogee happens at the Quadratures. And therefore the Moon is swifter as well as nearer to us in her Perigee, and more remote and slower in her Apogee at the Conjunctions, than at the Quadratures ; and her Motion is swifter also in the Earth's Aphelion, than in its Perihelion. The Apogee also goes forward swifter in the Conjunctions, and goes slower at the Quadratures : But her Nodes are at rest in the Conjunctions, and do recede most swiftly in the Quadratures.

The Moon also perpetually changes the Figure of her Orbit, or the Species of the Ellipse she moves in.

There are also some other Inequalities in the Motions of this Planet, which can hardly be redu-

ced to any certain Rule : As, That the Velocities or Horary Motions of the Apogee and Nodes, and their Equations, and the Difference between the greatest Eccentricity in the Conjunctions, and the least in the Quadratures ; and that Inequality which is called the *Variation of the Moon* : All these do increase and decrease annually, in a triplicate Ratio of the apparent Diameter of the Sun : And this *Variation* is increased and diminished in a duplicate Ratio of the Time between the Quadratures ; as Sir *Isaac Newton* proves in many places of his *Principia*.

That Curious Person found the Apogee in the Moon's *Syzygies* to go forward 23 min. each Day, in respect of the Fixed Stars ; and to go backward 16 min. $\frac{1}{2}$ each Day in the Quadratures : And therefore the middle Annual Motions he estimates at 40 deg.

This differs something from Mr. *Flamsteed's* Astronomical Tables ; where the Diurnal Progreſſion of the Moon's Apogee is 24 min. 28 seconds in the *Syzygies*, and the Recession 20 min. 12 seconds in the Quadratures. See the Words *Secondary Planets*.

That the Cause of the *Secondary Light of the Moon*, as they call it ; that is, the obscure Part of her, appearing like kindled Aethers, just before and after the Change or New Moon, is the Sun's Rays reflected from the bright Hemisphere of the Earth to those dark Parts of the Moon, and thence again reflected to the Earth destitute of the Sun's Light ; see proved in *Zucchi's Philosoph. Optic. Nov.* from p. 247, to p. 260. And also in *Tacquet's Opera Geometrica*.

The Excellent Sir *Isaac Newton* makes it a Proposition to inquire into the Figure of the Moon ; and supposing it, at its first Original, to have been a Fluid, like to our Sea, he calculates, that the Attraction of our Earth would raise the Water there to near 90 Foot high, as the Attraction of the Moon raiseth our Water to 12 Foot : Whence the Figure of the Moon must be a *Spheroid*, whose greatest Diameter extended, will pass through the Centre of our Earth ; and will be longer than the other Diameter perpendicular to it, by 180 Feet. And from hence it comes to pass, that we see always the same Face of the Moon : For she cannot rest in any other Position, but will continually endeavour to conform her self to this Situation. *Prop.* 38. *Lib.* 3.

The Moon hath properly no Atmosphere, such as our Earth hath, abounding with Clouds, Winds, Thunder or Lightning ; because her Face always, when our Air is clear, appears distinct and clear ; and by our Telescopes we can see the Sun's Light pass regularly and uniformly from one mountainous Place to another.

Mr. *Flamsteed* in *Philosoph. Transact. N.* 154. saith, That the best Tables of the Moon's Motions do err 12 minutes, or more, in her apparent Place ; which causes a Fault of Half an Hour, or 7 $\frac{1}{2}$ Degrees of the Longitude of Places endeavoured to be found out by her.

M. Azout says, That this Planet's Diameter never appear'd to him above 33 min. and never less than 24 min. 45 seconds.

Sir *Isaac Newton* reckons the mean Diameter of the Moon to be 32 minutes, 12 seconds, as the Sun's is 31 minutes, 27 seconds.

The Density of the Moon he concludes to be to that of the Earth, as 9 to 5 nearly : And that

the Mass or Quantity of Matter in the Moon to that of the Earth, is as 1 to 26 nearly.

The famous Dr. Wallis agrees with Des Cartes in the Solution of that Difficulty, Why the Moon appears to our common Sight so much bigger when near the Horizon, than she doth when near the Meridian; though she be (nearly) one Semi-diameter of the Earth nigher to us in the latter Case, than in the former: Which is, That the Horizontal Moon is capable of being compared with many intervening Objects, interposed Hills, &c. but the Meridional Moon hath nothing to be compared withal; and therefore the Distance between us and her, is judged to be vastly greater, than when she is in the Horizon. He says, It cannot be at all from the Refraction of Vapours near the Horizon, because that can only increase the Altitude of her, but not her Azimuth or Breadth; for the Horizon, in the whole, will always be but a Circle. *Philos. Trans. N. 187.*

The Plane of the Moon's Orbit is inclined to that of the Ecliptick, and makes with it an Angle of about 5 Degrees. *Greg. Astron.* And this Declination varies; and is greatest when the Moon is in the Quadratures; and least when she is in her Syzygies.

By means of the Spots in the Moon (which *Hewellius*, *Grimaldus* and *Ricciolus* gave Names to) the Lunar Eclipses are more accurately observed than formerly, to the great Advancement of *Geography* and *Navigation*, in settling the Longitudes of Places: For the Immersions and Emergences of these Spots from the Shadow of the Earth, are most nicely determined.

Although the Moon's Period round the Earth be in 27 Days, 7 Hours, $\frac{1}{2}$ of an Hour, (which is the Periodical Month) yet because in the Space of a Periodical Month, the Earth also with its Satellite, the Moon, is moved on almost an intire Sign, in *Consequentia*; therefore the Point of the Moon's Orbit, in the last Conjunction, or New Moon, will be gotten too far to the Westward: And therefore the Moon cannot come yet to a new Conjunction with the Sun, but wants of it 2 Days and 5 Hours; which must be past before the intire Lunation will be over, and before the Moon hath exhibited all her *Phases*. These 2 Days and 5 Hours therefore being added to the Periodical Month, make the Synodical one, which consists of 29 Days, 12 Hours, and $\frac{1}{2}$ of an Hour.

Mr. Flamsteed makes the Lunar Periodical Month to be 27 days, 7 hours, 43 minutes, 7 seconds; as, on Enquiry, he assured me.

The other secondary Planets move swifter round their Axes than the Moon; for her (as the Earth's) uniform Revolution round her Axis, is just the Time of her Periodical Month above-mentioned: Which is the Reason that she always obverts the same Face towards us, allowing a little for that Motion of hers which they call her *Libration*. See *Evection* and *Libration*.

The Axis of this Motion is always parallel to its self, and therefore cannot be at Right Angles with the Plane of the Moon's Orbit, (for this, by reason of the Sun's Perturbation of her Motion, is continually changing) but is inclined to it, and is almost at Right Angles with the unchangeable Plane of the Ecliptick.

Tho' the Moon, as well as the Earth, and probably all the Planets, be of a Figure *Oblately Spheroi-*

dical, (that is, having its Diameter at the Equator longer than its Axis) yet the Excels of the Equatorial Diameter in her, is so inconsiderable, that she may well enough pass for a Globe; and perhaps this nearly Spherical Figure of the Moon, may be the Result of her slow Motion round her Axis: For *Jupiter*, which moves the swiftest of any round its Axis, is of a Figure more *Oblate* than any other Planet.

If an Eye were placed in the Moon, it would judge, that the Sun, the Earth, and the other Planets, together with the Fixed Stars, did move from East to West on the Poles of the Ecliptick in a Periodical Month, because in that Space of Time, the Moon turns round her Axis; and these Poles of the Ecliptick would be very remarkable and conspicuous; for the North Pole would be near a Star of the fourth Light, in the third Flexure of *Draco*, which would be but three Degrees distance from the true Pole of the Ecliptick, and the Southern would be distinguished by the four Stars in *Xiphia Piscis*, one of which is nearer that Pole of the Ecliptick, than the Pole-star is to the Arctick Pole: And it would be yet more remarkable by the Nearness of the *Nubecula major*.

The apparent Revolution of the Sun (to a Lunar Spectator) about the Moon seemingly at rest, would seem longer than really it is, because of the Moon's being carried along with the Earth round the Sun in *Consequentia*: So that the Natural Day in the Moon would be an intire Synodical Month; wherefore there the Sun will appear to rise but 12 times, but the Fixed Stars 13. And more exactly, in 19 Years the Sun will rise 235 times, and the Fixed Stars 254: And the rising Sun will always be almost an whole Sign forwarder than he was the Day before.

The Lunar Natural Day would appear to be near equally divided into Light and Darkness, because the Axis of the Moon's Revolution is nearly at Right Angles with the Plane of her Orbit round the Sun; so that she enjoys a perpetual Equinox: And there can be no *Twilight*, because this Planet hath no Atmosphere. In one half of the Moon's Surface (except just near the Edge of the other Hemisphere) the Earth cannot be seen by our Spectator; whereas in the other half it will be always visible, and seem fix'd in the Heavens like a Star.

The Famous Sir ISAAC NEWTON'S Theory of the MOON.

This Theory hath been long expected by all the true Lovers of *Astronomy*, was communicated from Sir Isaac Newton, to Dr. Gregory, *Astron. Professor* at Oxford, and by him published in his *Astron. Elem. Philos. & Geomet.* p. 336. From whence, as it was lately translated into *English*, I thought fit to insert it here.

By this Theory, what by all Astronomers was thought most difficult and almost impossible to be done, the Excellent Sir Isaac Newton hath now effected; viz. To determine the Moon's Place even in her Quadratures, and all other Parts of her Orbit, besides the Syzygies, so accurately by Calculation, that the Difference between that and her true Place in the Heavens, shall scarce be two Minutes, and is usually so small, that it may well enough

enough be reckon'd only as a Defect in the Observation. And this Sir *Is. Newton* experienced by comparing it with very many Places of the Moon, observ'd by Mr. *Flamsteed*, and communicated to him.

The Royal Observatory at *Greenwich*, is to the West of the Meridian of *Paris* 2 deg. 19 min. Of *Urainburgh* 12 deg. 51 min. 30 seconds. And of *Gedani* 18 deg. 48 minutes.

The mean Motions of the Sun and Moon, accounted from the Vernal Equinox at the Meridian of *Greenwich*, I make to be as followeth.

The last Day of *December* 1680, at Noon (*Old Style*) the mean Motion of the Sun was 9 Signs 20 deg. 34 min. 46 seconds. Of the Sun's Apogee, was 3 S. 7 deg. 23. min. 30 sec.

The mean Motion of the Moon at that time, was 6 S. 1 deg. 35 min. 45 seconds. And of her Apogee, 8 S. 4 deg. 28 min. 5 seconds. Of the Ascending Node of the Moon's Orbit, 5 S. 24 deg. 14 min. 35 seconds, &c.

And on the last Day of *December* 1700, at Noon, the mean Motion of the Sun, was 9 S. 20 deg. 43. min. 50 seconds. Of the Sun's Apogee, 3 S. 7 deg. 44 min. 30 seconds. The mean Motion of the Moon was 10 S. 15 deg. 19 min. 50 seconds. Of the Moon's Apogee, 11 S. 8 deg. 18 min. 20 seconds. And of her Ascending Node, 4 S. 27 deg. 24 min. 20 seconds. For in 20 *Julian* Years, or 7305 Days, the Sun's Motion is 20 Revolut. 0 S. 0 deg. 9 min. 4 seconds. And the Motion of the Sun's Apogee, 21 min. 0 seconds.

The Motion of the Moon in the same time, is 247 Revolut. 4 S. 13 deg. 34 min. 5 seconds. And the Motion of the Lunar Apogee, is 2 Revolut. 3 S. 3 deg. 50 min. 15 seconds. And the Motion of her Node, 1 Revolut. 0 S. 26 deg. 50 min. 15 seconds.

All which Motions are accounted from the Vernal Equinox: Wherefore if from them there be subtracted the Recession or Motion of the Equinoctial Point, in *Antecedentia*, during that space, which is 16 min. 0 sec. there will remain the Motions in reference to the Fix'd Stars in 20 *Julian* Years, viz. the Sun's 19 Revolut. 11 S. 29 deg. 52 min. 24 seconds. Of his Apogee, 4 min. 20 seconds. And the Moon's 247 Revolut. 4 S. 13 deg. 17 min. 25 seconds. Of her Apogee, 2 Revolut. 3 S. 3 deg. 33 min. 35 seconds. And of the Node of the Moon, 1 Revolut. 0 S. 27 deg. 6 min. 55 seconds.

According to this Computation the *Tropical Year* is 365 Days, 5 Hours, 48 Minutes, 57 Seconds. And the *Syderal Year* is 365 Days, 6 Hours, 9 Minutes, 14 seconds.

These mean Motions of the Luminaries are affected with various Inequalities: Of which,

1. There are the Annual Equations of the aforesaid mean Motions of the Sun and Moon, and of the Apogee, and Node of the Moon.

The Annual Equation of the mean Motion of the Sun, depends on the Eccentricity of the Earth's Orbit round the Sun, which is $16\frac{1}{2}$ of such Parts, as that the Earth's mean Distance from the Sun shall be 1000: Whence 'tis called the Equation of the Centre; and is when greatest 1 deg. 56 min. 20 seconds.

The greatest Annual Equation of the Moon's mean Motion, is 11 deg. 49 seconds; of her Apogee, 20 min. and of her Node 9 minutes 30 seconds.

And these four Annual Equations are always mutually proportional one to another: Wherefore when any of them is at the greatest, the other three will also be greatest; and when any one lessens, the other three will also be diminished in the same Ratio.

The Annual Equation of the Sun's Centre being given, the three other corresponding Annual Equations will be also given; and therefore a Table of that will serve for all. For if the Annual Equation of the Sun's Centre be taken from thence, for any Time, and be called P, and let $\frac{1}{3}P = Q$, $Q + \frac{1}{3}Q = R$, $\frac{1}{3}P = D$, $D + \frac{1}{3}D = E$, and $D - \frac{1}{3}D = 2F$; then shall the Annual Equation of the Moon's mean Motion for that time be R, that of the Apogee of the Moon will be E, and that of the Node F.

Only observe here, That if the Equation of the Sun's Centre be required to be added; then the Equation of the Moon's mean Motion must be subtracted, that of her Apogee must be added, and that of the Node subtracted. And on the contrary, if the Equation of the Sun's Centre were to be subtracted, the Moon's Equation must be added, the Equation of her Apogee subtracted, and that of her Node added.

There is also an Equation of the Moon's mean Motion, depending on the Situation of her Apogee, in respect of the Sun; which is greatest when the Moon's Apogee is in an Octant with the Sun, and is nothing at all when it is in the Quadratures or Syzygies. This Equation, when greatest, and the Sun in *Perigee*, is 3 min. 56 seconds. But if the Sun be in *Apogee*, it will never be above 3 min. 34 seconds. At other Distances of the Sun from the Earth, this Equation, when greatest, is reciprocally as the Cube of such Distance. But when the Moon's Apogee is any where but in the Octants, this Equation grows less, and is mostly at the same Distance between the Earth and Sun, as the Sine of the double Distance of the Moon's Apogee, from the next Quadrature or Syzygy, to the Radius.

This is to be added to the Moon's Motion, while her Apogee passes from a Quadrature with the Sun to a Syzygy; but this is to be subtracted from it, while the Apogee moves from the Syzygy to the Quadrature.

There is moreover another Equation of the Moon's Motion, which depends on the Aspect of the Nodes of the Moon's Orbit with the Sun: And this is greatest, when her Nodes are in Octants to the Sun, and vanishes quite, when they come to their Quadratures or Syzygies. This Equation is proportional to the Sine of the double Distance of the Node from the next Syzygy, or Quadrature; and at greatest, is but 47 seconds. This must be added to the Moon's mean Motion, while the Nodes are passing from their Syzygies with the Sun to their Quadratures with him; but subtracted while they pass from the Quadratures to the Syzygies.

From the Sun's true Place take the equated mean Motion of the Lunar Apogee, as was above shewed, the Remainder will be the Annual Argument of the said Apogee. From whence the Eccentricity of the Moon, and the second Equation of her Apogee may be compared after the manner following (which takes place also in the Computation of any other Intermediate Equations.)

Let T represent the Earth, TS a Right Line joining the Earth and Sun, T A C B a Right Line drawn from the Earth to the middle or mean Place of the Moon's Apogee, equated as above: Let the Angle S T A be the Annual Argument of the aforesaid Apogee, T A the least Eccentricity of the Moon's Orbit, T B the greatest. Bisect A B in C; and on the Centre C, with the Distance A C describe a Circle A F B, and make the Angle B C F = to the double of the Annual Argument. Draw the Right Line T F, that shall be the Eccentricity of the Moon's Orbit; and the Angle B T F, is the second Equation of the Moon's Apogee required.

In order to whose Determination, let the mean Distance of the Earth from the Moon, or the Semi-diameter of the Moon's Orbit, be 1000000; then shall its greatest Eccentricity T A be 66782 such Parts; and the least T A, 43319. So that the greatest Equation of the Orbit, viz. when the Apogee is in the Syzygies, will be 7 deg. 39 min. 30 seconds, or perhaps 7 deg. 40 min. (for I suspect there will be some Alteration according to the Position of the Apogee in *Cancer* or *Capricorn*). But when it is in Quadrature to the Sun, the greatest Equation aforesaid will be 4 deg. 57 min. 56 seconds; and the greatest Equation of the Apogee 12 deg. 15 min. 4 seconds.

Having from these Principles made a Table of the Equation of the Moon's Apogee, and of the Eccentricities of her Orbit to each Degree of the Annual Argument, from whence the Eccentricity T F, and the Angle B T F (viz. the second and principal Equation of the Apogee) may easily be had for any Time required; let the Equation thus found be added to the first Equated Place of the Moon's Apogee, if the Annual Argument be less than 90 Degrees, or greater than 180 Degrees, and less than 270; otherwise it must be subtracted from it; and the Sum or Difference shall be the Place of the Lunar Apogee secondarily equated; which being taken from the Moon's Place equated a third time, shall leave the mean Anomaly of the Moon corresponding to any given Time. Moreover, from this mean Anomaly of the Moon, and the before-found Eccentricity of her Orbit, may be found (by means of a Table of Equations of the Moon's Centre made to every Degree of the mean Anomaly, and some Eccentricities, viz. 45000, 50000, 55000, 60000 and 65000) the *Prosthaphæresis* or Equation of the Moon's Centre, as in the common way: And this being taken from the former Semi-circle of the middle Anomaly, and added in the latter to the Moon's Place thus thrice equated, will produce the Place of the Moon a fourth time equated.

The greatest Variation of the Moon (viz. that which happens when the Moon is in an Octant with the Sun) is nearly, reciprocally as the Cube of the Distance of the Sun from the Earth. Let that be taken 37 min. 23 seconds, when the Sun is in *Perigæo*, and 33 min. 40 seconds, when he is in *Apogæo*: and let the Differences of this Variation in the Octants be made reciprocally as the Cubes of the Distances of the Sun from the Earth; and so let a Table be made of the aforesaid Variation of the Moon in her Octants (or its Logarithms) to every Tenth, Sixth or Fifth Distance of the mean Anomaly: and for the Variation out of the Octants, make, as Radius to the Sine of the double Distance of the Moon from the next Syzygy or Quadrature: so let the aforesaid Variation in the Octant be to the Variation congruous to any other Aspect; and this added to the Moon's Place before-found in the first and third Quadrant (accounting from the Sun) or subtracted from it in the second and fourth, will give the Moon's Place equated a fifth time.

Again, as Radius to the Sine of the Sum of the Distances of the Moon from the Sun, and of her Apogee from the Sun's Apogee (or the Sine of the Excess of that Sum above 360 deg.): so is 2 min. 10 seconds, to a sixth Equation of the Moon's Place, which must be subtracted, if the aforesaid Sum or Excess be less than a Semi-Circle, but added, if it be greater. Let it be made also, as Radius to the Sine of the Moon's Distance from the Sun: so 2 deg. 20 seconds to a seventh Equation: which, when the Moon's Light is increasing, add; but when decreasing, subtract; and the Moon's Place will be equated a seventh time, and this is her Place in her proper Orbit.

Note here, The Equation thus produced by the mean Quantity 2 degrees 20 seconds, is not always of the same Magnitude, but is increased and diminished according to the Position of the Lunar Apogee. For if the Moon's Apogee be in Conjunction with the Sun's, the aforesaid Equation is about 54 seconds greater: But when the Apogees are in Opposition, 'tis about as much less; and it librates between its greatest Quantity 3 minutes 14 seconds, and its least 1 minute 26 seconds. And this is when the Lunar Apogee be in Conjunction or Opposition with the Sun's: But in the Quadratures, the aforesaid Equation is to be lessened about 50 seconds, or one minute, when the Apogees of the Sun and Moon are in Conjunction; but if they are in Opposition, for want of a sufficient Number of Observations, I cannot determine whether it is to be lessened or increased. And even as to the Augment or Decrement of the Equation, 2 minutes 20 seconds above-mentioned, I dare determine nothing certain, for the same Reason, viz. the want of Observation accurately made.

If the sixth and seventh Equations are augmented or diminished in a reciprocal Ratio of the Distance of the Moon from the Earth, i. e. in a direct Ratio of the Moon's Horizontal Parallax; they will become more accurate: And this may readily be done, if Tables are first made to each Minute of the said Parallax, and to every sixth or fifth Degree of the Augment of the sixth Equation for the sixth, as of the Distance of the Moon from the Sun, for the seventh Equation.

From the Sun's Place, take the mean Motion of the Moon's ascending Node, equated as above; the Remainder shall be the Annual Argument of the Node, whence its second Equation may be computed after the following manner in the preceding Figure.

Let *T*, as before, represent the Earth; *T S* a Right Line conjoining the Earth and Sun: Let also the Line *T A C B*, be drawn to the Place of the Ascending Node of the Moon, as above equated; and let *S T A* be the Annual Argument of the Node. Take *T A* from a Scale, and let it be to *A B* :: as 56 to 3, or as $11\frac{2}{3}$ to 1. Then bisect *BA* in *C*, and on *C* as a Centre, with the Distance *CA*, describe a Circle as *A F B*, and make the Angle *B C F*, equal to double the Annual Argument of the Node before found: So shall the Angle *B T F*, be the second Equation of the Ascending Node: Which must be added when the Node is passing from the Quadrature to a Syzygy with the Sun, and subtracted when the Node moves from a Syzygy towards a Quadrature. By which means the true Place of the Node of the Lunar Orbit will be gained: Whence from Tables made after the common way, the Moon's Latitude, and the Reduction of her Orbit to the Ecliptick, may be computed, supposing the Inclination of the Moon's Orbit to the Ecliptick, to be 4 deg. 59 min. 35 seconds, when the Nodes are in Quadrature with the Sun; and 5 deg. 17 min. 20 seconds, when they are in the Syzygies.

And from the Longitude and Latitude thus found, and the given Obliquity of the Ecliptick, 23 degrees 29 minutes, to the Right Ascension and Declination of the Moon will be found.

The Horizontal Parallax of the Moon, when she is in the Syzygies at a mean Distance from the Earth, I make to be 57 min. 30 seconds, and her Horary Motion 33 min. 32 seconds, 32 thirds; and her apparent Diameter 31 min. 30 seconds. But in her Quadratures, at a mean Distance from the Earth, I make the Horizontal Parallax of the Moon to be 59 min. 40 seconds, her Horary Motion 32 min. 12 seconds, 2 thirds, and her apparent Diameter 31 min. 3 seconds. The Moon in an Octant to the Sun, and at a mean Distance, hath her Centre distant from the Centre of the Earth about $60\frac{1}{2}$ of the Earth's Semi-diameters.

The Sun's Horizontal Parallax I make to be 10 seconds, and its apparent Diameter at a mean Distance from the Earth, I make 32 minutes, 15 seconds.

The Atmosphere of the Earth, by dispersing and refracting the Sun's Light, casts a Shadow as if it were an Opaque Body, at least to the height

of 40 or 50 Geographical Miles (by a Geographical Mile, I mean the sixtieth part of a Degree of a great Circle, on the Earth's Surface.) This Shadow falling upon the Moon in a Lunar Eclipse, makes the Earth's Shadow be the larger or broader. And to each Mile of the Earth's Atmosphere, is correspondent a Second in the Moon's Disk, so that the Semi-diameter of the Earth's Shadow projected upon the Disk of the Moon, is to be encreased about 50 seconds: Or which is all one, in a Lunar Eclipse, the Horizontal Parallax of the Moon is to be encreased in the Ratio of about 70 to 69.

Thus far the Theory of this Incomparable Mathematician. And if we had many Places of the Moon accurately observed, especially about her Quadratures, and these well compared with her Places at the same time calculated according to this Theory; it would then appear whether there yet remain any other sensible Equations, which, when accounted for, might serve to improve and enlarge this Theory.

Dr. Greg. Astr. Elem. Phys. & Geom.

pag. 336.

MOOR at Sea, signifies the laying out the Anchors of a Ship so, as is best and safest for her Riding. There are several ways of *Mooring* a Ship. Sometimes they *Moor her a Toward*, by laying one Anchor on one side of a River, and another right against it on the other side; in order to make both the Cables bear together, as well at Tide of Ebb, as at Flood.

To *Moor Alongst*, is to lay one Anchor right in the middle of the Stream, and another right a head of the Ship, which is done when they are in danger of driving ashoar; for by this Means both her Anchors do bear together, and so will save her from falling on either Shore.

To *Moor Water-foot*, is to Moor a Ship in the middle between the two former ways, quartering as it were, neither across the Tide, nor alongst it, but between both. When a Ship comes into a Place of Riding, the Master and his Mates observe on what Point of the Compass the Wind is likeliest to endanger the Ship, and there they lay out an Anchor; and this is called *Mooring for East, North, &c.* according to the Point she is Moored upon. They don't say a Ship is *Moored*, unless she have at least two Anchor's out; except in one Case, and that is, when, tho' she have but one Anchor out, yet there is a Hawser ashoar; and then they say she is Moored with her Head to the Shoar.

MOORSHEAD, is the Head of a Copper, or Glas-Still, or Alembick, which is luted on to the Body, or Cucurbit; and hath a Beak, Nose, or Pipe, to let the raised Spirit run down into the Receiver.

MOOT, is a Term well understood in the Inns of Court, to be that Exercise or Arguing of Cases, which young Students perform at appointed times, the better to enable them for Practice, and Defence of Clients Causes. In the Inns of Court, there is a *Bayliff*, or *Surveyor of the Inns*, yearly chosen by the Bench, to appoint the *Moot-men* for the Inns of *Chancery*, and to keep account of Performance of Exercises, both there and in the Houle.

MOOT.

MOOT-MEN, are those that argue Reader's Cases (or Moot-Cases) in the Houses of *Chancery*, both in Term-time, and also in Vacations.

MORAL Quantity. See *Quantity*.

MORATUR or *Demoratur in Lege*, signifies as much as *He demurs*, because the Party goes not forward in Pleading, but rests upon the Judgment of the Court in the Point, who deliberate, and take time to argue and advise thereupon.

MORBUS Regius, the same that *Icterus*.

MORTAR-PIECE, is a kind of very short piece of Cannon, or Ordnance, thick and wide, proper for the discharging of Bombs, Carcasses, Stones, &c. It is usually mounted on a Carriage, the Wheels whereof are very low. *Mr. Anderson*, in his Book of the Gun, saith, That 70 or 80 Degrees of Elevation, is the best for ren-

dring Mortars serviceable, to cast Shells into Towns, Forts, &c. And he saith, That if Mortar-pieces were all, as they ought to be, exactly Similar, and their Requisites of Powder as the Cubes of the Diameters of their several Bores; and if also their Shells, Bombs, Carcasses, &c. were Similar, then, comparing, like with like, their Ranges upon the Plane of the Horizon under the same Degree of Elevation, would be equal; and consequently one Piece being well proved, that is, the Range of the Granado, Bomb, Carcass, &c. being found to any Degree of Elevation, the whole Work of the Mortar-piece would become very easie and exact: But since Mortars are not thus Similar, there is required the Range of the Piece at any convenient degree of Elevation, with its requisite of Powder; and then you must work by the Tables,

The Use of which Table of Horizontal Distances, is this, in Anderfon's Words.

I. Any degree of Elevation under 45 degrees, being given; What degree above 45 degrees, will hit the same Horizontal Distance? Suppose 12 degrees: I look against 12 in the Table, and find 4361, which I look for beyond 45 degrees, and find it against 76 degrees 57 minutes: So I conclude, a Piece charged with the same quantity of the same Powder, and the same Ball put to either 12 degrees, or 76 degrees 57 minutes of Elevation, will range the Shot to the same Horizontal Distance.

Here Note, Suppose a Piece be charged with 1, 2, 3, and 4 Parts of Powder, and the same Ball, and put to those degrees of Elevation, if the upper and lower Ranges be equal, there is no sensible Resistance of the Medium.

II. June the 5th. 1677. on *Wimbleton-Heath*, I charged the Mortar-piece with 4 Ounces of Powder, and put it to 15 degrees of Elevation; it ranged the Ball to the Horizontal Distance of 659 Paces; with that, I would hit a Mark with the same Piece, Ball, and quantity of Powder, at the Horizontal Distance of 1000 Paces: Then as 659 is to 1000, so is 5261 the Tabular Number of 15 degrees to 7983, which gives in the Table 25 degrees 47 minutes, and 63 degrees 16 minutes, to hit a Mark at the Horizontal Distance of 1000 Paces.

III. Feb. the 12th. 1677. on *Wimbleton-Heath*, a Piece whose Length of its Chase is 18 Inches, and Diameter of Bore 3 Inches, charged with 8 Ounces of Powder, and laid to 10 degrees of Elevation, ranged its Shot to the Horizontal Distance of 805 Paces: With that I would hit a Mark at the Horizontal Distance of 2112 Paces; that is, 2 *Englisch* Miles. Then as 805 is to 2112, so is 3734, the Tabular Number at 10 degrees, to 9797, which gives in the Table 38 degrees 41 minutes, and 50 degrees 25 minutes, to hit a Mark at the Horizontal Distance of 2112 Paces, viz. 2 *Englisch* Miles.

N. B. Since this, our Excellent Mathematical Instrument-maker, Mr. *John Rowley*, (whose Shop is by *St. Dunstan's Church in Fleet-street*) hath contrived this Table on a Scale of Box, where, by sliding only a fiducial Edge of Brass over the Diagonals of the Distance required, both the Elevations, upper and lower, are shewn at the same time.

Mr. *Anderfon* gives us also the following TABLE of the Requisite Weight of Powder for all Mortars, from 6 to 20 Inches Diameter.

Inc.	Docim.	Pounds.	Ounces.
6.	0		13
6.	5	1.	01
7.	0	1.	05
7.	5	1.	10
8.	0	2.	00
8.	5	2.	06
9.	0	2.	14
9.	5	3.	06
10.	0	3.	14 $\frac{1}{2}$
10.	5	4.	08
11.	0	5.	03
11.	5	5.	15
12.	0	6.	12
12.	5	7.	10
13.	0	8.	09
13.	5	9.	10
14.	0	10.	11 $\frac{1}{2}$
14.	5	11.	14
15.	0	13.	03
15.	5	14.	09
16.	0	16.	16
16.	5	17.	09
17.	0	19.	03
17.	5	20.	15
18.	0	22.	12 $\frac{1}{2}$
18.	5	24.	11
19.	0	26.	13
19.	5	28.	14
20.	0	31.	04

The Use of this TABLE is Plain and Easy.

If you would know the Quantity of Powder requisite to load a Mortar of 15 Inches Diameter; against 15 Inches you have 13 Pounds 3 Ounces, and that is the true Weight of Powder required.

MORTGAGE, in Law, signifies a Pawn of Land, or Tenements, or any thing moveable, laid or bound for Money borrowed, to be the Creditors forever, if the Money be not paid at the Day agreed upon: And the Creditor holding Land, or Tenement upon this Bargain, is called Tenant in Mortgage. He that pledgeth this Pawn or Gage, is called the Mortgager, and he that taketh it, the Mortgagee.

MORTIFY. The Chymists say a Thing is Mortify'd, when its outward Form is altered or destroyed, as particularly when *Mercury*, or any other Metal is dissolved in an *Acid Menstruum*. Sometimes they say also, that Spirits are Mortified, when they are mix'd with such Things as destroy their Strength, and hinder their Operation.

MORTMAINE, a Term in Law, signifying an Alienation of Lands and Tenements to any Guild, Corporation, or Fraternity, their Successors, as Bishops, Parsons, Vicars, &c. which may not be done without the King's Licence, and the Lord of the Manor, or of the King alone, if it be immediately holden of him.

MORTUARY, is a Gift left by a Man at his Death, to his Parish-Church, for the recompence of his Personal Tythes and Offerings, not duly paid in his Life-time. A *Mortuary* is not properly and originally due to an Ecclesiastical Incumbent from any, but those only of his own Parish. But by Custom in some Places of this Kingdom, they are paid to the Parsons of other Parishes, as the Corps passes through them.

MOSAICK Work, was anciently used only in Pavements, and began in *Rome* about *Sylla's* time; who made a Pavement of *Mosaick Work* at *Preneste* in the Temple of *Fortune*, about 170 Years before Christ. It was called *Lithostrotion*, in Greek only a Stone Pavement; but it is understood of Figures made or represented by inlaying of small Stones, or rather pieces of Stone of different Colours; by the variety of which, many Curious Figures may be wrought. Afterward it came to be in Fashion for the Insides of the Walls of Rooms; and now adays they work it with Shells, or small Pieces of Glas variously Colour'd and Figured: 'Tis a very pleasant and a lasting Ornament, when 'tis curiously and excellently done.

MOTHER Tongues, in *Latin*, *Matrices Linguae*, are such Languages as seem to have no Dependence upon, Derivation from, or Affinity with one another. 'Tis a Conjecture commonly received, That at the Confusion of Languages at the Tower of *Babel*, there were formed 70, or 72 severally distinct Languages: But Bishop *Wilkins* thinks 'tis probable there were not so many, and that at the first Dispersion, Men did not divide into so many Colonies. But now the Languages used in the World, do far exceed that Number: If you will believe *Pliny* and *Strabo*, there was a Town in *Colchos* called *Discuria*, to which Men of three hundred Nations, and as many several Languages, did resort for Trading. Some of the *American* Historians relate, That in every 80 Miles of that vast Country, and also in almost every particular Valley of *Peru*, the Inhabitants had a distinct Language or Mother-Tongue by themselves. And *Purchas* tells us, *Pilgr. Lib. 8. Sect. 4. Cap. 1.* That by Converse and Enquiry, in the Northern Parts of *America*, about *Florida*, he found more than 1000 different Languages amongst the Inhabitants of those Places.

Joseph Scaliger affirms there are no more than Eleven Mother-Tongues used in *Europe*; of which Four are of more general and large Extent, and the other Seven of a narrower Compass and Use.

1. The *Greek*, which was anciently of very great Extent, not only in *Europe*, but in *Asia* and *Africk* too, where several Colonies of that Nation were planted; by which Dispersion and Mixture with other People, it did degenerate into several *Dialects*. Besides those Four that are commonly noted, the *Doric*, *Ionic*, *Eolic*, *Attic*, *Herodotus* doth mention Four several *Dialects* of the *Ionic*. The Inhabitants of *Rhodes*, *Cyprus*, *Crete* had each of them some Peculiarity in their Language:

And the present *Coptic* or *Egyptian* seems, both from the *Words* and the *Character*, to be a Branch of this Family, and was probably spread amongst that People in the Days of *Alexander the Great*, upon his conquering of them; tho' some conceive that there were at least 30000 Families of *Greeks* planted in that Country long before his Time.

2. The *Latin*, tho' this be much of it a Derivation from the *Greek*, (of which the now *French*, *Spanish*, and *Italian*, are several Off-springs and Derivations) had anciently Four several *Dialects*, as *Petrus Crinitus* shews out of *Varro*.

3. The *Teutonic* or *German*, is now distinguished into *Upper* and *Lower*. The *Upper* hath two notable *Dialects*: 1. The *Danish*, *Scandian*, or perhaps the *Gothic*; to which belongs the Language used in *Denmark*, *Norway*, *Swedeland*, and *Island*. 2. The *Saxon*, to which appertain the several Languages of the *English*, the *Scotch*, the *Frisians*, and those on the North of *Elbe*.

4. The *Slavonic* is extended, tho' with some Variation, through many large Territories, *Muscovia*, *Poland*, *Bohemia*, *Vandalia*, *Croatia*, *Lithuania*, *Dalmatia*; and is said to be the *Vulgar Language* used amongst Sixty several Nations.

The Languages of lesser Extent, are,

1. The *Albanese*, or Old *Epirotic*, now used in the Mountainous Parts of *Epirus*.

2. The *European Tartar*, or *Scythian*, from which some conceive our *Irish* to have had its Original.

As for the *Turkish Tongue*, that is originally no other but the *Asiatick Tartar* mixed with *Armenian* and *Persian*, some *Greek*, and much *Arabic*.

3. The *Hungarian*, used in the greatest Part of that Kingdom.

4. The *Finnic* used in *Finland* and *Lapland*.

5. The *Cantabrian*, used amongst the *Biscainers* who live near the Ocean on the *Pyrene Hills*, bordering both upon *France* and *Spain*.

6. The *Irish*, in *Ireland*, and from thence brought over into some Parts of *Scotland*; tho' *Mr. Camden* would have this to be a Derivation from the *Welsh*.

7. The Old *Gaulish* or *British*, which is yet preserved in *Wales*, *Cornwal*, and *Britain* in *France*.

To this Number *Mr. Brerewood* doth add Four others, viz.

1. The *Arabick*, now used in the steep Mountains of *Granata*; which yet is a *Dialect* from the *Hebrew*, and not a Mother-Tongue.

2. The *Cauchian*, in *East-Friesland*.

3. The *Illyrian*, in the Isle of *Veggia*.

4. The *Fazzygian*, on the North-side of *Hungary*.

MOTION, is a continual and successive Mutation or Change of Place. All Motion may be consider'd either *Absolutely* or *Relatively*. *Absolute Motion* is the Change of the *Locus Absolutus* of any moving Body, and therefore its Celerity will be measured by the Quantity of the *Absolute Space*, which the Moveable hath run through. But *Relative Motion* is a Mutation of the *Relative* or *Vulgar Place* of the moving Body, and so hath its Celerity accounted or measured by the Quantity of *Relative Space* which the Moveable runs over.

All Motion is of it self rectilinear, or made according to strait Lines, with the same constant uniform Velocity, if no external Cause make any Alteration in its Direction.

If a Body, moving uniformly, and with the same Degree of Velocity, pass over two Spaces, the Times of the Motions will be as the Spaces; as is very plain to him that will consider it.

If a Body move through two Spaces in equal Times, those Spaces will be to one another as the Velocities of the Motions.

If two Bodies move uniformly, but with unequal Velocities, through the same Space, the Times will be as the Velocities.

If two Bodies, moving uniformly, go with unequal Velocities, the Spaces which will be pass'd over by them in unequal Times, will be to one another in a Ratio compounded of that of the Velocities and that of the Times. *Galileus, de Motu Local. Dial. 3. Giorn. terza.*

If any Bodies are impelled upwards by different Forces, they will be rais'd to different Heights; which Heights will be to one another as the Squares of their Velocities.

And if Bodies fall from different Altitudes, the Celerities will be to one another as the Squares of such Altitudes.

M O T I O N ; Its Laws.

The Incomparable Sir *Isaac Newton* gives but these Three Laws of Motion, which may be truly call'd *Laws of Nature*.

1. That every Body will continue in its State, either of Rest, or Motion uniformly forward in a Right Line, unless it be made to change that State by some Force impress'd upon it.

2. That the Change of Motion is proportionable to the moving Force impress'd; and is always according to the Direction of that Right Line in which the Force is impress'd.

3. That *Reaction* is always equal and contrary to *Action*; or, which is all one, the mutual Actions of two Bodies one upon another are equal, and directed towards contrary Parts: As when one Body presses and draws another, 'tis as much press'd or drawn by that Body.

The Quantity of any Motion is discoverable by the joint Consideration of the Quantity of Matter in, and the Velocity of the moving Body: For the Motion of any Whole, is the Sum of the Motions of all the Parts. And consequently if a Body be twice as great as another, and be moved with an equal Degree of Velocity, the

Quantity of the Motion is *double* in the Former; but if the Velocity be also double, then the Quantity of the Motion is *Quadruple* of that of the latter. *Newton's Princip.*

The Quantity of Motion, which is found by taking either the Sum of Motions made the same way, or the Difference of those which are made contrary ways, is not at all changed by the Action of Bodies one upon another. For Action and Reaction are always equal, (by Law 3.) wherefore (by Law 2.) they must needs produce equal Changes in the Motions towards contrary Parts: Wherefore, if the Motions be both according to the same Direction, whatsoever is added to the Body to be moved, or which is forced to give place, is subducted from the Body which moves, or drives away the other; so that the Sum remains the same as before. But if the Bodies meet with contrary Directions, there must be an equal Subtraction of the Motion of each, and consequently the Difference of the Motions made towards the contrary parts, will remain the same. Suppose the Spherical Body A to be thrice as big as B, and of the like Figure. Let A have two Degrees of Velocity, and B pursue it with ten Degrees of Velocity: Wherefore the Quantity of the Motion of A to B, is as 6 to 10; therefore the Sum of the Motions of both is 16. Suppose then B to overtake A, and to give it 3, 4, or 5 Degrees of Velocity; 'tis plain it must lose just as much it self: Wherefore A will go on with 9, 10, 11 Parts of Velocity; and B will follow after with 7, 6, or 5. So that the Sum will still be 16; and thus will it always be. *Idem.*

Mr. *Keil*, in his *Lectiones Physicae*, proves this distinctly, by branching of it into two Theorems. See p. 127.

Which T H E O R E M S are these.

I: If one Body strike against another, whether at rest, or moving more slowly, according to the same Direction with the Former; then will the Sum of the Motion in both Bodies towards the same Parts, remain the very same as before such striking one against another.

Let the Body A move according to the Direction CD, and in its way strike against the Body B; which suppose to be either at rest, or moving on more slowly than A, and according to the same Direction with it: I say, the Sum of the Motions in both Bodies, towards the same Parts, that is from C towards D, will be the same as before. Let CD express the Motion of A from C to D; and if B be in Motion too, let EF express its Motion the same way. Then will the Sum of both Motions be expressed by $CD + EF$. But because Action and Reaction are always equal, and towards Contrary Parts; if FG express the Motion impress'd on B by the Stroke of A; DK, equal to it, must express the Motion impress'd on A by the Stroke of B, with a contrary Direction from D towards C. Wherefore since $DK = FG$, CK will express the Motion of the Body A after the Shock, and EG the Motion of B; and therefore the Sum of

of both will be $CK + EG$. But since FG is supposed $= KD$, if you add CK and EF to both, $EG + CK$ must be equal to $CD + EF$. Wherefore the Sum of the Motions of both is the same as at first.

And if FG be equal to CD , the Points K and C must be coincident; that is, CK will be $= 0$, and consequently the Body A , after the Occurſe or Shock, will be quite at reſt. But if FG be greater than CD , the Point K must be found ſomewhere beyond or to the Left Hand of C ; and the Motion of A will become changed towards the contrary Parts, and the Sum of the Motions towards G will be as $EG - CK$: And becauſe $FG = CK$, add to both $EF - CK$, and it will be that $EF + FG - CK$, (*i. e.*) $EG - CK = EF + DK - CK$, (*i. e.*) $EF + CD$. From whence 'tis plain that the Sum of the Motions towards the ſame Parts (which in this Caſe is their Difference towards contrary Parts) continues the ſame after the Shock as before.

COR. After the ſame manner it will appear, if many Bodies, moving with the ſame Direction, ſhould ſtrike againſt one another, the Sum of their Motion, after that, will be the ſame as before.

II. If Two Bodies move towards each other with exactly contrary Directions, the Sum of their Motions towards the ſame Parts (which is all one as the Difference of them towards contrary Parts) will continue the ſame after the Shock as before it.

Let the Body A move from C towards D , and let CD expreſs its Line of Motion; and let the Body B be moving at the ſame time with a quite contrary Direction from E to F , and let EF expreſs its Motion. Let DH be ſuppoſed equal to EF ; ſo ſhall CH , which is the Difference of their Motion towards contrary Parts, expreſs the Sum of the Motions made towards G . I ſay then, that the ſame CH is the Sum of their Motions towards G , as well after the Shock as before it: For after the Shock, ſuppoſe the Motion of B to be changed, and to be now towards G , and let the Line EG repreſent it; wherefore the Force impreſſed upon B after the Shock, and which carries it towards G , will be equal to the Sum of the Motions EF and GF , and confequently be expreſſed by FG : For in that Right Line, the Motion EF , towards F , is deſtroyed; and the new one, EG , towards G , produced. But now ſince the impulſive Force in both Bodies acts equally towards contrary Parts, if DK be made equal to FG , this ſhall repreſent the Force impreſſed on the Body A , and carry it in a contrary Direction to its former Motion: So that if the Line of Motion DK , be taken from the Line CD , there will remain CK repreſenting the true Motion of A towards G . But becauſe $DK = FG$, and $DH = FE$; $DK - DH$ (*i. e.* KH) $= FG - FE$ (*i. e.*) EG : And confequently ſince $KH = EG$, KH will repreſent the Motion of the Body B , after the Shock;

but CK repreſents the Motion of A after it: Wherefore CA is the Sum of the Motion in both Bodies towards G .

If FG had been equal to CD , then the Points, K and C would be coincident, and the Motion of A will be quite deſtroyed, (*i. e.*) after the Shock A will be perfectly at reſt, and CA will be equal to EG .

But if FG be greater than CD , the Point K will fall to the Left Hand of C , and the Motion of the Body A will be from C towards K . But (becauſe $FG = DK$, and $FE = DH$) $KH = EG$; wherefore taking CK from both, CH must be equal to $EG - CK$; which repreſents the Sum of the Motions made towards the ſame Parts, and their Difference towards contrary ones after the Shock: Wherefore the Sum of the Motions towards the ſame Parts remains the ſame after, as before the Shock.

Our Excellent Mathematician Dr. Wallis, in a Letter to the Famous Mr. Oldenburgh, Secretary of the Royal Society, gives the following Short Account of the Laws of Motion, Nov. 26. 1688. And intimated, that they were made Publick Eight Months before, at the Meeting of the Royal Society.

1. If any Agent, as A , produce any Effect, as E ; then an Agent, as $2A$, will produce an Effect, as $2E$; $3A$, as $3E$, &c. *ceteris paribus*. And univerſally, if m be put for the Exponent of the Power, $m A$, as $m E$.

2. Wherefore if any Force, as V (which ſtands for *Vis*) move any Weight, Maſs, or Body, as P ; the Force, which is as $m V$, ſhall move $m P$, *ceteris paribus*; *viz.* with the ſame Celerity, or through the ſame Space in the ſame Time.

3. If the Force in the given Time T , move any Weight thro' the Space or Length L , in the Time $n T$, it ſhall move it thro' the Space $n L$.

4. Wherefore if the Force V , in the Time T , move any Weight, as P thro' the Length or Space L , the Force $m V$ in the Time $n T$, ſhall move $m P$ thro' the Space $n L$: And confequently as $V T$, (the Rectangle under the Force and Time) is to $P L$ the Rectangle under the Weight and Diſtance: So is $m n V T$, to $m n P L$.

5. Since the Degrees of Celerity are proportionable to the Lengths run over in the ſame Time, or, (which is the ſame thing) are proportionable to the Times taken up in paſſing over ſuch Lengths: Therefore it will be, as $\frac{L}{T}$. $C ::$

$\frac{m L}{n T} \frac{m}{n} C$. That is, the Degrees of Celerity will be in a Ratio compounded directly of the Lengths, and Reciprocally of the Times.

6. Since as $V T . P L :: m n V T$ to $m n P L$, it will be as $V . \frac{P L}{T} :: m V . \frac{m n P L}{n T}$. That is,

$V . P G$.

$V, P C :: m V, m P C :: m P \times \text{by } C ; \text{ or } = P \times \text{by } m C.$

7. That is, if the Force V be able to move the Weight P , according to the Celerity C ; then will the Force $m V$, move the same Weight P , in the Celerity $m C$; or with the bare Celerity C , the Weight $m P$: Or, in one word, it will be able to move any Weight with that Celerity; if the Product of the Weight multiplied by the Celerity, be $m P C$.

8. And on this depends the Reason of the Construction of all manner of Engines and Machines, for facilitating of Motion, viz. That in whatever Proportion the Weight be encreased, the Celerity be decreased accordingly: From whence it comes that the Product of the Celerity multiplied by the Weight, for moving the same Force, is always the same, viz. $V : P C ::$

$N, m P + \frac{1}{m} C$: That is, $P C$.

9. If the Weight P , by the Force V , carried according to the Celerity C , strike directly against the Weight $m P$; which, tho' supposed at rest, yet is capable of being moved; both the Bodies after the stroke, will be carried with the Celerity $\frac{1+m}{1} C$. For, by reason the same Force is impelled to move the greater Body, the Celerity of it will be lessened after the same Ratio, viz. $V : P C :: V : \frac{1+m}{1} P \times \frac{1}{1+m} C = P C$. And therefore the Impetus, (or Product of the Weight multiplied by the Celerity) of the other will be $\frac{1}{1+m} P C$; and of the Remaining one $\frac{1}{1+m} m P C$.

10. If against the Weight P , moved by the Force V , with the Celerity C , another Weight or Body shall strike directly, moving the same way, but with greater Celerity: As suppose the Weight $m P$, with the Celerity $n C$, (which therefore will be carried forward with the Force $m n V$.) After this, they will both move forward with the Celerity $\frac{1+m n}{1+m} C$.

For, $V : P C :: m n V, m n P C :: V + m n V$
 $\left(\frac{1+m n V}{1} \right) \frac{1+m n}{1} P C$: which is equal to
 $\frac{1+m}{1} P \times \text{by } \frac{1+m n}{1+m} C$.

And therefore the Impetus of the Preceding Body will be $\frac{1+m n}{1+m} P C$: and of the following, $\frac{1+m n}{1+m} m P C$.

11. If the Weights or Bodies are carried contrary ways, they will meet, and mutually strike against each other.

Suppose the Weight P , carried by the Force V , with the Celerity C , towards the Right Hand; and the Weight $m P$ with the Celerity $n C$, (and consequently carried by the Force $m n V$) toward the Left Hand: Then may the Impetus,

Direction, and Celerity of each be thus calculated.

The Body which moved towards the Right Hand, if the other had been at rest, would have given it the Celerity $\frac{1}{1+m} C$, (by the 9th);

and consequently the Impetus $\frac{1}{1+m} m P C$, of moving to the Right Hand; and would have retained to it self the same Celerity, and the Impetus $\frac{1}{1+m} m P C$; also towards the Right Hand. And the other Body, carried toward the Left Hand, would, if the former had been at rest, have given it the Celerity $\frac{m n}{1+m} C$; and therefore the Impetus $\frac{m n}{1+m} m P C$, towards the Left Hand, by the same Reason; and it would have retained to its self the same Celerity, and therefore the Impetus $\frac{m n}{1+m} m P C$ also toward the Left Hand.

Wherefore since the Motion was made both ways, the Aggregate of the Impetus of the former Body, will arise out of the Impetus $\frac{1}{1+m} P C$ to the Right, and $\frac{m n}{1+m} P C$ to the Left: And therefore in reality, it will move either to the Right or Left, according as that or this is greater, and by an Impetus, which is the Difference between those 2 Impetus's. That is, Supposing $+$ to signifie to the Right Hand, and $-$ to the Left, the Impetus will be $\frac{1}{1+m} P C - \frac{m n}{1+m} P C$, which is equal to $\frac{1-m n}{1+m} P$. And the Celerity will be $\frac{1-m n}{1+m} C$, (and towards the Right or Left Hand, according as 1 or $m n$ is the greater Quantity.)

And in like manner the Impetus of the other Body, which first moved towards the Left Hand, will be $\frac{1}{1+m} m P C - \frac{m n}{1+m} m P C =$ to $\frac{m n}{1+m} m P C$. And the Celerity will be $\frac{1-m n}{1+m} C$, and the Direction to the Right or Left Hand, according as 1 , or $m n$, is the greater Quantity.

12. But if the Bodies neither move on in the same way directly, nor directly contrary to one another, but do encounter one another Obliquely; then the preceding Calculus must be moderated, according to the Measure of that Obliquity: And the Impetus of the Body striking Obliquely, is to the Impetus it would have had, if it had gone directly :: as the Radius to the Secant of the Angle of the Obliquity.

Which Consideration duly applied to the former Calculus, will determine with what Impetus, Celerity, and Direction, the Obliquely encountering Bodies shall move afterward.

And there is the very same Ratio of the Gravitation of heavy Bodies, which descend Oblique-ly

ly to their Gravitation, supposing them to have descended perpendicularly; as we elsewhere demonstrate.

13. If the Bodies, which thus encounter or strike one against another, are not infinitely hard (as hath hitherto been supposed) but do yield something to the Stroke, but yet so as that by a Spring, or Elastick Force, they can recover their Figure or Position again: It may happen from hence, that those Bodies may rebound back from one another mutually, which otherwise would have moved on together; (and this more or less, according to the Quantity of the Elasticity) viz. if the Elastick Force exceed the Progressive.

In Motions which are accelerated and retarded, the Impetus in each Moment is to be esteemed that which agrees to the degree of Celerity then acquired. But when the Motion is made in a Curve Line, that is to be accounted the Line of Direction of the Motion in each Moment, which is truly the Tangent to the Curve in that Point. And if when the Motion, being either accelerated or retarded, is made in a Curve Line (as in the Vibrations of a Pendulum) the Impetus is to be estimated in each Point, according to both the Degree of Acceleration, and the Obliquity of the Tangent there. *Philosoph. Transact. N. 40.*

An Account of the Laws of Motion, in Bodies striking one against another, you have also from the famous Mr. Hugen, in *Philos. Transact. N. 46.*

Mr. John Keil, late of Baliol-College in Oxon, in his Book called, *Introductio ad veram Physicam*, gives the following Theorems about the Quantity of Motion, and the Spaces passed over by the Moving Body, and which he there plainly demonstrates.

1. In comparing the Motions of Bodies, if the Quantity of Matter be the same, the Moments, or Quantities of Motion, will always be as the Velocities, and *vice versa*, if the Moments are as the Velocities, the Quantity of Matter in the Moving Bodies, is always the same.

2. If the Celerities are equal, the Moments, or Quantities of Motion, will be as the Quantities of Matter; or if the Moving Bodies are Homogeneous, as their Magnitudes.

And if the Moments are as the Quantities of Matter, the Velocities will be equal.

3. In comparing the Motions of any Bodies, the Ratio of the Moments is compounded of the Ratios of the Quantities of Matter, and the Celerities. See the Word *Moments*.

4. In comparing the Motions of any Moving Bodies, the Ratio of the Celerities is compounded of the Ratio of their Moments directly, and of their Quantity of Matter reciprocally.

5. If the Celerities of any Moving Bodies are equal, the Spaces passed over, will be directly as the Times in which the Motions are made.

And consequently, if the Times are as the Spaces, the Celerities must be equal.

6. If the Times are equal, the Spaces passed through, will be as the Velocities, and consequently, if the Spaces are as the Velocities, the Times will be equal.

7. The Distances, or Lengths run, are in a Ratio compounded of the Ratios of the Times and Celerities; so that Spaces or Distances moved thro', may be consider'd as Rectangles, under the Times and the Celerities.

Wherefore if the Spaces, or Distances run, be equal, the Rectangle under the Celerity and Time of one Moveable, will be equal to that under the Celerity and Time of the other: And therefore, because equal Rectangles with unequal Sides, have their Sides reciprocally proportionable (14. & 6 *Euclid.*) as Celerity is to Celerity; so reciprocally shall Time be to Time; and consequently, when the Spaces are equal, the Times will be reciprocally as the Celerities.

8. The Ratio of the Times is always compounded of the Ratio of the Spaces passed over, directly, and of the Celerities reciprocally.

The Incomparable Sir ISAAC NEWTON, thus expresses these Two last Theorems.

When the Celerity is given, the Space passed through will be as the Time; and the Time being given, the Space is as the Celerity: Wherefore if neither be given, the Space will be as the Celerity and Time conjunctly.

When the Celerity is given, the Time is directly as the Space moved through; and the Space being given, the Time is reciprocally as the Celerity: Wherefore if neither be given, the Time is as the Space directly, and as the Celerity reciprocally.

Hence 'tis plain, the Motions of all Bodies are as the Rectangles under the Velocities, and the Quantities of Matter: wherefore the Matter and Celerity of Motion being given, the Momentum or Quantity of Motion is given: And if the Momentum and Matter be given, the Celerity is given by dividing the Momentum by the Quantity of Matter, *v. gr.* Let the Quantity of Matter be a , the Celerity c , and the Momentum m : then will $ca = m$, and $c = \frac{m}{a}$ and $a = \frac{m}{c}$.

Also since the Space passed over, or through, is always proportional to the Rectangle under the Velocity and the Time; let the Space be $= S$, the Time $= T$, and the Celerity as before $= C$. Then will $S = CT$, and $C = \frac{S}{T}$, and $T = \frac{S}{C}$. And since also $m = ac$, m will be equal to $\frac{a S}{T}$: Or, if T be given, $m = aS$.

Hence also may be concluded, That if two Bodies are moved with equal Velocities, the Moments will be as the Quantity of Matter in each; and *vice versa*, the Quantity of Matter as the Moments. Wherefore if Bodies of equal Bulk are found to have unequal Moments, or Quantities

of Motion, the Quantities of Matter must be unequal; and consequently, that which hath the least Moment, must have more of Pores or Vacuities interspersed than the other.

For Instance: If two Globes, one of Lead and the other of Cork, having equal Bulks, are moved with equal Swiftness; since the Quantity of Motion in the former, or its Force to move other Bodies, will be much greater than in the latter; it's plain there must be many more Pores or Vacuities in this; than in that.

Mr. Varignon's Laws and Proportions about Motion.

1. In all kind of Motions whatever, Rowling, Sliding, Uniform, Accelerated, or Retarded, in Right Lines, or in Curves, &c. The Sum of the Forces which produce the Motion of all Parts of its Duration, is always proportionable to the Sum of the Paths, or Lines, which all the Points of the moving Body describe.

2. There is more Force required to make a Body Rowl, or Revolve, (as suppose a truly Spherick Bowl on a mathematical Plane) than to make it Glide along with the same Celerity.

3. In all Gliding or Sliding Motions, whether Uniform, Accelerated, or Retarded, &c. The Force in the whole is always proportional to the Product of the Mass (or Quantity of Matter) multiplied by the Path or Line described by the Centre of Gravity of the moving Body.

4. The Product of the Duration of all Uniform Motions, multiplied by the Force which began the Motion, is always proportionable to the Product made by the Path, or Line of Motion multiplied by the Mass or Quantity of Matter in the moving Body.

Let B, b. stand for the Body moved.
M, m. for the Mass, or Quantity of Matter in it.
S, s. for Space, or Distance moved through.
T, t. for the Time in which the Motion is made.
F, f. for the Force producing the Motion.
C, c. for the Celerity of the Motion.

Then I say, $FT : ft :: MS : ms$. of any two Bodies in Motion. Then

$$\begin{aligned} 5. F : f :: MS : ms \\ T : t :: MS : ms \\ M : m :: FT : ft \\ S : s :: FT : ft \end{aligned}$$

6. If $F = f$, then shall

$$\begin{aligned} T : t :: MS : ms \\ M : m :: TS : st \\ S : s :: TM : Mt \end{aligned}$$

And reciprocally, Whenever T t, M m, S s, are in any of these Proportions, Then are the Forces which move the Bodies equal; which is the General Principle of all Des Cartes's Statics.

7. If $T = t$, then shall

$$\begin{aligned} F : f :: MS : ms \\ M : m :: FS : fs \\ S : s :: TM : Mt \end{aligned}$$

And so reciprocally, If F, M, or S, be in the Proportions, The Times will be equal. And from this may the Laws of all Machines be demonstrated after Des Cartes his manner.

8. If $M = m$, then will

$$\begin{aligned} F : f :: S : s \\ S : s :: FM : fm \\ T : t :: Sf : sF \end{aligned}$$

And reciprocally, If these Proportions be discovered, Then the Masses are equal.

9. If $S = s$, then will

$$\begin{aligned} F : f :: MT : mT \\ M : m :: FT : ft \\ T : t :: Mf : mF \end{aligned}$$

And reciprocally, If such Proportions are found, The Spaces are equal.

$$10. \text{ If } F : f :: \begin{cases} M : m \\ S : s \end{cases}$$

Then will

$$T : t :: \begin{cases} S : s \\ M : m \end{cases}$$

And reciprocally,

$$\text{ If } T : t :: \begin{cases} S : s \\ M : m \end{cases}$$

Then will

$$F : f :: \begin{cases} M : m \\ S : s \end{cases}$$

11. If $F : f :: T : t$. Then

$$\begin{aligned} M : m :: FF : ff \\ S : s :: TT : tt \\ MS : ms :: FF : ff \\ TT : tt :: MS : ms \end{aligned}$$

And reciprocally, If the Masses of the Bodies moved, or the Spaces run through, or the Products of the Masses, by the Spaces, (that is, the Quantity of Motion in the Bodies B and b) are as in these Proportions, then are the Forces to one another as the Times.

And this observe also for a Principle to explain Machines and Engines, as above in Numbers 6 and 7.

12. If $M : m :: S : s$. Then

$$\begin{aligned} F : f :: SS : ss \\ T : t :: MM : mt \\ FT : ft :: SS : ss \\ MT : mt :: MM : mF \end{aligned}$$

And

MOT

S f f ... And

And Reciprocally, If these last Proportions are true, the first are so also.

24. If $F : f :: T : t$. Then shall

$$\begin{aligned} C : c :: m T : M t. \\ T : t :: M C : m c. \\ M : m :: T c : t C. \end{aligned}$$

And Reciprocally, If the Celerity, or the Masses, or the Times, or the Forces, are as in these Proportions, then the Forces shall be to one another as the Times; which was the Principle of *Galileus*, mentioned before in Number 20.

25. If $M : m :: S : s$. Then shall

$$\begin{aligned} C : c :: F s : f S. \\ F : f :: S C : s c. \\ S : s :: F c : f C. \end{aligned}$$

And Reciprocally, If the Celerities, or the Forces, or the Masses, or the Spaces run thro', are as in these Proportions; then the Masses of the Bodies moved, are to one another as the Spaces run thro'.

26. If $F : f :: m :: M$. Then $C : c :: \begin{cases} m m : M M \\ F F : f f. \end{cases}$

And Reciprocally, If these last Proportions are true, the first must be so also.

27. If $T : t :: s : S$. Then $C : c :: \begin{cases} S S : s s. \\ t t : T T. \end{cases}$

And Reciprocally,

If $C : c :: \begin{cases} S S : s s \\ t t : T T \end{cases}$ Then shall $T : t :: s : S$.

28. If $F : f :: s : S$. Then

$$\begin{aligned} C : c :: s m : S M. \\ M : m :: c s : C S. \\ s : S :: C M : c m. \end{aligned}$$

And Reciprocally, If the Celerities or the Masses, or the Forces, or the Spaces, are as in the last Proportion; then the Forces shall be Reciprocally as the Spaces.

29. If $T : t :: m : M$. Then

$$\begin{aligned} C : c :: F T : f t. \\ F : f :: t C : T c. \\ T : t :: f C : F c. \end{aligned}$$

And Reciprocally, if the Celerity, or the Forces, or the Times, or the Masses, are as in the last Proportion; then the Times shall be to one another in a Reciprocal Ratio of the Masses.

30. If $\begin{cases} F : f :: t : T. \\ M : m :: s : S. \end{cases}$ Or, Then

$$\begin{aligned} C : c :: F S : f s :: t m : M T. \\ t : f :: s C : S c. \\ t : T :: M C : m c. \\ M : m :: t c : T C. \\ s : S :: F c : f C. \end{aligned}$$

And Reciprocally, If the Celerities, Forces, Times, Masses, or Spaces run thro', are in the last Proportions; then the Masses shall be in a Reciprocal Ratio of the Spaces, and the Forces Reciprocally as the Times: Which is also the same that *Dr. Cartes* took for his first Principle of *Statics*. See the *Memoirs de la Mathematique & de la Physique*.

MOTION of the Apogee, in the *Ptolemaick System*, is an Ark of the Zodiac of the *Primum mobile*, contained between the Line of the Apogee and the Beginning of Aries.

MOTION Compounded. See *Composition of Motion*.

MOTORII, the Third Pair of Nerves which move the Eye.

MOTRIX *Vix*. See *Vis Motrix*.

MOVEABLE Feasts, are those Festivals which, tho' they are Celebrated on the same Day of the Week, have no Fixed Seat in the Calendar, but in several Years happen on several Days of the Month; of which kind are *Easter* and *Whitsontide*, &c.

MOVEMENT, the same with what many do call an Automaton, and with us signifies all those Parts of a Watch, Clock, or any such Curious Engine which are in Motion, and which by that Motion carry on the Design, or answer the End of the Instrument.

The Numbers of the *Wheels*, *Pinions*, *Notches*, &c. in any Piece of Clock or Watch-work, are usually thus written or express'd:

Where the uppermost Number above the Line is the Pinion of the Report 4, the Dial-wheel 36, and 9 the Turns of the Pinion of Report. The second Number (under the Line) is 5 the Pinion, 55 is the great Wheel, and 11 the Turns of the Pinion it driveth. The third Numbers are the second Wheel, &c. The fourth the Contrate-wheel, &c. And the single Number 17, under all, is the Crown-wheel.	<table border="0"> <tr><td>4</td><td>36</td><td>(9)</td></tr> <tr><td colspan="3"><hr/></td></tr> <tr><td>5</td><td>55</td><td>(11)</td></tr> <tr><td>5</td><td>43</td><td>(9)</td></tr> <tr><td>5</td><td>40</td><td>(8)</td></tr> <tr><td colspan="3"><hr/></td></tr> <tr><td></td><td></td><td>17</td></tr> </table>	4	36	(9)	<hr/>			5	55	(11)	5	43	(9)	5	40	(8)	<hr/>					17
4	36	(9)																				
<hr/>																						
5	55	(11)																				
5	43	(9)																				
5	40	(8)																				
<hr/>																						
		17																				

These Numbers, by some, are also express'd Fraction-wise, thus, $\frac{36}{5}$, $\frac{55}{5}$, $\frac{43}{5}$, $\frac{40}{5}$, 17 Notches in the Crown-wheel.

MOULINET, a French Term, signifying a Turn-stile: 'Tis used in Mechanicks, and signifies a Roller, which being cross'd with two Levers, is usually applied to *Cranes*, *Capstans*, and other sort of Engines of the like Nature, to draw Cords, and heave up Stones, Timber, &c. Also a kind of Turn-stile or Wooden Cross, which turns horizontally upon a Stake fix'd in the Ground; and is usually placed in Passages, to keep out Horses, and to oblige Passengers to go or come one by one.

These *Moulinets* are often set up near the Out-works of Fortified Places, at the side of the Barriers, through which People pass on Foot.

MOUND. The Term in Heraldry for a Ball or Globe, with a Cross upon it, such as our Princes are usually drawn or painted with, holding it in their Left Hand, as they do the Sceptre in their Right. Mound also signifies a Fence or Hedge.

MOYENAU (a French Term) in Fortification, is a small flat Bastion, commonly placed in the middle of an over-long Currain, by which the Bastions at the Extremities are not well defended from the Small-shot, by reason of their Distance; so that this Work is proper for placing in it a Body of Musqueteers to fire upon the Enemy from all sides.

MUCILAGE, in Pharmacy, is a viscidous Extraction made of Seeds, Gums, Roots, &c. with Water.

MUCILAGINOUS Glands, are a numerous sort of Glands seated in the Joints, first, I think, particularly taken Notice of by Dr. *Havers*, in his *Osteologia*: He saith, these are of two sorts, some are small, and in a manner miliary Glands, being Glandules placed all upon the same Surface of the Membrane, which lies over the Articulations. The other sort are conglomerated, or many Glandules collected and planted one upon another, so as to make a Bulk, and appear conspicuously, and are considerable Glands. In some of the Joints there are several of them; in others there is a single Gland.

For the Structure of these large Glands, they consist of small Vesicles, which are not gathered into several Lobules or Bags of Glandules, but are disposed upon several Membranes lying one over another; of which Membranes there are several in every one of these Glands, which appear evidently in them that are Hydropical.

They have their Blood-Vessels, as other Glands, but their Veins have a particular Flexure in their Course for retarding the Return of the Blood from the Glands, that the mucilaginous Liquor, which is not separated with the greatest Expedition, may have Time to penetrate the secretory Pores of the Glandules.

The large Mucilaginous Glands are variously seated; some in a *Sinus*, formed in the Joint; others stand near or over-against the Interstice, between the Articulated Bones; but in general they are so placed, as to be squeez'd gently, and lightly press'd in the Inflection or Extension of the Joint, so as to separate a Quantity of Mucilage proportionate to the Motion of the Part, and the present Occasion, and yet without any Injury.

The Design of all these Glands is to separate a mucilaginous kind of Liquor that serves principally to lubricate the Joints, to make them so slippery, as to be moved with the greatest Facility imaginable. It serves likewise to preserve the Ends of the Articulated Bones from Attrition, and an immoderate Incalcescence. But all these Things it performs in Conjunction with the medullary Oyl; of which two Ingredients, is made a Composition admirably fitted for these Ends: For the Mucilage adds to the Lubricity of the Oyl, and the Oyl preserves the Mucilage from growing too thick and viscidous.

The Doctor observes the same sort of Glands to lie between the Muscles and Tendons, and supposes that there is the same Mixture of an Oyl and Mucilaginous Substance; the one being that Fat which is found between the Muscles, and is supply'd by the Adipose Glands; the other being separated by the mucilaginous Glandules, of which the common Membrane of the Muscles is every where full. This Mixture in the Interstices of the Muscles, lubricates them and their Tendons, and preserves them from shrinking, and from growing dry and rigid.

For the Generation of this Mucilage, he supposes that Nature has designed one large *Viscus*, and that this is the Office of the Spleen; the Glandules of which he makes to have two secretory Pores; by one of which some Acid, and by the other, some Austere Particles are separated; which meet-

ing in the small Cavities of the Glandules, they are converted into a Mucilaginous and Gummous Substance; he having observed, that Spirit of Vitriol mix'd with a Decoction of Galis, will produce a Gum.

After this, he gives an Account of Experiments made with the Mucilage; the most of which come to this, That all Acids do coagulate it, as all Austeres and Austere Acids; but with this Difference, that the *Coagulum* or Curd made by Acids only, is tenderer than that which is produced by an Austere only, or an Austere Acid.

MUCRO Cordis, or *Apex*, is the lower pointed End of the Heart.

MUCRONATED, is whatever ends or terminates in a Point, like that of a Sword, &c.

MUCRONATUM Or: See *Ensisformis Car-tilago*.

MUFFLE, in Chymistry, is the Cover of a Test or Copper, which is put over it in the Fire.

MULLET, the Term in Heraldry for a Star of Five Points, of this Figure; and is usually the Difference or Distinguishing Mark for the Third Brother, or House.

Though 'tis often also born as Coat-Armour; as here:

Ruby on a Chief Pearl, Two Mullers Diamond; being the Coat of the Famous Lord Verulam, first Sir Francis Bacon. The Heralds say, the Mullet represents a Falling Star; 'tis rarely born of Six Points.

MULTA, or *Multura Episcopi*, was a Fine given to the King, that the Bishop might have Power to make his Last Will and Testament, and to have the Probate of other Mens, and the granting Administrations.

MULTANGULAR Figure, is one that has many Sides and Angles.

For its Superficial Content, see *Area*.

MULTILATERAL, in Geometry, are those Figures that have more than Four Sides.

MULTINOMIAL Root: See *Polynomial*.

MULTIPLE Proportion, is when the Antecedent being divided by the Consequent, the Quotient is more than Unity: And the Reason of the Name is, because the Consequent must be multiplied by the Index, or Exponent of the Ratio, to make it equal to the Antecedent. Thus 12 is multiple in proportion to 4, because, being divided by 4, the Quotient is 3, which is the Denominator of the Ratio: And the Consequent 4 being multiplied by 3, makes the Antecedent 12; wherefore 3 is *Sub-multiple* of 12.

MULTIPLE *Super-particular Proportion*, is when one Number or Quantity contains another more than once, and such an Aliquot Part more; of which see more under *Proportion*.

MULTIPLE *Super-partient Proportion*, is when one Number or Quantity contains another divers times, and some Parts thereof besides.

MULTIPLICATION, is, in general, the taking or repeating of one Number or Quantity as often as there are supposed Unites in the other. The Number *multiplied*, is called the *Multiplicand*; the Number *multiplying*, the *Multiplicator*; and that which is found or produced, is called the *Product*.

Multiplication is only a *Compendious Addition*, effecting at once what in the ordinary way of *Addition* would require many Operations: For the *Multiplicand* is only added to it self, or repeated, as often as the Unites of the *Multiplicator* do express. Thus if 6 were to be multiplied by 4, the *Product* is 24, which is the Sum arising from the *Addition* of 6 four times to it self.

In all *Multiplication*, as 1 is to the *Multiplicator*, so is the *Multiplicand* to the *Product*. Whence 'tis plain, that in *Multiplication* of *Integers*, the *Product* must be greater than either of the *Factors*, (for so the *Multiplicator* and *Multiplicand* are called, because between them they make up the *Product*) because either *Factor* is greater than *Unity*. But in *Multiplication* of *Fractions*, the *Product* must be less in Value than either of the *Factors*, because they are both less than *Unity*. Thus 24, the *Product* of 6, multiplied by 4, is greater than either 6 or 4; but $\frac{12}{5}$, the *Product* of $\frac{3}{5}$, multiplied by $\frac{2}{5}$, is less in Value than either $\frac{3}{5}$ or $\frac{2}{5}$.

MULTIPLICATION in Algebra or Species.

The General Rule is, To conjoin the Quantities propoed by the Sign (\times); which Sign, when the Quantities to be multiplied are express'd by but one or two Letters, is usually omitted, and the Quantities written down like Letters in a Word. Thus a multiplied by $b d$, may be written $a \times b d$, or, as is most usual, $a b d$.

And if the Signs $+$ or $-$, prefixed before the Quantities to be multiplied, are like, the *Product* is $+$; if unlike, the *Product* is $-$.

N. B. In Algebraic Multiplication, 'tis most commodious to begin to multiply at the Left-Hand, because we write that way.

Particular RULES.

I. RULE.

When two or more single Quantities, express'd by Letters, whether like or unlike, are to be multiplied into one another, and have no Numbers prefix'd; join the Quantities together, like Letters in a Word, and 'tis done:

$$\begin{array}{r} \text{Thus, } \begin{array}{c} d \\ f \end{array} \text{ and } \begin{array}{c} ab \\ dc \end{array} \text{ and } \begin{array}{c} mno \\ pqr \end{array} \\ \hline \text{Product} = \begin{array}{c} df \\ abdc \end{array} \begin{array}{c} mno \\ pqr \end{array} \end{array}$$

II. RULE.

If two Simple Quantities, whether like or unlike, are to be multiply'd, having Numbers or Coefficients prefixed before them; first multiply the Coefficients one into another, and to the *Product* annex the Letters of both Quantities; so this new Quantity is the *Product* sought.

Thus 3 a multiplied by 4 b , produces 12 ab .

III. RULE.

The *Multiplication* of Compound Quantities, depends on the preceding Rules: For every Member of the one, must be multiplied into every Member of the other; respect being had to the Signs, by the Caution given in the General Rule.

$$\text{Thus, } \begin{array}{c} a \quad d-c \\ g-b \quad +f \end{array}$$

$$ag + gd - gc - ba + bc - bd \times fa + fd - fc$$

IV. RULE.

Sometimes, when Compound Quantities are to be multiplied one by another, it is commodious to omit the Operation, and to set only the Word (*into*) or (\times) between them; having first drawn a Line over each Compound Quantity, to shew that every Member of the One is to be multiplied by every Member of the Other,

$$\text{Thus, To multiply } \begin{array}{c} aaa + 3aa - 2aa + 1 \\ \text{by } a \end{array} = 5a + 6,$$

$$\text{Write } aaa + 3aa - 2aa + 1 \times \text{ or into } aa - 5a + 6.$$

That in *Algebraic Multiplication* Like Signs give $+$, and Unlike $-$, in the *Product*, may be thus demonstratd:

1. Since *Multiplication* is the same thing as adding one *Factor* to it self, or repeating it so oft as there are Unites in the other:

2. Therefore, $+$ multiplying $+$, must produce $+$, since Positives added, will produce a Positive Sum.

3. A Positive multiplying a Negative, must produce a Negative: For 'tis only adding the Negative *Factor* to it self, or repeating it so often as there are Unites in the other. Now many Defects added, must still be Defects, or must have a Negative Sign, thus:

$$-6 \text{ multiplied by } +2, \text{ produces } -12.$$

4. Negatives multiplying Positives, must produce Negatives: For when the *Multiplicator* is defective, (there being really no Unites in it) it must work on the *Multiplicand* by Subtraction; therefore, in this Case, the *Multiplicand* must be subtracted (or made Negative) as often as there are Negative Unites in the *Multiplicator*: But to take away Positives, is to add Negatives; therefore the Defect of the *Multiplicand* is to be added or repeated as often as the Case requires; and if

it so, the Product must be Negative (by the last) thus :

+6 multiplied by — 2, gives — 12 in the Product.

5. *Negatives multiplying Negatives, must produce Positives* : For since Multiplication by a Negative, is the same as Subtraction ; and subtracting a Defect or Negative, the same as adding Positives, therefore 'tis clear, the Defect of the Multiplicand must be subtracted (that is, the Positive Multiplied added) so often as there are seeming Unites in the Multiplier ; which must needs produce Positive, thus :

— 6 into — 2, produces + 12.

MULTIPLICATION of Integers, in Common Arithmetick, is performed thus :

Suppose 365, the Days in a Year, were to be multiplied by 24, the Hours in a Natural Day ; write down the *Multiplicator* orderly under the *Multiplicand*, Unites being under Unites, Tens under Tens, &c. as you see here, and draw a Line under them. Then say, 365
4 times 5 is 20 ; I set down 0, and 24
carry two Tens to the next Rank ;
therefore 4 times 6 is 24, and 2 I carried is 26 : I set down 6, and carry 2 1460
(that is 200) to the next Rank. Then 730
I say, 4 times 3 is 12, and 2 I carried make 14 ; (i. e. 1400) which 14, because I have now done with the first Figure 4, I set down as you see. Then I begin with 2, the second Figure of the *Multiplicator*, which stands in the Place of Tens, and say, twice 5 is 10 ; I set down 0 under 6 (which is under 2, the Figure that I multiplied by, for that Rule must always be observed) and carry 1. Then twice 6 is 12, and 1 I carried is 13 ; I set down 3 on the Left-Hand of the last, and carry 1, as before. Lastly, I say, twice 3 is 6, and 1 I carried makes 7 ; which 7 I set down, as you see. Then adding the two Products, thus found, together, you will have 8760 for the true Product.

N. B. When there are Cyphers at the End of either Factor, or after both, multiply the significant Figures one into another, and to the Right Hand affix as many Cyphers as were in both ; v. gr.

$$\begin{array}{r} 466000 \\ 4000 \\ \hline 1164000000 \end{array}$$

When Cyphers are intermixed with the significant Figures of the *Multiplicator*, the Operation of them may commodiously be omitted, regard being had to the due placing the Figures of the Product, as you see in this

Example.

$$\begin{array}{r} 26845 \\ 3004 \\ \hline 107380 \\ 80535 \\ \hline 80642380 \end{array}$$

The Proof of Multiplication can only certainly be effected by Division, the Common Method by casting out the Nines, being false : For if you divide the Product by either Factor, the Quotient, if you have wrought truly, will be the other ; for Division destroys what Multiplication builds up. Thus,

If 8760 be divided by 365, it gives 24.

If divided by 24, it gives 365.

MULTIPLICATION in Geometry, or in Lines

Is made by supposing a Right Line, as *a b* ; to be moved in a perpendicular Posture along another, as *b c* ; in which Case, the Line *a b* is

	a	1	2	3	4	5	6	7	d
1									
2				21					
3									

called the *Describent*, and *b c* the *Dirigent* : For by this means the *Describent* *a b*, will form the Rectangle *a d c b* ; and if it be divided, together with the *Dirigent*, into any Number of equal Parts, it will by its Motion describe as many little Rectangles, as the Unites in the *Describent* and *Dirigent* will produce, by being multiplied into one another, viz. 21. For when the Line *a b* hath moved over one part of *a d*, it will, by its 3 Parts, have described the 3 little Rectangles in the first Column ; when it comes to 2, it will have described 3 more, &c.

And this is the Reason why Multiplication, in the Latin Tongue, is usually expressed by the Word *Ducta* ; (and from hence also comes *Product*) as if *a b* were multiplied by *b c* ; they say *a b ducta in b c* ; because the *Describent* is led, as it were, or carried along in an erect Posture upon the *Dirigent*, and by that means describes the Rectangle : So that Rectangle and Product are all one in Geometry.

Since in all Multiplication, Unity is to one Factor, as the other is to the Product ; therefore Multiplication in Lines may be performed Geometrically thus :

Let ab be to be multiply'd by ad , make any Angle at pleasure, and then on one of the Legs set off $u =$ to Unity; and on the same Leg set off ud , the *Multiplicator* (3). Then set the *Multiplicand* ab (2) from a on the other Leg of the Angle; draw ub , and parallel to it, through d , draw dc . I say, dc , or 6, is the *Product*: For $au : ud :: ab : bc$.

MULTIPLICATION of *Decimal Fractions*. See *Decimal*.

MULTIPLICATION of *Fractions*. See in *Fractions*.

MULTIPLICATION of *Logarithms*. See *Logarithms*, N. 6.

MULTIPLICATION by *Logarithms*. See *Logarithms*, N. 8.

MULTIPlicAND, in Arithmetick, is the Number to be multiplied. See more in *Multiplication*.

MULTIPlicATOR, in Arithmetick, is the Number by which you multiply, or the Number multiplying.

MULTIPLIER, the same with *Multiplicator*.

A *MULTO fortiori*, or à *Minori ad majus*, is an Argument often used by *Littleton*, and is fram'd thus: If it be so in a Feoffment passing a New Right, much more is it for the Restitution of an Ancient Right, &c.

MUNIMENTS, among the Lawyers, are taken for such Authentick Deeds and Writings, as a Man can defend the Title to his Land or Estate by.

MURAGE, in Law, signifies a Toll or Tribute to be levied for building or repairing of Publick Walls; and is due either by Grant or Prescription. It seems also to be a Liberty granted to a Town by the King, for the Collecting Money towards the Walling of the same.

MURDER, according to our Law, is a Wilful and Felonious Killing of another upon premeditated Malice, whether secretly or openly, and whether *Englishman* or *Foreigner*, living under the King's Protection. And this premeditated Malice is Twofold:

1. *Express*, When it may be evidently proved that there was Ill-will; 2. *Implied*, When one killeth another suddenly, having nothing to defend himself, as going over a Stile, or such like: For in such a Case, or when a Man killeth a meer Stranger, the Law presumeth that he had Malice against him, or else he would not do it without any manner of Provocation.

MURDERERS, are small Pieces of Ordnance, either of Brass or Iron, having *Chambers* (that is, Charges made of Brass or Iron) put in at their Breeches: They are mostly used at Sea, at the Bulk-heads of the Fore-castle, Half-deck, or Steer-

age, in order to clear the Decks when an Enemy boards the Ship; they are fastned and traversed by a Pintle, which is put into a Stock.

MUSCLE, the chief Instrument of Voluntary Motion in an Animal Body. The Parts of a *Muscle* are Three; its *Head*, *Belly*, and *Tail*. The *Head* of a *Muscle* is its Beginning, and, as it were, the Centre of its Motion; and this is always fixed to the most stable Part. The *Belly* of a *Muscle* is its Middle Part, which is tumid, or extended, in all muscular Motion. The *Tail* is the other End or Extreme, which is fastned into the Part to be moved.

Muscular Motion, or which way the Belly of a *Muscle* comes to be swelled, and consequently its Extremes brought nearer together, in order to move the Part required, is a very great Mystery; as indeed many other Things are in an Human Body, which is fearfully and wonderfully made. There have been many *Hypotheses* to solve this, which whether satisfactory or not, must be left to every one's Judgment to determine.

Dr. *Willis* supposes the Animal Spirits, brought by the Nerves, to be lodged in the *Tendons* of the *Muscles*, and that meeting with other active Particles brought from the Blood, they make an *Efferescence*; by which the *Carnous Fibres* of the *Muscle* are agitated, stuffed and swelled, and so the whole *Muscle* is contracted in its Length.

Steno imagines the *carnous Fibres* of the *Muscles*, as also the opposite *Tendons*, to be in their Construction like to *Parallelograms*; by an Alteration of the Angles of which, the *Muscle* is contracted, and the *Head* and *Tail* brought near together: And this he thinks may be done without the Accession of any New Matter.

Dr. *Mayo* falls nearly in with Dr. *Willis* his Notion: He thinks the Contraction of the *Muscle* is made by an *Efferescence*, arising from the Mixture of the *Sulphurous Saline Particles* of the Blood, with the *Nitro-aerious* ones brought by the Nerves, which blow up and distend the Belly of the *Muscle*.

M. *Du Verney* fancies this Intumescence may be made without *Fermentation*, by the Animal Spirits, and a Juice from the Arteries, running into the *Tendons* and *carnous Fibres*, and so extending themselves, as Ropes and Cat-gut Strings swell in moist Weather.

Dr. *Croon* supposes every *carnous Fibre* to be made up of small Globules or Bladders, all opening one into another, into which the *nutritious Juice*, and one or two other fine and active Liquors, entering, do, by means of the natural Heat, make an Ebullition or *Efferescence*; by which means the whole Body of the *Muscle* becomes extended, and its Length contracted, &c.

Borelli takes the *Fibres* of a *Muscle* to consist of a Chain of divers *Rhombs* or *Lozenges*, whose *Areas* are capable of being enlarged or contracted, according as the nervous Juice, together with the *Lympha* and Blood, are let and forced into or out of them, *ad Imperium Animæ*.

The accurate Mr. *Cowper* seems to think the Blood to be the true *Pondus*, by which the Action of a *Muscle* is compounded; and that either by a Turgescence begun in the *Parietes* of the Cells of the *Fleshy Fibres*, caused by the Liquor contained in the Nerves, agitated *ad Imperium Animæ*; or by the Construction of the *Venous Ducts*, there be-

comes

comes a Repletion of their Cells, whereby the Length of the *Fibrilla* is contracted.

Dr. *Chirac*, Professor of Medicine at *Montpellier*, supposes, and thinks he can prove it analytically, That every Muscle being composed of a vast Multitude of Fibres, like Threads, folded up all together within one Skin or Membrane, and every Fibre having its proper Vein, Artery, and Nerve, it hath also from Space to Space several little Cavities or Pores which are of an oblong Form, when the Muscle is slack or flaccid; but the Blood circulating through the Muscle, is continually despoiling into those Pores a Sulphurous Recrement, abounding with *Alkali* Salts, which meeting with the Spirits that flow also by the Nerves into those oval Pores, their *Nitro-aerial* Particles ferment in a most violent manner with the Saline ones of this Sulphurous Recrement, and thereby distend the Pores so, as to make them change their long oval Figure into a round one; and thus the Muscle must be contracted.

MUSCLE Vein. This Vein is Two-fold, the *Superior* and the *Inferior*. The former arises from the Muscles of the Neck, and the latter from the upper Muscles of the Breast; and this sometimes opens into the External Jugular.

MUSCULUS Stapedis, is a Muscle of the Ear, which lies hid in a Bony Pipe, excavated in the *Os Petrosus*, almost at the bottom of the *Tympanum*, whence it takes its Origin. Its Belly is big and fleshy, and suddenly forming a very thin Tendon, which descends to its Insertion at the Head of the *Stapes*: When this acts, it draws the *Stapes* upwards, to the *Foramen Ovale*.

MUSCULUS Nauticus. See *Tibialis Posterior*.

MUSICK is one of the Seven Sciences, commonly called *Liberal*, and comprehended also among the *Mathematical*; as having for its Object *Discrete Quantity* or *Number*, but not considering it in the Abstract, like *Arithmetick*; but with relation to *Time* and *Sound*, in order to make a delightful Harmony.

This Science is also *Theoretical*, which examineth the Nature and Properties of *Concords* and *Discords*, explaining the Proportions between them by Numbers: And *Practical*, which teacheth not only Composition, that is to say, the manner of Composing all sorts of Tunes or Airs; but also the Art of singing with the Voice, or playing upon Musical Instruments. See Vol. 2.

MUSKET-Baskets, in Fortification, are Baskets of about a Foot and half high, and 8 or 10 Inches Diameter at the Bottom, and a full Foot at the top: They are filled with Earth, and are set on low Parapets or Breast-works, or on such as are beaten down, that the Musqueteers may fire between them at the Enemy, and yet be tolerably well secured against their Fire.

MUTE. (A Term in Law) A Prisoner is said to stand *Mute*, when he refuses to plead to an Indictment.

MUTULE, in Architecture, is a kind of Square *Modillon*, set under the Cornice of the *Doric* Order, and so called from the Word *Mutilus*, Maim'd, or Imperfect, because they represent the ends of the Rafters which are crooked or bent; in like manner, as the Beams, or Joists are represented by the *Triglyphs* in the *Frieze* of the same Order.

MYDRIASIS, is a too great Dilation of the *Pupil* of the Eye, which makes the Sight

Dim, because too much Light is then admitted into the Eye.

MYELOS, the Marrow of the Bones, or of the Brain, or Spinal Marrow.

MYGLOSSUM, is a pair of Muscles which arise about the backside of the Grinding Teeth, and are inserted into the Ligament of the Tongue, and are said to turn the Tongue upwards. *Blanchard*.

These from their Use, I suppose are the same which our Mr. *Cowper* calls *Styloglossus*, a Muscle, which arising sharp and fleshy from the *Processus Styloides*, descends obliquely forward, and is inserted to the Root of the Tongue immediately below the Implantation of the *Ceratoglossus*: This puts the Tongue inward, and turns it upwards.

MYLOHOIDEUS, is a Muscle which *Fallopian* makes double, but Mr. *Cowper* thinks it a single one, not being to be divided without great Violence: It possesses all that Space which is between the Lower Jaw, and the *Os Hyoides*; arising fleshy from both sides of the *Mandible* Internally, near the *Dentes Molares*; whence marching with a double Order of fleshy Fibres, the outwardmost of which pass directly to their Implantation in the *Os Hyoides*; and the middle run Transversely over the following Muscles, being inseparably joined to each other with a middle Line, as is well express'd by *Bidloo*, (Tab. 14.) Besides the Uses commonly ascribed to this Muscle in moving the *Os Hyoides*, Tongue, and *Larynx*, upwards, and forwards, and to either side; its last described Transverse Order of Fibres, have still a further use in Compressing the *Glandule Sublinguales*, which lie immediately under them on each side; whereby they hasten the Egress of the Spit, from the Inferior Salival Ducts in the Mouth. Hence it is we employ these Muscles (as in the Action of *Deglutition*) when we want *Saliva* to moisten the Mouth: And in that Action also they supply it with fresh *Saliva*, to join with those Aliments where Mastication is not required; which Artifice of Nature deserves our Admiration. *Cowper*.

MYLPHA, according to some, the falling off of the Hairs of the Eye-lids; and with others Medicines against the falling off of the Hair. *Blanchard*.

MYOCEPHALON, is the falling off of a small Portion of the *Tunica Uvea*, just begun, like the Head of a Fly; whence it has its Name. *Blanchard*.

MYODES Platysma, is a broad Muscous Expansion in the Neck, proceeding there from a sort of a fat Membrane. *Blanchard*.

MYOLOGIA is a Description of the Muscles of an Animal Body.

MYOPIA, *Purblindness*, is a certain Dimness or Confusion of Sight in distant Objects, and yet a Perspicacity in things near at hand: It is occasioned by the Globe of the Eye's being too Convex, so as to unite the Rays before they come to the *Retina*: Wherefore since the *Distinct Base* falls not on the *Retina*, but perhaps in the *Vitreous Humour*, the Vision in such an Eye cannot be distinct, unless of Objects very near. But all such Persons may be helped by *Concave Glasses*, or Spectacles.

MYRACH, an Arabian Word, signifying the same with *Epigastrium*.

MYRINX,

MYRINX, the same with *Tympanum*, or the Drum of the Ear.

MYRMECIA, is a sort of Wart; they are harder and lower than those fleshy Tumours called *Thymi*, take deeper Root, and occasion greater

Pain; broad below, and small at top, and emit less Blood. They are scarce ever bigger than a sort of Pulse called *Lupines*: They breed in the Palms of the Hand, or the Sole of the Foot. *Blanchard*.

N A A

NAAM in Common Law, signifies a Distress, or the taking another Man's Goods, and is either *Lawful*, or *Unlawful*; *Lawful Naam*, is a reasonable Distress, proportionable to the Value of the thing Distressed for.

NADIR, is that Point of the Heavens seemingly under the Earth, which is Diametrically opposite to the Point directly over our Head, viz. the *Zenith*; so that they are both as it were the Poles of the Horizon, and distant from it on each side 90 Degrees, and consequently fall upon the *Meridian*, one above, the other under the Earth; and whatever Distance one of them has from the Equator, and one of the Poles of the World; the same on the contrary, has the other from the opposite Pole, and adverse part of the Equator.

NAIANT, or *Natant*, (*i. e.* Swimming) is the proper Term in Heraldry, to Blazon *Fishes* in an Escutcheon, when they are drawn in an Horizontal Posture, *Fess-wise*, or Transversely across the Escutcheon; but if they are Erect, 'tis called *Hauriant*.

NAILING of Cannon, is the driving of a Nail, or Iron Spike, by force into the Touch-hole of a Piece of Artillery, so as to render it useless to the Enemy.

NAISSANT, *i. e.* *Nascent*, just new Born; the Herald's Term for a Lyon, or other Beast, appearing to be issuing or coming out of the middle of any *Fesse*, or other Ordinary; for if it come out from the lower Line of the Ordinary, they call it *Issuant*.

NAKED Fire, a Term used by the Chymists, for an open Fire, or one not pent or closed up.

NAPIER's Bones. See *Neper's*.

NARCOSIS, is a privation of Sense, as in a Palsie, &c. or in taking of *Opium*, &c. whence strong Opiate Medicines are frequently called.

NARCOTICKS, or Narcotick Medicines.

NASALIA, the same that *Erribina*.

NASCALIA, are little Globular Bodies which on some Occasions, are put into the Neck of the Matrix; they are made of the same Substance as the *Pessaria*. See *Pessaria*.

NASI *Os*, is a thin but solid Bone, which makes the upper part of the Nose; it's upper end is join'd to the *Os Frontis* by the *Sutura Transversalis*: One of its Sides joins its fellow, and its lower is joined to the *Os Maxillare*, upon its lower end the Cartilages of the Nostrils are fastened; externally it is smooth, but internally it is rough.

NATES *Cerebri*, are two round Prominences in the Brain, behind the Beds of the Optick Nerves, which grow to the upper part of the marrowy Substance; they are small in Men, and larger in Brutes.

NATTA, is a great soft Tumor, with Pain and

N A A

Colour, which grows most usually in the Back, but sometimes in the Shoulders; its Root is slender, yet it encreases so prodigiously, that it will grow as big as a Melon, or a Gourd; it is made of fat Matter, and therefore ought to be reckoned amongst the *Steatomata*. See *Steatomata*. *Blanchard*.

NATURE: This Word has usually these Significations.

First, and more strictly, it is taken for a peculiar Disposition of *Parts* in some particular *Body*; as we say, it is the *Nature of Fishes* to live in the *Water*.

Secondly, It is taken more largely for the Universal Disposition of all *Bodies*: And in this Sense 'tis nothing else, but the *Divine Providence*; so far as it governs and directs all things by certain *Rules* and *Laws*, accommodated to the *Natures* of things.

Thirdly, It is taken for the *Essence* of any thing, not *Corporal*, with the *Attributes* belonging to it: Thus we say, That it is the *Nature of God* to be *Good*, and the *Nature of the Soul* to *Think*.

NATURALIZATION, is when an *Alien* born Subject, is made the King's *Natural*; and this must be done by Act of Parliament. *Vide Denizons*.

NATURAL Day. See *Day*.

NATURAL Horizon, the same with *Sensible Horizon*. See *Horizon*.

NATURAL Quantity. See *Quantity*.

NATURAL Philosophy, is the same with what is usually call'd *Physicks*, viz. That Science which contemplates the Powers of Nature, the Properties of Natural Bodies, and their mutual Action one upon another.

NAVICULARE *Os*, called also *Cymbiforme*, is the third Bone in each Foot, in that Part of it which immediately succeeds the Leg.

NAVIGATION, is the Art of *Sailing*, whereby the Mariner is instructed how to guide a *Ship* from one Port to another, the shortest and safest way, and in the shortest Time: And this is twofold; either

Improper, Which is called *Coasting*, in which the Places are at no great distance one from another, and the Ship sails usually in sight of Land, and is within Soundings. Now for the Performance of this, there is required a good Knowledge of the Lands, the Use of the Compass, the Lead, or Sounding-Line, and such Books as *Rutters*, &c.

Navigation Proper, is where the Voyage is perform'd in the vast Ocean, out of sight of all Land; and here is necessary not only the Knowledge of the *Lead*, *Compass*, &c. but the Master must be a thro' Sailor or *Artist*, and understand well *Mercator's Charts*, *Azimuth* and *Amplitude Compass*, *Log-Line*,

Log-Line, and all good Instruments for *Celestial Observations* that can be used at *Sea*. And how to perform the several Parts and Cases of this Art, you will find under the Word *Plain*, and *Mercator's Sailing*.

NAUSEOUSNESS, or *Nausea*, Loathing, is an earnest Endeavour to Vomit, with Sickness and Uneasiness.

NAUTICAL Chart. See *Chart*.

NAUTICAL Compass. See *Compass*.

NAUTICAL Planisphere, is a Description of the Terrestrial Globe upon a Plane, for the Use of Mariners; and is either,

1. The *Plane Chart*, as they call it, where the *Parallels of Latitude* are all of the same Length with the *Meridians*; and which therefore is very erroneous, except in short Voyages, and near the Equator: Or,

2. *Wright's*, commonly called *Mercator's Chart*, where the *Meridians* are increased in Proportion, as the *Parallels* shorten: That is, as the Secants of the Arks contained between the Point of Latitude, and the Equator.

NE Admittas, is a Writ directed to the Bishop, at the Suit of one who is Patron of any Church, and he doubts that the Bishop will Collate one his Clerk, or admit another Clerk presented by another Man to the same Benefice: Then he that doubts it, shall have this Writ, to forbid the Bishop to Collate or Admit any to that Church.

NEBULOSE, a Term in Heraldry, when the out-Line of any Bordure, Ordinary, &c. is of this Form, *i. e.* resembling something of the Figure of Clouds.

NEBULOUS Stars, are certain fixed Stars of a dull, pale, and obscure Light.

NECROSIS, is a black and blue Mark in any part of the Body.

NEEDLE. See *Box and Needle*.

NEGATIVE Pregnant, is when an Action, Information, or such like, is brought against one, and the Defendant Pleads in Bar of the Action; or otherwise a *Negative Plea*, which is not so special an Answer to the Action, but that it includes also an Affirmative: As if a Man being impleaded to have done a thing on such a Day, or in such a Place, denieth that he did it *Modo & forma declamata*; which implieth nevertheless, That in some sort he did it: Or, if a Man be said to have alienated Land in Fee, and he saith, he hath not alienated in Fee, this is *Negative Pregnant*; for tho' it be true, that he hath not alienated in Fee, yet it may be, he hath made an Estate in Tail.

NEGATIVE Quantities in Algebra, are such as have before them the

NEGATIVE Sign —, and which are supposed to be less than nothing. These are directly contrary to Positive, Affirmative, or Real Quantities.

NE injuste vexes, is a Writ which lies for a Tenant that is Distrained by his Lord for other Services than he ought to make, and is a Prohibition to the Lord in it self, commanding him not to Distrain.

NEIPE TIDES, written also *Nepe* or *Neep*, are those Tides (when the Moon is in the middle of the second and last Quarter) which are opposite to the *Spring-Tides*; and as the highest of the *Spring-Tides* is three Days after the Full or Change, so the lowest of the *Neep* is four Days before the Full or Change; and then the Seamen say, that it is *Deep Neep*: Also when a Ship wants Water, so that she cannot get out of a Harbour, off from the Ground, or out of the Dock, the Seamen say she is *Neiped*.

NEOMENIUM, signifies only the *New Moon*, or *Change*.

NEPER's Bones, or *Rods*, are a kind of larger Multiplication Table, contrived by that Excellent Mathematician my Lord Neper, Baron of *Merchiston* in *Scotland*, for the more easie multiplying, dividing, and extracting of Roots out of great Numbers.

Their Fabrick is very easie, as well as their Use: Both which follow.

The *Rods* are best made of Wood or Ivory, four Square, having all the Digits on them, and their Multiplication to 9; being only *Pythagoras's Table* cut into pieces; they have an Index prefixed, shewing the Value of the Multiples to 9. The Complement *viz.* Remainder to 9, is on the back-side of each Bone, the other Sides being disposed in the most convenient form, the Figures represented being set on the Ends: But they are so common, and so well known, that there needs no further Description of them.

The INDEX.

1	6	1	2	3	6123
2	12	2	4	6	12246
3	18	3	6	9	18369
4	24	4	8	12	24492
5	30	5	10	15	30615
6	36	6	12	18	36738
7	42	7	14	21	42861
8	48	8	16	24	48984
9	54	9	18	27	55107

Having any given Number to Tabulate, or to be laid down by the Rods: As suppose 6123.

From your Set of Rods, take as many of them as you have Numbers in your Figures, as here 4 Rods, having at the top of them the given Figures, which set in their respective Order as above; and the Product of the whole given Number into any of the Digits, you have right against that Digit, as the Index directs; taking the Sum of every Diagonal Square; and setting them down from the Right to the Left.

To Multiply by the Rods.

A Single ROD.

Set your Multiplicand down, or Tabulate it on the Rods, and take every several Product answering the Figures of your Multiplier; which, all added together, gives the Product: As if 6123 was to be multiplied by 356, having Tabulated the Multiplicand, (as you see above) the several Products thereof into each Figure of the Multiplier, you are directed to by the Index: Which being added together, (respect being had to the due placing, their Sum) is 2179788, which is the Product of 6123 by 356.

$$\begin{array}{r}
 6123 \\
 356 \\
 \hline
 36738 \\
 30615 \\
 18369 \\
 \hline
 2179788
 \end{array}$$

Division by Neper's Bones.

Tabulate your Divisor, then you have it multiplied by all the Digits; out of which you may choose such convenient Divisors as will be next less to the Figures in the Dividend, and subscribe the Index answering in the Quotient; and so continually, till the Work is done. Thus 2179788, divided by 6123, gives in the Quotient 356.

Having Tabulated the Divisor 6123, then I see that 6123 cannot be had in 2179; therefore I take five Places, and on the Rods find a Number that is equal or next less to 21797, which is 18369, that is three times the Divisor: I set 3 in the Quotient, and subtract 18369 from the Figures above, there rests 3428; to which I add 8, the next Figure of the Dividend, and seek again on the Rods for it, or the next less, which I find to be 5 times; I set 5 in the Quotient, and subtract 30615 from 34288, rests 3673; to which I add 8, the last Figure in the Dividend, and finding it to be 6 times the Divisor, set 6 in the Quotient.

$$\begin{array}{r}
 6123 \) \ 2179788 \ (\ 356 \\
 \underline{18369} \\
 34288 \\
 \underline{30615} \\
 36738 \\
 \underline{36738} \\
 00000
 \end{array}$$

Of the Extraction of Roots by the Rods.

For the Easie and Expeditious Performance of which, there are two Rods on Purpose; one for the Square, and another for the Cube.

To Extract the Square Root.

As, suppose that of 571536.

First, Point each other Figure, beginning with the last.

$$\begin{array}{r}
 571536 \ (\ 756 \\
 \underline{49} \\
 145 815 \\
 \underline{725} \\
 1506 9036 \\
 \underline{9036} \\
 0000
 \end{array}$$

2. Take the Rod, called the Square Rod, and set it to the Index, and seek for the Figures of the first Prick (57,) finding 49 the nearest, set 7 in the Quotient, and subtract 49 from 57, there rests 8.

3. To the Remainder (8) add the next two Figures to the next Prick (15) makes 815.

4. Double the Quotient 7, viz. 14, which Tabulate between the Index and the Square Rod each time after the Work; seek then upon the Rods for the next less or equal Number to the Figures 815, which I find to be 725, that is five times; set 5 in the Quotient, and after the Divisor; then multiply and subtract, and to the Remainder add the two Places to the next Point 36.

5. Double the Quotient 75, which is 150; this set betwixt the Index and the Square Rod, and work as before, you'll find the Root to be 756.

If your Root be not perfect, but something remains after the last Subtraction, add a Cypher to the Square, and proceed.

To Extract the Cube Root by the Rods.

$$\begin{array}{r}
 91733851 \ (451 \\
 \underline{64} \\
 48 27733 \\
 \underline{24125} \\
 300 \\
 6075 608851 \\
 \underline{607501} \\
 135 \\
 608851
 \end{array}$$

1. Point every third Figure from the last, set the Cube Rod to the Index; seek the next less Cube on the Rod, which in the foregoing Example is 64; that is 4 times; set 4 in the Quote, and subtract, rest 27; to which add the three Figures to the next Point, the Sum is 27733.

2. Square the Figure found in the Quotient, and triple that Square, (and this must be done each time for a Divisor) which set betwixt the Index and the Cube Rod: Thus here the 4 in the Quote, squar'd, gives 16; then tripl'd is 48, which set between the Index and the Cube Rod for a Divisor.

3. Seek a Quotient (5) which set down, and the Number answering 24125 place as in the Example; but before you subtract, you must triple the Quote 4, which is 12, and multiply it by the Square of the last Figure 5. viz. 25; now 25 by 12 = 300, which place under 24125, one place forward to the Left Hand, and subtract, there rests 608. This Work must be repeated for each Figure in the Quotient, viz. to 608 and 851 for a Resolvend; square 45, and triple that Square, it gives 6075 for a new Divisor, which placed next before the Cube Rod, shews it will be but 1 for the Quotient, which answers to 607501, which set down; and tripling 45, and multiplying it by 1, makes 135: This set one short, their Sum will be 608851; so that after Subtraction nothing remains. But if there remains any thing, add three Cyphers to it, for every Decimal Place you would have in the Root, and proceed as before.

NEPHELÆ, are small White Spots upon the Eyes; also little Clouds, as it were, that swim in the middle of the Urine; likewise little white Spots in the Surface of the Nails like little Clouds.

NEPHRITICKS, are Medicines against the Diseases of the Reins.

NEPHRITIS, is a Pain in the Reins, proceeding either from an ill Disposition, or an Inflammation; or from the Stone and Gravel, accompanied with Vomiting and Stretching of the Thigh. *Blanchard.*

NEPHROS, is a Kidney, one on each side of the Abdomen, placed about the Loins under the Liver and Spleen; it is shaped like a Kidney-Bean: Its Substance is made up of a great Company of little Pipes. On both sides it receives the Serum from the Glandules which border upon the Arteries, and carries it to the little Bodies in the Reins called *Caruncula Papillares*, (which see) that so it may be discharged by the *Pelvis*, the *Ureters*, the *Bladder*, &c. See *Renes*.

NERVE, is an Organical Similar Part of an Human Body, being also of a fibrous round, long, white porous Substance, and whose Use is to convey the Animal Spirits so, as to make the Parts of the Body moveable and sensible.

The Nerves are supposed to contain a Three-fold Substance; the Innermost of which is white and medullary, and is thought to proceed from the *Medulla Cerebri*; the other two are supposed to arise from the *Meninges* of the Brain: Of which the middle and softer comes from the *Pia mater*, and the outer and harder from the *Dura mater*.

All the Nerves take their Rise from the *Medulla oblongata cerebri*, either within the Skull, or from its Continuation, when it becomes the *Medulla spinalis*. *Diemerbroeck* reckons 39 Pairs or Conjugations of Nerves, besides the *Nervous sine pari*; and he reckons that Nine Pair of these arise within the Skull, and the other 30 he saith come from the *Medulla spinalis*, through the Perforations of the *Vertebrae*; which he subdivides into the Eight *Cervical Pairs*, the Twelve *Thoracical*, the Five that come from the Region of the Loins, and the other Five which come from the *Os sacrum*; to which the *Nervous sine pari* is to be added, which arises from the End of the Spinal Marrow, and which some have taken for a kind of Ligament.

The Nerves do ordinarily accompany the Arteries thro' all the Body, that by the Pulse of the Arteries, the Animal Spirits may be kept warm and moving.

The Nerves have also Blood-Vessels attending them, which are spread usually on their Coats; and do also sometimes run in among the Medullary Fibres, as may be seen in those of the *Retina*.

Where-ever a Nerve sends out a Branch, or receives one from another, there is commonly a *Ganglio* or *Plexus*, as you may see at the Origin of all the Nerves in the *Medulla spinalis*, and in many Places of the Body.

NERVUS, in Botanicks, signifies a long Filament or rigid String, which runs a-cro's or length ways in the Leaf of a Plant. And thus, because there are Five such Nerves or Filaments running long ways in the Leaves of one kind of *Plantane*, that Plant hath been called *Quinque nerva*.

NETTINGS, in a Ship, are a sort of Grate made with small Ropes, and seized together with Rope-yarn; and are laid in the Waist of a Ship sometimes, to serve instead of *Gratings*.

NEURODES, is a sort of lingering Fever, so called by the Learned Dr. *Willis*; because that the Nervous Juice, departing from its own right and natural Crasis, becomes the Occasion of an Atrophy.

NEUROLOGY, is an accurate Description of, or Discourse on, the Nerves of an Human Body.

NEUROTICKS, are Remedies against the Diseases of the Nerves.

NEUROTOMY, is an Anatomical Section of the Nerves, for the Benefit of the Patient; and sometimes also a pricking of the Nerves by unskillful Bleeding, &c.

NEUTRAL. Mr. *Boyle* calls some kind of Spirits which he could distil from Tartar, and some ponderous Woods, by this Name of *Neutral Spirits*, as also *Adiaphorous* and *Anonymous*; because he found them very different in Quality and Nature from either the *Acid*, *Vinous*, or *Urinous* Spirits. For the Way of making it, see *Adiaphorous*.

NICHE, in Architecture, is a Cavity left designedly in the Wall of a Building, to place a Statue in.

NICTITANS *Membrana*, is a thin Purplish or Reddish Membrane or Film, which several Beasts and Birds have to cover or shield their Eyes from Dust, &c. they can draw it over their Eyes at pleasure, and 'tis so very much thinner

than the Eye-lid, that they can see pretty well thro' it.

NIENT *comprise*, is an Exception taken to a Petition, as unjust, because the thing desired is not contained in that Act or Deed, whereon the Petition is grounded. For Example, One desireth of the Court to be put into Possession of a Houfe, formerly amongst other Lands, &c. adjudged unto him : The adverse Party pleadeth, That this Petition is not to be granted, because tho' he had a Judgment for certain Lands and Houfes, yet the Houfe, into the Possession whereof he desireth to be put, is not contained amongst those for which he had Judgment.

NIHL, or *Nicbil*, is a Word which the Sheriff answers, that is opposed concerning Debts illeivable, and that are nothing worth, by reason of the insufficiency of the Parties from whom they are due.

NIHIL dicit, is a failing to put in Answer to the Plea of the Plaintiff by the Day assigned, which if a Man omit, Judgment passeth against him of Course by *Nihil dicit* ; that is, because he says nothing in his own Defence, why it should not.

Nihil capiat per Breve, is the Judgment given against the Plaintiff, either in Bar of his Action, or in Abatement of his Writ.

Nihil capiat per Billam, the same with *Nihil capiat per Breve*.

NIPPERS, are small Ropes in a Ship about a Fathom or two long, with a little Truck at one End, and sometimes only a Wale-knot ; their Use is to help hold off the Cable from the Main or Jeer Capstan, when the Cable is so slimy, so wet, or so great, that they cannot strain it to hold it off with their bare Hands.

NISI Prius, is a Writ Judicial, which lieth in Case, where the Jury is Impannell'd, and return'd before the Justices, the one Party or the other requesting to have this Writ for the ease of the Country, whereby the Sheriff is willed to cause the Inquest to come before the Justices in the same County at their coming ; and it is called a Writ of the *Nisi prius*, of these two Words, whereby the Sheriff is commanded to bring to *Westminster* the Men Impannell'd at a certain Day, or before the Justices of the next Assizes, *Nisi die Luna apud talem locum prius venerint*, &c.

NITRE, the same with Salt Petre. Some are mighty fond of the Notion of a *Volatile Nitre*, which abounds in the Air ; and they attribute abundance of *Phænomena* to the Operation of the Nitrous Particles in the Air.

That the Air abounds with Saline Particles, is most certain ; for being filled continually with *Effluvia* from the Earth and Sea, it must needs have from both a great Quantity of Saline Corpuscles ; and these will be of different Kinds according to the Variety of those Salts from whence they are derived. But why these should be mostly supposed of a *Nitrous Nature*, is not so easie to prove ; for Salt Petre is by no means found in a greater Quantity than the other Salts (especially common Salt ; nor is it of a much more Volatile Nature than they, nor capable of being raised more easily, or by a lesser heat. But since Soot, and that which produces it, Smoak, is found to abound very much with a truly Volatile Salt ; and since such a kind of Salt is produced frequently by the Putrefaction of Animal

and Vegetable Bodies, there is good reason to suppose the Air may abound with Salts of this kind : As also with many decomposed ones, of very different Kinds and Natures, and to which no proper name can well be assigned ; and therefore they have been called *Anonymous*, by Mr. Boyle, and many others.

NOCTAMBULO, or *Noctambulus*, is one who walks in his Sleep.

NOCTURNAL, is an Instrument made of Box, Ivory or Brass, divided on both sides, to take the Altitude or Depression of the Pole-Star, in respect to the Pole it self, in order to find the Latitude and nearly the Hour of the Night.

NOCTURNAL Ark, is that Space in the Heavens which the Sun, Moon, or Stars, run thro' from their Rising to their Setting.

NOCTURNLABE, is an Instrument used to find how much the *North Star* is higher or lower than the Pole at all Hours of the Night.

NOCTILUCA, is one of the two kinds of *Phosphorus* ; the former of which, such as the *Bolanian Stone*, *Hermetick Phosphorus Balduini*, &c. will not shine, except first exposed to the Sun-beams, but this kind of *Noctiluca*, is a self-shining Substance, which requires the being exposed to no Light to render it Luminous : As the *Phosphorus* made of Urine, &c. which see in *Phosphorus*.

Mr. Boyle in his Book of the *Aerial Noctiluca*, reckons three of these *Noctiluce*.

1. The *Gummos*, Consistent or Constant one, (as some *Germans* call it) which is in the Form of a Consistent Body.

2. The *Liquid Noctiluca*, which probably is only the former dissolved in a proper Liquor.

The *Aerial Noctiluca*, because it would immediately begin to shine, on being exposed to the open Air. See the Process for this last, P. 105, of the afore-mentioned Book, which being much the same with that of the *Phosphorus*, commonly made out of Humane Urine, I have omitted. See *Phosphorus*.

NODES, in *Astronomy*, signifie the Points of Intersection of the Orbit of the Sun, or any Planet, with the Ecliptick, so that the Point where a Planet passes over the Ecliptick, out of Southern into Northern Latitude, is called the North Node : And where it descends from North to South, 'tis the South Node ; which *Nodes* (according to some) change their Places in the Zodiac, like the Planets : But Sir *Is. Newton* proves *Prop. 14. Lib. 3.* that the *Nodes* of all the Planets Orbits (as well as their *Apselias*) are at Rest.

NODULUS, *Nodus*, is a Bag of such suitable Ingredients as the Disease requires, put into Beer or Wine, the Tincture whereof the Patient is to drink.

NODUS or *Node*, in *Dialing*, in a certain Point in the Axis or Cock of the *Dial*, by the Shadow of which, either the Hour of the Day in Dials without Furniture, or the *Parallels of the Sun's Declination*, its Place in the Ecliptick, the *Italian* or *Babylonish Hours*, &c. are shown, in such Dials as have Furniture.

'Tis an easie thing, and sometimes of good Use, to make Dials which shall shew the Hour of the Day by an Hole or

NODUS.

NODUS. One Method of which; *Mr. Collins* at the End of his Sector on a Quadrant, gives as follows.

First, Draw an Horizontal Dial for the Latitude proposed: Then by the Help of the Sun's Azimuth (which may be found by a Quadrant) or by knowing the Hour of the Day by that Horizontal Dial, draw a true Meridian from the Hole or *Nodus* proposed, both above in the Ceiling, and below on the Walls and Floor of the Room; so that if a Right Line were extended from the said Hole or *Nodus* to any Point in any of those Lines, it would be in the Meridian Circle of the World.

Next, Fix the End of a Thread in the Centre of the Hole or *Nodus*, and move the other End thereof up or down in the said Meridian drawn on the Ceiling or Wall, until by applying the side of a Quadrant to that Thread, it is found to be elevated equal to the Latitude of the Place, then that Thread is directly situated parallel to the Axis of the World, and the Point where the End of that Thread toucheth the Meridian either on the Ceiling or Wall, is that Point in the direct Axis sought for; wherein fix one End of the Thread, which Thread will be of present Use in projecting the Hour-Points in any place proposed.

Then place the Centre of the Horizontal Dial in the Centre of the Hole or *Nodus*, and situate it exactly parallel to the Horizon, and its Meridian in the Meridian of the World, (which may easily be done, if at the Instant you know the true Hour of the Day) then take the Thread, whose End is fixed in a Point in the direct Axis, and move it to and fro, until the Thread doth interpose between your Eye, and the Hour Line on the Horizontal Dial, and keeping your Eye in that Position, make a Point or Mark where you please, so that the Thread may interpose between that Point and your Eye; which Point so found, will shew the true Time of the Day at that Hour all the Year long, the Sun shining thereon, so will the Point and the said Thread serve to shew the Hour instead of an Hour-Line.

In like manner, the Thread fixed in the Axis, may be again moved to and fro, until the Thread doth interpose between the Eye and any other Hour-Line desired on the Horizontal Dial, and then (as before) make another Point or Mark in any Place at pleasure, by projecting a Point from the Eye, so that the Thread interpose between that Point to be made, and the Eye, so will that Point so found shew the true Time of the Day for the same Hour that the Hour-Line did on the Horizontal-Dial, which was shadow'd by the Thread.

Thus you may proceed (by the help of that Thread and the several Hour-Lines on the Horizontal Dial) to find the other Hour-Points, which must have the same Numbers set to them, as the Hour-Lines on the Horizontal Dial have.

Otherwise, to make a Dial from a Hole in any Pane of Glafs in the Window, and to graduate the Hour-Lines on the Ceiling, Floor, &c. that Hole is supposed to be the Centre of the Horizontal Dial, and being true placed, the Stile thereof, if supposed continued, will run into the Point in the Meridian of the Ceiling before found, where a Thread is to be fixed; then let one extend a Thread fast-

ened in the Centre of the Horizontal Dial, parallel to the Horizon over each respective Hour-Line; and holding it steady, let another extend the Thread fastned in the Meridian in the Ceiling, along by the Edges of the Horizontal Thread, which will find divers Points on the Ground, thro' which, if Hour-Lines be drawn, the Sun shining thro' the Hole in the Pane of Glafs, will shew the Time of the Day.

For the Points that will be thus found on the Beam or Transome, the Thread fixed in the Ceiling, or instead of it a piece of Tape there fixed must be moved to up and down, that the Spot of the Sun may shine upon it; and being extended to the Transome or Beam, graduated with the Hour-Lines, it there shews the Time of the Day.

Note, That 'twill be convenient to have that Pane of Glafs darkned, through which that Spot is to shine;

In like manner may a Dial be made from a Nail-head, a Knot in a String tied any where across, or from any Pin driven into the Bar of the Window; and the Hour-Lines graduated upon the Transome or Board underneath.

To make a Reflected Dial on the Ceiling of the Room, is only the contrary of this, by supposing the Horizontal Dial, with its Stile, to be turned downwards, and run into the true Meridian on the Ground, where the Thread is to be fixed, and to be extended along the former Horizontal Thread (held over the respective Hours) upward, to find divers Points in the Ceiling.

NOLI me tangere, is a sort of Canker in the Face, especially above the Chin; there arises a Tumour or Ulcer about the Mouth and Nose; like an exulcerated Canker, which grows slowly at the beginning, like a little Pimple; it remains a whole Year, otherwise is less troublesome than a Canker, which gnaws and eats more in one Day, than a *Noli me tangere*, doth in a Month.

NOMBRILO or Navel-Point in an Escutcheon: See the Word *Escutcheon*.

NOME, are deep and putrid Ulcers in the Mouth. *Blanchard.*

NOME, in *Algebra*, is any Quantity with a Sign prefixed to it, and by which 'tis usually connected with some other Quantity; and then the whole is called a *Binomial*, or *Trinomial*, &c. Thus $a + b$ is called a *Binomial*, whose Names are a and b ; and $a + b + c$ is a *Trinomial*, whose Names are a , b , and c , &c.

NON-ABILITY, in Law is an Exception taken against the Plaintiff or Defendant, upon some Cause why he cannot commence Suit in Law, as *Premunure*, *Outlawry*, *Protest in Religion*, *Excommunication*; or a *Stranger born*, which last holds only in Actions real and mix'd, and not in Personal, except he be a Stranger and an Enemy. The *Civilians* say, That such a Man hath not *Personam standi in judicio*.

NON admittas. See *Ne admittas*.

NONAGE, a Term in Law, signifying all that Time of a Man's Age, under One and twenty Years in some Cases, and Fourteen in others, as Marriage.

NONAGESIMAL Degree, is the highest Point, or 90th Degree of the Meridian.

NON-

NON-CLAIM, a Term in Law, signifying the Omission or Neglect, of him that ought to challenge his Right within a time limited, by which Neglect he is either barr'd of his Right, as at this Day upon *Non-claim* within five Years after a Fine, and Right to him accrued; or of his Entry by his Descent, for want of *Claim*, within five Years after the *Disseisin*.

NON compos mentis; That is, not of sound Memory or Understanding; of such in Common Law they reckon:

First, An Idiot Born.

Secondly, He that by Accident wholly loseth his Memory and Understanding.

Thirdly, A Lunatick, that hath *Lucida intervalla*; sometimes has Understanding, and sometimes not.

4. He that by his own Act for a Time depriveth himself of his right Senses, as a Drunkard; but this last kind shall give no Privilege to him or his Heirs.

NON distringendo, is a Writ comprising under it divers Particulars, according to divers Cases. See Tab. of Orig. Reg. Verb. *non distringendo*.

NONES of a Month, are the next Days after the Kalends, which is the first Day. In March, May, June and October, the Romans accounted six Days of the Nones, but in all the rest of the Months but four. They had this Name probably because they were always 9 Days inclusively, from the first of the Nones to the Ides; i. e. reckoning inclusively both those Days.

NON est Culpabilis, in Law, signifies the general Plea to an Action of Trespas, whereby the Defendant doth absolutely deny the Fact imputed to him by the Plaintiff; whereas in other Special Cases the Defendant but alledgeth some reason in his own Defence.

NON est factum, is an Answer to a Declaration, whereby a Man denieth that to be his Deed; whereupon he is Impleaded.

NON Implacitando aliquem de libero tenemento sine brevi, is a Writ to inhibit Bayliffs, &c. from distraining any Man without the King's Writ, touching his Free-hold.

NON Intromittendo, quando breve de Præcipe in Capite subdole impetratur, is a Writ directed to the Justices of the Bench, or in Eyre, willing them not to give one that hath, under colour of Intirling the King to Land, &c. as holding of him *in Capite*, deceitfully obtained the Writ called *Præcipe in Capite*, but to put him to his Writ of Right, if he think good to use it.

NON Mercandizanda Viſualia, is a Writ directed to the Justices of Assize, commanding them to enquire, Whether the Officers of such Towns do sell Viſuals in Groſs, or by Retail, during their Office, contrary to the Statute, and to punish them if they find it true.

NON Moleſtando, is a Writ that lieth for him which is Molested, contrary to the King's Protection granted him.

NON-Natural Things, or the *Non-Natural Causes of Diseases*, as the Physicians reckon them are fix, viz. The Air, Meat and Drink, Sleep and want of Sleep, the Morions and Repose of the Body, the Retention, or Evacuation of the Excrements and Recrements of it, and the Passions of the Mind.

NON-Organical Part of an Animal, is that

whereeto some Use is only appropriated, but no Action, as a Gristle, Bone, Foot, &c.

NON Obſtante, is a Clause frequent in Statutes and Letters Patent; it signifies *Notwithstanding*, and was first brought in by the Pope, and in the Reign of Hen. 3. was used by that King in his Grants, &c.

NON omitt. propt. aliquam libertat. is a Writ that lies where the Sheriff returns upon a Writ to him directed, that he hath sent to the Bayliff of such a Franchise which hath the return of Writs, and he hath not served the Writ, then the Plaintiff shall have this Writ directed to the Sheriff to enter into the Franchise, and execute the King's Process himself. Also the Sheriff shall warn the Bayliff, That he be before the Justices at the Day mentioned in the Writ, and if he come not, then all the *Judicial Writs*, during the same Plea, issuing, shall be Writs of *Non Omittas*, and the Sheriff shall execute the same.

NON Ponendis in Affis & Furatis, is a Writ founded upon the Statute of West. 2 cap. 38. and *Articuli super Chartas*, cap. 9. which is granted upon divers Causes to Men, for the freeing them from *Affizes* and *Furors*.

NON Procedendo ad Affsam Rege inconsulto, is a Writ to stop the Trial of a Cause appertaining unto one that is in the King's Service, &c. until the King's Pleasure be further known.

NON Residentia pro Clericis Regis, is a Writ directed to the Ordinary, charging him not to molest a Clerk employed in the King's Service, by reason of his *Non-Residence*.

NON-Residence, in Law, is applied to such Spiritual Persons as are not Resident on, but do absent themselves for the space of a Month or two; at several times in one Year from their Benefices, for *Personal Residence* is required of Ecclesiastical Persons upon their Cures.

NON Sane Memory, in Law, is an Exception taken to an Act declared by the Plaintiff or Demandant, to be done by another, whereupon he grounds his Plea or Demands: And the Effect of it is, That the Party that did that Act was mad, or not well in his Wits when he did it. See *Non compos mentis*.

NON Solvendo Pecuniam ad quam Clericus multatur pro non Residentia, is a Writ prohibiting an Ordinary to take a Pecuniary Mulct imposed upon a Clerk of the King, for *Non-Residence*.

NON-Suit, in Law, is Renouncing of the Suit by the Plaintiff or Demandant, most commonly upon the Discovery of some Error or Defect, when the Matter is so far proceeded in, as that the Jury is ready at the Bar to deliver their Verdict. The *Civilians* term it; *Litis renunciationem*. And in what Cases a Man cannot be *Non-Suit*. See the Statute of 2 H. 4. cap. 7.

NON Sum Informatus. See *Informatus non Sum*.

NON Tenure, in Law, is an Exception to a Count, by saying, That he holdeth not the Land specified in the Count, or at least some part of: And 'tis either *Non tenure General*, or *Non tenure Special*: The *Special Tenure*, is an Exception, alledging that he was not Tenant the Day when the Writ was purchased. *Non tenure General*, is when one denies himself ever to have been Tenant to the Land in Question.

NORMAL, the same with Perpendicular, or at Right Angles, and 'tis usually spoken of a Line or a Plane that Intersects another Perpendicularly.

NORTHERN Signs of the Ecliptick or Zodiac, are those Six which constitute that Semi-circle of the Ecliptick which inclines to the Northward from the Equator, as *Aries, Taurus, Gemini, Cancer, Leo, Virgo*.

NOSOCOMIUM, is an Hospital for Poor Sick People, where they are attended, and cured, if possible.

NOTES in Musick, are certain Terms invented to distinguish the Degrees of Sound in Tuning, and the Proportion of Time thereto belonging: For in regard that a Voice doth express a found best, when it pronounceth some Syllable or Word with it, six select Syllables were formerly used to that Purpose, ascending and descending in order, viz. *Ut, Re, Mi, Fa, Sol, La*; but four of them, viz. *Mi, Fa, Sol, La*, being found sufficient for the right Tuning of all the Degrees or Sound, and less burthenome to the Memory, the other two, *Ut* and *Re*, are generally now laid aside as superfluous. It is reported, That *Guido Aretinus*, having undertaken to reduce the Greek Scale of Musick to a more regular form about A. D. 960, assumed for the Names of these six Notes as many Syllables taken out of the *Sapphick Hymn* of *St. John Baptist*, which began thus:

*Ut queant Laxis RESonare fibris,
MIRA Gestorum FAMuli tuorum,
SOLve polluti LABii reatum.*

As for other sort of Notes relating to Time, they are Nine in Number, viz. *Large, Long, Breve, Semi-breve, Minim, Crotchet, Quaver, Semi-quaver, and Demi-semi-quaver*. The four first are usually termed *Notes of Augmentation, or Increase*, and the five last of *Diminution or Decrease*. The *Semi-breve* being the last of Augmentation, is commonly called the *Master-Note, or Measure-Note, or Time-Note*, because it is of a certain determinate Measure or Length of Time by it self; and all the other Notes both of *Augmentation* and *Diminution*, are measured by, or adjusted to its value: But it ought to be observed, that the *Large* and *Long* are now of little use, as being too long for any Voice or Instrument (the Organ only excepted) to hold out to their full length; altho' their *Rests* are still very often used, more especially in Grave Musick, and Songs of many Parts.

NOTHE costæ, are the five lowest Ribs on each side, called Bastard Ribs; so named, because they do not join with the Breast-bone as the other Ribs do, nor are they as the others, Boney, but Cartilaginous.

Diseases are likewise called *Nothi*, or Bastard, when they agree not with the Ordinary and Common Rules, as *Tertian, Quartan, and Quotidian, Bastard Agues, Bastard Pleurisies, &c.*

NOTIONAL Quantity. See *Quantity*.

NOVACULA, is a Chirurgion's Knife, the Shape whereof differs according to the Difference of Operations.

NOVAL Assignment, in Law, is an Assignment of Time, Place, or the like, otherwise than as it was before assigned. See *Assignment*.

NOVEL Disseisin. See *Assize of Novel Disseisin*.

NOUNS (in Grammar) are such Words as signify the several Objects of our Thoughts.

NUBECULÆ are little light Particles which mutually, but loosely close with one another, and swim upon the Urine.

NUCAMENTUM in *Phytology*, or *Botanicks*, is the same with *Julus*. Which see.

NUCHA is the hinder part, or Nape of the Neck, called also *Cervix*.

NUCIOSITAS: the same that *Myopia*.

NUCIFEROUS Plants or Shrubs are such as bear Nuts.

NUCKIANÆ Glandule, are a sort of Glands (first taken notice of by Dr. Nuck) seated in that Orbit of the Skull, wherein the Eye is placed betwixt the abducent Muscle of the Eye, and the upper part of the *Oculus jugale*. Their Shape is various, in some Oblong, in others flatly Round, in others Oval, and in others somewhat Triangular.

NUCLEUS is the Edible part of the Kernel of any Nut, which is contained within the Skin of the Kernel; and in a larger Sense is by Botanists used for any Fruit or Seed contained within an Husk or Shell.

NUCLEUS also in an Astronomical Sense is by *Hewellius* and others used for the Head of a Comet, and by others for the Central Parts of any Planets.

NUCLEUS, in Architecture, is the middle part of the Flooring of the Ancients, consisting of Cement, which they put betwixt a Lay or Bed of Pebbles cemented with Mortar made of Lime and Sand.

NUDE Contract, in Law, is a bare Promise of a thing, without any consideration; and therefore 'tis said, *Ex nudo pacto non oritur actio*.

NUDE Master, in Common Law, is a naked Allegation of a thing done to be proved only by Witnesses, and not, either by Record or other Speciality in Writing under Seal.

NUMBER is Discrete Quantity, or a Collection of Unites, and is that which teacheth us to know how many any of the Objects of our Knowledge are.

Every Number in *Arithmetick* (which is the Art of Numbering truly) may be considered as composed of two Parts, of which one may be called the *Denominator*, and the other the *Numerator*.

Thus the Number 9, as it signifies the Thing Numbered, as the 9 Mules, or 9 Men, 9 Pounds, &c. is a *Denominator*: But as it expresses how many of that thing are taken or accounted, it is a *Numerator*. Therefore when the *Denominator* signifies a whole thing, the Number is called an *Integer*; but if it signify or stand for the Parts of any thing, then the Number is a *Fraction*.

Thus Nine Shillings, considered as distinct Things, are an *Integral Number*; but when you consider them as $\frac{9}{20}$ Parts of a Pound Sterling, that Number is a *Fraction*: And the Knowledge of this will facilitate the Understanding of the Doctrine of Fractions, which appears difficult to Beginners, because they do not consider that as well *Integer Numbers* as *Fractions* have both Numerators and Denominators: The Difference lying chiefly here, That in *Integers* the Ratio of the Denominators is certain, one and the same; but

Wells Anatomical.

NUMERATOR of a Fraction, is that Part of it which shews or numbers how many of those Parts which any Integer is supposed to be divided into, are expressed by the Fraction. Thus in $\frac{6}{11}$, 6 is the Numerator, (which stands

NYMPHOTOMY, is a Cutting off the *Nym-*
phæ, the too great Protuberance whereof in Mar-
riageable Virgins sometimes hinders the *Coitus*, or
at least renders it difficult. The *Egyptians* cut
them frequently, as *Galen* saith; but in our
Parts of the World such Instances have been
very rare.

OAKHAM, (a Term used in the Yards for building Ships) is Old Ropes untwisted and pulled again out fine, into loose Hemp or Flax, with a Design to drive it into the Seams, Trennels, and Rends of a Ship, to stop or prevent a Leak.

OAZY, or *Oazie Ground*: So the Seamen call soft, slimy, muddy Ground. This is not good Anchorage, because the Anchor cannot hold firm, but will *come home* (as they call it) in a Stress of Weather; besides it will rot their Cables, if a Ship ride long over such Ground: But then it is good to bring a Ship a-ground upon, because she can there dock herself, and lie soft; but yet if she lie long, she will rot her Plank, and spoil the Oakham in her Seams.

OBLÆ, is the *Sagittalis Sutura* in the Skull, (see *Sagittalis*) which touches the Coronal Suture forward, and the *Lamdoideal* backward; for it is made of the Mutual Conjunction of the Bones of the Forehead. *Blanchard*.

OBELISK, is a magnificent high Piece of Solid Marble, or other fine Stone; having usually Four Faces, and lessening upwards by Degrees, till it ends in a Point like a Pyramid.

OBJECTIVE Line. See *Line Objective*.

OBJECT-Glass, of a Telescope or Microscope, is that Glass which is placed at that End of the Tube which is next the Object.

OBLATA, is a Word used in the *Exchequer*, signifying old Debts brought together from precedent Years, and put to the present Sheriff's Charge.

OBLIGATION, is a Bond containing a Penalty, with a Condition annex'd, either for Payment of Money, Performance of Covenants, or the like; and so differs from a Bill that hath no Penalty nor Condition; and yet a Bill may be Obligatory.

OBLIGOR, is he that enters into such an Obligation; and *Obligee*, the Person to whom it is entered into.

OBLIQUE Ascension, is that Degree and Minute of the *Equinoctial* which riseth with the Centre of the *Sun* or *Star*, or with any Point of the Heavens, in an Oblique Sphere.

To find the Sun's Oblique Ascension by the Globe.

Bring the Sun's Place to the Horizon on the East-side; and the Number of Degrees intercepted between that Degree of the *Equinoctial* which is now come to the Horizon, and the Beginning of *Aries*, is the *Oblique Ascension*.

To find the Oblique Ascension, having the Right Ascension and Ascensional Difference given.

1. If the Declination be North, the Difference between the *Right Ascension* and the *Ascensional Difference*, is the *Oblique Ascension* required.

2. If the Declination be South, the Sum of the *Right Ascension*, and the *Ascensional Difference*, is the *Oblique Ascension*.

To find the Oblique Descension.

1. If the Declination be North, the Sum of the *Right Ascension*, and *Ascensional Difference*, is the *Oblique Descension*.

2. If the Declination be South, the Difference between the *Right Ascension*, and the *Ascensional Difference*, is the *Oblique Descension*.

OBLIQUE Angles. See *Angles Oblique*.

OBLIQUE Descension, is that part of the *Equinoctial* which sets with the *Sun* or *Star*, or with any Point of the Heavens, in an Oblique Sphere.

OBLIQUE Plains, in Dialing, are such as recline from the *Zenith*, or incline to the *Horizon*: The Obliquity of which *Inclination* or *Reclination*, is easily found by a Quadrant: Being an Ark of some Azimuth or Vertical Circle intercepted between the Vertex of the Place and of that Plane; also observe, this Azimuth or Vertical Circle is always perpendicular to the Plane.

OBLIQUE Sailing, is when the Ship runneth upon some Rhumb between any of the Four Cardinal Points, making an Oblique Angle with the Meridian; and then she changeth continually both Latitude and Longitude. There are Three kinds of *Oblique Sailing*, viz. *Plain Sailing*, *Mercator's* or *Wright's Sailing*, and *Great Circle Sailing*; which see.

The Seamen call also the Application of the Method of Calculating the Parts of Oblique Plane Triangles, in order to find the Distance of a Ship from any Cape, Head-Land, &c. *Oblique Sailing*.

OBLIQUE Sphere, is where the Pole is elevated any Number of Degrees less than 90 Degrees, and consequently the Axis of the World, the Equator, and Parallels of Declination, will cut the Horizon obliquely; whence comes its Name.

OBLIQUUS Superior, a Muscle of the Head, which ariseth fleshy from the back-part of the transverse Process of the first *Vertebra* of the Neck, and in its somewhat oblique Ascent becometh a fleshy Belly, and lessening it self again, is inserted to the *Os Occipitis*, laterally. By this together with its Partner, (they never acting separately) the Head is moved backwards on the first *Vertebra*.

OBLIQUUS Inferior, is a Muscle of the Head; arising fleshy from the External Part of the Spinal Process of the second *Vertebra* of the Neck, close by the Origination of the *Rectus Major*; and being dilated into a fleshy Belly, passes obliquely to its Insertion at the transverse Process of the first, where the former Muscle begins.

When this acts on either side, the transverse Process of the first *Vertebra* of the Neck is moved towards the Spine of the second; wherefore some Authors have reckoned it among the Muscles of the Neck. But since the Head is also moved thereby, and the Face turned on that side on which it acteth, it is not improperly reckoned amongst

U u u

amongst the Muscles that move the Head; it is assisted by the *Mastioideus*.

OBLIQUUS Superior, or Trochlearis, is a Muscle of the Eye, which receives its First Denomination from its oblique Position and Course, in regard of the rest of its Fellows. The Second, it derives from that Cartilaginous Ring suspended near the Brink of the upper Part of the Orbit towards the Nose, thro' which its Tendon passes, being reflected on it, as a Rope on a Pulley: Besides which, it is called *Longissimus Oculi*, as exceeding the other in Length: Its Use is to help roll the Eye up and down.

It arises sharp and fleshy from the deepest part of the Orbit, near the Origination of the *Abducens*, and becoming a fleshy Belly as it passes obliquely close under its Superior Part, makes a round Tendon running thro' the *Trochlea*, (as above-mentioned) from whence reverting back, it is inserted to the *Tunica Sclerotis*, in the Middle of the Distance between the Termination of the *Astollens* and Optick Nerve, towards the back-part of the Bulb of the Eye.

OBLIQUUS Inferior, is a Muscle called also *Brevissimus Oculi*, it being the shortest Muscle of the Eye. This springs sharp and fleshy from immediately within the lower and almost outward Part of the Orbit, at the Juncture of the First Bone of the upper Jaw, with the Fourth; and becoming thicker, ascends obliquely over the *Depressor*, growing tendinous at its Insertion to the *Tunica Sclerotis*, near the Implantation of the former, directly betwixt the *Abducens* and Optick Nerves.

Its Use is to help roll the Eye to and fro, and therefore this and the former are by some called *Circumagentes* and *Amatorii*. Some also reckon Two other Muscles belonging to the Eye, which are called by this Name *Oblique*, viz.

OBLIQUUS Major, a Muscle that pulls the Eye forwards and obliquely downwards.

OBLIQUUS Minor, is a Muscle that pulls the Eye forwards and obliquely upwards.

OBLIQUUS Ascendens seu Acclivis, one of the large Muscles of the Abdomen, serving to compress the Belly, and by that means to help the Discharge of the Ordure and Urine; it also compresses and straitens the Cavity of the *Thorax* in Expiration, and helps to turn the Trunk of our Body to either side, when our Feet stand still; and so is a kind of *Antagonist* to the *Obliquus Descendens*, which see.

It arises fleshy from the whole circular Edge of the *Os Ilium* and *Ligamentum Pubis*; and thence mounting with an Order of Fibres, inclining forwards, it forms a broad membranous thin Tendon, which is implanted into the whole Length of the *Linea Alba*, and the Cartilages of the 8th, 9th, 10th, and 12th Ribs.

OBLIQUUS Descendens seu Declivis, the Name of one of the large *Epigastrick Muscles*, or Muscles of the Abdomen: Besides its Use, in common with the rest, to compress the Intestines and Bladder, and to help exclude the *Fetus*; Mr. *Cowper* assigns it another, not observed before by any one (except Dr. *Glisson*) which is to move our Body round to either side when our Feet stand still. It arises with several acute Productions, partly fleshy and partly tendinous, from the lower Margin of the Sixth, Seventh, and Eighth Ribs, where its several separate Originations lie

between the Indentations of the *Major Anticus*: Besides these, it continues to derive more Heads from the Ninth, Tenth, Eleventh, and sometimes from the Extremity of the lowest Bastard-Rib, where it is also indented with the *Serratus Inferior Pecticus*; thence its oblique descending fleshy Part expands it self into a broad membranous Tendon, before it marches over the *Rectus* to its Insertion in the *Linea Alba* and the *Os Pubis*; after this descending, it ends partly tendinous in the *Ligamentum Pubis*, but chiefly fleshy on the upper and fore-part of the circular Edge of the *Os Ilium*.

OBLIQUUS Auris, is a Muscle of the Ear, which may be also called *Semi-circularis*, from its Position, it lying in the external Parts of the Bony Channel of the *Aqueduct*, whence marching somewhat upwards and backwards, it enters the *Tympanum* in a very oblique Sinuosity excavated immediately above the Bone where the *Tympanum* is incased, and is inserted to the slender Process of the *Malleus*. The Sinuosity in which this Muscle passes, is that which may be taken notice of in the upper Part of the Bony Circle of the *Fetus*. This we don't find described any where, before *Du Verney*.

OBLONG, in Geometry, is the same with a Rectangle Parallelogram, whose Sides are unequal.

OBSCURA Camera, In Opticks, is a Room darkened, all but in one little Hole, in which is placed a Glass to transmit the Rays of Objects to a piece of Paper or white Cloth: But by it are made many useful Experiments in Opticks, serving to explain the Nature of Vision; and among which, the following one deserves a particular Description.

To represent all outward Objects in their proper Colours, Distances and Proportions, on a White Wall, a Frame of Paper, or Sheet hung up for that purpose in a Darkened Room.

This most Wonderful and Glorious Experiment, tho' it be very common, will yet well deserve to have a clear Account given of it here; for I don't remember to have read a plain and intelligible Description of its Apparatus any where; neither is it so easie to do it with Advantage, as those perhaps who never tried it may imagine; what follows therefore you may rely on as the Result of my own repeated Experience.

Procure a good Convex, or Plano-Convex Glass, such an one as is made use of for the Object Glass of a Telescope; and if you have a good Telescope that draws about 6 Feet, you may unscrew its Object Glass, and it will serve your Turn very well: And indeed a Glass that draws about that length (tho' 4 or 5 Feet will do pretty well) is the fittest on all Accounts to make this Experiment withal; for if you use a small Glass whose Focus is not above a Foot, or thereabouts distant from the Hole, the Representation of your Objects will be very small, and the Figures hardly large enough to be distinguished: To which likewise may be added, that not above one Spectator can come to look on it at a time, and even he not without some Trouble.

On the other hand, if you make use of a Glass which draws 15, 20, or 25 Feet, either your Hole

Hole must be very large, and then so much Light will come in as will hinder the Objects from being visible on the Wall, Paper, &c. or if the Hole be but small, so little Light will come in, that at the Distance of 15 or 20 Foot from the Window, you will have hardly Light enough to see the Representation distinctly; such large Glasses likewise are not easily had every where, nor are they every one's Money; but a Glass that draws about six Feet, is very proper to be made use of in this Case.

Having gotten such a Glass, make Choice of some Room which hath a North-Window, tho' an East or West may do well enough (but a South one will not, for a Reason to be given below) and let it be well darkened, so that no Light can come into it, but at the Hole where your Glass is placed, or at least but very little. Then make a Hole in the Shutter of the North-Window of about an Inch, or an Inch and $\frac{1}{2}$ in Diameter, and leave open the Casement, if there be one, for there must be no Glass without your Hole. Then fasten the Glass with its Centre in the Centre of the Hole, by some small Tacks to the Shutter, so that no puff of Wind blow it down, and break it; and at the Distance that you know your Glass draws, hang up a white Sheet; or if you do not know exactly the Focus of the Glass, move the Sheet to and fro till you find the Objects are represented on it very distinctly, and then you may fasten it there by Nails to the Ceiling, &c. Then will whatever is without the Hole, and opposite to it, be represented on that Sheet with such exquisite Exactness, as far surpasses the utmost Skill of any Painter to express. For if the Sun shine brightly on the Objects (as indeed this Experiment is never made well when it doth not), you will have the Colours of all Things there in their Natural Paint, and such an admirable proportion of Light and Shadow, as is impossible to be imitated by Art; and I yet never saw any thing of that kind that comes near this Natural Landscape. But if the Sun do not shine, the Colours will be hardly visible, and all will look dirty, dark, and confus'd; therefore I advis'd a North-Window, that you may have the Meridian Sun shining on your Object in its greatest Splendor, that so the Experiment may be in its greatest Perfection: But you must by no means have the Sun shine on or near the Hole, for if it doth, all will be confus'd.

Another Thing in which this Representation exceeds Painting, is, That here you have Motion express'd on your Cloth. If the Wind move the Trees, Plants or Flowers without, you have it within on your lively Picture; and nothing can be more pleasant than to see how the Colours of the moving Parts will change as they do without, by their being in various Positions obverted to, or shaded from the Light. The Motion of any Flies or Birds, is painted also in the same Perfection: And the exact Lineaments of any Persons walking at a due distance without the Glass, will be also express'd to the Life, and all their Motions, Postures and Gestures, will as plainly appear on the Cloth, as they do to any one's Eye without.

In a Word, Nothing is wanting to render it one of the finest Sights in the World, but that all things are inverted, and the wrong End upwards. To remedy which, several Methods have been

thought on, as double Convex-Glasses, &c. but none, in my Opinion, are so well, nor so easie, as to take a common Looking-Glass of about 12 or 14 Inches Square, and hold it under or near the Chin, with an acute Angle to your Breast: For if you do so, and look down into it, you will see all things upon the Sheet inverted in the Glass, i. e. in this case restored to their Natural and Erect Position; and this Reflection also from the Glass, gives it a Glaringness that is very surprizing, and makes it look like some Magical Prospect, and the moving Images, like so many Spectrums or Phantoms. And no doubt but there are many Persons that might easily be impos'd upon with such a Scene, and who would believe it to be no less than downright Conjururation.

And I have made use of this Experiment to convince some credulous Persons, that those are abus'd and impos'd upon, who see Faces in the Glasses of some cheating Knaves amongst us, who set up for *Cunning-Men*, and Discoverers of Stollen Goods, &c. and have satisfied them, that much more may be done by this, and some other Optical Experiments, and that without the Help of the Devil too, than by any of the Clumsie Methods us'd by these Vermin.

If the Glass be placed in a Sphere or Globe of Wood (having an Hole as large as the Glass bored through it) which like the Eye of an Animal may be turned every way to receive the Rays coming from all Parts of the Objects, it will be of good Advantage to the Experiment; and such, ready fitted, are now commonly sold by Mr. Marshall, at the Archimedes on Ludgate-hill, and are called *Sciopticks*.

And as by this Method any Image may be made appear in a darkened Room, Dr. Hook, in *Philosoph. Transact.* N. 38. gives a way of doing the same thing in an Enlighten'd one, either by Day or Night. The Experiment I have tried myself, and is as follows.

Opposite to the Wall, or Place where the Apparition is to be, let a Hole be made about a Foot in Diameter, or bigger; if there be an high Window that hath a Casement in it, it will do better.

Without this Hole, or Casement, so that the Company in the Room may not see what is done, place the Picture or Object you would represent inverted; and by means of Looking-Glasses plac'd behind, if the Picture be *Transparent*, reflect the Rays of the Sun, so that they may pass through it towards the Place where it is to appear; and that no Rays may go besides it, let the Picture be incompass'd with a Board or Cloth on every side. If the Object be a Statue or some living Creature, then it must be the more enlightened by casting the Sun-Beams on it by Reflection and Refraction both: Between this Object and the Wall, must be plac'd a broad Convex-Glass, ground of such a Convexity, that it may represent the Object distinct on the Wall: And therefore, 'tis best to have a clean Linen Cloth instead of the Wall; which may be hung up any where, according to the Distance of the Glass's Focus. The nearer the Glass is to the Object, the more will the Object be magnified on the Wall or Cloth; and the further off, the less; which also will depend on the Convexity of the Glass.

and descendeth from thence directly, between the Windpipe and *Vertebrae* of the Neck, and the Four first *Vertebrae* of the *Thorax*, upon which it resteth; but when it is come to the Fifth *Vertebra*, it giveth way to the descending Trunk of the great Artery, by bending a little to the Right side; afterward accompanying the Artery down to the Ninth *Vertebra*; there it turns a little to the Left again, and climbs upon the Artery; and by and by, about the Eleventh *Vertebra*, it passeth thro' the Midriff, a little on the Left side of its Nervous Centre; at a Hole distinct from that of the great Artery, and is inserted or continued into the Left Orifice of the *Ventricle*.

It is composed of Three *Membranes*; the Outermost is common to it and the Stomach, and is very thin, being endowed only with membranous Fibres, and those very slender. Some derive its Origin from the Midriff, some from the *Pleura*, and some from the Ligaments of the *Vertebrae* of the Neck and Breast, upon which it resteth: All which Opinions (according to Dr. *Glisson*) may be true, if they be intended only of an Origin of Continuation or Connexion, seeing it is continued plainly to the Three first, and knit to the last; but none of them is true, if they be intended of a sustaining or maintaining Origin, or of a Principle of Influence: The Second or Middle is fleshy and thick, and consists of Two Ranks of fleshy Fibres, which ascend and descend obliquely, (spiralwise) and do mutually intercrossate or cross one another, so as that the Fibre, which before it met with another to intersect, did lie underneath another, rides upon that which it intersects, and so continues uppermost, till it comes to a second, and so on by Turns. The Third or Innermost is endowed with slender strait Fibres, and those only, as Ancient Anatomists have taught; but Dr. *Willis* affirms it to have Fibres of divers kinds, and those diversly woven one with another. It is wholly nervous, saving a certain hoary or downy Substance that cloaths its Inside. It is continued to that Membrane that covereth the Mouth, Jaws and Lips; and (according to Dr. *Willis*) it descends Three Fingers Breadth below the Mouth of the Stomach.

From its being thus common to the Mouth, Gullet, and upper Orifice of the Stomach, proceeds that great Consent among these Parts in Vomiting, &c.

It hath *Veins* in the Neck from the Jugulars, in the *Thorax* from the *Vena sine pari*; but where it is joined to the Stomach, it hath some Twigs from the *Ramus coronarius*, which is a Branch of the *Vena porta*.

It hath *Arteries* in the Neck from the *Carotides*; in the *Thorax*, from the *Intercostals*; and in the *Abdomen*, from the *Ramus celiacus coronarius*.

Nerves it hath, from the *Par vagum* or Eighth Pair.

It hath Four *Glandules*; Two in the Throat, which are called *Tonsillae*, or Almonds, common to it and the *Larynx*, which separate a mucous or pituitous Humour to moisten them. Other Two it hath near its middle, on its out and backside, about the Fifth *Vertebra* of the *Thorax*; namely, where it gives way to the Trunk of the *Aorta*, and turns somewhat to the Right side, or at the Place where the *Aspera Arteria* is divided into two Branches. These are as big, each of

them, as a Kidney-bean, and of the same Shape; but sometimes there are more than two, and then they are less: They are soft and fungous; and their Use hath been reckoned to be for the Separation of a Juice to moisten the Gullet. But Dr. *Wharton* rejects this Opinion, because there appears no excretory Vessels that might convey the Liquor that is separated in them to within the Gullet. However, tho' such Vessels do not appear, yet it is more probable that they serve for that Use, than for that which he assigns to them, viz. to draw out from the *Lympha*, that runs thro' them, that Juice which is more mild and fit for Nourishment, for the Use of the Nerves that are fastened to them; or to deposit the Remainder into the common *Chyliferous Duct* by a Pipe, which he supposeth there must be, but does not describe.

The Gullet serveth as a Conduit to convey Meat and Drink by from the Mouth to the Stomach; for these being turned down into the Throat by the Tongue, all the Membranes of the *Pharynx* are relaxed for the Reception thereof, and presently the same are squeezed down the Gullet, by the Constriction of its middle Coar, and the Muscles of the *Pharynx*.

OFFA Alba. So *V. Helmont* calls a white Coagulation which will arise, if equal Parts of highly Rectified Spirits of Wine and Urine be mix'd and shaken together; but the Spirit of Urine must be distilled from well-fermented Urine, and it must be truly dephlegmated, or else it will not succeed.

OFFICE, signifies not only that Function, by Virtue whereof a Man hath some Employment in the Affairs of another; but also an Inquisition made to the King's Use of any thing, by virtue of his Office who enquireth: And therefore we oftentimes read of an Office found, which is nothing else but such a thing found by Inquisition made *ex officio*. And 'tis used in this Sense in 33 H. 8. 20. and in *Stamf. Prærog.* Fol. 6. 61. Where to traverse an Office, is to traverse the Inquisition taken of an Office. And in *Kitchin*, Fol. 177, to return an Office, is to return that which is found by virtue of the Office. And there be two sorts of Offices, in this Signification, issuing out of the Exchequer by Commission, viz. An Office to entitle the King to the Thing enquired of, and An Office of Instruction. Office in Fee, is that which a Man hath to himself and his Heirs.

OFFICIAL. This Word, by the Ancient Civil Law, signified him that was the Minister or Apparitor of a Magistrate or Judge. In the Canon Law it is specially taken for him to whom any Bishop doth generally commit the Charge of his Spiritual Jurisdiction: And in this Sense, one in every Diocese is *Officialis Principalis*, whom the Statutes and Laws of this Kingdom call Chancellor: The rest, if there be more, are by the Canon Law called *Officiales Foranei*, but in Common Law Commissioners. The Difference of the Two Powers you'll find in *Linwood, Tit. De Sequestra possess.* cap. 1. *verbo Officialis*. And this Word *Official*, in our Statutes and Common Law, signifies him whom the Arch-deacon substituteth in the executing of his Jurisdiction.

Officiatus non faciendis vel amovendis, is a Writ directed to the Magistrates of a Corporation, willing them not to make such a Man an Officer, and to put him out of the Office he hath; until Enquiry

Enquiry be made of his Manners, according to an Inquiry formerly ordained.

OFFIN. So the Seamen call that Part of the Sea which is a good Distance from Shoar, where there is deep Water, and no need of a Pilot to conduct the Ship into the Port. Thus if a Ship from Shoar be seen sailing out to Sea-ward, they say she stands for the *Offin*; and if a Ship having the Shoar near her, have another good way without her, or towards the Sea, they say that Ship is in the *Offin*.

OFF-WARD. If a Ship, being a-ground by the Shore, doth heel towards the Water-side, they say she heels to the *Off-ward*; so if she lie with her Stern only to Sea-ward, they say she lies with her Stern to the *Off-ward*, and her Head to Shoar-ward.

OGRESSES, a Term in Heraldry; the same with *Pellets*, which see.

OIL, which the Chymists call *Sulphur*, is the Second of their *Hypostatical* and of the true Five Chymical Principles. 'Tis an inflammable, unctuous, subtil Substance, which usually arises after the Spirit. The Chymists attribute to this Principle all the Diversity of Colours, and all the Beauty and Deformity of Bodies: Probably their various Odours do in a great measure arise from it. And it sweetens the Acrimony of Salts; and by stopping or filling up the Pores of a mixt Body, keeps it longer from Corruption, where it abounds. And we find that the *Ever-greens*, such as *Box*, *Holly*, &c. do abound more with Oil than other Plants.

There are two sorts of Oils; One which seems to be mixt with Spirit, (for it can never be drawn pure) and which will swim upon Water; such as Oil of Aniseeds, Lavender, Rosemary, &c. which the Chymists call *Essential*, and is commonly drawn in a Limbeck with store of Water. And another kind, which probably is mixt with Salts, and these will sink in Water; such as the Oils of ponderous Woods, as of Guaiacum, Box, Cloves, &c.

There are some things which are very improperly called Oils; as Oil of *Tartar per Deliquium*, which is only a Fixt Salt dissolved. Oil of *Vitriol*, which is nothing but the most caustick and strongest part of the Spirit of *Vitriol*. Oil of *Antimony*, which is only a Mixture of Antimony, and an acid Spirit.

Mr. Boyle, to shew the Producibleness of Chymical Principles, tells us, That by mixing carefully and gradually together an equal Weight of Oil of *Vitriol*, and truly rectified Spirit of Wine; and then, by a very wary Management of the Fire, drawing off what will come over, he could obtain (besides a subtil odoriferous Spirit, and an acid and sulphurous Liquor) a considerable Quantity of Chymical Oil, sometimes deeply coloured, sometimes pale like Water, and sometimes exceeding fragrant, and without any Acidity in it at all; yet was so ponderous, as not only to sink in Water, but even in the acid Spirit which was drawn off with it, and seems to be the Oil of *Vitriol* only altered and exalted; nor would this Anomalous Oil at all mingle with Water, tho' both the Oil and Spirit, from whence it was distilled, would readily do so.

OIL of Philosophers. So the Vapouring Chymists call a Distillation in a Retort of pieces of Brick heated red hot, and then cast (while so)

into Oil of Olives, the Bricks will imbibe a good deal of Oil; which Oil being afterwards drawn from them again, is their Oil of *Bricks*, or Oil of *Philosophers*; and they attribute great Virtues to it.

OIL of Sulphur per Campanam. See *Spirit of Sulphur*.

OIL of Tartar per Deliquium, is a Fixt Salt of Tartar dissolved, by being exposed to the Air in a cool moist Place.

OIL of Vitriol, improperly so called, is what remains in the Cucurbit after the Distillation of *Vitriol* is rectified, and the Sulphureous and Acid Spirit both drawn off; 'tis the more Fixt Part of the Spirit of *Vitriol*, rendered Caustick by a vast Degree and Continuance of Fire. 'Tis used in the Dissolution of Metals, and sometimes given inwardly, when in a small Dose, and duly diluted.

This Oil, if it be mingled either with Spirit of *Vitriol*, common Water, or any *Etherial Oil*, as the Chymists call Oil of Turpentine, &c. it will grow so very hot, as often to break the Vial that contains the Mixture.

OLEAGINOUS, Oily, or pertaining to the Nature of Oil: Thus in Soap, which is made of Oil, (or Grease) Salt and Water; we say there are some *Oleaginous*, some *Saline*, and some *Aqueous* Parts.

OLECRANUM, or *Ancon*, is the greater Process of the first Bone of the Cubit called *Ulna*; also the upper part of the Shoulder: *Blanchard*.

OLIGOTROPHUS (*Cibus*) is Meat that nourishes little; to which is opposed *Polytrophus*, that which affords much Nourishment. *Blanchard*.

OLIGOTROPHY, is a Decrease of Nutrition; or a very small one.

OLFACTORY Nerves, or those which give us the Sense of Smelling, are the first Pair of those Ten which arise from the *Medulla oblongata*: They come from the Basis of the *Corpora striata*, and passing through the little Holes of the *Os cribriforme*, they are spread upon the Membrane which covers the *Os spongiosum*.

OLIVARIA Corpora, are two Protuberances of the under part of the Brain, placed on each side of the *Corpora Pyramidalia*, towards the lower end; having their Name from their Figure, which is like that of an Olive.

OLOR. See *Cygnus*.

OLYMPIAD, a Term in Chronology, signifying the Space of Four Years, or Fifty Months, reckoning Thirty Days to a Month; from whence the Ancient *Grecians* derived their Account of Time. This kind of Computation took its Rise from those Famous *Olympick Games* which were celebrated every Fifth Year, in the Festival Solstice, during Five Days, on the Banks of the River *Alpheus*, near the City *Olympia*, where the noted Temple of *Jupiter Olympicus* stood. The First *Olympiad* began about 500 Years after the Destruction of *Troy*, in the 3938 Year of the *Julian Period*, A. M. 3174, and 766 Years before Christ.

OMENTUM, *Rete*, or *Reticulum*, the Cawl, is a double Membrane arising from the *Peritoneum*, or as some say, from the *Mesentery*, spread upon the Intestines or Guts, interwoven with fat and small Vessels like a Fisher's Net, enriched also with two or three Glandules; on the Fore-part it is annexed to the Bottom of the Stomach.

math, to the Gut Colon, to the Spleen; and sometimes to the *Pancreas*, and the round Lobe of the Liver.

Its Use is to cherish the Intestines with its Warmth, and to facilitate the Concoction of the Aliments in the Guts, as well as to knit loosely the Stomach, Spleen, *Pancreas*, Colon, &c. together.

It hath some Milky and Lymphatick Vessels, as also a great many *Ductus's*, and little Bags of Fat.

OMOPLATA, and *Homoplata*, the same with *Scapula*.

OMPHALMICUS, is a Branch of the Fifth Pair of Nerves which move the Eye.

OMPHALOCLE, is a Rupture about the Navel, to wit, when the Cawl or Intestines are Protuberant in that Part; which happens from a Relaxation, or bursting of the *Peritonaeum*.

ONERANDO *pro rata portiois*, is a Writ that lies for a Joint-Tenant, or Tenant in Common, that is distrained for more Rent than his Proportion of the Land cometh to.

ONL. In the *Exchequer*, as soon as a Sheriff enters into his Accompts, for Issues, Amerciaments, and mean Profits, they set upon his Head this Mark, *Oni*, which denotes *Oneratur*, *nisi habet sufficientem exonerationem*; and thereupon he forthwith becomes the King's Debtor, and a Debt is set upon his Head; and then the Parties *Peravayle* become Debtors to the Sheriff, and discharged against the King.

ONYX, the same with *Hypopyon*, a gathering of Matter under the *Tunica Cornea* of the Eye.

OPACOUS Bodies, are such whose Pores (probably) lying in an oblique and crooked Position, the Rays of Light cannot freely permeate and pass through them, as they do thro' transparent ones; wherefore if you hold them up against the Light, you cannot see through them.

OPEN Flank, in Fortification, is that part of the Flank which is covered by the Shoulder or Orillon.

OPERA, is a sort of Solemn Entertainment of Musick upon the Theatre or Stage, and is very common in *France* and *Italy*: It usually begins with an *Ouverture*, which commonly ends with a *Fugue*; the rest is composed of *Symphonys*, *Recitativo's*, *Chaccons*, *Preludes*, &c. with all sorts of Vocal and Instrumental Musick.

OPHIASIS, is a Disease where the Hairs grow thin and fall off here and there, so that they leave the Head spotted like a Serpent. *Blanchard*.

OPHIUCUS, one of the Northern Constellations, the same with *Serpentarius*: It contains 30 Stars, of which, one in the Head of the Man holding the Serpent, is of the second Light or Magnitude.

OPHTHALMICKS, are such Medicines as are good for Diseases in the Eyes.

OPIATES, are Medicines made of *Opium*, or something of the same Nature with it, designed to cause Sleep, and to ease Pain: When they produce the latter Effect, they call them *Anodynes*; when the former, *Hypnoticks*; and when they cause a very great Sleep or Stupefaction, *Narcoticks*. The Foreign Physicians confound an *Opiate* and an *Eletuary*; see *Blanchard* on the Word *Opiata*.

OPISTHOTONUS; see *Posticum*.

OPISTHOTONUS, or *Tetanus*, is a kind of

Cramp, or stretching of the Muscles of the Neck backwards; which proceeds sometimes from a Palsie of the Muscles of the Neck, whereupon the Antagonists or opposite Muscles move the intermediate Parts too much; or from a sharp and serous Matter in the Tendons; or from the Animal Spirits which enter the Fleishy Pipes more than usual, and will not easily recede, so that the Parts are swelled and wrinkled up. *Blanchard*.

OPPOSITE *Angles*; see *Angles*.

OPPOSITE *Cones*, are two Similar Cones veritically opposite, and having the same common Axis. And

OPPOSITE *Sections* are the two *Hyperbola's* made by a Plane cutting both those Cones. See the Figure under the Word *Latius Transversum*, where the Cones *VAD* and *BVA* are opposite, and the Sections *ODO*, *OEO*, are opposite *Hyperbola's*.

OPPOSITION, is that Position or Aspect of the Stars or Planets, when they are 6 Signs, or 180 Degrees distant from one another, and is marked thus 8.

OPTATIVE Mood, (in Grammar) is the way of forming a Verb so, as that it may express an ardent Desire that such a Thing may happen; and therefore there is usually an Adverb of wishing connected with it, as *Utinam*, &c.

OPHTHALMY, is an Inflammation of the Tunicks of the Eyes, proceeding from Arterious Blood, collected and extravasated there, because it cannot return by the Veins. *Blanchard*.

OPTICKS, is a Mathematical Science that treats of the *Sight* in general, and of every thing that is seen with direct Rays; and explains the several Properties and Effects of Vision in general, and properly of that which is direct and ordinary: For when the Rays of Light are considered as reflected, the Science which teaches their Laws and Properties, is called *Catoptricks*; and when the Refraction of Rays is considered, and the Laws and Nature of it explained and demonstrated, the Science is called *Dioptricks*. So that *Opticks* comprehends the Whole; of which *Catoptricks* and *Dioptricks*, are the two Parts.

OPTICK Glasses. Sir Isaac Newton, in his *Philos. Natur. Princip. Math. Lib. 1* Schol. ad Prop. 98, says, That for all Optick Uses, Spherick Figures are the most commodious. If the Object-Glasses of Telescopes were composed of two Spherick Glasses containing Water between them, perhaps the Irregularity of the Refractions that are made on the Surfaces of the Glasses towards their Edges, may be accurately enough corrected by the Refractions of the Water. And such Object-Glasses are preferable to Elliptick or Hyperbolic Glasses, not only because they are easier and more accurately to be formed, but also because they refract more accurately those Pencils of Rays that are (collateral, or) out of the Glasses Axis. But the different Refrangibility of different Rays will for ever hinder us from perfecting Opticks by Glasses, either Spherick, or of any other Figures whatsoever: And unless we can correct the Errors that arise from hence, all our Labour is lost in other Corrections.

Nor indeed is it possible, by whatever Figures, to render the Appearance of the Collateral Parts of an Object so distinct as the Direct; for the very Natural Eye does it not: And therefore we are

are forced to apply it successively, *directly* before the Parts of any Object we design to view.

To know whether Optick-Glasses be truly Centered, or not.

First Way.

Holding the Glasses at a due Distance from the Eye, observe the two reflected Images of a Candle; for where those two Images unite, or *coalesce*, there is the true Centre of the Glasses: And if this be in the middle or central Point of the Glasses's Breadth, the Glasses is truly centered.

A Second Way is

By presenting the Glass before the Sun, and making it reflect the Light on a Plane highly parallel to its Surface, and at a proper Distance; for then you'll perceive two sorts of Light reflected, one smaller, but much more strong and vigorous, within another more faint and large. Then by a due Posture of the Glass (found by Trials) both these Lights are to be projected as round as possible, and at a proper Distance from the Wall on which they are reflected; the round brightest Spot is to be brought into the smallest Compass that it can. (Trial will make all this plain.) When the Glass is in this Posture, if the bright Spot be projected just in the middle of the fainter Light, the Glass is well centered: But to whatever side of the faint Light this bright Spot is projected, on that side is the Glass thickest, and on that side lies the true Centre.

A Third Way

Of Examining the Centres of Glasses, is yet more Compleat than the former: For it does not only discover the Fault, (if there be any, as in long Object-Glasses 'tis very rare but there is, especially if they be wrought in the Form by the unguided Hand, and not by an Engine) but without it rectifies the Fault; and is thus:

Cover the Surface of the Glass within a thin piece of Paper, in which there is cut a round Hole of about an Inch Diameter; about this Hole there are to be struck two or three Concentrick Circles. Move this Paper upon the Glass, 'till you see on the Plane that receives the reflected Light, that the bright Spot is exactly in the middle of the other fainter Light round it.

This also one may measure by a Pair of Compasses, having, to that end, slightly fix'd the Paper to the Glass, that we may more nicely determine whether this bright Spot be exactly in the middle. This therefore being carefully adjusted, by gently sliding the Paper on the Glass, (if it be requisite) we are, without the least altering this true Position of the Paper, to fix it more firmly to the Glass; and laying it thus on a Table, let us mark on the Glass (by the Point of a Diamond) three Points in one of the Circumferences concentrick to the round Hole in the Paper; and sticking a small piece of Cement on the Glass, about the middle of the round Hole, by means of the three marked Points let us find the exact Centre of this round Hole: Then uncovering the whole Glass, (except only the Cement in which

the Centre is marked) with a Diamond-pointed Compass let us strike as large a Circle on the Glass as its Breadth will bear; then round the Glass according to this Circle, and 'tis as exactly centred as the Sense can judge.

For trying the Regularity and Goodness of an Object-Glass, to the greatest Exactness.

On a Paper strike two Concentrick Circles, one whose Diameter is the same with the Breadth of the Object-Glass, 't'other, of half that Diameter: This inward Circumference divide into six equal parts, by the known way of applying the Radius six times in the Circumference, and making six fine small Holes therein with a Needle. Let us cover one side of the Glass with this Paper, and then exposing it to the Sun, we are to receive the Rays that pass through these six Holes, on a Plane, at a just Distance from the Glass; and by withdrawing or approaching this Plane from or to the Glass, we shall find whether the Rays that pass through these six Holes unite exactly together at any Distance from the Glass; if they do, we may be assured of the Regularity of the Glass, that is of its just Form; and at the same time we obtain exactly the Glass's Focal Length.

But, after all, there is no better way for trying the Excellency of an Object-Glass, than by placing it in a Tube, and trying it with small Eye-Glasses, at several distant Objects: For that Object-Glass that represents the Objects the brightest and most distinct, that bears the greatest Aperture, and most Convex and Concave Eye-Glass, without Colouring or Haziness, is surely the best. The most convenient Object to try them at, is the Title Page of a large Book, where there are generally Letters printed of divers Magnitudes, and therefore affords Variety of small Objects; whereby the Comparative Excellency of Object-Glasses may be nicely estimated.

OPTICK Nerves, or the *Nervi Visorii*, are the Second Pair, which bestow on the Eyes the Faculty of Seeing. They spring from the upper sides of those unequal Protuberances of the *Cruca* of the *Medulla oblongata*, which are called *Nervi opticorum ophiorum thalami*; from whence being carried forward, and somewhat downwards, after having fetch'd a Compass, they meet one another about the *Infundibulum*, upon the *Sella* of the *Ossphenoides*; where they are united by the closest Conjunction, but not Confusion, of their Fibres, which run parallel lengthways in these Nerves, as they do in all other.

They are obscurely hollow untill they be united; but after, their Hollowness cannot be discerned. This Hollowness may be shew'd in a large Beast newly killed, and in a clear Light.

Thus do *Riolanus*, *Glisson*, &c. teach; but *Vesalius*, *Aquapendente*, &c. deny that they have any manner of Cavity. *Malpighius* says, they have not one Cavity only, but sundry; but that these Cavities result only from the Necessity of their Structure, all their inner or medullar part consisting of round *Intestinnula* of Fibres running lengthways, which cannot be so closely fitted to one another, but that there will result long Interstices, which yet perhaps are of no use, nor of

the Nature of Ducts, but only accidental; but whether the *Intestinales*, or Filaments themselves, have not little Channels in them (like to Blood-vessels) he thinks may be doubted of: But seeing Sense hath not discovered any such, 'tis probable that there are to be admitted only little Pores and Interstices in the medullary Substance, by means whereof the nourishing and vivifying Juice may be propagated. After their Union they are separated again, and each of them running farther forwards, passes thro' an Hole of the *Os Cuneiforme*, and is inserted obliquely into the Centre of the Eye on its own side.

Dr. Willis says, they receive not only nervous Fibres from the Third Pair of Nerves, but also Twigs of Arteries from the fore Branches of the *Carotides*, which run upon them as far as the *Basis* of the Eye: Whence, he thinks, a Reason may be assign'd, why, when a Man grows sleepy after plentiful eating or drinking, he presently feels a notable Heaviness or Oppression as it were about his Eyes. For when the Blood, becoming very turgid, fills the Vessels that run through the Brain, more than usual, and by distending them, stops the Pores of the Brain; these Nerves also in their whole Course are compressed by the Blood that is become turgid in their Blood-Vessels likewise.

Dr. Ridley says, That he has seen the Blood-Vessels to run not only upon or within them, but also in injected Bodies exactly quite thro' the medullary Substance of them, into the Reticular Coat of the Eye, wherein they end in an infinite Number of the most capillary Ramifications, which, by an Injection of that Artery, made with Mercury, becomes very delightfully conspicuous to the Eye.

They are very soft, so long as they are within the Skull; but having pass'd the *Os sphenoides*, they become somewhat more firm and hard. The Reason of which Alteration seems to be, that within the Skull they are only clad with the *Pia mater*; but as they go out, they assume a Second Coat from the *Dura mater*.

From the whole Substance of these Nerves, viz. from their two Membranes and the inner medullary and fibrous Substance, are the three (proper) Tunics of the Eyes framed; for the *Cornea* or *Sclerotica* doth proceed from the *Dura mater*, the *Choroides*, or *Uvea* from the *Pia mater*, and the *Retina* from the marrowy Substance.

OPTICK Place of a Star or Planet, is that Point or Part of its Orbit which is determined by our Sight when the Star is there: And this is either True, when the Observer's Eye is supposed to be at the Centre of the Earth or Planet he inhabits; or Apparent, when his Eye is at the Circumference of the Earth: And the Difference between these two is the *Parallax*, whose Use is great in determining the Distances of the Planets, &c.

OR, (French) in Heraldry, is the Colour of Gold; and they say without this, or *Argent*, there can be no good Armoury. In the Coats of Nobles 'tis called *Torraz*, and in those of Sovereign Princes, *Sol*. 'Tis represented in Engraving by small Points or Pricks, thus.

ORB, is only a Hollow Sphere.

ORBICULAR Bone, is one of the little Bones of the inward Ear, ty'd by a slender Ligament to the sides of the *Strapes*,

ORBICULARIS, or *Constringens*, or *Osculatus*, is a Muscle that draws both Lips together: 'Tis called also *Sphincter Labiorum*.

ORBICULARIS *Palpebrarum*, is a thin fleshy Muscle, whose Fibres do Circularly environ the Eye-lids, and are inserted to them, (like the *Sphincter Labiorum*) not adhering to any Bone, from whence we may derive their Origin, except the Superior part of the great Bone of the Nose, by some reckoned the fourth Bone of the Upper Jaw: The Muscle acting like the *Sphincters* of all other Parts, constringes the Eye-Lids.

ORBIS *Magnus* is the Orbit of the Earth in its Annual Revolution round the Sun.

This *Copernicus*, Dr. Gregory, and some others, will have to be but a Point in comparison of the Distance between us and the fix'd Star's: But our most Accurate Astronomer, Mr. Flamsteed, found a very sensible Parallax of this *Orbis Magnus*, in respect of the Pole Star; so that the Pole Star was nearer to the Pole in Summer (at the Solstice) than in Winter by 40 or 45"; and this was the Result of above Seven Years most Accurate and continual Observation: And from hence he justly draws a *Demonstration* for the Annual Motion of the Earth. Vide *Wallis Latin Works*, Tom. 3.

The Semi-diameter of this Annual Orbit of the Earth round the Sun, Dr. Gregory makes to be 50000000000, or Fifty Thousand Millions of Feet; which is (allowing 5280 Feet to a Mile) 94.696969 Miles *Englishe*. Which therefore may be taken for the mean Distance of the Earth from the Sun. And the Semi-diameter of *Saturn's* Orbit, is about 10 times as great.

All the Ancients and the Astronomers before the Great *Kepler* supposed this Orbit to be a perfect Circle, but he proves it to be an Ellipsis; the remotest end of whose Longer or Transverse Diameter is eight Signs and eight Degrees distant from the first Star in *Aries*, and having the Sun in one of its Focal Points.

ORBIT of any Planet, is the Curve that it describes in its Revolution round its Central Body: Thus the Orbit of the Sun (or of the Earth) in its Annual Course, is the *Ecliptick*.

ORBITER *Externus*, is a Hole in the *Os Maxillare*, below the Orbit, thro' which the Nerves and Vessels which come from the Teeth, pass to the Cheeks.

ORBITER *Internus*, is a Hole in the *Coronal Bone*, within the Orbit a little above the *Os Planum*, thro' which passes a Branch of the fifth pair of Nerves which goes to the Nose.

ORDER is a Term in *Military Discipline*, being the equal Distance of one Rank or File from another. The usual Order in Files is 3 Foot, and in Ranks 6 Foot; the Open Order is double in each.

ORDER in Architecture, is a Rule for the Proportion to be observed in the erecting of Pillars, and for the form of certain parts appertaining to them.

So Buildings are said to be of several Orders, when the Proportion between the thickness of the Columns, and their height, together with all things requisite thereto are different.

There are Five Principal Orders of Architecture, viz. The *Tuscan*, *Dorick*, *Ionick*, *Corinthian*, and the *Composit*.

The *Tuscan* is the most Simple, and the most destitute of Ornaments, so that it is seldom used except

except in Vaults, in some Rustick Edifices, vast Piles of Buildings, as *Amphitheatres*, &c.

The *Tuscan Pillar* with its Base and Capital generally hath for its height seven Diameters of its thickness taken below, and the top ought to be diminished one quarter of its Diameter: The Pedestal is very plain, and only one Model high.

The *Dorick Order*, hath its Column eight Diameters high, and ought to have no Ornament neither in its Capital nor Base. The *Astragal* and *Listel* below the Capital, which is half a Diameter high, constituting part of the Shank or Body of this Pillar.

The *Ionick Order*, when first invented had its Column only eight Models high; but the Ancients designing to make it more beautiful, augmented the height of the Pillars, and added a Base not used before; so that with its Capital and Base it contains nine Diameters of its thickness taken below: The Pedestal is two Diameters, and about two thirds high; and the Capital is chiefly composed of *Voluta's* or Scrolls, which render it different from the other Orders: The *Ionick Pillars* are also usually channelled with 24 Flutes.

The *Corinthian Order*, is the finest and richest of all; the Length of its Columns with their Bases and Capitals, is commonly about nine and a half or ten Diameters; and the Capitals are adorned with two Rows of Leaves, and eight *Voluta's* that support the *Abacus*.

The *Composite or Roman Order*, hath the Capital of its Pillar composed of two Rows of Leaves like the *Corinthian*, and of the *Voluta's* or Scrolls of the *Ionick*. These Columns are usually ten Diameters high, altogether like the *Corinthian* in all its Dimensions and Numbers, except the Capital, which hath only four *Voluta's* taking up the whole Space, which is filled both by the *Voluta's* and Stems or *Skalks* in the *Corinthian*.

To these Five Orders, may be added also,

The *Attick*, which is a small Order of Pilasters of the shortest Proportion, having a Cornice raised after the manner of an Architrave, for its Entablature. As also

The *Gothick Order*, which is so far from the ancient Proportions and Ornaments, that its Columns are either too massie in form of vast Pillars, or as slender as Poles, having Capitals without any certain Dimensions, carved with the Thorny Leaves of *Thistles*, *Coleworts*, *Bears-foot*.

ORDINANCE, of Parliament, the same with *Acts of Parliament*: And Acts of Parliament are in the Parliament-Rolls often called *Ordinances of Parliament*. If there be any Difference, it is, that an *Ordinance* is but Temporary, and to be alter'd by Commons alone; but an *Act* is a perpetual Law, and cannot be altered but by King, Lords and Commons. But Sir *Edw. Coke* asserts, That an *Ordinance of Parliament* is to be distinguished from an *Act*, for as much as the latter can be only made by the King and the threefold Consent of the Estates, whereas the former is ordain'd with or by two of them.

ORDINARY, in the Civil Law, signifies any Judge that hath Authority to take Cognizance of Causes in his own Right, as he is a Magistrate, and not by Deputation; but in the Common Law, it is taken for him that hath exempt and immediate Jurisdiction in Causes Ecclesiastical.

ORDINARIES, in Heraldry, are such Charges as are proper to the Art and Usage of Armory; and therefore are commonly called the Honourable Ordinaries; and are the *Cross*, the *Chef*, the *Pale*, the *Bend*, the *Fesse*, the *Escutcheon*, the *Chevron*, the *Saltier*, and the *Bar*.

ORDINATE, or *Ordinate*. *Applicate*, is a Line in any Conick Section drawn at Right Angles to and bisected by the *Axis*, and reaching from one side of the Section to the other; the half of which is properly the *Semi-ordinate*, but is now usually called the *Ordinate*.

Thus, in the Parabola OVD, OD, or *o d*, is an Ordinate rightly apply'd, and its half *r d*, or RD, is the true Semi-ordinate, tho' usually called the Ordinate it self.

The Properties of these Lines you will find under the several Conick Sections.

Dr. *Wallis* in his *Conick Sections*, calls the whole Ordinates OD, &c. the *Linee Ordinariae Inscriptae*; and the Semi-ordinates OR, &c. he calls the *Ordinate Applicatae*.

ORDINATIONE *contra servientes*, is a *Writ* that lieth against a Servant for leaving his Master.

ORDNANCE, all sort of Great Guns used in War. The several Parts of a Piece of Ordnance; or Great Gun, are thus called.

1. The Outside round about the Piece, is called the *Superficies of her Metal*.

2. The Substance or whole Mass of Metal, is called her *Body*.

3. The Part next to us when she stands ready to fire, is called the *Breech* or *Coyles*, and the Pummel or round Knob at the End of it, is called the *Cascabel*; by some the *Cascabel Dock*.

4. The *Trunnions* are the two Knobs, Spindles, or Ears, which hold the Piece in the Carriage.

5. *Manigions* or *Dolphins*, after the German way of casting Guns, are two Handles placed on the Back of the Piece near the *Trunnions*, and near the Centre of Gravity, to mount and dismount it the more easily.

6. The *Rings* about it are these four: The *Base Ring* is that which is next below the *Touch-hole*: The next *Ring* above the *Touch-hole* is called the *Reinforced Ring*: The next to that forward the *Trunnion Ring*: The next to that, the *Cornice-Ring*: And that at the *Mouth* is called the *Muzzle-Ring*, or the *Freeze*: Also all the *Rings* near the *Mouth* are sometimes called the *Freezes*.

7. As to the *Internal Parts*, the whole *Cavity* or *Bore* of the Piece is called her *Chase*. That Part of the *Cavity* between the *Trunnions*, and the *Muzzle* or *Mouth*, is called the *Vacant Cylinder*: The Part from the *Trunnions* to the end of the *Cavity*, or so much of it as containeth (or is Loaded with) the *Powder* and *Shot*, is called the *Chamber*. The *Diameter* of the *Mouth* is called

the *Calibre*. The *Space* between the *Shot* and the *Hollow Superficies* of the Piece within is called the *Vent*; being the *Difference* between the *Diameter* of the *Shot*, and of the *Mouth* of the Piece.

Great Guns in *England* are distinguished into two kinds only, viz. *Field-Pieces*, which are from the least sort of all, to 12 Pounders (*i. e.*) those which carry a *Ball* or *Shot* of 12 Pound; and *Cannon of Battery*, which are from a *Calvering* to an whole *Cannon*.

The Table following gives you all things necessary to be known of the *Names*, *Proportions*, *Weights*, *Lengths*, *Bullets*, *Ranges*, &c. of a Great Gun.

PHILLIPS'S TABLE.

The Names of the several Pieces of Ordnance.	Guns Length.	Guns Weight.	Guns Bore.	Bullets Diameter.	Bullets Weight.	Ladies Length.	Ladies Breadth.	Weight of Powder.	Point-Blank, or the Level Range.	Urmolt Random.
	Inches. Feet.	Pounds.	8 Parts. Inches.	8 Parts. Inches.	Ounces. Pounds.	8 Parts. Inches.	8 Parts. Inches.	Ounces. Pounds.	Paces.	Paces.
A Base ———	4 6	200	1 2	1 1	0 5	4 0	2 0	0 8	60	600

To this Table I thought it necessary to adjoin Mr. *Anderson's*; which, I question not, is much truer: As being the Result of more Experience, and more Skill in this kind of Mathematical Learning. However, the Differences of the Ranges are so great, that it is worth Examining which is the Trueſt.

Mr. Anderson's TABLE of the Names, Diameters, Chases, Requisites of Powder, Comparative Forces, and Greatest Ranges, to Eight Degrees of Elevation, of Ten several Pieces of Cannon, Experimentally and Mathematically demonstrated.

Names of the Pieces.	Length of the Chase.	Diameter of the Bore.		Requisite of Powder.		Greatest Range.	Comparative Force.
	Feet.	Inches.		lb.	3.	Paces.

The Strength and Serviceableness of a Piece of Ordnance, consists very much in the Thickness of the Metal, especially about its Chamber and Breech, and this is called its *Fortification*.

And of this there are three degrees both for Cannons and Culverines.

1. Such as are ordinarily fortified, are called *Legitimate Pieces*.

2. Those whose Fortification is lessened, are called *Bastard Pieces*.

3. There are some that are doubly fortified, which are called *Double-fortified*, or *Extraordinary Pieces*.

The Fortification of a Gun is reckoned from the Thickness of the Metal at the Touch-hole, at the Trunnions and at the Muzzle, in proportion to the Diameter of the Bore.

The *Doubly-fortified Pieces*, are a full Diameter of the Bore in Thickness at the Touch-hole, $\frac{1}{8}$ of it at the Trunnions, at $\frac{1}{4}$ at their Muzzle.

The *Lessened Cannons* have but $\frac{1}{2}$ or $\frac{1}{3}$ of the Diameter of their Bore, in Thickness at the Touch-hole, $\frac{1}{4}$ at the Trunnions, $\frac{1}{2}$ at the Muzzle.

All the *Double-fortified Culverines*, and all lesser Pieces of that kind, have a Diameter and $\frac{1}{4}$ at the Touch-hole, $\frac{1}{2}$ at the Trunnions, and $\frac{3}{4}$ at the Muzzle. And the Ordinary Fortified Culverines are every way as your Double-Fortified Cannon; and the Lessened Culverines are as the Ordinary Cannons, in all respects.

The Ordinary Fortified Cannons have $\frac{7}{8}$ at the Touch-hole, $\frac{1}{2}$ at the Trunnions, and $\frac{1}{4}$ at the Muzzle.

The Famous Galileus was the first who proved the Line of a Bullet to be in the Curve of a Parabola (abstracting from the Line of Impulse, and the Resistance of the Medium, as I judge) as you may find in his Fourth Dialogue; where also he gives a Table of Horizontal Ranges. *Discorsi e Dimostrazioni Matematiche*, p. 280, 281.

And his Scholar *Torricellius*, in his Second Book *De Motu Projectorum*, brings the Horizontal Ranges to the Table of Sines, and the greatest Altitudes to the Versed Sines: That is, he proves, That all Ranges on the Plane of the Horizon, are in proportion to one another, as the Sines of the Double Angles of the Elevation of their Lines of Direction. And for the Time of the Continuance of any Shot above the Horizon, he shews in *Prop. 18. Book 2.* That as Radius is to the greatest Duration (i. e. when the Elevation of the Piece is 90 degrees, or when it stands perpendicular): so is the Sine of any other Elevation of the Gun, to the Time of the Range of that Shot.

After this, one *Robert Anderson*, by Trade a Weaver, but peculiarly skilful both in the Application of Mathematicks to this Matter, and also prodigiously industrious and accurate in making Trials with both Guns and Mortars, which he procured to be cast and fitted at his own Charge: This Man, I say, in the Year 1674. published a Book of the *Genuine Use and Effects of the Gun*, together with Tables of the Altitudes of Projections above the Horizon, &c. Calculated by Mr. Street; in which, in Fifty Propositions, he shews:

1. How from any Shot of a Great Gun, or any Piece, howsoever made, to find the greatest Random of that Piece: And also to strike any Place upon either Ascents or Descents within the Reach of the Piece.

2. He shews the Relations of all Guns of the same kind among themselves; and thence the Dimensions and requisite Powder of any Piece with a Range answerable to any Degree being given: He gives Rules to find the requisite Powder of any other Piece, and to strike any Place at demand within Reach, its Dimensions being also given.

COROLLARY.

Hence it follows, That half the Parameter is the greatest Random, and that happens at the Elevation of 45 Degrees, the Sine of whose double is Radius: Likewise that the Ranges equally distant above and below 45 are equal, as are the Sines of all double Arches to the Sines of their double Complements.

PROP. II.

The Altitudes of Projections made with the same Velocity, at several Elevations, are as the Versed Sines of the double Angles of Elevations.

As e is to s :: so is $\frac{p s s}{r r} = GB$ to $\frac{p s s}{r r} = BF$, and $UK = RU = \frac{BF}{4}$, the Altitude of the Projection $= \frac{p s s}{4 r^2}$. Now by the foregoing Lemma $\frac{2 s s}{r} =$ to the Versed Sine of the double Angle, and therefore it will be as Radius to Versed Sine of double the Angle $FG B$, so an 8th of the Parameter to the height of the Projection UK ; and so these Heights at several Elevations, are as the said Versed Sines, Q. E. D.

COROLLARY.

From hence it is plain, that the greatest Altitude of the Perpendicular Projection is a 4th of a Parameter, or half the greatest Horizontal Range; the Versed Sign of 180 Degrees, being $= 2r$.

PROP. III.

The Lines $G F$, or Times of the Flight of a Project cast with the same Degree of Velocity at different Elevations, are as the Signs of the Elevations.

As c is to r :: so is $\frac{p s c}{r r} = GB$ by the 6th Proposition to $\frac{p s}{r} = GF$; that is, as Radius to Sine of Elevation, so the Parameter to the Line GF ; so the Lines GF are as the Sines of Elevation, and the Times are proportional to those Lines: Wherefore the Times are as the Sines of the Elevation: Ergo constat propositio.

PROP. IV.

Problem. A Projection being made as you please, having the Distance and Altitude, or Descent of an Object through which the Project passes, together with the Angle of Elevation, with the Line of Direction; to find the Parameter and Velocity that is (in Fig. 2.) having the Angle $FG B$, GM , and MX .

SOLUTION.

As Radius to Secant of $FG B$, so GM the Distance given, to GL ; and as Radius to Tangent of $FG B$, so GM to LM . Then $LM = MX$ in Heights, or $+MX$ in Descents; or else $MX = ML$, if the Direction be below the Horizontal Line, is the Fall in the Time that the direct Impulse given in G , would have carried the Project from G to $L = LX = GY$. Then by reason of the Parabola, as LX or GY is to GL or YX :: so is GL to the Parameter sought.

To find the Velocity of the Impulse, by Prop. 2. and 4, find the Time in Seconds that a Body would fall the Space LX , and by that dividing the Line GL , the Quote will be the Velocity, or Space moved in a Second sought, which is always a mean Proportional between the Parameter, and 16 Feet 1 Inch.

PROP. V.

Problem 2. Having the Parameter, Horizontal Distance, and Height or Descent of an Object, to find the Elevations of the Line of Directions necessary to hit the given Object; that is, Having GM , MX , and the greatest Random equal to half the Parameter; to find the Angles $FG B$.

Let the Tangent of the Angle sought be $= t$, the Horizontal Distance $GM = b$, the Altitude of the Object $MX = h$, the Parameter $= p$; and Radius $= r$, and it will be as r to t , so b to $\frac{t b}{r} = ML$, and $\frac{t b}{r} + b$ in Ascents

$= LX$, and $\frac{p t b}{r} + p b = GL \square = + Y \square$ by reason of the Parab. but $b b + \frac{t t b b}{r r} = GL$

$\square. 47. 1$ Euclid. Wherefore $\frac{p t b}{r} + p b =$

$b b + \frac{t t b b}{r r}$ which Equation transposed, is $t t b b = \frac{p t b}{r} + p b - b b$, divided by $b b$

is $\frac{t t}{r r} = \frac{p t}{b r} + \frac{p b}{b b} - 1$. This Equation shews the Question to have two Answers, and the Roots thereof are $\frac{t}{r} = \frac{p}{2 b} + \sqrt{\frac{p p + 4 p b}{4 b b}} - 1$.

From which I derive the following Rule.

Divide half the Parameter by the Horizontal Distance, and keep the Quote, viz. $\frac{p}{2 b}$, then say, As Square of the Distance given to the half Parameter, so half Parameter $+ double$ Height to the Square of the Secant $= \frac{p p + 4 p b}{4 b b}$ the Tangent answering to that Secant, will be $\sqrt{\frac{p p + 4 p b}{4 b b}} - 1$ or $r r$: So then the Sum

and

too deep in the Ground, to do all that Damage they might, if they came more Oblique, and broke upon or near the Surface of the Earth; which is a thing acknowledged by the Besieged in all Towns, who unpave their Streets to let the Bombs bury themselves, and thereby stifle the force of their Splinters.

A Second Convenience is, That at the extrem Elevation, the Gunner is not obliged to be so Curious in the Direction of his Piece, but it will suffice to be within a Degree or two of the Truth; whereas in the other Method of Shooting he ought to be very curious.

But a Third, and no less considerable Advantage is, in the saving of the King's Powder, which in so great, and so numerous Discharges, as we have lately seen, must needs amount to a considerable Value.

And for Sea Mortars, it is scarce practicable otherwise to use them, where the Agitation of the Sea continually changes the Direction of the Mortar, and would render the Shot very uncertain, were it not that they are placed about 45 Degrees of Elevation, where several Degrees above or under, make very little difference in the Effect.

In Numb. 179. of these *Transactions*, I considered and demonstrated all the Propositions relating to the Motion of the *Projectiles*, and gave a Solution to this Problem, viz. To hit an Object above or below the Horizontal Line, with the greatest Certainty and least Force, as may be seen in that *Transaction*, p. 16, 17. That is, That the Horizontal Distance of the Object being put $= b$, and the perpendicular Height $= h$, the Charge requisite to strike the Object with the greatest Advantage, was that which with an Elevation of 45 Degrees, would cast the Shot on the Horizontal Line, to the Distance of $\sqrt{bb + hh} + h$, when the Object was above the Horizon; or if it were below it, the Charge must be lesser, so as to reach on the Horizon, at 45 Degrees Elevation, no greater a Distance than $\sqrt{bb + hh} - h$; that is in the one Case, the Sum of the Hypothenusal Distance of the Object from the Gun, and the Perpendicular Height thereof above the Gun; and in the other Case, when the Object is below the Horizon, the Difference of the same, per 47. 1. Euclid.

And I then shewed how to find the Elevation proper for the Gun so charged, viz. As the Horizontal Distance of the Object, to the Sum or Difference of the Hypothenusal Distance, and Perpendicular Height :: So Radius to the Tangent of the Elevation sought. But I was not at that time aware that the aforesaid Elevation did constantly bisect the Angle between the Perpendicular and the Object, as is demonstrated from the Difference and Sum of the Tangent and Secant of any Arch, being always equal to the Tangent and Co-tangent of the half Complement thereof to a Quadrant.

Having discovered this, I think nothing can be more compendious, or bids fairer to compleat the Art of Gunnery, it being as easie to shoot with a Mortar at any Object on Demand, as if it were on the Level: Neither is there need of any Computation, but only simply laying the Gun to pass, in the middle Line between the Zenith and the Object, and giving it its due Charge. Nor is

there any great need of Instruments for this Purpose: For if the Muzzle of the Mortar be turned truly Square to the Bore of the Piece, as it usually is, or ought to be, a piece of Looking-glass Plate applied parallel to the Muzzle, will by its Reflection give the true Position of the Piece; the Bombardeer having no more to do, but to look perpendicularly down on the Looking-glass, alongft a small Thread with a Plummer, and to raise or depress the Elevation of the Piece, till the Object appear reflected on the some Point of the Speculum, on which the Plummer falls; for the Angle of Incidence and Reflection being equal, in this case a Line at Right Angles, to the Speculum, as is the Axis of the Chafe of the Piece, will bisect the Angle between the Perpendicular and the Object, according as our Proposition requires. So that it only remains by good and valid Experiments to be assured of the force of Gun-powder. How to make and conserve it equal, and to know the Effect thereof in each Piece; that is, how far differing Charges will cast the same Shot out of it; which may most conveniently be engraven on the outside thereof, as a standing Direction to all Gunners, who shall from thenceforward have occasion to use that Piece: And were this Matter well ascertained, it might be worth the While to make all Mortars of the like Diameter, as near as may be alike in length of Chafe, Weight, Chamber, and all other Circumstances.

This Discovery that the utmost Range on an inclined Plane is, when the Axis of the Piece makes equal Angles with the Perpendicular and the Object, compared with what I have demonstrated of the same Problem in the aforesaid Number 179, does lead to and discover two very ready Theorems; the one to find the greatest Horizontal Range at 45 Degrees Elevation by any Shot made upon any inclined Plain with any Elevation of the Piece whatsoever: And the other to find the Elevations proper to strike a given Object with any Force greater than what suffices to reach it with the aforesaid middle Elevation. Both which being performed by one Single Proportion, may be very serviceable to such as are concerned in the Practice of Gunnery, but are unwilling to trouble themselves with tedious and difficult Rules.

The Two Propositions are, these.

P R O P. I.

A Shot being made on an inclined Plane, having the Horizontal Distance of the Object it strikes, with the Elevation of the Piece, and the Angle at the Gun between the Object and the Perpendicular: To find the greatest Horizontal Range of that Piece, laden with the same Charge; that is, half the Latus Rectum of all the Parabole, made with the same Impercus.

R U L E.

Take half the Distance of the Object from the Nadir, and take the Difference of the given Elevation from that half; the Versed Sine of that Difference subtract from the Versed Sine of the Distance of the Object from the Zenith: Then shall the Difference of those Versed Sines be to the Sine of the Distance of the Object from the

the Zenith, as the Horizontal Distance of the Object struck, to the greatest Horizontal Range at 45 Degrees.

PROP. II.

Having the greatest Horizontal Range of a Gun, the Horizontal Distance, and the Angle of Inclination of an Object to the Perpendicular, to find the two Elevations necessary to strike that Object.

R U L E.

Halve the Distance of the Object from the Nadir, this half is always equal to the half Sum of the two Elevations we seek. Then say, As the greatest Horizontal Range is to the Horizontal Distance of the Object : So is the Sine of the Angle of Inclination or Distance of the Object from the Perpendicular, to a fourth Proportional ; which Fourth being subtracted from the Versed Sine of the Distance of the Object from the Zenith, leaves the Versed Sine of half the Difference of the Elevation sought ; which Elevations are therefore had by adding and subtracting that half Difference to and from the aforesaid half Sum.

I shall not need to speak of the Facility of these Solutions : I shall only observe, That they are both general, without Exception or Caution, and derived from the Knowledge that these two Elevations are equi-distant above and below the Line, bisecting the Angle between the Object and the Zenith.

ORDONANCE, in Architecture, is the giving to all the Parts of an Edifice that just Quantity and Dimension which they ought to have, according to the Model.

OREXIS, is the Natural Appetite of Meat, which proceeds from an Acid Ferment in the Ventricle that comes from the *Caliac* Arteries, with which the nervous Tunick of the Stomach and its Nerves are extraordinarily moved to cover Nourishment. *Blanchard*.

ORGANICAL Part, is that Part of an Animal or Vegetable Body, which is designed for the performing some particular Action : Whereas some Parts are *Non organical* ; which have no particular Action, but rather some Use in the Oeconomy of the Whole.

ORGANS, the Parts of an Animal Body, fitted as Instruments to discharge any particular Office or Function. Thus the Organ of Sight is the Eye with all its Parts ; the Organ of Hearing is the Ear, &c. Therefore by *Organical Parts* are meant the Substantial Parts or Members of the Body, appointed to perform any particular Function or Action.

ORGANUM, or *Organon*, the Name or Title that *Aristotle* gave to his Book of Logic.

ORGASMUS, is an *Impetus* and quick Motion of Blood or Spirits ; as when the Animal Spirits rush violently into the Nerves.

ORIENT, is the East Quarter of the *Horizon*, or is that Part of the *Horizon* where the *Ecliptick*, or the Sun therein, ascends into the upper Hemisphere ; and therefore, according to some Writers way of Expression, the

Estival ORIENT, is that Point of the *Horizon* where the Sun rises, when he enters into *Cancer*.

Equinoctial ORIENT, is that Point of the *Horizon* which the Sun rises upon, when he enters into *Aries* or *Libra*.

ORIENTAL, in Astronomy : A Planet is said to be *Oriental*, when it rises in the Morning before the Sun.

ORIFICE, the Mouth, Entry, or Brim of any thing, more-especially that of a Wound, Vein, Tube, &c.

ORIGINAL Equations. A Term used by *Harriot* in his Algebra ; see *Quadratick Equations*.

ORIGINALIA, in the Treasurer's Remembrancer's Office in the *Exchequer*, are Records or Transcripts sent thither out of the *Chancery*, and are distinguished from *Recorda*, which contain the Judgments and Pleadings in Suits tried before the Barons of that Court.

ORILLON, in Fortification, is a small Round- ing of Earth lined with a Wall, which is raised on the Shoulder of those Bastions that have Caisements, to cover the Cannon in the Retired Flank, and prevent their being dismounted by the Enemy.

There are also other sorts of *Orillons*, properly called *Shoulderings* ; which are almost of a Square Figure : They are also called *Epaulements*.

ORION, a Southern Constellation, consisting of 39 Stars.

ORGUES, in Fortification, are many Harquebusses link'd together, or divers Musket-Barrels laid in a row, within one Wooden Stock, so that they may be discharged either all at once, or separately. They are made use of to defend Breaches and other Posts that are attack'd.

This Term is also appropriated to certain long and thick pieces of Timber, arm'd with Iron Plates at the ends, and separated one from another. They are hung with Cords over the Gates of a Town or Fortrefs, and in Case of Surprise, let fall perpendicularly ; by which means the Passage is stop'd, so that the Enemy cannot easily remove or hoist up all the Wooden Bars with a Leaver, or any other Machine set under them : On which account these *Orgues* are to be prefer'd before *Hermes* or *Portcullices*, because the Pieces whereof the latter consist are join'd together ; so that when any Part is hung or heaved up, the whole Machine is likewise removed. These *Orgues* therefore are much better than *Portcullices*.

ORLE, is an Ordinary in Heraldry, almost of the Figure of an *Inescutcheon*, only it is voided, so that the Field appears through ; Thus : He beareth *Or*, an *Orle Azure*, by the Name of *Bertram*. Whenever an *Orle* is flowered, it is called a *Tressure* ; and if there be two of them, a *Double Tressure*.

Sometimes an *Orle* consists of three pieces one within another. Also if a Round of *Martlets*, *Cinquefoils*, *Escallop-shells*, &c. are placed about any Ordinary, 'tis called an *Orle* of *Martlets*, *Cinquefoils*, &c.

ORLE, a Term in Architecture ; the same with *Plinth*, which see.

ORLOPE, properly the Spare-Deck in a great Ship, reaching from the Main-mast to the Mizen ; and in a Three-Deck'd Ship the Second and Lowest Deck are sometimes called *Orlopes*.

ORNAMENTS, in Architecture, are the *Architraves*, *Frizes*, and *Cornices* of the several Orders. But there are also many Ornaments frequent-

ly carved in the Mouldings, and on all other Members; as divers sorts of *Leaves, Chanellings, Wreaths, Ovals, Chaplets, Tresses, Festoons, Flowers, Roses, &c.* The Ornaments of the Columns the French call *Oeufs*.

ORNITHOLOGY, is a Description of the several Natures and Kinds of Birds.

OROBIDES, is a subsiding in Urine, like to a kind of Pulse called *Vetches*. *Blanchard*.

ORTEIL, a Term in Fortification; the same with *Berne*, which see.

ORTHODROMIQUES, is the Art of sailing in the Ark of some great Circle: For the Ark of every great Circle is *orthodromia*, the shortest straight Distance between any two Points on the Surface of the Globe.

ORTHOGRAPHY, in *Grammar*, is writing and spelling any Language truly, according to its just Etymologies and Proprieties.

ORTHOGRAPY, in *Mathematicks*, is the true Delineation of the fore-right Plain of any Object.

In *Architecture*, 'tis taken for the Model, Platform, and Delineation of the Front of a House that is to be built and contrived according to the Rules of Geometry; according to which Pattern, the whole Fabrick is erected and finished.

In *Perspective*, the *Orthography* of any Body, or Building, is the foreright side of any Plane; that is, the Side or Plane that lies parallel to a straight Line, that may be imagined to pass thro' the outward Convex Points of the Eyes, continued to a convenient Length. The Word *Orthography* is used by *Lamy* and Others in the same Sense.

In *Fortification*, it is the Profile or Representation of a Fortrefs, made after such a manner, that the Length, Breadth and Height of its several Parts may be discovered.

ORTHOGRAPHICAL Projection of the Sphere, is the drawing the Superficies of the Sphere on a Plane which cutteth it in the middle, the Eye being placed at an infinite Distance vertically to one of the Hemispheres; then a Right Line extended from the Eye to any assigned Point in the Surface of that Hemisphere, shall project the assigned Point upon the Plane; and the Distance upon the Plane from the Apex, or top of the Hemisphere to the projected Point, is equal to the Sine of the Ark, from the Vertex of the Hemisphere to the assigned Point, the Radius being the Semi-diameter of the Sphere. This Projection is also called the *Analemma*, which see.

ORTHOAGONIAL, the same with *Right-angled*; and when referred to a Plain Figure, supposes one Leg or Side to stand perpendicular to the other: And when it is spoken of Solids, it supposes their Axis to be perpendicular to the Plane of the Horizon.

ORTHOPNOEA, is an ill Respiration, when the Person affected cannot breathe but with his Neck erect.

OS, a Bone, is an hard, dry, and cold Substance, consisting especially of earthy and saline Particles; which Particles, saith *Dr. Havers*, being in their several Series united at their Extremities, form Strings; and those Strings united make distinct Plates, which lying one above another, constitute the whole Thickness of the Bone.

The Bones in an Human Body, are designed for the upholding of the Body, to render its Mo-

tion easie, and for a Fence for several Parts. Some make the Number of the Bones to be 249, others commonly 304, and others as many as the Days of the Year; yet the Number of them is uncertain, because the Bones of Infants differ from those of Adult Persons; also, because the Bones called *Sesamoides*, (see them in their proper Place) and the Teeth, are not determined to a certain Number in Old Men and Adult Persons. They are of different Shapes; some are round, others plain, acute, obtuse, hollow, spongy, solid, oblong, triangular, &c. If you would find any particular Bone, see the Word that distinguishes it; as, for *Os frontis*, or *Coronale*; see *Frontis Os*, or *Coronale*.

OS Calcis. See *Calcaneus*.

OSCILLATION. If a Ball be hung at the end of a String or Wire, and that Wire or String hang on a Pin fastened above, so that the Ball may swing or play freely on that Pin, it is called a *Pendulum*, and the Pin is the Centre of Suspension: But if you imagine the Pin to be the Centre of a Circle, whose Circumference shall divide the Ball or Bob into two equal Parts, the middle Point of the Ark, so dividing the Ball, is called the Centre of Oscillation. If the Bob be of any other Figure but orbicular, the Centre of Gravity of it will be the Centre of Oscillation.

N. B. The shorter the Oscillations or Swings are, the truer will the *Pendulum* measure Time; or the more *Isochrone* will the Vibrations be, as some love to express themselves.

To find the Centre of Oscillation exactly, in order to adjust the Royal Pendulum of a Clock, *Mr. Hugen* gives this Proportion, (*Horol. Oscillat. p. 141.*)

As the Length of the String from the Point of Suspension, to the Centre of a Ball or Bob: is to the Semi-diameter of that Ball or Bob:: so is that Semi-diameter to a Fourth Number.

Add $\frac{3}{4}$ of that Fourth Number to the former Length, and you have the Centre of Oscillation.

But this Term, the Centre of Oscillation is often in *Mechanicks* taken in a more large and comprehensive Sense. As suppose there be a *Libra*, as B D, having the Weights B and D,

hanging at its ends by their Centres of Gravity B and D; and let the Point C be the *Hypomochlion*, *Fulcrum* or Prop which is supposed to support the *Libra* in the common Centre of Gravity C, belonging to the two Bodies B and D; then will those Weights be in *Equilibrio*. Let this *Libra*, with the Weights B and D hanging at it, descend perpendicular to the Horizon all together, and still retain a Parallelism to itself

self in its first Situation; and as it thus moves, let it meet with an Obstacle, as E, which shall strike it in C, the above-mentioned common Centre of Gravity: Then because the Descent of the *Libra* was by a parallel Motion, the Points B and D will have acquired equal Velocities; and consequently the Weights hanging at such Points will also gain equal Velocities; and therefore if the *Libra* strike upon E, the *Æquilibrium* must continue the same as before, that is, will not oscillate or swing any way, but keep at Right Angles with the Line CE: Wherefore C is both the common Centre of Gravity, and also of Oscillation.

But supposing the *Libra* to turn round the Centre A, or to swing on it like a *Pendulum*, with its Weights B and D affixed to it, as before: In this Case will the Weights B and D acquire each a Degree of Velocity, proportionable to their respective Distances from the Centre. And consequently if *o* (suppose) had been their common Centre of Gravity, before the new Rotation of the *Libra* round A, it cannot now be the Point on which the Revolving Bodies B and D will poize, or be in *Æquilibrio*: That is, the Point *o* cannot be the Centre of Oscillation.

For since *o* is supposed to be the common Centre of Gravity, therefore the Moment of B O \times B, must be equal to the Moment of D O multiplied by D: But since the Velocity of B is to that of D, as A B is to A D; therefore the Compound Moment of B \times B O \times A B cannot be equal to the Compound Moment of D \times D O \times A D; and consequently there cannot be an *Æquilibrium* about the Point *o*: Wherefore if an *Obex* or Obstacle should meet with the *Libra* in the Point *o*, the *Libra* would oscillate or dip towards the Parts of D, because that *Momentum* is the greater of the two. But the true Centre of Oscillation will be a Point as C, taken so, that the Moment of B \times B C \times A B, shall be equal to the Moment of B \times D C \times A D. That is, if A D . A B :: B \times B C . D \times D C, then will C be the true Centre of Oscillation; and if the Revolving *Libra* should be supposed to meet with an *Obex*, it would not oscillate upon it.

In like manner, if instead of a *Libra* burden'd with two Weights, as above, we conceive any plain or solid Figure to revolve about the Centre A, its Centre of Oscillation is to be determin'd by the same Principle.

Thro' the Point C of the Revolving Figure taken in the Axis *e d*, let the Line *k i* be drawn, dividing the Figure into two Parts, *e k i g*, and *k f b i*; the Centres of Gravity of which Parts

suppose to be at *b* and *d*: Then if the Compound Moment of *i e*, *k c* \times *b c* \times *A b* = *k f b i* \times *c d* \times *A d*: for the same Reason as before, C will be the Centre of Oscillation.

This I had from Mr. Humphry Ditton.

OSCITATION, Yawning, is a certain light Convulsive Motion of those Muscles which open the lower Jaw of the Face. Some think that Excrementitious and Halituous Matter, which irritates the neighbouring Parts, is expelled by this Action of Yawning.

OScula, are the Openings of Vessels in an Animal Body, at their ends.

OSculATORIUS Musculus. See *Orbicularis*.

OS Mali. See *Zygoma*.

OS Unguis. See *Unguis Os*.

OS Occipitis. See *Occipitis Os*.

OS Palati. See *Palati Os*.

OSSA Parietalia. See *Parietalia Offa*.

OSSA Temporum. See *Temporum Offa*.

OS Sphenoides. See *Sphenoides*.

OSSICULUM, among the Botanists, is the Stone of a Plum, Cherry, or such like Fruit.

OSTENSIVE Demonstrations, are such as plainly and directly demonstrate the Truth of any Proposition; in which they are distinguished from *Apogogical* ones, or *Deductiones ad Absurdum*, five *ad Impossibile*, which prove the Truth proposed, by demonstrating the Absurdity or Impossibility of asserting the contrary.

OSTENSIVE Demonstrations, are of two sorts: Some of which barely (but directly) prove the Thing to be, which they call *veri*; and Others demonstrate the Thing from its Cause, Nature, or Essential Properties, and these are called in the Schools *divini*.

OSTEOLOGIA, is a Description of Bones.

OSTOCOPI, are Pains in the Bones, or rather in the Membranes and Nerves about the Bones: For Bones, as such, are insensible. *Blanchard*.

OTACOUSTICKS, are Instruments which help or improve the Sense of Hearing. See *Acoustica*.

OTALGIA, is a Pain in the Ears, whence-soever it proceeds.

OTENCHYTA, an Auricular Clyster. *Celsus* calls it *Oegin*, a little Syringe or Squirt which injects Medicines into the Ears.

OTICA, are Medicines against Distempers in the Ears.

OVAL, in Architecture, the same with *Echinus*. Some write it *Obo*, because of its Figure, being like an Egg. It is placed in the Mouldings of the Cornices, for Ornament; and in a Pillar it is placed next the *Abacus*.

OVAL Figure, in Geometry, is a Figure bounded by a regular Curve Line returning into its self; but of its two Diameters cutting each other at Right Angles in the Centre; one is longer than the other, in which it differs from the *Circle*. See *Ellipsis*.

OVAL Window, one of the Holes in the Hollow of the Ear, opening pretty wide into the *Labyrinth*; the other being called the *Round Window*.

OVARIA, are the Testicles of Females, and are so called, because they resemble and have the same Use as the Lathers or Collections of Eggs in the Bodies of Fowls.

OVEL

OVELTY of *Services*, in Law, signifies Equality of *Services*; as when the Tenant Paravail owes as much to the Mesne, as the Mesne does to the Lord Paramount.

OVER-Rake. When a Ship, riding at Anchor, doth so over-beat her self into a Head Sea, that she is wash'd by the Waves breaking in upon her, then they say the Waves do *Over-rake her*.

OVERT-ACT, a Term in Law, signifying an Open ACT, which may be manifestly proved.

OVIDUCTUS, the same with *Tubā Fallopiana*.

OVIPAROUS Animals, are such as lay Eggs.

OUTACoustacon, an Ear-pipe to augment Hearing.

OUTLAW, signifies one deprived of the Benefit of the Law, and out of the King's Protection.

OUTLAWRY, is the Loss of the Benefit of a Subject, that is, of the King's Protection. See *Outlawry*.

OUTLICKEr, in a Ship, is a small piece of Timber three or four Yards long, as Occasion serves, and is made fast to the top of the Poop, and so stands right out a-stern: At the outmoſt end of it is a Hole, into which the standing part of the Sheet is reeved and made fast through the Block of the Sheet; and then again reeved thro' another Block, which is seized to this Outlicker, hard by the end of it. This is seldom used in Men of War, or in great Ships; and whenever it is made use of, it is because the Mizen-mast is placed so far aft, that there is not room enough within board to hale the Sheet flat.

OUTRIDERS, in Law, are Bailiffs Errant employed by the Sheriffs, or their Deputies, to ride to the farthest Places of their Counties or Hundreds, with the more speed to Summon such as they thought good to their County or Hundred Courts.

OUTWARD Flanking-Angle, or the *Angle of the Tenaille*, is comprehended by the two Flanking Lines of Defence.

OUT-Works, in Fortification, are all sorts of Works which are rais'd without the Inclosure of a Place, and serve for its better Defence, and to cover it from the Enemy, in the Plain without; as, *Ravelins, Half-moons, Horn-works, Crown-works, Counter-guards, Tenailles, &c.*

It is a general Rule in all Out-works, that if there be several of them one before another to cover one and the self-same *Tenaille* of a Place, the nearer ones must gradually, and one after another, command those which are farthest ad-

vanced out into the Campain; that is, must have higher Ramparts, that so they may over-look and fire upon the Besiegers, when they are Masters of the more outward Works.

The *Gorges* also of all Outworks must always be plain, and without Parapets; lest, when taken, they should serve to secure the Besiegers against the Fire of the Retiring Besieged; wherefore the *Gorges* of Out-works are only Pallisado'd, to prevent a Surprise.

Ouverture, is a kind of Musick, usually played at the Opening or Beginning of an Opera; it commonly ends with a *Fugue*.

OVUM, by some Writers, is a Name given to a certain Pain in the Head, affecting one particular Spot, no bigger than the End of an Egg; whence the Name.

OWELTY, in Law, is when there is Lord, Mesne, and Tenant; and the Tenant holds of the Mesne by the same Service that the Mesne holds over the Lord above him: This is called *Owely of Services*. See *Owely*.

OXELEUM, is a Mixture of Vinegar and Oil.

OXYCRATUM, is a Mixture of Vinegar with Water, called *Pusca* or *Posca*.

OXYDERCICA, are Medicines which quicken the Sight.

OXYGALE, is Sowre Milk.

OXYGONE, the same with an *Acute-Angled Triangle*; which see. And in the General,

OXYGONIAL, is *Acute-Angular*.

OXYMEL, is a Composition of Vinegar and Honey, like a Syrup.

OXYREGMIA, is an acid sowre Belch from the Stomach.

OXYRHODINUM, is Vinegar of Roses mix'd with Rose-water.

OYER and *Terminer*, in Law, is a Commission especially granted to some Eminent Persons for the hearing and determining one or more Causes: It is the first and largest of the Commissions, by which the Judges of Assize do sit in their several Circuits.

OYER de Record, is a Petition made in Court, That the Judges, for better Proofs sake, will be pleased to hear or look upon any *Record*. So when an Action is brought upon an Obligation, the Defendant may pray *Oyer* of the Bond; or if Executors sue for any one, the Party sued may demand *Oyer* of the Testament.

OZOENA, is an old stinking Ulcer in the inside of the Nostrils, taking its Name from the Fulsonness of its Smell.

P A C

PACHUNTICK Medicines (from *παχυνσις*) Thick, Dense, &c. are such as are of a thickning Nature, and withal cold; these when mix'd with a thin Juice, by joining the Parts together stiffen it, and make it of a more Dense, and firm Composition: Such as Bole-Armoniack, Almonds, Poppies, Water-Lilies, &c. *Blanchard.*

PAINE fort & dure, in Law it signifies an especial Punishment for him that being Arraigned of Felony, refuses to put himself upon the ordinary Trial of God and his Country, and thereby stands Mute by the Interpretation of the Law.

And is thus described by *Stamford.*

"He shall be sent back to the Prison, whence he came, and laid in some low dark House, where he shall lie Naked on the Earth, without any Litter, Ruffes, or other Cloathing, and without any Rayment about him, but only something to cover his Privy Members: And he shall lie upon his Back, with his Head covered and his Feet; and one Arm shall be drawn to one quarter of the House with a Cord, and the other Arm to another quarter, and his Legs used in the same manner; let there be laid upon his Body, Iron and Stone as much as he may bear, or more: And the next Day following he shall have three Morfels of Barly-bread, without Drink; and the second Day he shall have Drink three times, as much at each time as he can Drink of the Water next unto the Prison, except it be running Water, without any Bread: And this shall be his Diet till he Die."

This sort of Punishment, called by the Law *Paine forte & dure*, is that which is vulgarly called *Pressing to Death.*

PALATUM, the Palate, is the upper part of the Mouth, which because it resembles the Roof of an House, is thence called the *Roof of the Mouth.*

PALATI Os, is a small Bone almost square, it makes the posterior part of the Roof of the Mouth: It is joined to that part of the Os *Maxillare*, which makes the fore-part of the Palate; it is also joined to its Fellow, and the *Processus Pterigoides*. It has a small Hole, thro' which a Branch of the fifth pair of Nerves goes to the Membrane of the Palate.

PALINDROME, is a Disease into which one relapses. *Blanchard.*

PALE, one of the Eight Honourable Ordinaries in Heraldry, containing the third part of the Escutcheon, thus:

He beareth *Gules, a Pale Or.*

P A L

PALL, the *Heralds* have a kind of Cross, which they call by this Name, and they describe it thus:

He beareth *Gules a Cross Pall Argent.*

PALLET, is the Moiety, or half of the *Pale*, and must never be charged with any thing either Quick or Dead; neither can it be divided into two equal parts, but it may into four, for one fourth part of the *Pallate*, or $\frac{1}{4}$ part of the *Pale*, is called an *Endorse*.

If the *Pale* be upon any Beast, they say the Beast is *Debrused with the Pale*: But if the Beast be upon the *Pale*, they say he is *Supported of the Pale*.

Pallets also is a Term which belongs to the *Ballance* of a Watch or Movement. See *Ballance*.

PALLET is a Room within the Hold of a Ship, closely parted from it, in which by laying some Pigs of Lead, &c. a Ship may be sufficiently Ballasted, without losing room in the Hold; which therefore will serve for Stowing the more Goods.

PALLIATION of a Disease, or a *Palliative Cure*, is a Method which helps (as much as is possible) incurable Diseases by the Application of prevent Remedies.

PALLIER, a Landing-place in a Stair-Case or a Step, which being much broader than the others, serves to rest upon.

PALLISADOES, or *Pallisades* in Fortification, are strong Wooden sharp-pointed Stakes, six or seven Inches square, eight Foot long, of which three Foot is in the Ground, set up half a Foot sometimes one above another, with a cross piece of Timber that binds them together: Some of these are also sometimes arm'd with two or three Iron-Spikes.

These *Pallisadoes* are usually fixed in the void Spaces without the *Glacis*, near the Bastions and Curtains; and in the Avenues of all such Posts as are liable to be surprized by the Enemy, or carried by Assault. Sometimes they are driven downright in the Ground, and sometimes stand at an Acute Angle towards the Enemy, that if they should throw Cords about them to pull them up, they may slip off again.

Pallisadoes are always planted on the *Berne* of Bastions, and at the *Gorges* of Half-Moons and other Out-works: They also *Pallisade* usually the Bottom of the Ditch; and to be sure, the *Parapet* of the *Covert way*: And tho' sometimes they have placed these *Pallisadoes* three Foot from the said *Parapet* outwards towards the Campaign, yet of late they have been planted in the very middle of the *Covert way*: All *Pallisadoes* should stand so close, as to admit between them only the Muzzle of a Musquet, or a Pike.

PALMARIS *Longus*, is a Muscle of the Palm of the Hand, which has an Acute Beginning from the Internal Exuberance of the Os *Humeri*; and soon becoming a Fleishy Belly, and contract-

ing

For let EF be called ib , as EI was before called eb : Then the Parameter being $\frac{ooo}{b}$

the Square of FG the Ordinate, will be equal to the Parameter multiplied by ib the *Abcissa*; that is $= oicc$: as before, the Square of KI was $= oecc$. But Rectangles having the same Bases, are as their Altitudes; wherefore these Rectangles will be as the *Abcissa*: And these Rectangles are $=$ to the Squares of the Ordinates; wherefore the Squares of the Ordinates are as the *Abcissa*. Q. E. D.

COROLLARY.

If a Line, as LO, be drawn parallel to the Diameter or Axis of the Section, and be cut by the Transverse Line EG in M, and by the Curve of the Parabola in K; then shall OL, ML, and KL, be in continual Proportion.

For the Triangles EFG and ENM being similar, and NM parallel to FG, EF must be to EN:: as FG: NM (*i. e.* IK). But the Squares of GF and IK are in a duplicate Ratio of EF to EN, and yet are by this Proposition as the *Abcissa* FE and EI; wherefore FE to IE, is in a duplicate Ratio of EF to EN; that is, EF: EN:: EN: EI. And by the Construction of the Figure, it will be the same in LO, which is parallel to EF: that is, OL: ML:: ML: KL: or OL, ML, and KL are in continual Proportion. Q. E. D.

PROPOSITION III.

In the Parabola, the Parameter is to the Sum of any two Ordinates, as their Difference is to the Difference of the *Abcissa*.

I say, EL the Parameter, is to $IK + FG$: (see the last Figure) that is, to HO : OG their Difference, is to IF (or KO) the Difference of the *Abcissa*.

Let EF the greater *Abcissa* be called ib , and the lesser EI, eb . Then, by Prop. I. the Square of the Ordinate KI, will be $oecc$, and consequently the Ordinate it self $= \sqrt{oicc}$; so also putting i instead of e , \sqrt{oicc} will be the Ordinate FG.

Having thus noted them, if you set the *Latus Rectum*, the Sum and Difference of the Ordinates, and the Difference of the *Abcissa*, after the manner of four Terms, in disjunct Geometrical Proportion (as below) you will find the Rectangles of the Extremes and Means equal, and consequently the four Terms to be truly proportional. Q. E. D. As,

Param.

ooo : Sum of the Ord. :: Diff. of the Ord.: D. *Abf.*

$b \cdot \sqrt{oicc} + \sqrt{oicc} \cdot \sqrt{oicc} = oicc - \sqrt{oicc} \cdot \sqrt{oicc} = ib - eb$.

And to avoid the Trouble of Multiplication in Surds, which is the Case of the two middle Terms, you need only consider this Theorem: That the Sum of any Two Quantities multiplied by their Difference, is equal to the Difference of their Squares. For so you will easily find, that the Product in both Cases, will be the same Quantity $oicc - oecc$.

N. B. This is that Property of the Parabola on which our famous Mr. Baker founded his *Clavis Geometrica Catholica*, which was unknown to the Ancients, and communicated to him by Mr. Tho. Storde of Maper-ton in Dorsetshire: And by which he shews how to find the Value of the Unknown Root in all Equations, not exceeding Biquadratics.

See Construction and Central Rule.

This Property of the Parabola, I thus briefly demonstrate in my *Algebra*, p. 78.

Let P be the Parameter of any Parabola, whose two Ordinates are O and o, and their respective *Abcissa* A and a. Then I am to prove that $P: O + o :: O - o : A - a$. Which is clear; because from the first Property of the Parabola, $PA = OO$ and $Pa = oo$. Wherefore $PA - Pa = OO - oo$, from the Nature of Equations. And that last, resolved into Proportionals, will stand thus,

$$P: O + o :: O - o : A - a.$$

Which was the Thing at first proposed to be proved.

A PARABOLICK Space, is that Area contain'd between the Curve of the Parabola and any Entire Ordinate GH.

And this Space is to a Parallelogram circumscribed as 2, 3, and to a Triangle inscribed as 4, 3.

Let FH, the Semi-Ordinate be divided into 4 Parts, or into 8, 16, &c. and thro' the Divisions draw Lines, as ef , ef , &c. to parallel the Axis EF. Suppose also EF to be 4.

Then I say, The Parabolick Space EHF, is to the Parallelogram F.K :: 2. 3. But to the $\triangle E$ FH :: as 4: 3.

Z z z z For;

For, 1. $gf, gf, gf, &c.$ are in continual Arithmetical Proportion from the Nature of Plain Triangles.

2. $fe, ge :: ge, eb$, (by Cor. 1. Prop. 2. of the Parabola.) But be in the Axis $EF = e$, and in the first Parallel ef must be equal to $\frac{1}{2}$; in the next ef , it will be equal to $\frac{4}{3}$; in the third to $\frac{9}{4}$; and so on in a Duplicate Arithmetical Progression. For as $ef (=4) . ge (=1) :: fo$ is $ge (=1) . eb (= \frac{1}{2})$. And as the second $ef (=4) . eg (=2) :: eg 2, to eb = \frac{4}{3}$, &c. And thus will it be if the Lines $Ff, ff, &c.$ be again bisected, &c. *ad Infinitum*. So that all the Indivisibles of the Trilinear Space $E K H E$ will be in a Duplicate Arithmetical Progression increasing. But

3. The Sum of a Rank of such Terms is sub-triple to a Rank of as many equal to the greatest; (as we proved in N^o 7. of *Arithmetical Progression*, which see) wherefore the whole Trilinear Space $E K H E$ is to the Parallelogram :: as 1 to 3. And consequently the remaining Parabolick Space must be to it as 2 to 3. Q. E. D.

And since the Triangle $F E H$ is to the Parallelogram as 1 to 2, it must be to the Parabola as $\frac{1}{3}$ to 2, or as 3 to 4. Q. E. D.

And this is a true and very short Quadrature of the Parabola of which Archimedes wrote so long ago, and many Geometricians have since expedited. 'Tis plain also that this Demonstration is Universal, and extends to any Parabolick Space.

The Quadrature of the Parabola, by the Method of Fluxions, I have formerly in my *Algebra* shew'd to be very briefly thus:

Let the Parameter be $p = 1$, the Abscissa be called x , and the Ordinate y .

Then by the first Property of the Parabola $x = yy$, because $p = 1$.

And consequently by the Extraction of the Roots of each, and using the new Notation,

$x = y$. Then multiplying x by x the Fluxion of the Abscissa, it will stand thus $xx =$ to the Fluxion of the Area. After which find the

Flowing Quantity answering to that Fluxion, which shall give the Area in known Terms.

To do which, the Fluxion being $xx^{\frac{1}{2}}$, first take away the x , and there will remain $x^{\frac{1}{2}}$; next increase the Index of that Power by Unity, and it will stand thus $xx^{\frac{3}{2}}$. Then divide $xx^{\frac{1}{2}}$ by $1 + \frac{1}{2}$ or by $\frac{3}{2}$ (thus $\frac{1}{2}$) $\frac{xx^{\frac{1}{2}}}{\frac{3}{2}} \left(\frac{2xx^{\frac{1}{2}}}{3} \right)$ and the Quotient you see will be $\frac{2xx^{\frac{1}{2}}}{3}$.

Lastly, instead of $x^{\frac{1}{2}}$ substitute what was before found equal to it, viz. y , and it will be $\frac{2xy}{3} =$ to the Area of the Semi-parabola VMP.

And if you double that, you will gain the Area of the whole Parabola MVO.

Wherefore the Parabolick Area is Two thirds of a Rectangle under the Abscissa and the Ordinate. Q. E. D.

The Following General Method for the Quadrature of all manner of Parabolick Curves, is Mr. Humphrey Ditton's.

The General Equation of these Curves, is $r^{\frac{p-q}{p-1}} x^{\frac{q}{p-1}} = y^{\frac{p}{p-1}}$, where p and q are the Indices, and r is the Latus Rectum: That is, because of r a stable quantity, $x^{\frac{q}{p-1}} = y^{\frac{p}{p-1}}$, wherefore in Fluxions $p y^{\frac{p}{p-1}-1} = q x^{\frac{q}{p-1}-1}$, and from the General Equation, it is $y^{\frac{p}{p-1}-1} : x^{\frac{q}{p-1}-1} :: x : y$, wherefore substituting x and y , instead of $y^{\frac{p}{p-1}-1}$, and $x^{\frac{q}{p-1}-1}$ in the Fluxional Equation, we have $p x y = q y x$, but all $xy =$ all $SHMN =$ the Complement, and all $y x =$ all $PLMN =$ the Area: The Area therefore is to the Complement as $p . q$. Q. E. D.

PARABOLICK Pyramidoid, is a solid Figure, so named by Dr. Wallis from its Genesis, or Formation, which is as follows.

Let all the Squares of the Ordinate Applicates in the Parabola be imagined to be so placed, that the Axe shall pass thro' all their Centres at Right Angles.

Then will the Aggregate of these Planes, which he proves before to be Arithmetically proportional (Prop. 9. Wallis Con. Sect.) Form the Parabolick Pyramidoid.

Whose Solidity is gain'd by multiplying the Base by half the Altitude: The Reason of which is clear; for its component Planes being a Series of Arithmetical Proportionals beginning from 0, their Sum will be = to the Extrems multiplied by half the Number of Terms, i. e. in the present case = to the Base multiply'd by half the height.

PARABOLICK

PARABOLICK *Cuneus*, is a Solid mention'd by the same Author, and formed thus :

Multiply all the DB's into the DS's, or which is the same thing, upon the Base APB erect a Prism, whose Altitude shall be AS or PS; and this shall be the *Parabolick Cuneus*, which must of Necessity be equal to the *Parabolick Pyramidoid*; being all the Component Rectangles in one, are severally equal to all the Component Squares in the other.

PARABOLICK *Conoid*, is a solid Figure made by the Rotation of a *Semi-Parabola* about its Axis, and is $\frac{1}{2}$ of its circumscribing Cylinder: And the Circles which may be conceived to be the Elements of this Figure, are in an Arithmetical Proportion decreasing towards the Vertex.

A PARABOLICK *Conoid*, ASB *b* C, is to a Cylinder of the same Base and Height, as 1 to 2; and to a Cone of the same Base and Height, as $\frac{1}{2}$ to 1.

Let BD be divided into Three equal parts; then $\square AD : \square SH :: BD : BH$, (by the second Property of the *Parabola*) that is, as 3 to 1, and $\square AD : \square TI :: BD : BI :: 3 : 2$. Wherefore 'tis plain, That the Squares on SH, TI and AD, (as also on Sb, Ti, and AC) and the Circles answering to them, will be in Arithmetical Progression, or as 1, 2, 3; and thus it will be *ad Infinitum*, if the Three Divisions be bisected, and those again bisected, &c. But a Rank of Numbers in simple Arithmetical Progression, will be to a Rank of as many equal to the greatest as 1 to 2, and consequently, the *Pa-*

rabolick *Conoid*, will be just half the Cylinder. Q. E. D.

And a Cone being $\frac{1}{3}$ of the Cylinder, the *Conoid* will be $\frac{1}{2}$ of it; and therefore Cylinder *Conoid*, and Cone will be as 3, $\frac{1}{2}$, 1.

PARABOLICK *Spindle*, is a solid Body made by Rotation of a *Semi-parabola* about its *Ordinate*; and is equal to $\frac{8}{7}$ of its circumscribing Cylinder, Cavalieri Exerc. Geometr. p. 282.

PARABOLISMUS, the same with the Depression of an Equation. See Equation, N 3.

PARACELSISTICK Medicines. See Hermetical.

PARACENTESIS, or *Punctio*, is a Perforation of the Ghest, or Abdomen. It is made in the Breast, when that is stuffed with putrified Matter, or Water, and then the Perforation is made in the Side between the fifth and sixth Vertebra. It is made in the Abdomen, when that is swelled by a Dropsie, and near the *Linea Alba*, in the Muscles that either ascend right or oblique: In which last Case, if a Man be strong, and has taken a Purge, and also his Lungs, and the rest of his Entrails be uncorrupted, when you see the Navel doth Proruberate, there you must make the Incision; don't let Purulency and Water come out both together, for that were to kill the Patient, but one after the other: As in Seven Days about a Pound, or a Pound and a half, as the Patient can endure it: After the Operation is finished, draw the Wound up with an Astringent Plaister. Blanchard.

PARACIUM, in Law, signifies the Tenure that is between *Parceners*, viz. That which the Youngest oweth to the Eldest.

PARACHYNANCHE, is an Inflammation with a continual Fever and difficulty of Breathing excised in the outward Muscles of the Larynx.

PARACMASTICA, is a daily declining Fever; also declining Age. Blanchard.

PARADE, is a Military Word, signifying the Place where Troops usually draw together, in order to mount the Guards, or for any other Service.

PARALLAX, is that Arch of a great Circle, passing thro' the Zenith and true Place of the Sun or Stars, and intercepted between the true and apparent Place.

In this Figure,

A, denotes the Centre of the Earth.
B, the Place on the Superficies of the Earth, from whence the Star is seen.
S, S', the Stars or Planets Places in their Orbs.
A S C, A O E, A G, the Lines of their true Places.

B S D,

B ♂ D, B ⊙ F, B ◐, the Lines of their apparent Places.

Here the Angle made by the Interfection of the said two Lines thro' the Body of the Planer, is the Angle of *Parallax*.

That is,

In *Mars*, the Angle A ♂ B = Angle C ♂ D,
(by 15 e. i.)

In the *Sun*, the Angle of *Parallax*, is the Angle
A ⊙ B = Angle E ⊙ F.

In the *Moon*, it is the Angle A ◐ B = Angle
G ◐ H.

Here 'tis manifest, that the nearest Star is to the Horizon, and Center of the Earth, the greater is the *Parallax*: Whence it is, That the Orbit of the Moon being nearest to the Earth, her *Parallax* is greatest and most perceptible: For the Semi-diameter of the Earth bears a greater Proportion to the Semi-diameter of the Moon's Orbit, than to any of the rest.

The Horizontal *Parallax* of the Moon is the Difference between her Real and Apparent Place when she is either Rising or Setting. As suppose her Setting, then the Angle of the Horizontal *Parallax* will be B ◐ A = O A R. The Knowledge of the Quantity of which, is of the greatest use in Astronomy; because from thence the Distance of the Moon, Sun, (or any other Planet) from the Earth may most easily be had; for in the Triangle B A ◐: A B the Semi-diameter of the Earth, B the Right Angle, and ◐ the Angle of the *Parallax* being known, 'tis easie to find any Side or Angle sought, and consequently A ◐, the Distance of the Moon from the Earth. This came first to be discovered by the ancient Astronomers, thus:

They observed, That the apparent Semi-Diurnal Motion of the Moon was but 4 Degrees, whereas in Reality and Truth, it was 6 Degrees: Wherefore they concluded, That the Moon's Place was put forward in her Rising 1 Degree, and as much put backwards in her Setting; which must needs cause her visible Motion above the Earth in 12 Hours, to be observed nearly 2 Degrees less, than the half of 12 Degrees, her apparent Motion, in 24 Hours.

Wherefore from hence they concluded the Horizontal *Parallax* to be just 1 Degree: which having found, 'twas easie to discover, that A ◐ must be near 60 times A B, or 60 Semi-Diameters of the Earth (i. e. at 70 Miles to a Degree, and 4000 Miles the Earth's Radius) 240000 Miles *English*.

Mr. Auzout gives you a Method to find the Moon's Parallax, thus; On a Day when she is in her Perigee, or Apogee, and in the most Boreal Signs,

Take her Diameter towards the Horizon, and then towards the South, with her Altitude above the Horizon; the Difference of which Diameters will shew the Proportion of her Distance with the Semi-diameter of the Earth; but this is best of all done in those Places where she passes thro' the Zenith.

If the Moon's Horizontal *Parallax* could be truly and exactly found, it would be of prodigious Advantage; for by it the Longitudes of Places on Land (and tolerably well at Sea) might be discovered.

Captain *Halley* saith (at the End of his *Observations and Catalogue of the Southern Stars*), "That 'tis the want of a true Knowledge of *Geometry*, " which hath occasioned the Defects and Mistakes " of Astronomers as to this Point."

He there gives three ways to find the Moon's *Parallax*, which are nearly *Geometrical*, of which the first seems the best; and is thus:

Let two times of Observation be taken when the Sun is (nearly) equally distant from each Node of the Moon, and when the Moon also is to be Northerly in one Node, and Southerly in the other; in these Things there needs no great Exactness, because the Differences of Latitude may be sufficiently supplied from the Tables.

At these Times of Observation, let the visible Places of the Moon, both in Longitude and Latitude be taken, together with her visible Altitudes and Diameters, which let be reduced to the Horizontal; then from the Times and visible Places, let in each Observation the Vertical Angle be computed, which is made with the Circle of Latitude at the Moon's Centre; and then the Difference by which the Southern Latitude exceeds the Northern (in our Northern Part of the World) is the Sum of the *Parallaxes* of Latitude, which must be divided into two Parts; which to do, put into one Sum the Logarithms of the Sine of the Horizontal Semi-diameter of the visible Distance of the Moon from the Vertex, and of the Complement of the Angle of the Vertical Circle, with the Cycle of Latitude, in each Observation.

Then out of the greater Sum, take the lesser, and to the Difference add Radius, the Sum shall be the Logarithm of the Tangent of an Ark, from whence take 45 Degrees; then will it be as Radius to the Tangent of the Remaining Ark:: So is the Tangent of the half Sum of the *Parallax*, to the Tangent of half their Difference: But the half Sum and half Difference together, is the greater *Parallax* of Latitude, and the Difference between them is the lesser. Take this *Parallax* of Latitude out of the visible Southern Latitude; or add it to the Northern, and it will shew the *Inclination*.

And then, lastly, it will be as the Rectangle under the Sines of the Distance seen from the Zenith, and of the Complement of the Angle of the Vertical Circle with the Circle of Latitude, is to the Square of the Radius:: So is the Sine of the *Parallax* of Latitude, to the Sine of the Horizontal *Parallax*.

And there is between the Sine of the Horizontal Semi-diameter of the Moon, and the Horizontal *Parallax*, so constant a Proportion, that if it can be but once known, the Moon's *Parallax* at any time will be had from the Observation of her Diameter.

All the Difficulty of this Process, is, in observing the visible Latitudes of the Moon, and which indeed cannot be had without the Help of the Fixed Stars, whose Latitudes are in no Catalogue yet extant, correct to a Minute: Therefore the accurate Solution of this Problem must depend on some better Tables than are yet published. And those I hope we may expect from the most
Accurate

Accurate Astronomer, Mr. *Flamsteed*, when he hath finished his Catalogue of the Fixed Stars, which he is now about.

In the Ingenious Dr. *Gregory's Astronomia Physica & Geometrica*, you have a great and very useful Variety of Propositions for the finding the Parallax, *Vide Lib. 2. Sect. 7.*

Though there be no Parallax of the Fixed Stars, in respect of the Earth's Semi-diameter, the whole Body of the Earth being but a Point in reference to the Distance between us and the Fixed Stars; yet in respect of the annual Orbit of the Earth, it hath justly been expected by Astronomers, that some Parallax should be found: And this would be a Discovery of great Moment, if it could be made; because it would be an undoubted Demonstration for the annual Motion of the Earth round the Sun, if any such Parallax could be discovered.

This the Ingenious Dr. *Hook* attempted to find by observing the various Distance of a Fixed Star from the Zenith (See a Dissertation of his designedly written on this Subject). And our Excellent Astronomer Mr. *Flamsteed*, actually did observe it by the Access and Recess of a Fixed Star to and from the Pole of the Equator at different Times of the Year.

And he assures us, in his Letter to Dr. *Wallis*, written Decemb. 20. 1698, and published in the Latin Edition of Dr. *Wallis's Works*: "That he found the Distance of a Fixed Star near the Pole of the World to be 40 Seconds, or 45 Seconds nearer to it at the Winter-Solstice than at the Summer one." And this he observed for Seven Years together with great Accuracy.

So that he judges the Objection of *Ricciolus* against the Earth's Motion to be intirely removed, and its Revolution round the Sun proved.

Dr. *Gregory* seems not satisfied with this Proof, (though he believes the Doctrine from other Principles) but inclines rather to the Opinion of *Copernicus*, That the Diameter of the Earth's annual Orbit is insensible, in respect of the Distance of the Fixed Stars. But others may judge whether he brings Reasons sufficient to overthrow Observations so carefully, and so often made, as those produced by Mr. *Flamsteed*. See his *Astron.* P. 275, 276.

PARALLAX of Latitude, is an Arch of a great Circle passing by the Poles of the Zodiac to the apparent Place of the Star, and intercepted between two Circles of the Ecliptick equally distant, whereof the one passeth by the True place of the Star, and the other by the Apparent place.

PARALLAX of Longitude, is an Arch of the Ecliptick (or Parallel thereto) intercepted between two great Circles, whereof the one passeth from the Poles of the Ecliptick, and the true Place; the other from the said Poles by the apparent Place: So that the Parallax of Longitude is only the Difference of the true and apparent Place according to the Longitude of the Ecliptick.

PARALLACTICAL Angle, is an Angle made by the Oblique cutting of a Circle of Altitude, or Vertical Circle with the Ecliptick: How to find it, see *Angle of the Ecliptick with the Vertical Circle*.

PARALLEL Lines, in Geometry, are those which run always equi-distant from each other; so that if they were infinitely produced, they would

neither go further from, nor come nearer to each other; and their Distance is always measured by a Perpendicular, which, where-ever it be taken, is of the same Length, or is always equal to it self.

Thus the two Lines, *a b* and *c d*, are Parallel, if they are equally distant from each other in *a c*, *B D*, *b d*, and in all other Places.

COROLLARY I.

Parallel Lines *P p*, have the same Inclination one as the other, to any Right Line as *Z Z*, which cuts or crosseth them both, and consequently (since an Angle is the Mutual Inclination of two Lines which meet in a Point) the External Angle *o* or *a*, must be equal to the Internal and Opposite One, *f* or *b*: that is, $o = f$, and $a = b$.

For if *o* be not equal to *f*, and *a* not equal to *b*, it must be because the upper Parallel *P*, is either more or less inclined to *Z Z*, than the lower Parallel *p* is; which if true, then the Line cannot be parallel; which contradicts the Supposition.

PROPOSITION.

A Right Line *Z Z* falling on Two Parallel Lines *P p*, makes the alternate Angles $o = f$, and $e = b$; also $o = d$, and $a = g$, and the two Internal Angles $c + b$, or $e + f$ = to two Right ones.

That is, $\begin{cases} 1\ o = f \\ 2\ e = b \\ 3\ o = d \\ 4\ a = g \end{cases}$ and $\begin{cases} 5\ c + b \\ 6\ e + f \end{cases} = 2\text{ Right Angles}$

DEMON-

DEMONSTRATION.

1. $c = f$, because $c = o$, its Vertical or opposite Angle, and $o = f$, by the precedent Corollary.
2. $e = b$, because $= a$, which is $= b$, proved the same way.
3. $o = d$, because $= c$, $= f$, $= d$.
4. $a = g$, because $= e$, $= b$, $= g$.
5. $c + b = 2 L$, because $b + f = 2 L$, (by 13 e 1 Euclid.) and $f = c$ by Step. 1. Wherefore $c + b = 2 L$.
6. $e + f = 2 L$, because $f + b = 2 L$, (by 13 e 1 .) and $e = b$ (by Step. 2.) Wherefore $e + f = 2 L$. See the last Figure.

COROLLARY II.

Two Right Lines as ZZ , parallel to a Third, as T , are parallel to each other. For since the Angle $a = b$, and c also $= b$, because the Outer Lines are parallel to the Inner one: Therefore the Angle $a = c$, i. e. the two Outer Lines, are also parallel by Cor. 1.

PROBLEM I.

A Right Line, as ZQ , being given, to draw another parallel to it, thro' A , a given Point.

From A draw a Line making any Angle, as ABQ , with the given Line; then setting one Foot of the Compasses in A , make the Angle $BAC = ABQ$, so shall CAO be the Line required, for the Angle $A =$ to the Alternate one B .

PARALLEL Sphere, is where the Poles are in the Zenith and Nadir, and the Equator in the

Horizon, which is the Case of such (if any such there be) who live directly under the North and South Pole.

The Consequences of this Position are, That the Parallels of the Sun's Declination will also be Parallels of his Altitude.

The Inhabitants can see only such Stars as are on their side the Equinoctial; and they must have six Months Day, and six Months continual Night every Year; and the Sun can never be higher with them, than 23 Degrees 30 Minutes, which is not so high as he is with us in February.

PARALLEL Ruler, is an Instrument made of Brass, Steel, or Wood, to draw Lines parallel to each other; of great Use in Fortification, Architecture, and many other Parts of the Mathematics.

PARALLELS of Altitude, or Almucanters, are Circles parallel to the Horizon, imagined to pass thro' every Degree and Minute of the Meridian, between the Horizon and Zenith, having their Poles in the Zenith. And on the Globes there are described by the Divisions on the Quadrant of Altitude, in its Motion about the Body of the Globe, when 'tis screw'd to the Zenith of any Place.

PARALLELS of Latitude, on the Terrestrial Globes, are the same with Parallels of Declination on the Celestial. But the

PARALLELS of Latitude on the Celestial Globes, are small Circles parallel to the Ecliptick, imagined to pass through every Degree and Minute of the Colures, and are represented there by the Divisions of the Quadrant of Altitude, in its Motion round the Globe, when it is screw'd over the Poles of the Ecliptick.

PARALLELS of Declination, are Circles parallel to the Equinoctial, imagined to pass thro' every Degree and Minute of the Meridians, between the Equinoctial and each Pole of the World.

PARALLEL Rays, in Opticks, are those that keep an equal Distance from the visible Object to the Eye, which is supposed to be infinitely remote from the Object.

PARALLEL Planes, are those Planes which have all the Perpendiculars drawn betwixt them equal to each other; that is, when they are every where equally distant.

PARALLEL Circles on the Globes, the same with the Lesser Circles.

PARALLELS also on the Terrestrial Globe, are Circles drawn thro' the middle of every Climate, dividing them into two Halves, which are called Parallels.

PARALLELISM of the Earth's Axis, is the Earth's keeping its Axis in its annual Revolution round the Sun, in a Position always parallel to its self, which it doth nearly, but not exactly; for tho' the Difference be insensible in one Year, Dr. Gregory in his Astronomy saith, It becomes sensible enough in many Years.

This Parallelism he shews to be the necessary Result of the two Motions of the Earth, that is round its Axis, and its Annual one; and that there needs no third Motion be feigned to explain it, or account for it: For as the Earth moves Annually round the Sun (without the Diurnal Motion) it moves only according to its Centre of Gravity; and each Point and Line in it keeps always the same Position: Let its Axis be one of those Lines; the Diurnal Revolution of the Earth round this (which as to that Motion is supposed immoveable)

able) cannot change the Position of it; and therefore it will be always the same, *i. e.* always Parallel to it self.

PARALIPSIS (a Figure in *Rhetorick*) is a pretended desire in us of omitting what we say; as if one should say, *I am willing to forget the Wrong that my Enemy has done me; I will not speak of the Injury that I have received from him, &c.*

PARALLELOGRAM in *Geometry*, is a Right Lined Quadrilateral Figure, whose Opposite Sides are Parallel and Equal. To find its Superficial Content: See *Area*.

The Formation, or Generation of all Parallelograms, Squares, and Rectangles, may be thus conceived.

If a Right Line, as AD, having one of its Ends or points in the Top (or Vertex A) of the Angle EAB, be supposed to move downwards, with a Motion always Parallel to its self in its first situation: And as it moves thus, always keep its said end A in the Line AE; till at last it be moved down so low, as that it is all of it gotten within the Legs of the Angle, and is come to lie in the Situation EB: 'Tis plain, this Line AD, will by its Motion downwards have described the Quadrilateral Figure ADBE. And as in its Descent, the Line AD continually cuts the Line AB, so it will describe also on each side of AB the two equal Triangles ADB and AEB. The Parts of the former of which, do continually decrease, as those of the latter AEB do increase.

Also, if either Leg of an Angle EAD, as suppose the Leg AD, or any part of that Leg AB, be conceived to move along the other AE, with a Motion Parallel to its first Situation, it will also describe a Quadrilateral Figure, which if the Describent Line AB, be equal to the Dirigent AE, (for so those two Lines may be called) will be an Equilateral one. But when the Dirigent is either longer or shorter than the Describent Line, then the opposite Sides of the Figure only will be equal.

From which Formation of Quadrangles, (and also of Triangles) these Corollaries may be deduced.

COROLLARY I

That all Quadrilateral Figures thus formed, must also be Parallelograms, or have their opposite Sides equal and parallel. The Reason of which is because the Moving Line, or Describent AD, is always supposed to be carried Parallel to it self; and the Distance between A and D, or A and B the Describent Points, are always the same. 33. *e. 1.*

COROLLARY II

Since the Angles A and E are together equal to two Right Angles, if one be a Right Angle, the other must be so also; and then all the Angles of the Figure will be Right ones, and so 'twill be a Rectangle as AF; and if the Describent be equal to the Dirigent, the Figure will be a Square, as AG. *Cor. 29. e. 1. Eucl.*

Hence also 'tis plain, That the Opposite Angles of every Parallelogram are equal; because they do each of them, with the Angle between them, make two Right Angles.

COROLLARY III

Whence it appears, That every Diagonal AB, Divides, the Parallelogram into two equal Parts: 34. *e. 1. Eucl.*

COROLLARY IV

As also, That every Parallelogram must be Double to a Triangle, having the same, or an equal Base and Height. 41. *e. 1. Eucl.*

For every Triangle that can be drawn on the Base EB, or on a Base equal to it, and having the same Height, or being between the same Parallel Lines, will be equal to the Triangle AEB, which is half the Parallelogram AB, *per Cor. 3.*

COROLLARY V

Hence all Parallelograms that are between the same Parallel Lines, and on one and the same, or equal Bases, must be equal.

I say, The *Parallelograms* AF, DE, GE, having the same Base DE, or its equal GH, must be equal to one another.

For the *Parallelograms* AF, and GE, have both the Describent and Dirigent Lines equal.

And also, AF, and DE, have the same Describent Lines DF; and the Line DE, tho' it go not in the same Dirigent Line to form the *Parallelogram* DE, yet it goes in the whole but the same Perpendicular Altitude, and only moves slower for going Obliquely, but all the Indivisibles or Component Lines in one, must be equal to those in the other.

COROLLARY VI.

Hence also follows, That Triangles on the same, or equal Bases must be equal if they are between the same Parallels; because they are the Halves of equal *Parallelograms*.

COROLLARY VII.

Also from hence is easily proved, That the three Angles a, b, c , of any Triangle, are equal to two Right Angles. (See Fig. 1.)

For since the Angle $c + a + o = 2L$, (because A D is Parallel to E B.)

And that $b = o$, for the same Reason.

Therefore $b + c + a = 2L$. Q E D.

COROLLARY VIII.

If the Line A C, standing at Right Angles with C D, be divided into Three Parts, as C D is into Five; and being made a Describent, be moved along the Dirigent C D, till it come at last to the End of it, and stand in the Position B D; the *Rectangle* A D will by this means be divided into as many little *Rectangles* as the Unites both in the Describent and Dirigent Line will produce, by being multiplied one by another, that is 15; for

3 times 5 is 15. And this is what is called a *Rectangle* made between any two Lines, or the Product arising from the Parts of the one multiplied by the Parts of the other.

And this is usually in the *Latin* Tongue express'd by the Verb *ducere*, which signifies to lead or guide along. As, for Instance, if the Line A C were to multiply C D, they would say in that Language, *Duc A C in C D*; that is, set your Line A C perpendicular to C D; and then keeping it always in that Position, lead or guide it along till it comes to the End of C D, and it will by its Motion have formed the *Rectangle* A D; and by its Three Parts, the 15 little ones within it. And therefore in *Latin* Mathematical Books the Product would be thus expressed, *AC Ducta in CD = 15*.

And from hence 'tis plain, that the Product of any two Numbers is equal to a *Rectangular Parallelogram*, made out of the Multiplicand and the Multiplier, or out of the two Factors, as they are called by some Writers; that is, a *Rectangle* whose two Sides are divided into as many Parts as there are Unites in both Factors.

PARALLELOGRAM, is also an Instrument made of five Rulers of Brass or Wood, with Sockets to slide or set to any Proportion, used to enlarge or diminish any Map or Draught, either in Fortification, Building or Surveying, &c.

PARALLELOGRAM Protractor, is a Semi-circle of Brass, with four Rulers, in form of a *Parallelogram*, made to move to any Angle: one of which Rulers is an Index, which shews on the Semi-circle the Quantity of any inward or outward Angle.

PARALLELOIPEID, is a Solid Figure contained under Six *Parallelograms*, the Opposites of which are equal and parallel; or 'tis a Prism, whose Base is a *Parallelogram*. This is always triple to a Pyramid of the same Base and Height, as is demonstrated under *Proportion of Solids*; which see.

PARALLELOPLEURON, a Word used by some Geometricians for an Imperfect *Parallelogram*, or kind of Trapezium, having unequal Angles and Sides, yet not all so, in regard that at least some of them answer to one another, observing a certain Regularity and Proportion of Parallels; so that they do not extend so largely as Trapeziums, which are any Irregular Four-sided Figures; nevertheless, like them, they are capable of being variously diversify'd.

PARALOGISM, is a pretended Demonstration or Method of Arguing, but which is in reality fallacious and false.

PARALYSIS, the Palsy, is an entire Loss of voluntary Motion or Sense, or both, either in all the Body, or only in some Part. It comes by either an Obstruction, Obfession, Contusion, or pressing of the Nerves, or by an Indispotion, or ill Conformity of the Muscles. *Blancbard*.

PARAMESUS, is the next finger to the Middle one, called the Ring-finger.

PARAMETER, by some, as *Mydorgius* and others, called the *Latus Rectum* of a *Parabola*, is a Third Proportional to the *Abscissa* and any *Ordinate*: So that the Square of the *Ordinate* is always equal to the *Rectangle* under the *Parameter* and *Abscissa*. See the Demonstration under *Parabola*.

This

This Word *Parameter*, or *Latus Rectum*, is also used as to the *Ellipse* and *Hyperbola*; but in thole it hath another Proportion, as you will find under thole Words.

PARAMOUNT, in our Law, signifies the Supreme Lord of the Fee: For there may be a Tenant to a Lord, that holdeth himself another Lord; the former of which is called *Lord Mesne*, and the second *Lord Paramount*. And a *Lord Paramount* consisteth only in Comparison, as one Man may be great, being compared to a less; and little, being compared with a greater. So that none simply seemeth to be *Lord Paramount* but only the King, who is *Patron Paramount* to all the Benefices in England.

PARAPET, in Fortification, is an Elevation of Earth and Stone upon the Rampart, behind which the Soldiers stand secure from the Enemies Great and Small Shor, and where the Cannon is planted for the Defence of the Town or Fortresses. Every *Parapet* having its *Embrasures* and *Merlons*, is about Six Foot high on the Side of the Place; and from Four to Five on that towards the Country. So that this Difference of Heights forms a kind of *Glacis* above, from whence the Musketeers mounting the *Banquet* of the *Parapet*, may easily fire into the Moats, or at least upon the Counterfearp. It ought also to be from 18 to 20 Foot thick, if made of Earth; and from 6 to 8 if of Stone. The Earth is much better than Stone, because Stone will fly to pieces when battered, and do mischief.

This Word *Parapet* is also given to any Line that covers Men from the Enemies Fire: So there are *Parapets* of Barrels, of Gabions, of Bags filled with Earth, &c.

PARAPHANALIA, or, according to the Civil Law, *Paraphernalia*, are those Goods which a Wife, besides her *Dower* or *Jointure*, is after her Husband's Death allowed to have; as Furniture for her Chamber, Wearing Apparel, (and Jewels, if the be of Quality) which are not to be put into her Husband's Inventory, especially in the Province of *York*.

PARAPHIMOSIS, is a Fault of the Yard, when the *Preputium*'s too short; also a Narrowness and Contraction of the Womb.

PARAPLEGIA, is a Palsie which seizeth all the Parts of the Body below the Head, thro' an Obstruction of the Spinal Marrow. *Blanchard*.

PARAPHRENITIS, is madness accompanied with a continual Fever, through the Inflammation of the *Diaphragm*, with Difficulty of Breathing, as the Ancients dream'd. But *Doctor Willis* has confuted this Opinion of it, and says the Matter of it lies in the *Cerebellum*, whereby the Animal Spirits cannot flow, and thence the Midriff and Lungs are troubled. *Blanchard*.

PARAPHROSYNE, is a slight sort of Dreaming in the Imagination and Judgment. *Blanchard*.

PARASELENE, a *Mock Moon*, is occasion'd by the same Means as the *Parhelia* are about the *Sun*; tho' not so frequent.

PARASITICAL Plants, are those which some call *Epidendras*, because they grow not on the Ground, but on the Arms or Limbs of Trees, as our *Viscum* or *Mistletoe* doth.

PARASTATÆ. See *Epididymis*.

PARASYNANCHE, is an Inflammation of the Muscles of the Upper part of the *Oesophagus*, with a continued Fever.

PARAVALLE, in Common Law, signifies the lowest Tenant, or him that is Tenant to one who holdeth his Fee over of another; and is called *Tenant Paravaile*, because it is presumed he hath Profit and *Avails* by the Land.

PARBUNCLE, is the Name of a Rope in a Ship, almost like a pair of Slings: 'tis seized both Ends together, and then put double about any heavy thing that is to be hoisted in or out of the Ship; having the Hook of the Runner hitched into it to hoist it up by.

PARCENERS, is a Word taken either according to the Course of the Common Law, or according to Custom. *Parceners*, according to the Course of the Common Law, are, Where one seized of an Estate of Inheritance, hath Issue only Daughters, and dies, and the Lands descend to the Daughters, then they are called *Parceners*, and are but as one Heir. The same Law is, If he have not any Issue, but that his Sisters be his Heirs.

Parceners, according to Custom, are, Where a Man is seized of Lands in *Gavel-kind*, as in *Kent*, and other Places Franchised, and hath Issue divers Sons, and dies, then the Sons are *Parceners* by the Custom.

PARCENARY, in Law, signifies a holding or occupying of Land *pro indiviso*, by Joint-Tenants, or otherwise called *Co-parceners*: For if they refuse to divide their common Inheritance, and choose rather to hold it jointly, they are said to hold in *Parcenary*.

PARCO Fracto, is a Writ that lies against him that violently breaketh a Pound, and taketh our Beasts thence, which for some Trespasses done upon another Man's Ground, are lawfully impounded.

PARCELLING of a Ship, is laying of Pieces of Canvase of about a Hand's breadth, over the Seams, when she is newly Calked.

PARCEL-Makers, are two Officers in the *Exchequer* that make the *Parcels* of the *Escheators* Accounts, wherein they charge them with every thing they have levied for the King's Use within the Time of their Office, and deliver the same to one of the *Auditors* of the Court to make an Account with the *Escheator* thereof.

PARENCEPHALOS, the same as the *Cerebellum*.

PARENCHYMOUS Parts of the Body, by the Old Anatomists, are reckoned such Flethy Parts of it as fill up the Interstices between the Vessels, and not consisting of Vessels themselves. But by the Help of the Microscope, and more accurate Observations, it hath since been discovered, that there is no part of an Animal Body but what is a kind of Net-work of an innumerable Quantity of small Capillary Vessels.

PARENCHYMATA, are the Intrails thro' which the Blood passes for its better Fermentation and Perfection, as the Lungs, Liver, Heart, and Spleen, &c.

Sometimes the Word *Parenchyma* is taken in a large Sense for all the Intrails. *Blanchard*.

PARIETAL Bones, or the Bones of the *Synsippus*, are the thinnest Bones of the Cranium, in Form almost square, somewhat long; they are joined to the *Os Frontis* by the *Sutura Coronalis*, to one another in the Crown of the Head by the *Sutura Sagittalis*, to the *Os Occipitis* by the *Lambdoidalis*, and to the *Ossa Temporum* by the *Sutura Squamosa*. They are smooth and equal on

on their Out-side, but on their Inside they have several Furrows made for the Passage of the Veins of the *Dura mater*. They have each a small Hole near the *Sutura Sagittalis*, through which there pass some Veins which carry the Blood from the Teguments to the *Sinus Longitudinalis*.

PARISTMIA, or *Amygdala*, are two Glandules of the Mouth tied together by a broad slender Production; they have one common Cavity large and oval, opening into the Mouth. The Use they serve for is, to transmit a certain slimy or pituitous Matter into the Jaws and Mouth. They are called also *Tonsille*, which see. *Blanchard*.

PARK of the *Artillery*, is a certain Place in a Camp without Cannon-shot of the Place besieged, where the Cannon, Artificial Fires, Powder, and other Warlike Ammunition are kept, and guarded only by Pike-men, to avoid Casualties which may happen by Fire. Every Attack at a Siege hath its *Park of Artillery*.

PARK of *Provisions*, is another Place in the Camp on the Rear of every Regiment, which is taken up by the Sutlers, who follow the Army with all sorts of Provisions, and sell them to the Soldiers.

PARONYCHIA, a *Whitlow*, is a preternatural Swelling in the Fingers, and very troublesome: It arises from a sharp malign Humour, which sometimes gnaws the Tendons, Nerves, the Membrane about the Bone, and the very Bone it self. *Blanchard*.

PAROTIDES, are glandules behind the Ears; also a preternatural Swelling of those Glandules.

PAROXYSM, a *Fit*, is Part of the Period of Diseases, whereby they encrease and grow worse. It is either Regular, which returns at certain Times, as in a Tertian or Quartan Ague; or Irregular, that hath no certain Times, but comes sometimes one Day, sometimes another, as the Erratick Ague. *Blanchard*.

PARRELS, in a Ship, are Frames made of Trucks, and Ribs, and Ropes, which having both their Ends fastened to the Yards, are so contrived as to go round about the Masts, that the Yards by their means may go up and down upon the Masts. These also, with the Breast Ropes, do fasten the Yards to the Masts.

PARRICIDE, signifies properly him that kills his Father, and may be applied to him that murders his Mother.

PARSON, *Persona*, is the Law Term for the Rector of a Church; because for his Time he represents his Church, and sustaineth the Person thereof, as well in suing, as in being sued in any Action Touching the same. Formerly he who had a Church by Institution and Induction only for his own Life, was called *Parson Mortal*.

But any Collegiate or Conventual Body, to whom the Church was for ever appropriated, was called *Parson Immortal*.

In the New book of Entries, *Verb. Aid in Annuity*, are these Words: *Et Prædictus A. dicit quod ipse est Persona Prædictæ Ecclesiæ de S. Impersonata in eadem ad Præsentationem F. Patronis*. By which it seems that *Persona* or *Parson* anciently was the Patron, and *Persona Impersonata* the Rector to whom the Benefice was given by the Patron's Right; which also *Dyer* sheweth, fol. 221. So that in Law, the *Parson Impersonæ* is he that hath the Possession of a Benefice or Rectory, be it appropriate, or otherwise, by the Act of another.

PARSONAGE, or *Rectory*, is a Spiritual Living composed of Glebe-Land, Tythe, and other Oblations of the People, separate or dedicate to God in any Congregation, for the Service of his Church there, and for the Maintenance of the Minister to whose Charge the same is committed.

PARTES *Finis nihil habuerunt*, &c. in the Common Law, is an Exception taken against a Fine levied.

PARTIES, in Law, are those which are named in a Deed, or Fine, as Parties to it; as those that Levy the Fine, and to whom the Fine is levied: So those that make any Deed, and they to whom it is made, are called *Parties in the Deed*.

PARTITIONE *Facienda*, is a Writ that lies for those that hold Lands or Tenements *pro indiviso*, and would sever to every one his Part, against him or them that refuse to join in *Partition* as Copartners, &c.

PARTITION, is a dividing of Land descended by the Common Law, or by Custom, among Co-Heirs or Parceners, where there are two at least; and this Partition is made Four ways, whereof Three are by Agreement, the Fourth by Compulsion. The First *Partition* by Agreement is, When they divide the Land equally themselves into so many Parts as they are Coparceners, and each to choose one Share or Part, according to Order. The Second is, when they choose some of their Friends to make the Division for them. The Third is by drawing Lots, thus: Having first divided the Land into as many Parts as there are Parceners, they write every part severally in a distinct Scroll, and wrapping it up, throw each of them into a Hat, Basin, or such like thing, out of which each Parcener draws one, according to their Superiority; and so the Land is severally allotted. The Fourth *Partition*, which is by Compulsion, is, When one or more of the Parceners, by reason of the Refusal of some other, sues out a Writ of *Partitione facienda*; by Force whereof they shall be compelled to part.

In *Kent*, where Land is of *Gavel-kind* Nature, they call their Partition, *Shifting*.

Partition also may be made by Joint-Tenants, or Tenants in Common, by Ascent, by Deed, or by Writ.

PARTY-Fury. See *Medietas Lingue*.

PARTNERS, in a Ship, are strong pieces of Timber bolted to the Beams incircling the Masts, to keep them steady in their Steps, and also keep them from rowling (that is falling) over the Ship's Sides. There are also of these *Partners* at the Second Deck, to the same End; only the Mizen-mast hath only one pair of *Partners* in which that Mast is wedged so firm, as that it can by no means budge. Some Ships sail not well, unless their Masts are loose, and have leave to play in the Partners: But in a Storm this is dangerous, lest the Partners should be *wronged*, (as they say) i. e. forced out of their places; for then there is no Help, but to cut the Mast by the Board.

PARTNERSHIP, a Rule in Arithmetick; the same with the *Rule of Fellowship*, which see.

PART *Proportional*, is a Part or Number agreeable and analagous to some other Part or Number; or a Medium to find out some Number or Part unknown by Proportion and Equality of Reason.

PAR Vagus, a pair of Nerves arising below the *Auditory* ones, from the Sides of the *Medulla Oblongata*, behind the *Processus Annularis*, by several Threads which join together, and go out by the same Hole that the *Sinus Laterales* discharge themselves into the *Jugulares*. It is joined by a Branch of the *Nervus Spinalis*, or *Accessorius Willisii*, and by a small Branch of the *Portio Dura*. Immediately after it comes out of the Skull, it gives a small Branch to the *Larynx*, as it goes down the Neck, above the *Intercostal Nerve*, by the Side of the *Internal Carotide*. At the *Axillary Artery* it casts back the *Recurrent Nerves*, of which the Right embraces the *Axillary Artery*, and the Left the *Aorta*. These two Branches ascend on each side of the *Trachea*, or *Aspera Arteria*, to the *Larynx*, where they are spent on the Muscles of the *Larynx* and Membranes of the *Trachea*. This Pair, after it has entered the Cavity of the *Thorax*, sends out several Branches to the *Pericardium*, Heart, Lungs, and Concave side of the Liver.

This Pair of Nerves was formerly accounted the Sixth, but is now usually reckoned the Eighth.

There is a notable Fibre, or rather Nerve, coming from the Spinal Marrow, about the Sixth or Seventh *Vertebra* of the Neck, which is so joined to this *Par Vagus*, as if they grew into one Nerve; being covered with it, with the same Coat, from the *Dura mater*, but appears distinct when that is taken off. This Nerve they call the *Accessory Nerve*, which runs to the Muscles of the Neck and Shoulder-Blade.

Out of the Trunks of this Eighth Pair spring two Nerves that they call the *Recurring Nerves*; the Right of which rises higher, and winds about the *Axillary Artery*; the Left springs lower, and twisting about the Trunk of the descending *Aorta*, recurs or returns back from thence.

Dr. Willis thinks this *Recurrent Nerve* to be really a distinct one from the very Original, to be no Branch of the *Par Vagus*, but only is included in the same Coat or Cover with it, for Safety and Convenience of Passage.

About the first or second Rib this Pair hath a kind of *Plexus* or Knot, which is called *Plexus Cardiacus*, because it sends out Twigs which go to the Heart and its Appendages.

PARVO Nocumento, is a Writ of Nuisance; which see.

PARVUM & Crassum, is the Fourth Pair of Muscles of the Head; so called, because it is but a little one, yet pretty thick. It lieth under the *Complexum Trigeminum*, or Third Pair, and rises Nervous from the Transverse Processes of the Six uppermost *Vertebrae* of the Neck, and is inserted into the hinder Root of the Mamillary Process.

PARYLIS, is an Inflammation, Rottiness, or Excrefcency among the Gums. *Blanchard*.

PASCHA Clausum, signifies the *Ostaves* of Easter, or Low-Sunday, which closes or concludes that Solemnity. *Dia (cali) post pascha clausum*, is a Date in some of our Old Deeds. And the first Statute of *Westminster*, Anno 3 Edw. 1. is said to have been made *lendes mena de la close de Pasche*, that is, the Monday after Easter-Week.

PASCHAL Rents, are Rents or Annual Duties paid by the Inferior Clergy to the Bishop, or Archdeacon, at their *Easter Visitations*. They are also called *Synodals*; which see.

PAS de Souvris, a French Term in Fortification; the same with *Berne*; which see.

PASSANT. The Term in Heraldry for a Lion born in any Escutcheon in a walking Posture. But this in most other Beasts, they call *Tripping*.

PASSAGIO, is a Writ directed to the Keepers of the Ports, to permit a Man to pass over Sea that hath the Kings License.

PASSARADO, is a Rope in a Ship, whereby all the Sheer-Blocks of the Main and Foresails are haled down after; the *Clew* of the Main-sail to the *Cubbridge-head* of the Main-mast, and the *Clew* of the Fore-sail to the *Cat-head*. This is to be done when the Ship goes large; and they are also kept firm down, and hindred from flying up, by this *Passarado-Rope*.

PASSPORT, signifies a Licence made by any one that hath Authority, for the safe Passage of any Man from one Place to another.

PASSIVE Principles. So the Chymists call *Water* and *Earth*, because either their Parts are at rest, or else at least not so rapidly moved as those of Spirit, Oil, and Salt, and so do serve to stop and hinder the quick Motion of the *Active Principles*. Besides if these Principles could be drawn pure, they would have nothing in them but bare Bulk, Figure, Colour, and Weight; the one is a Fluid, the other in a Solid Form; and would be without either Smell, Taste, &c. or any Active Operations.

PASTILIS, are Odoriferous Tablets, or Trochisks made up of Perfumes or Odorous Bodies, with Mucilage or Gum *Tragacanth*.

PATE, in Fortification, is a kind of Platform like what they call an Horseshoe, not always regular, but generally oval, encompassed only with a Paraper, and having nothing to flank it. It is usually erected in Marshy Grounds to cover a Gate of a Town.

PATEE, a Term in Heraldry for a Cross of this Figure. The Field is *Sable* a Cross *Patee Argent*, by the Name of *Cross*: This Form of a Cross is called also *Formee*.

PATELLA. See *Mola genu*, the Knee Pan.

PATENTS. See *Letters Patent*.

Note, That *Patents* differ from *Writs*, and that a Coroner is made by Writ, and not by *Patent*.

PATENTEE, is he to whom the King grants his *Letters Patent*.

PATHETICK Nerves, are the Fourth pair arising from the Top of the *Medulla Oblongata*, (and so is different from all others, which arise either from its Base or Sides) behind the round Protuberances, called by Anatomists the *Nates* and *Testes* of the Brain; whence bending forwards by the Sides of the *Medulla Oblongata*, they presently hide themselves under the *Dura Mater*; under which proceeding a while, they pass out of the Skull, each in a single Trunk, at the same Hole with the Optick Nerves, (and they communicate with no other in their whole Passage) and are bestowed entirely, as *Willis* saith, on that Muscle of the Eye which they call *Trochlearis*, because it serves to rowl the Eyeball about; which being a Motion that is usually consequential upon some Passion of the Mind, such as Love, &c. these Nerves

Nerves are therefore very properly called *Oculorum motores pathetici*.

PATH of the *Vertex*, a Term frequently used by Mr. Flamsteed in his *Doctrine of the Sphere*, and signifies a Circle described by any Point of the Earth's Surface, as the Earth turns round its Axis. This Point is considered as Vertical to the Earth's Centre, and is the same with what is called the *Vertex* or the *Zenith* in the *Ptolemaick Projection*.

The Semi diameter of this *Path of the Vertex* is always equal to the Complement of the Latitude of the Point or Place that describes it; that is, to that Places Distance from the Pole of the World.

PATHOGNOMONICK, a Term in the Art of Medicine, is a proper inseparable Sign which agrees only to such a thing, and to all of that kind, and tells the Essence of its Subject, and also lasts from the Beginning to the End; as in a true Plurisie there's always a continual Fever, hard Breathing, and Stiches, with a Cough. *Blanchard*.

PATHOLOGY, is a part of Physick that teacheth us the preternatural Constitution of a Man's Body, so as thereby to discover the Nature and Causes of Diseases.

PATONCE: The Herald's Term for one of their Crosses of this Figure.

Gules, a Cross Patonce, Argent, by the Name of Latimer.

PATRIMONY, is an Hereditary Estate, or Right, descended from Ancestors. The Legal Endowment of a Church, or Religious House, was called *Ecclesiastical Patrimony*.

PATRON, is used in the Civil Law for him that hath manumitted a Servant, and thereby is both justly accounted his great Benefactor, and challengeth certain Reverence and Duty of him during his Life.

In the Canon and Civil Law it signifies him that hath the Gift of a Benefice; and the Reason is, Because the Gift of Churches and Benefices belonging unto such good Men as either built, or else endowed them with some great part of their Revenue.

PATROUILLE, or *Patrouil*, as we generally pronounce it, is a Round of Soldiers, to the Number of Five or Six, with a Serjeant to command them: These set out from the *Corps de Garde*, and walk round the Streets of a Garrison, to prevent Quarrels, Mischief, &c. and to keep all in Order, Peace and Quietness.

PAUPER. See *Forma pauperis*.

PAUSE or *Rest*, in Musick, is a Silence or Artificial Intermittion of the Voice or Sound, proportioned to a certain Measure of Time, by the Motion of the Hand or Foot.

These *Pauses* or *Rests* are always equal to the Length or Quantity of the Notes whereto they are annex'd, and are therefore called, by the same Names, as a *Long-rest*, *Breve-rest*, *Semi-breve-rest*, &c.

Odd Rests are those which take up only some part of a *Semi-breve's* Time or Measure, and have always reference to some *Odd Note*: for by those two Odds the Measure is made even.

PAUNCH, or *Panch*, is those Mats made of Sinnet, which in a Ship are made fast to the Main and Fore-yards, to keep them from galling against the Masts.

PAWLE, in a Ship, is a small piece of Iron bolted to one End of the Beams of the Deck, close to the Capstan, but yet so easily as that it can turn about. Its Use is to stop the Capstan from turning back, by being made to catch hold of the Whelps: Therefore they say, *Heave a Pawle!* That is, Heave a little more for the Pawle to get hold of the Whelps: And this they call *Pawling the Capstan*.

PAYING. The Seamen call laying over the Seams of a Ship a Coat of hot Pitch, *paying her*; which when 'tis done with Canvass, is called *Parcelling*. Also, when after she is *Graved*, and her Soil burned off, a new Coat of Tallow and Soap, or one of Train-Oil, Rosin and Brimstone, boiled together, is put on upon her, that is called *Paying of a Ship*. They say also sometimes, when in tacking about, a Ship's Sails being backstay'd, fall all flat against the Masts and Shrouds, *she is payed*.

PEAN, in Heraldry, is when the Field of a Coat of Arms is *Sable*, and the Powderings are *Or*.

PECTEN *Arboris*, is the Grain of the Wood of any Tree.

PECTINEUS, is a Muscle of the Thigh; so called from its Beginning at the *Os Pubis* or *Pelvis*. It has a thick, broad, and fleshy Origination from the External part of the said Bone, between the *Psoas Magnus* and the *Iliacus Internus*, and second Head of the *Triceps*; and descending obliquely backwards, it becomes a flat strong Tendon near its Implantation to the Asperity on the Posterior part of the *Os Femoris*, immediately below the lesser *Trochanter*, at the Insertion of the *Psoas Magnus* and *Iliacus Internus*.

This acting together with the *Psoas Magnus* and *Iliacus Internus*, doth not only draw the *Os Femoris* upwards, but direct it outwards, by its Curve Descent from its Origination to its Insertion at the Posterior part of the *Os Femoris*; which is a Provident Contrivance of Nature in walking, since the Thigh-Bones by their oblique Position do thereby render the Toes liable to turn inwards.

PECTINIS, or *Pubis Os*, the Share-Bone, is the lower and inner, or fore-part of the *Os Innominatum*; and even before, is joined to its Fellow by a Cartilage, called *Synchondrosis*, which is much thicker, but looser and softer in Women than in Men; for in Women, one Bone can a little recede from the other in Travail, to make way for the *Fetus*. It has a very large *Foramen* between the *Sinus* of the *Coxendix*, and that part whereby it is joined to its Fellow, making room for two Muscles of the Thigh; and above this *Foramen* is a *Sinus*, by which the Crural Veins and Arteries pass to the Thighs. The Upper part of this Bone is called its *Spina*, into which the Muscles of the *Abdomen* are inserted.

PECTORALS, or *Pectoral Medicines*, are such as are used in Diseases of the Breast, by attenuating, or thickning, or allaying the Heat thereof, and render the Matter which causes coughing, fit to be expectorated or spit out. *Blanchard*.

PECTORALIS, a Muscle of the Arm, so called from its Situation. This hath a broad semicircular

circular fleshy beginning above, from near half the Inferior part of the *Clavicula*: Below, from the *Os Pectorale*, and all the Cartilaginous Endings of the Six superior Ribs, and from the Bony part of the Seventh, it hath a distinct *Fasciculus* of fleshy Fibres, (which sometimes is confounded with the *Obliquus Descendens Abdominis*.) From this large Origin it marcheth transversely, and becometh narrower but thicker, and lessens it self as it passeth over the upper part of the *Biceps Cubiti*, and is inserted by a short, but broad, strong Tendon, to the Superior part of the *Os Humeri*, above the Termination of the *Deltoides*: The Fibres of this Muscle decussate each other, near their Implantation to the *Os Humeri*; those of the Superior part running downwards, and those of the Inferior marching up, intersect the former in Acute Angles. When it acts it moves the Arm either obliquely upwards, or directly forwards, or obliquely downwards, according to the various Direction of its *Series* or *Fibres*.

PECULIAR, signifies a particular Parish or Church that hath Jurisdiction within it self, for *Probat* of Wills, &c. exempt from the Ordinary, and the Bishops Courts.

The King's Chapel is a Royal *Peculiar*, exempt from all Spiritual Jurisdiction, and referred to the Visitation and immediate Government of the King himself, who is Supreme Ordinary.

It is an Ancient Privilege of the See of *Canterbury*, That wheresoever any Mannors or Advowsons do belong to it, they forthwith become exempt from the Ordinary, and are reputed *Peculiar*s.

PEDESTAL, in Architecture, is that part which supports a Pillar or Column, having its proper Base and Cornice different, according to the several Orders of Architecture.

The *Tuscan Pedestal*, being the most simple of all, hath only a *Plinth* for its Base, and an *Astragal* crown'd for its Cornice.

The *Dorick Pedestal*, (according to *Palladio*) borrowing the *Attick* Base, ought to have for its Height $2\frac{1}{2}$ Diameters of the Column taken below. But no *Pedestals* to this Order are seen among the Ancient Buildings.

The *Ionick Pedestal* is Two Diameters and about Two thirds high.

The *Corinthian Pedestal* hath the Fourth part of the Column for its Height, being divided into Eight parts; whereof one must be allowed for the *Cymatium*, two others for the Base, and the rest for the Dye or Square.

The *Composite Pedestal* ought to have the Third part of the Pillar for its Height.

PEDICULARIS Morbus. See *Phthiriasis*.

PEDICULUS, in Botany, is the Foot-stalk of any Leaf, Flower, or Fruit.

PEDIMENT, a Term in Architecture; the same with *Fronton*, which see.

PEDIUM. See *Tarsus*.

PEDRERO, or, as it is usually called by the Seamen, *Petterero*, is a small piece of Ordnance, most used on board of Ships to fire Stones, Nails,

broken Iron, or Partridge-shot, on the Enemy, when he attempts to board you. Most of these are open at the Breech, and have the Chamber to take out, and to be loaded that way, and not at the Muzzle.

PEEK, a Sea-word, used in these Senses: An Anchor is said to be *a-peek*, when a Ship being about to weigh, comes so over her Anchor, that the Cable is perpendicular between the Hawse and the Anchor; and to bring the Ship thus, is called *Heaving a-peek*.

They say also, *Peek the Miffen*; that is, Put the Miffen-yard right up and down by the Mast.

A Ship is said to *Ride a-peek*, where she lies with her Main and Fore-yards hoisted up; and then having one end of the Yards brought down to the Shrouds, the other is raised up an end: And this is done to contrary Sides; (*i. e.*) the Star-board Yard-arm of the Main-yard comes down to the Starboard side, and so doth the Larboard end of the Fore-yard; so that the Yards appear a cross each other like *St. Andrew's Cross*. The Way to do this, is, To let go the Starboard Top-sail-sheets from the Main-yard; and then topping up the Larboard-lifts: And so quite contrary for the Fore-yard.

To *Ride a-broad peek* is much after the same manner, only the Yards are raised up but half so high.

The Reason why they thus *peek* up their Yards is, lest lying in a River (and they hardly ever use it but then) with their Yards a-cross, another Ship should be foul upon them, and break their Yards.

There is also a Room in the Hold of a Ship, that is called the *Peek*: 'Tis from the Bitts forwards to the Stern. Here Men of War keep their Powder; and Merchant-men, Outward-bound, place their Victuals here.

PEGASUS, a Constellation in the Northern Hemisphere, containing 23 Stars.

PEIRCED. When any Ordinary or Charge, in Heraldry, hath an Hole in it, so that the Field appears through, they say that Ordinary or Charge is *pierced*.

PELAGIÆ, is a Term used by the Writers of Natural History, to express such Sea Shell-fishes, as never or very rarely are found near the Shores, but always reside in the Deep, in those parts of the Bottom of the Sea which are most remote from Land.

PELICOIDES, is the Name given by some to the Figure B C D A, contained under the two

inverted Quadrantal Arks AB and AD , and the Semi-circle BCD , whose Area is $=$ to the Square AC , and that to the Rectangle EB .

'Tis equal to the Square AC , because it wants of the Square on the Left Hand the two Segments AB and AD , which are equal to the two Segments BC and CD , by which it exceeds it on the Right Hand.

PELIDNUS, is a Black-and-blue Colour in the Face, frequent in Melancholick Men.

PELLETS, a Bearing in Heraldry. See *Balls*.

PELLICAN, is the Chymists Term for a kind of Double Vessel, used in Circulations. See *Double Vessels*.

PELLICLE, a little Skin. When any Solution in Chymistry is in a gentle Heat evaporated so long till a thin Skin or Film arise on the top of the Liquor, 'tis call'd an *Evaporation to a Pellicle*; and then there is very little more Liquor left than what will just serve to keep the Salts in Fusion.

PELVIS, is the Place at the Bottom of the Belly, wherein the Bladder and Womb are contained.

PELVIS Aurium. See *Cochlea*.

PELVIS Cerebri. See *Choana*.

PELVIS Renum, is a Membranous Vessel or Receptacle in either Kidney, which receives the Urine, and pours it into the Bladder.

PEMPHIGODES Febris, is a Spotted Fever; some say a Windy or a Flatulent Fever.

PENCIL of Rays in Opticks, is a double Cone of Rays joined together at the Base; one of which hath its Vertex in some one Point of the Object, and the Glass GLS for its Base; and the other hath its Base on the same Glass, but its Vertex in the Point of Convergence, as at C .

Thus: $BGSC$ is a Pencil of Rays, and the Line BLC , is called the Axis of that Pencil.

PENINSULA, in Geography, is a Portion of

Land, which being almost surrounded with Water, and is joined to the Continent only by an *Isthmus*, or narrow Neck of Land; as *Africa*, the greatest *Peninsula* in the World, is joined to *Asia*; that of *Morea* to *Greece*, &c.

PENETRATION of *Dimensions*, is a Philosophical way of expressing, That two Bodies are in the same Place, so that the Parts of one do every where penetrate into, and adequately fill up the Dimensions or Places of the Parts of the other; which is manifestly impossible, and contradictory to Reason.

PENUMBRA, in Astronomy, is a faint kind of Shadow, or the utmost edge of the perfect Shadow, which happens at the Eclipse of the Moon; so that it is very difficult to determine where the Shadow begins, and where the Light ends.

PENDANTS of a Ship, are of two kinds.

1. Those long Colours, or *Streamers*, cut pointing out towards the end, and there divided into two parts, and which are hung out at the Heads of the Masts, or at the Yard-Arm ends, are called *Pendants*; and are used for shew, and sometimes for Distinction of Squadrons.

2. That short Rope is called a *Pendant*, which at one end is fastened to the Head of the Mast, or to the Yard, or to the Clew of the Sail, and at the other end hath a Block and Shiver, to reeve some running Rope into. Thus the *Pendant* of the *Tackle* is made fast to the Head of the Mast; and the *Pendants* to the *Back Stays* are fastened to, and hang down on the Inside of the *Shrouds*. Also all the Yard-Arms, except the *Miszen*, have of these *Pendants*, into which the *Braces* are reeved.

PENDULUM, is a Weight hanging at the end of a String, Chain, or Wire, by whose *Vibrations* or *Swings* to and fro, the Parts or Differences of Time are measured.

The Velocities of *Pendulums* in their lowest Points are as the Chords of the Arks they fall from or describe.

Thus if the *Pendulum* NP be let fall from the Height H , its Velocity at P will be expounded by the Chord HP . (In the Figure following.)

'Tis said that *Ricciolus* was the first that attempted to measure Time by the *Pendulum*, and therein he was followed, tho' near about the same time, by *Langrenus Vendelinus*, *Mersennus*, *Kircherus*, &c. some of which declare they knew nothing of *Ricciolus's* Attempt: But the first that applied it to a Movement, Clock, or Watch, was *Mr. Christopher Hugens*, and who brought it also to a good degree of Perfection.

The Learned Sir *Isaac Newton*, in his Accurate Experiments on *Pendulums*, found that the Matter of all Bodies is exactly proportionable to their Weight.

If the Pendulum P, be let fall from the Height H, and then at its return that way come up again as far as K, the Ark HK represents the Retardation arising from the Resistance of the Air.

The shorter Arks any Pendulum describes, the equaller will the Vibrations be to one another; and when the Arks are exceeding small, the Vibrations will be nearly equal as if the Pendulum did swing in a Vacuum. Wherefore it seems to be a Mistake in those who admire a Clock or Watch for its Pendulums swinging far, or taking a great Compals as they call it.

PENDULUMS, *Mersennus* found the length of a Pendulum that would swing Seconds to be 3 Feet 6 Inches, and since 'tis agreed that in our Latitude, it is just 39 Inches, 2 Tenths.

A Pendulum of 10 Inches, wanting about one Tenth of an Inch, will very near swing half Seconds, or the 120th part of a Minute of Time; which is 7200th part of an Hour.

The Lengths of Pendulums (which are always accounted from the Centre of Oscillation, to the Centre of the Ball or Bob) are to each other in a Duplicate Proportion of the Times in which their Vibrations are respectively performed; or are as the Squares of the Vibrations performed in one and the same time, Wherefore the Times must be in Subduplicate Proportion to the Lengths. Sir Isaac Newton demonstrates, Cor. 2. Prop. 34. Princip. That if the Force of the Movement of a Clock required to keep a Pendulum in Motion, could be so compounded with the gravitating force of the Pendulum, that the whole Force or Tendency downwards, shall be as the Line which arises by dividing the Rectangle under the Semi-ark of the Vibration and the Radius, is to the Sine of that Semi-ark, then all the Oscillations shall still be made in the same space of Time.

PROBLEMS.

I. To find the Length of a Pendulum which shall make any Assigned Number of Vibrations in a Minute.

Let the Number of Vibrations be 50, the Length of a String counted from the Point of Suspension, to the Centre of Oscillation, or of the Bullet or Round Ball at the end of it, is required.

Since the Lengths of Pendule's are to each other as the Squares of their Vibrations. And that a Pendule Vibrating Seconds (or 60 times in a Minute) is by Experience found to be of the length of 39 Inches and $\frac{2}{3}$ of an Inch.

I here use Sir *Jonas Moor's* Computation.

Say, as the Square of 50, (which is 2500): to

the Square of 60 (which is 3600) :: So is 39, 2 : to the Length of the Pendulum required; which will be found to be 56, 4 Inches. See the Work.

As 2500 to 3600 :: to 39, 2 to

39,2
7200
32400
10800

25 | 00 14112 | 00 (56,4

125

161

150

112

100

12

But for ready Practice; since in these Questions the Product of the mean Terms will always be 1411200 (that is the Product of the Square of 60 Multiplied by 39,2.) i.e. $3600 \times 39,2$. You need only divide that Number by the Square of the Number of Vibrations assign'd, and the Quotient will give the Length of a Pendulum, that shall Vibrate just so many times in a Minute.

PROBLEM II.

The Length of a String and Plumbet being known (reckoned as before from the Point of Suspension to the Centre of the Weight;) To find the Number of Vibrations such a Pendulum shall make in a Minute.

This is the Reverse of the former Problem; therefore say, As the Length given suppose 56,4, to the Length of the Standard Pendulum swinging Seconds, viz. 39,2. So is the Square of the Vibrations of the Standard Pendulum to the Squares of the Vibrations sought. See the Work.

As 56,4 : 39,2 :: 3600 : 2500, as will be found by working the Golden Rule as before. And the Square Root of 2500, will be 50, the Number of Vibrations sought.

But for use (here as in the former Problem) you need only to divide 1411200 by the Length, and it gives the Squares of the Vibrations, as there you divided by the Square of the Vibrations to find the Length.

USE.

And these two Problems may be of excellent use, both to regulate the Motion of a Clock or Watch, and exactly to measure Time without either; which may gratifie and assist the Curious in observing Eclipses, especially those of the *Satellites of Jupiter*, and in the Transits of the Moon under the fix'd Stars, and her Occultations of them: Whose Duration may be thus easily measured, without Clock, Watch, or any such way of distinguishing Time.

As for Instance, Suppose you were on a Journey or Voyage, or some place where you cannot have

have the conveniency of a good Clock or Watch, &c. and yet you would willingly observe the Duration of an Eclipse; which by your Table you know will happen such a Night, and near such a time of it.

Hanging up a String and Weight on a fine P.n. and letting it swing just at the Entrance of the Shadow on the Moon's Orb; let a Correspondent or Servant carefully count the Vibrations, and marking them down with a Pencil, or some such way; (moving the *Pendulum* dexterously also that way that 'tis going, when 'tis almost at rest, by a gentle push of his Hand, and by that means keeping it in constant Motion;) the Number of the Vibrations will be known, during the whole Eclipse; which note down on a piece of Paper, and measuring exactly the Length of your String in Inches, and Decimal parts of an Inch: Divide (by this Problem) 1411200 by the Length of your *Pendulum*, and the Quotient will afford you a Number, whose Square Root is the Number of Vibrations, the *Pendulum* you employ'd made in one Minute. Divide therefore the Number of all the Vibrations, during the whole time of Observation, by 60, and the Quotient will be the Number of Minutes the Eclipse lasted.

N. B. 'Twill be best to use a pretty long String, because the Vibrations being by that means slower, they may be the more distinctly counted. If at such a time you are furnished with a good Foot Rule, you may let your *Pendulum* be just 39, 2, and then each Vibration will be a Second: But if you are destitute of such an Advantage, you may, as before, hang up a *Pendulum* at a venture, and by another String, or some such way, taking its exact Length, you may keep it by you, with the Number of all the Vibrations, and compute the Time afterwards at your Leisure.

PROBLEM III.

To find the Length of any String which hath a Weight hanging at it, without coming to measure it; or without making use of any Quadrant, or such like Instruments, to take Heights.

Let the String and Weight annex'd be made to swing; and at the same time hang up a *Pendulum* of any known Length, (as suppose a Yard) and let it vibrate likewise, so that both the *Pendulums* may swing together; to effect which, you must let the *Pendulum* you hang up go away just when the other you would measure is beginning to make any Vibration: This done, stay till the *Pendulum* you hang up hath made a Competent Number of Vibrations (as suppose about 50 or 60;) and let a Correspondent count how many Vibrations the *Pendulum*, whose length is sought, made in the same time: And let us suppose, that That made 10 Vibrations while your String and Plummer made 60; since, as was said before, The Lengths of *Pendulums* are to each other as the Squares of their Vibrations: If you divide 3600 (the Square of 60) by 100, (the Square of 10) the Quotient will be 36, which will shew you that the String sought was 36 times as long as that which you hung up; i. e. was in length 36 Yards, or 108 Foot.

And thus you may easily find the height of any Church or Theatre, by means of a Branch-Can-

dlestick which hangs from the Roof: For it you hang up a String and Plummer of a Yard long, suppose, (or of any known length) and make this Candlestick and your *Pendulum* begin to swing both together (which is easily done by the help of a Correspondent:) The Vibrations that the Candlestick makes, while your *Pendulum* makes any Competent Number, will easily help you to the Length of the String or Wire, that holds the Candlestick, and consequently the height of the Church will be known likewise.

As in the former Example, Suppose the Candlestick made 10 Vibrations, while your *Pendulum* of a Yard made 60; then it is 36 Yards, or 108 Foot from the Centre of the Candlestick, to the end of the Rope or Wire that holds it to the Roof; to which, adding the height of the Centre of the Candlestick above the Ground, you have the whole height of the Church.

PROBLEM IV.

According to these Principles and Experiments on *Pendulums*, it will not be difficult to estimate nearly the Depth of a deep Well, by the fall of a Stone into the Water from the Mouth: Or the Distance that any Ship at Sea, or that any Fort is off, by the Time between seeing the Flash of the Powder, and hearing the Report of the Gun: Or the Distance that any Thunder-Cloud is off, &c.

For Sir Isaac Newton hath found that a Sound moves 968 Feet in a Second of Time.

'Tis asserted also by Mr. Hugen, and now generally agreed to, That a heavy Body descends in the first Second of Time after its beginning to fall, very near 16 Feet.

An Example to find the Depth of a Well, may serve for all.

Suppose you hang up a short *Pendulum*, that will vibrate Quarter Seconds, (the way to find its Length hath already been shewn) and letting go the Stone and the *Pendulum* together, you find the *Pendulum* hath made 16 single Vibrations before you hear the noise of the Stones fall into the Water. Then since 16 Quarters of a Second are equal to 4 Seconds, if you account the Acceleration of the Descent of heavy Bodies to be either as the Squares of the Times, or as the Encrease of the odd Numbers, either way will give you the Number 256 for the Depth of the Well.

For since, as it is elsewhere shewn, a Body descends 16 Feet in the first Second of Time, in the fourth Second it will descend 16 times 16 Feet; for the Times being 1 and 4, the Descent will be as their Squares; that is, as 1 to 16: Wherefore Multiplying 16 by 16, you have 256, the Depth of the Well.

Or, if according to Galileus's way, you account 16 Feet for the first Second, and then 3 times 16 for the next Second, 5 times 16 for the third Second, and 7 times 16 for the fourth Second; all these Numbers added together, will make 256, the Depth as before.

Indeed some Abatement must be allowed for the Time the Noise of the Stones fall into the Water takes to reach the Ear. Wherefore since a Sound moves 968 Feet in a Second, and 256 is a little more than $\frac{1}{4}$ of that Number, a little more than

than $\frac{1}{4}$ of 16 Foot must be taken out of the former found Depth 256. So that the Depth of the Well may roundly be accounted 250 Feet.

But in the other Estimations of the Distance of a Cloud, Ship, or Fort, there needs no such Allowance; and the bare Multiplication of 968, by the Number of Seconds between the Flash and the Report, will give the Distance of the Cloud or Ship from the Observer.

That Night, (*viz.* April 12.) on which our late Mighty Monarch King William was buried, we counted oftentimes very accurately, That the Distance between seeing the Flash, and hearing the Report of the Tower Guns, (which were then fired very solemnly and distinctly) was always 7 Seconds of Time. Multiplying then 968 by 7, it produces 6775, which is to be accounted the Distance between Amen-Corner and the Tower of London; which is one Mile, and 1495 Feet, or something more than a Mile and a Quarter.

PENDULUMS Royal, are those Clocks whose Pendulum swings Seconds, and goes eight Days, shewing the Hour, Minutes, and Seconds.

The Numbers of such a Piece are calculated thus:

First, Cast up the Seconds in 12 Hours, and you'll find them to be $43200 = 12 \times 60 \times 60$. The Swing-wheel must needs be 30, to swing 60 Seconds in one of its Revolutions: Now let $\frac{1}{2} 43200 = 21600$ be divided by 30, and you'll have 720 in the Quotient, which must be broken into Quotients; the first of them must be 12 for the Great Wheel, which moves round once in 12 Hours. 720 divided by 12, gives 60, which may also be conveniently broken into two Quotients, as 10 and 6, or 5 and 12, or 8 and $7\frac{1}{2}$; which last is most convenient: And if you take all your Pinions 8, the Work will stand thus:

8)	96	(12
8)	64	8
8)	60	(7 $\frac{1}{2}$

39

According to this Computation, the Great Wheel will go about once in 12 Hours, to shew the Hour, if you will; the Second Wheel once in an Hour, to shew the Minutes; and the Swing-wheel once in a Minute, to shew the Seconds.

PENNATA folia, winged Leaves, is a Term among the Botanists, for such Leaves of Plants as grow directly one against another on the same Rib or Stalk; as those of *Ash*, *Wail-nut-tree*, &c.

PENSION, that which in the two Temples is called a *Parliament*, and in *Lincoln's-Inn* a *Council*, is in *Gray's-Inn* termed a *Pension*: That is, An Assembly of the Members of the Society, to consult of the Affairs of the House. Also in the Inns of Court, *Pensions* are certain annual Payments of each Member to the House, for certain Occasions.

PENSION Writ, when a *Pension Writ* is once issued, none sued thereby in the Inns of Court shall be discharged, or permitted to come into Commons, till all Duties be paid.

PENSION Order in *Grays-Inn*, seems to be a peremptory Order against such of the Society as are in Arrear for *Pensions*, and other Duties.

PENTAGON, in Geometry, is a Figure having five Sides, and five Angles: If all the Sides are equal, and consequently the Angles, 'tis called a *Regular Pentagon*.

PROPOSITION.

The Side *a b* of a Regular Pentagon, or which can be inscribed in a Circle, is in Power equal to the Side of an Hexagon and Decagon, inscribed in the same Circle: That is, The Square of *ab*, is equal to the Sum of the Squares of *af* and *ao*.

Let *ao*, the Side of the Hexagon, be called *H*; and *af* (that of the Decagon) be called *D*; and *ab* be called *P*.

I say $PP = HH \times DD$.

For the Angle at the Centre *boa* being 72 Degrees, the equal ones, *b* and *a*, in the same Triangle, must be 54 Degrees each. Bisect then the Angle *foa* by the Prick'd Line *ob*; and then 'tis plain the Angle *bob* will also be 54 Degrees, (*i.e.* $36 + 18$ Degrees,) and consequently the $\triangle abo$ and $ob b$ are similar. Wherefore $ab : bo :: bo : bb$ (*i.e.* in

our Notation, $P : H :: H : \frac{HH}{P}$.)

Again, In the $\triangle bfa$, the Angles *b* and *a* are $=$; and also in the little $\triangle fba$, the Angle $f = a$; and consequently the $2 \triangle bfa$: and fba , are Similar; and consequently $ba : af :: af : ab$. That is, $P : D :: D : \frac{DD}{P}$.

Wherefore of the whole Line *ba*, the 2 Parts are found to be by this Notation, $\frac{HH}{P}$ and $\frac{DD}{P}$;

That is, the whole is $\frac{HH + DD}{P}$, but this

Line *a b* is $= P$: Wherefore $PP = HH + DD$. *Q. E. D.*

PENTANGLE, a Figure having five Angles.

PENTAPOTES, (in Grammar,) are such definite Nouns as have but five Cases, as *Nemo*.

PERACUTUM *Menstruum*. See *Menstruum Peracutum*.

PERAMBULATION of the Forest, is the Surveying or Walking about the Forest, or the Limits of it, by Justices, or other Officers thereto appointed, to set down the Meres and Bounds thereof, and what is within the Forest, and what without.

PERAMBULATIONE *facienda*, is a Writ that is sued out by two or more Lords of Manors lying near one another, and consenting to have their Bounds severally known. It is directed to the Sheriff, commanding him to make *Perambulation*, and set down their certain Limits.

PERAMBULATOR, or *Walking-wheel*, is an Engine made of Wood or Iron, commonly half a Pole in Circumference, with a Movement, and a Face divided like a Clock, with a long Rod of Iron or Steel, that goes from the Centre of the Wheel to the Work: There are also two Hands, which (as you drive the Wheel before you) count the Revolution; and from the Composition of the Movement, and by the Division on the Face, shew how many Yards, Poles, Furlongs, and Miles, you go. The Use of this Instrument is to measure Roads, Rivers, and all Level Lands, with great Expedition.

PERAVAYLE. See *Paravayle*.

PERCEPTION, is the clear and distinct Apprehension of any Object offered to us, without forming any Judgment concerning them.

PERCH, a Measure, by our Statute Law, of 16 Foot and a half in Length. See *Pole*.

PERDONATIO *utlagarie*, is a Pardon for him who, for Contempts in not coming to the King's Court, is out-law'd, and afterwards of his own Accord, yieldeth himself to Prison.

PEREMPTORY, in Law, signifies a final and determinate Act, without Hope of renewing or altering.

PERFECT *Concords*, in Musick. See *Concords*.

PERFECT *Fifth*, the same with *Diapente*; which see.

PERFECT Numbers, are such whose aliquot or even Parts, join'd together, will exactly return the whole Number, as 6, 28, &c. For of six, the half is three, the third Part two, and the sixth Part one, which added together, make six; and it hath no more aliquot Parts in whole Numbers: So twenty eight, which has these Parts, viz. 14, 7, 4, 2, and 1, exactly return 28; which therefore is a Perfect Number, whereof there is but ten between one and one Million of Millions.

PERFORANS, is a Muscle of the Fingers, so called because its Tendons run thro' those of the *Perforatus*; it's also called *Profundus* from its Situation; and *Tertii Internodii Digitorum Flexor*, from its Use. It riseth fleshy from near two Thirds of the Superior and Forepart of the *Ulna*, as also from the Ligament between the last named Bone and the *Radius*; and becoming a large thick belied Muscle, grows outwardly Tendinous, before it passes over the *Pronator Radii Quadratus*, and is divided into four round Tendons, which march under those of the *Perforated Muscle*, beneath the *Ligamentum Transversale*; from each of these Tendons the *Musculi Lumbricales* are said to arise, after which they pass thro' the *Fissures* of those of the *Perforated Muscles*, and proceeding over their Ex-

tremities, terminate in the Superior and Forepart of the third Bone of each Finger.

The Tendons of this Muscle running through those of the *Perforated*, is a no less useful than stupendous Artifice in Nature. For to the End the Fingers (like so many Leavers) should be bended with great Force, it is absolutely necessary the strongest Muscle should be inserted nearest their Extremities, and farthest from their *Fulcimenta* the *Ossa Metacarpi*: But in regard every Internode should be attended with a particular Muscle, the better to accommodate them to various Employments, and the Origination of the Superior or *Perforatus*, is confined to the *Apex* of the Internal Exuberance of the *Os Humeri*, and upper Part of the *Radius* only; wherefore could not be a fit Instrument for so strenuous an Action, and that not only in regard to its Magnitude, but by the Approach of its two Extrems when the *Cubiti* or *Carpus* are bended; both which would be no small Impediments in divers Actions; it's therefore necessary it should be employed in the Motions of the second Internodes: But since these Superior Tendons would be hereby liable to interrupt the Inferior in their right Progress to the Extremities of the Fingers; it seems an Argument of great Counsel in transmitting the latter through the *Fissures* of each of the former, whereby the Actions of both are not only distinctly performed, and the Extremities of the Fingers attended with the largest Muscle, (whose Origin is below the *Os Humeri*, wherefore its Extrems cannot approach in the Flexion of the *Cubiti*;) but their Motions are preserved, tho' the Superior Muscle is totally divided; which indeed is a provident Contrivance of the Author of Nature, and is in it self sufficient to excite our Admiration.

PERFORANS, a Muscle of the lesser Toes; so called, because its Tendons run thro' the *Fissures* in the Tendons of the *Musculus Perforatus Pedis*: It is also called *Flexor tertii Internodii Digitorum Pedis*, from its Use. It hath an acute fleshy Origination from the Backpart of the *Tibia*, immediately under the *Musculus Subpopliteus*, having a double Order of Fibres united in a middle Tendon like the *Flexor Pollicis Longus*, but ceaseth to be fleshy as it passeth behind the *Malleolus Internus*, and running in a Channel over the Internal Part of the *Os Calcis*, under it, Imbanding Ligaments in half its Progress thro' the Sole of the Foot; it is divided into four Tendons, which march thro' the Perforations of the Tendons of the *Perforatus Pedis*, and are inserted to the third Bone of every lesser Toe.

PERFORATUS, is a Muscle belonging to the Fingers; and so called, because its Tendons are Perforated to admit those of the *Perforating Muscles* to pass thro' them to their Insertions: It is also called *Sublimis*, from its Situation, being above the *Perforating Muscles*; and *Flexor secundii Internodii Digitorum*, from its Use: It riseth Tendinous from the Internal Exuberance of the *Os Humeri*, between the *Flexores Carpi*: It also has a disgregated fleshy Origination from the Forepart of the *Radius*, between the *Pronator Radii Teres* and *Flexor Pollicis Magnus*, composing a fleshy Belly, lessens it self in less than half its Progress, where it's divided into four fleshy Portions, each of which soon becomes so many roundish Tendons, which are included in their proper Mucilaginous Membrane as they pass under the *Ligamentum*

trum Transversale Carpi thro' the Palm; near the first Internode of the Fingers each Tendon is divided to admit those of the Perforated Muscle thro' them; then joining and subdividing again immediately before they are inserted to the Superior Part of the second Bone of each Finger.

PERFORATUS Pedis, is a Muscle of the lesser Toes; so called, because its Tendons are Perforated like those of the Fingers. It is also called, *Flexor secundi Internodii Digitorum Pedis*, from its Use; and *Sublimis* from its Situation. It springeth from the Inferior and Internal Part of the *Os Calcis*, between the *Musculi Abductores* of the greater and lesser Toes, dilating it self to a Flethy Belly: After it hath passed the Middle of the *Planta Pedis*, it is divided into four Flethy Portions, which becoming so many Tendons, are divided near their Terminations, to admit the Tendons of the *Perforans* to pass thro' them to their Inferiors: These being united again, pass underneath them to their Implantations at the upper Part of the second Bone of each lesser Toe.

PERFORATED, *i. e.* bored thro'. The Armourists use it to express the passing or penetrating of one Ordinary (in part) thro' another; as thus:

He beareth Or, a bend Ermine Perforated thro' a Chevron Gules. But when there is only a Hole made thro' the Ordinary, and nothing in it to fill it up, they call it *Piercing*.

PERIAMMA, called also *Periapia*, is a Medicine, which being tied about the Neck, is believed to expel Discaes, especially the Plague. See *Appensa*.

PERIAPTUM. *Vid. Periamma*.

PERICARPIUM, is a Medicine applied to the Wrists, to cure an Ague, &c.

PERICARDIUM, is a double Membrane which surrounds the whole Substance of the Heart, and contains a Liquor to Moisten, Lubricate, and, as some say, to Refrigerate the Heart: It hath five Holes, according to the Number of Vessels which go out of the Heart. It adheres to the *Mediastinum* at the Basis, and at the *Mucro* to the Centre, or Nervous Part of the *Diaphragma*.

PERICRANIUM, is a Membrane which infolds the Skull, seated next to the *Periostrium*, covering the whole Skull, except just where the Temporal Muscles lie. It is of exquisite Sense; and causes intolerable Pain when the Temporal Muscle is wounded.

PERIÆCI, are those Inhabitants of the Earth who live under the same Parallels, but under opposite Semi-circles of the Meridian, whence they have the same Seasons of the Year, *viz. Spring, Summer, Autumn, and Winter*, at the very same Time, as also the same Length of Days and Nights; for 'tis in the same Climate, and at an equal Distance from the Equator: But the Changes of Noon and Midnight, are alternate one to the other.

PERIGÆON, or *Perigeum*, is a Point in the Heavens, wherein a Planet is said to be in its nearest Distance possibly from the Earth.

PERIHELION, is that Point of a Planet's Orbit, wherein it is nearest to the Sun.

PERIMETER, is the Compass or Sum of all the Sides which bound any Figure, whether *Rectilineal* or *Mix'd*.

PERINDE Valere, a Term belonging to the Ecclesiastical Law, signifying a Dispensation granted to a Clerk, that being defective in his Capacity to a Benefice, or other Ecclesiastical Function, is *de Facto* admitted to it: And it hath the Appellation from the Words, which make the Faculty as effectual to the Party dispensed with, as if he had been actually capable of the Thing for which he is dispensed with at the Time of his Admission. It is called a *Writ*.

PERINÆUM, is the Ligamentous Seam betwixt the *Scrotum* and the Fundament.

PERIOD, is a Full-stop at the End of any Sentence. A *Period* in Numbers, is a Distinction made by a Point or Comma after every sixth Place or Figure; and is used in *Numeration* for the readier distinguishing and naming the several Figures or Places: Which how to do, see under *Numeration*.

PERIOD, in Chronology, signifies a Revolution of a certain Number of Years; as the *Metonick Period*, the *Julian Period*, and the *Calippick Period*: Which see in their proper Places.

PERIODICAL, is the Term for whatever performs its Motion, Course, or Revolution, regularly, so as to return again, and to dispatch it always in the same Period or Space of Time. Thus the *Periodical Motion* of the Moon, is that whereby she finishes her Course round about the Earth in a Month; and this is in 27 Days, 7 Hours, 45 Minutes; and is called, The Moon's

PERIODICAL Month; which is the Space of Time that the Moon finishes her Revolution in.

PERIODUS Sanguinis, is a continued Circulation of the Blood thro' the Body; which is thus made: The Blood is carried out of the Arteries by Fibres, either of the Fleth or of the Entrails, or the Membranous Parts, saith *Blanchard*; but 'tis certain it is by Capillary Arteries continued with the like small Veins into the Mouth of the greater Veins; and implanted in them, as we see, many other little Channels in the Veins; so the Blood, passing thro' these out of the Arteries, is presently sent to the Veins, that it may be carried back again to the right Ventricle of the Heart; and thence by the Arterious Vein to the Lungs; in which after the Blood has been accended by some Nitrous Particles, breathed in thither by the Air, it goes into the Venous Artery, thence into the left Ventricle of the Heart; which again empties it self into the *Aorta*, or Great Artery; so that the Body may be nourished and enlivened, it goes into every Part of it. This is *Blanchard's* Account of the Matter. See more in the Word *Circulation of the Blood*.

PERIOSTIUM, is a Thin Membrane that incloses immediately almost all the Bones in the Body, except the Teeth, Bones of the Ear, &c. It hath a most exquisite Sense, and probably is an *Expansion* of the Nervous and Tendinous Fibres of the Muscles. Its Use is to cover the Bones, and to sustain the Vessels which enter into them to nourish them. *Dr. Havers* in his Excellent Book, called, *Osteologia Nova*, saith, That this Membrane consists of two Sorts of Fibres, of which those that lie next the Bone, are derived from the *Dura Mater*, and the others from the Tendons of the Muscles.

PERIPATETICK Philosophy, is named from those, who from their Action of Walking while they Studied or Taught were called,

PERI.

PERIPATETICKS. The Chief of these was *Aristotle*; then his Successors; among whom you may reckon *Theophrastus*, *Cratippus*, *Boethius*, and all his very numerous Interpreters. But about 460 Years ago, there arose a new Set of Famous *Aristotelians*, which were called also *Peripateticks*; from them came the three chief Sects of the *Peripatetick Philosophy*. The *Thomists* from *Thomas Aquinas*, who flourished A.D. 1224. The *Scotists* from *Johannes Dun Scotus*, A.D. 1308. And the *Nominalists* from *Ocham*, who was born about A.D. 1310. And now a days by the *Peripatetick Philosophy*, we understand that which was founded on the Principles of *Aristotle* and his Commentators and Followers; and which therefore is as frequently called, *The Aristotelian Philosophy*.

PERIPHERY, in Geometry, is the Circumference of a Circle, or of any other Regular Curvilinear Figure.

PERIPHRAIS, is a Circumlocution used to avoid certain Words, whose Idea's are unpleasing; and to prevent the speaking of something that would produce ill Effects.

PERIPEUMONIA, is an Inflammation of the Lungs and Breast, accompanied with a sharp Fever, hard Breathing, a Cough, and an heavy Pain. *Blanchard*.

PERITERE, in Architecture, is a Place encompassed round with Columns, and with a kind of Wings about it; here the Pillars stand without, whereas in the *Peristyle* they stand within.

PERISCHII, are the Inhabitants of the two Frozen Zones, or those that live within the Compa's of the *Arctic* and *Antarctic* Circles; for as the Sun never goes down to them after he is once up, but always round about, so do their Shadows. Whence the Name.

PERISSOLOGY, is a Discourse fill'd up with unnecessary and superfluous Words.

PERISTALTICK Motion, is a *Vermicular* or *Wormlike* Motion of the Intestines, whereby the Excrements are voided. Also the Motions of the Vessels, whereby Humours, as Water, Chyle, the Blood, &c. ascend and descend, is sometimes so called.

PERISTIPHALINUS, *internus* & *externus*, are Muscles of the *Uvula*, the one pulling it forwards, and the other backwards.

PERISTYLE, in Architecture, is a Place or Building encompass'd with Pillars, standing round about within the Court: But this Word *Peristyle* is sometimes taken for a Row or Rank of Columns, as well without as within any Edifice; as in Cloysters and Galleries: Sometimes this was called *Antiprostyle*.

PERITONÆUM, is a Membrane (of an Oval Figure) which clothes the whole *Abdomen* on the Inside, and its Entrails on the Outside: It consists of two Tunicks, and adheres above to the *Diaphragma*, below to the *Os Ilium*; before to the Transverse Muscles, but chiefly to their Tendons about the *Linea Alba*; behind, it grows to the Flethy Heads of these Muscles.

PERITROCHIUM, in Mechanicks is a kind of Wheel, or Circular Frame of Wood, placed somewhere upon an *Axis*, or Cylinder, round which a Rope is wound, in order to raise a Weight; and the Use of this *Peritrochium*, is to make the Cylinder or *Axis* be turned the more easily by the Means of Staves or Levers, which

are fix'd in its Circumference. See *Axis* in *Peritrochio*.

PERJURY, is a Crime committed, when a lawful Oath is ministred by any that hath Authority, to any Persons in any Judicial Proceedings; who swear absolutely and fally in a Matter material to the Issue or Cause in Question, either of their own Accord, or by the Subordination of others. *Note*, If a Man call me *Perjured Man*, I may have my Action upon the Case; but for calling me a *Forsworn Man*, no Action lies. And *Pejury* is excepted out of the Act of General Pardon.

PERMEATING, is penetrating into, and passing thro' the Pores of any Body. Mr. Boyle had a *Smoking Liquor*, which he called, *The Permeating Menstruum*, and its Operations, *The Penetrant*, or *Permeating Fumes*. It was made of equal Parts of *Flos Sulphuris*, *Sal Armoniack*, and good Quick Lime, all powdered, and well mingled together, and then distilled by Degrees of Fire in a Retort, till the Sand which contains the Retort, become almost red-hot; for then will come over a Liquor which will be continually smoking, and consequently must be kept well stop'd. With this Fuming Liquor he made several Experiments to evince the Porosity of Bodies; by discovering, that tho' Coins, &c. were wrap'd up close in Leather, &c. yet the Fumes of this *Permeating Menstruum* would get thro' them, and discolour the Metal. *Vid. Essay of Porosity of Body*, p. 36, 37.

PERMUTATIONE *Archidiaconatus* & *Ecclesie eidem annexæ cum Ecclesia* & *præbenda*, is a Writ to an Ordinary, commanding him to admit a Clerk to a Benefice, upon Exchange made with another.

PER my & *per toute*, in Law, a Joint-Tenant is said to be seised of the Lands that he holds jointly *Per my* & *per tout*; that is, he is seised by every Parcel, and by the whole.

PERNIO, is a preternatural Swelling, caused by the Winter Cold, especially in the Hands and Feet, which at last breaks out.

PERONA, is also called *Fibula*, because it joins the Muscles of the Leg; whence the first and second Muscle in the Leg is called *Peroneus*. It is the less and slender Bone, which is fastened outwardly to the greater Bone of the Leg, called *Tibia*.

PERPENDICULUM *Chronometrum*, the same with the *Pendulum*.

PER que *Servitia*, is a Writ Judicial, issuing from the Note of a Fine, and lieth for Cognisee of a Mannor, Seigniori, chief Rent, or other Services, to compel him that is Tenant of the Land at the Time of the Note of the Fine levied, to Attorn unto him.

PERQUISITE, is any Thing gotten by a Man's own Industry, or purchased with his own Money, different from that which descends to him from his Father or Ancestors.

PERQUISITES of Court, in Law, signifies those Profits that grow to a Lord of a Mannor, by virtue of his Court Baron, over and above the certain yearly Profits of his Land, as Fines of Copyholds, Harlots, Amerciaments, Waifes, Strays, &c.

PERSICK Order of Architecture, is where the Bodies of Men serve instead of Columns to support the *Entablature*, or rather the Columns are in that Form.

The Nile of it was this; *Pausanias* having defeated the *Persians*, the *Lacedaemonians*, as a Mark of their Victory, erected Trophies of the Arms of their Enemies, and then represented the *Persians* under the Figures of Slaves supporting their *Porches*, *Arches*, or *Houses*.

PER MINIMA, a Term used in Chymistry and Physick, expressing the perfect Mixture of any two or more Bodies: *v. gr.* If Silver and Lead be melted together, they will mingle and be united with one another *per minima*: That is, all the smallest Particles of one Metal will be mingled and united with those of the other.

PERNICITY, a Word used by some Philosophick Writers of *Celerity*, or extraordinary swiftness of Motion.

PERONÆUS primus, a Muscle of the *Tarsus*, by some it is called *Longus*, it being the first that offers it self to view, and the longest Muscle seated on the *Fibula* or *Os Perone*.

It arises Externally Tendinous, and Fleishy Internally from above half the Superior part of the said Bone, and marching somewhat backwards, becomes a strong, flat Tendon, four Fingers breadth in length above the Inferior Appendage of the said *Fibula*, called *Malleolus Externus*; passing behind which in a Channel, like a Rope in a Pulley; and from thence being inflected forwards, together with the Tendon of the following Muscle, they pass under an imbanding Ligament as they run over the *Os Calcis*, but this Tendon declining from its Companion, matches over the *Os Cuboides*, under the *Musculus Abductor Minimi Digiti*, and over the *Ossa Cuneiformia*, in the Bottom of the Foot, and under the Tendons and Muscles bending the Toes, and is Inserted to the Superior and Hindmost part of the *Os Metatarsi* of the Great Toe. The Tendon of this Muscle being conveyed over the Hindmost part of the *Malleolus Externus*, as on a Pulley, is an Elegant Contrivance in Nature, whereby the Ball of the Great Toe (as that part is commonly called to which it is Inserted) is directed towards a Perpendicular bearing of the Weight of the Body on the Leg, in standing on Tip-toe, by pulling the Foot and Toes somewhat outwards.

PERONÆUS secundus, a Muscle of the *Tarsus*, by some called *Semi-fibularis*: It has an Acute Fleishy beginning above the middle of the External part of the *Fibula*, under the Fleishy Belly of the *Peroneus primus*; it also continues its Fleishy beginning from the Posterior sharp edge of the said *Fibula*, and becoming a Fleishy Belly, grows Tendinous as it runs under the *Malleolus Externus*, together with the Tendon of the *Peroneus primus*, and is Inserted to the Superior and External part of the *Os Metatarsi* of the Little Toe. The proper Action of this Muscle, is to pull the Foot and Toes outwards.

PERPENDICULAR, in Geometry; when a Right Line standeth so upon another, that the Angles on either side are equal; then this Right Line which so standeth erected, is *Perpendicular* to that upon which it standeth.

Thus: The Line AB, is Perpendicular to the Line CD, when the Angles on either side are equal: That is, If the Angle $ABC =$ to the Angle ABD , and either of these Angles is equal to a Right one.

A Right Line is said to be

PERPENDICULAR to a Plane, when 'tis Perpendicular to all the Lines it meeteth with in that Plane.

One Plane is

PERPENDICULAR to another, when a Line in one Plane is Perpendicular to the other Plane.

PROBLEM I.

To Erect a Perpendicular on any assigned Point of a given Right Line. As suppose on the Point *c*.

On each side of the given Point *c*, cut off $ce = cd$; and with the Distance *de*, (or any other greater than *dc*) describe two Arches from *d* and *e*, intersecting each other in *a*, join *ac*; which shall be the Perpendicular required. *11* *Euclid*.

PROBLEM II.

To Erect a Perpendicular, on, or near the End of a given Line. As suppose at R.

Open your Compasses to any convenient distance, and setting one Foot in C, draw the Circle P R S. Lay a Ruler from S, thro' C, it will find the Point P in the Circumference; from whence draw P R, and 'tis done.

For the Angle P R S, being in a Semi-circle, must be a Right one; (by 31 *è* 3 *Eucl.*) and consequently P R must be Perpendicular to S R.

The same may be otherwise performed thus:

Suppose on A R, the Perpendicular P R were to be Erected at the End R.

With any convenient opening of your Compasses, one Foot being placed in R, draw the Circle O C S; then with the same Distance, set one Foot in S, and cross the Circle in C, as also in K; then on the Centres C and K, draw (with the same Distance) two more Circles cutting each other in P; I say P R, will be Perpendicular to A R. For the Angle P R S, is a Right one, being in the Semi-circle P K R S.

PROBLEM III.

To let fall a Perpendicular on a given Line, from a given Point. As a

Set one Foot of the Compasses in a the Point given, and with the other cross the given Line in the Points b and c: Then setting the Compasses in b and c, draw two Arks, crossing each other below in o: Then lay a Ruler from a to o, and 'tis done.

The Demonstration depends on the 9th *è* 1 *Euclid.*

PERPENDICULAR, or *Right Plane*, is where a *Plane*, (like a well made Wall) inclines and leans on one side, no more than it doth on the other.

PERPENDICULAR, to a Parabola, is a Right Line cutting the Parabola in the Point in which any other Right Line touches it, and which is also its self Perpendicular to that Tangent.

PERPETUAL *Caustick*. See *Infernal Stone*.
PERPETUITY, a Term used in Law, where an Estate is so designed to be settled in Tail, &c. that it cannot be undone or made void.

PER SE, a Term of Art often used; as in Logic, we say a Thing is considered *Per se*, when 'tis taken in the Abstract, and without Connexion with other things, which would confound the Notion, and hinder its being clear.

In Chymistry a Thing is said to be Distilled *Per se*, when 'tis without the usual Additaments of other things with it.

We say also a Man performs any Action, or Executes any Office *per se*, when he doth it himself in Person, and not by a Deputy or Substitute.

PERSEUS, a Constellation in the Northern Hemisphere, consisting of 38 Stars.

PERSONAL Verb, in Grammar, is one that is Declined or Conjugated with all the Three Persons, and in both Numbers; whereas an *Impersonal Verb* is only used in the Third Person Singular.

PERSONABLE, in Law, signifies as much as enabled to maintain Plea in a Court, thus: The Defendant was adjudged Personably to maintain his Action. Also the Tenant pleaded, that the Wife was an Alien Born in Portugal, without the Allegiance of the King; and Judgment was demanded, Whether he should be answered: The Plaintiff saith, She was made Personable by Parliament;

liament; that is, as the *Civilians* would speak it, *Habere personam standi in judicio*. *Personable* is also as much as to be of Capacity to take any thing granted or given.

PERSONAL, in Law, when 'tis join'd with the Substances, Things, Goods, or Chattels; as Things *Personal*, Goods *Personal*, Chattels *Personal*, signifies any moveable Thing belonging to a Man, be it quick or dead: Thus, they say, Theft is an unlawful Felonious Taking-away another Man's moveable *Personal* Goods.

PERSONAL Tythes, are Tythes paid of such Profits as come by the Labour of a Man's Person, as by Buying and Selling, Gains of Merchandize and Handicrafts, &c. See *Tyther*.

PERSONALITY, is an Abstract of *Personal*: the Action is in the *Personality*, viz. It is brought against the right Person, or the Person against whom in Law it lies.

PERSONS *ne Prebendaries ne seront chargeés as quinsim*, &c. is a Writ that lies for *Prebendaries*, or other Spiritual Persons, being distrained by the Sheriff or Collectors of Fifteens, for the Fifteenths of their Goods, or to be contributory to Taxes.

PERSPECTIVE, is that Part of the Mathematicks which give Rules for the representing of Objects on a plain Superficies, after the same Manner as they would appear to our Sight, if seen thro' that Plain, it being supposed as transparent as Glass.

Perspective is either *Speculative* or *Practical*.

Speculative Perspective, is the Knowledge of the Reasons of the different Appearance of certain Objects, according to the several Positions of the Eye that beholds them.

Practical Perspective, is the Method of Delineating that which is apparent to our Eyes, or that which our Understanding conceives in the Forms that we see Objects. See Vol. II.

PERSPECTIVE Lincal, is the Diminution of those Lines in the Plan of a Picture, which are the Representation of other Lines very remote.

PERSPECTIVE Aereal, is a proportional Diminution of the Tints and Colours of a Picture, when the Objects are supposed to be very remote.

PERSPECTIVE Military, is when the Eye is supposed to be infinitely remote from the Table or Plain.

PERSPICUOUS, is that which is clear and transparent, as that the Light may be seen freely thro' it. See *Diaphanous*.

PERSPIRATION, a breathing through, as Sweat through the Invisible Pores of the Body.

PERTICA, a Sort of Comer, the same with *Veru*.

PESSARY, is an Oblong Medicine, which being made of the Length of the Middle-Finger, is thrust up into the Neck of the Womb, and is good against several Diseases incident to it.

PESSULUS, the same with *Pessary*.

PESSUS, the same.

PESTILENTIAL Fever, is that which does not only afflict the Patient with a bare Distemper or Heat arising from Putrefaction, &c. but also with a Malignant and Venomous Quality. It differs from the Plague, as a Species or Sort from the Genus or Kind; because a *Pestilence* may sometimes happen without a Fever. *Blanchard*.

PESTOLOIDES, is a Sort of Urine which seems to have little Leaves or Scales in it. *Blanchard*.

PETALA, is a Term in Botany, signifying those fine coloured Leaves that compose the Flowers of all Plants. And from hence Plants are distinguished into *Monopetalous*, whose Flower is all in one continued Leaf; and *Tripetalous*, and *Pentapetalous*, when the Flower consists of three or five Leaves; and *Polypetalous* when of many, without determining the Number.

PETARD, in Fortification, is an Engine of Metal in the Form of an High-crown'd Hat, with narrow Brims, which being filled with very fine Powder, well primed, and then fix'd with a *Madder* or Plank, bound fast down, with Ropes running through Handles, which are round the Rim of the Mouth of it, to break down Gates, Port-cullices, Draw-bridges, Barriers, &c. This Engine is from 7 to 8 Inches deep, and 5 broad at the Mouth; the Diameter at the Bottom or Breech is an Inch and a half, and the Weight of the whole Mass of Metal is from 55 to 60 Pounds, generally requiring about 5 Pounds of Powder for the Charge. They are also used in Countermines to break through into the Enemies Galleries, and to disappoint their Mines.

PETECHIALIS, is a Malignant Fever, called also *Pulcaris*, because it makes the Skin look as tho' it were Flea-bitten.

PETIGO. See *Lichen*.

PETIT Cape. See *Cape*.

PETIT Larceny. See *Larceny*.

PETIT Treason, in Common Law, is when a Servant kills his Master, a Wife her Husband, a Secular or Religious Man his Prelate or Superior, to whom he owes Faith and Obedience: In how many other Cases it may be committed, see *Crompt. Justice of Peace*.

PETITIO Principii, *Begging of Principles*, is a precarious supposing a Thing to be true, or taking it for granted, when it really remains either dubious, or else is expressly denied. This frequently is called *Begging the Question*, when a Man supposes what he should prove.

PETREFACTION, is properly the changing of a mix'd Body into a Stoney Substance, when it had no such Nature before; and the Action by which this is performed, is called,

PETREIFICATION, and the Thing so chang'd is said to be *Petrefied*. 'Tis justly questionable, Whether there be any such Thing as *this* in Nature, or not? *Petrefaction* indeed now-a-days is a mighty modish Word, for every Thing almost that is found upon the Surface, or dug out of the Earth, passes with some Persons by this Name. But what is there that really and truly deserves the Name of *Petrefaction*? When the *Petrefying* Waters, as they are called, (which are nothing but Waters impregnated with a great deal of Stoney Matter, which in their Passage through the Earth became dissolved in them:) When these, I say, incrustate Rushes, Grass, or Stricks, all over with a Stoney Coat, by letting the Stoney Particles dissolved in them by little and little fall down upon and adhere to them; or, it may be, insinuate into their Pores, and deposit themselves there. And when after this the Vegetable Part inclosed rots and moulders away, and the Stoney Coat or Substance daily increases; this is not the Transmutation of a Vegetable Substance into a Stoney

or Mineral one; and therefore the new Body thus formed, is not properly a *Petrification* in the true Sense of the Word.

And when many Bodies are found in the Earth, which by all possible ways of judging and distinguishing, approve themselves to be Animal or Vegetable Bodies, such as the Shells, Teeth, Bones, of Animals, the Fossil-Trees, Pine-Cones, Hazel-Nuts, &c. which are every where found deep in the Earth. It appears odd to call these *Petrifications*, and more odd to suppose them nothing but the *Sportings of Nature*; and to affirm all these Things to be nothing but meer *Formed Stones*, only because we cannot account presently how they came thus into the Earth, or solve all the Objections or Difficulties about them. But every one will have his own way of Expression.

PETROSUM Os, is the Internal Process of the Bones of the Temples, so called from its Hardness and Cragginess: 'Tis pretty long, jutting out to the Inner Basis of the Skull, within which it hath two Holes, and thro' one of them an Artery, and thro' the other the Auditory Nerve passes to the Inner Cavities of the Ear, that are excavated in this Process, viz. the *Tympanum*, *Labyrinthus*, and *Cochlea*; and without the Skull it hath three Holes: The first of which is the *Meatus Auditorius*: The second is narrow, short, and oblique, near to the first, and thro' it the Jugular Vein enters the Inner Cavities: The third is seated betwixt the *Processus Mamillaris*, and the *Styloides Appendix*, and ends in the Passage which goes from the Ear to the Mouth.

PETTERERO. See *Pedrero*.

PEVETTS, are the Ends of the Spindle of any Wheel in a Watch; and the Holes into which they run, are called *Pevett-Holes*.

PEYNT fort & dure. See *Payne fort & dure*.

PHACIA. Vid. *Lenticula*.

PHACOS, is a Spot in the Face like a Nit, whence it is called *Lenticula* and *Lentigo*.

PHAGADÆNA, is an exulcerate Cancer.

PHAGADENICK Water, is made by dissolving a Dram of Sublimate Corrosive in a Pound of Lime-Water, on which it will immediately turn Yellow.

PHALACKOSIS, is the falling off the Hair.

PHALANGOSIS, is a Fault of the Eye-lids, when there are two Rows of Hair, or when the Hair grows inward and offends the Eyes.

PHALANX, according to some Writers, is the Order and Rank observed in the Finger-Bones.

PHANTASY is an Internal Sense or Imagination, whereby any Corporeal Thing is represented to the Mind, or impressed on the Brain by its proper Image.

PHANTASTICAL Colours, are such as are exhibited by the Rainbow, Triangular Glass Prism, the Surface of very thin *Muscovy* Glass, &c. They had this Name given 'em by the *Peripatetick Philosophers*, who supposed them to be no real Colours. This *Kircher* well refutes in his *Mundus Subterraneus*, Part 2. p. 13, 16. and shews also the Cause of such Colours.

PHARMACEUTIC, the same with *Pharmacum*.

PHARMACOPOEA, is the Doctrine or a Description of Things Medicinal, in order to cure Diseases.

PHARMACUM, is any Sort of Medicine against a Disease.

PHARMACY, is an Art of collecting, chusing, and compounding Medicines, viz. the Apothecary's Art; to which may also be added the Chymical Analysis of Bodies, in order to prepare good Medicines out of them.

PHARYNGETRUM is sometimes used for the *Pharynx*, sometimes for the Bone *Hyades*.

PHARYNX, is the upper Part of the Gullet, consisting of three Pair of Muscles; to which some add another, making the Number seven: It is continued to the *Fauces*, (or indeed is the greatest Part thereof,) reaching up behind to the *Uvula*, on the Sides to the *Tonsillæ*, and before to the *Epiglottis*: It is *Membranous*, but not entirely so, being in some Places *Carnous* and *Thick*. Three Pair of its Muscles open it in the Action of swallowing; and the odd one is a *Sphincter* which serves to straiten it.

PHÆNOMENON, in Natural Philosophy, signifies any Appearance, Effect, or Operation of a Natural Body, which offers its self to the Consideration and Solution of an Enquirer into Nature.

PHASES, signifies the Appearance or the Manner of Things shewing themselves, and therefore in Astronomy is used for the several Positions in which the Planets, (especially the Moon) appear to our Sight; as obscure, horned, half illuminated, or full of Light, which by the help of a *Telescope* may likewise be observed in *Venus* and *Mars*,

PHEONS, in Heraldry are the Barbed Heads of Darts or Arrows, and are usually of this Figure.

Sable, a Fesse Ermine between three Pheons, by the Name of *Egerton*.

PHILANTHROPY, is a generous Love for Mankind in general, or an Inclination to promote Publick Good.

PHILONIUM, is an Opiate Medicine; of which they reckon two Sorts, the *Philonium Romanum* and *Persicum*.

PHILOSOPHICAL Egg, among the Chymists is a thin Glass Vessel, or Bubble, of the Shape of an Egg, with a long Neck or Stem: 'Tis used in long Digestions.

PHILTRUM, is the Hollow Dividing the Upper Lip.

PHIMOSIS, is the same with *Paraphimosis*; also the Inversion of the Eye-lids through an Inflammation.

PHLEBORHAGIA, is the breaking of a Vein.

PHLEBOTOMY, opening of a Vein, or letting of Blood.

PHLEGM, or *Water*, the Fourth of the Five Chymical Principles. See *Water*.

The Insipid Water that comes first in the Distillation of Acid Spirits, the Chymists call the *Phlegm*: And the more any such Spirit is rectified, that is, distilled over again, to draw off still more of this *Phlegm*, they say 'tis the better *dephlegmated*.

PHLEGM of Vitriol, is the Moisture that is first drawn off when *Calcined Vitriol* is distilled, in order to get its Spirit and Oil, it comes off with a gentle Heat.

PHLEGMAGOGUES, are Medicines which purge or drain away that Humour which they call *Phlegm*.

PHLEGMON,

PHLEGMON. So the Surgeons call an hot Tumour, proceeding from an Over-affluxion of Blood to any Part.

PHLEGMONODES *Febriis*, a Fever with an Inflammation of the Blood.

PHLOGOSIS, is a light Inflammation of the Eyes, with a small Pain and Redness; which sometimes turns into a true *Ophthalmia*, and is the Original thereof.

PHLYCTOENA, is a Pimple in the Skin, also a little Ulcer, like a Bubble or Bladder, in the Corneous Tunick of the Eye, and proceeding from a sharp watry Humour. *Blanchard.*

PHONICKS, the same with *Acousticks*; which see.

PHOSPHORUS, a Chymical Preparation, which being expos'd to the Light or Air, will shine in the Dark. Of this there are several Kinds whose Process shall be briefly delivered.

To make the *Bolonian Phosphorus*, see under the *Bolonian Stone*.

The most common Way (with us) is to make the *Phosphorus* from Humane Urine. And the Hint came first by Chance thus:

One *Brand*, an Alchymist of *Hamburg*, wisely thinking to find the Philosopher's Stone in Human Urine, work'd upon it in a Retort, and so forced over the *Phosphorus* Matter; yet he would not communicate this Discovery to any one, and so the Secret died with him. After his Death, one *Kirkbelsius*, a *Saxon* Chymist set himself to find it out, (having heard of such a Thing,) and succeeded accordingly; and this Man shew'd the Process to several of his Friends.

The Honourable Mr. *Boyle* having (in part) had an Account of this *Phosphorus*, from one *Daniel Kraff*, a *German*, about the Year 1680, published in *English* an Account of the Way of making this *Phosphorus*, and several very Curious Experiments upon it, under the Title of *Noësiluca*. And since that, Mr. *Homburg* hath writen largely about it, as you may see in the Memoirs (for the Months *March* and *April*) of the Royal Academy of Sciences at *Paris*, 1692.

The Way of Preparing it, is this:

Take a good large Quantity of the New-made Urine of Beer-drinkers, and evaporate it gently, to the Consistence of Honey: Then put it in an Earthen Vessel, cover, and place it in a Cellar for three or four Months, that it may thoroughly ferment and putrefie. Then mix a double Quantity of Sand, or Powder of Pots, with one part of this corrupted Urine, and put it into an Earthen Retort or Glais one Coated; and fitting it to a large long-neck'd Glais Receiver, in which was before put two or three Quarts of Water, distil it in a naked Fire, in a Reverberatory Furnace, gently at first, for about two Hours; afterwards augment the Fire gradually, 'till all the Volatil Salt and black Fœtid Oil be drawn off. Then raise the Fire to the highest Degree, and white Clouds will come into the Receiver, and fix it by little and little, on one Side of it, in the Form of a yellowish Skin, and another Part will precipitate to the Bottom in Powder. Keep the Fire thus violent for three Hours, 'till no more Fumes will come. Let all cool, and unlute the Vessels; and

throwing more Water into the Receiver, shake all well about to loosen what will stick to the Sides; and then pour it all into a large Glais Vessel, where it will settle; the Volatile Salt will dissolve in the Water, but the *Phosphorus* and the Oil will sink to the Bottom. Pour off the Water, and gathering the remaining Matter together, put it into a little Glais Vessel, with a little fresh Water, and digest it in a Sand-heat, stirring the Matter about from Time to Time with a Wooden Spatula; the *Phosphorus* by this Means will separate from the Oil, and sink to the Bottom. Pour away the Oil, and make the *Phosphorus* up while hot, into little Sticks or Pieces, which must be kept in a Viol of Water close stop'd.

This is the *Solid Phosphorus*, with which, if you write any Letters on Paper, or on a Wall, they will appear Luminous in the Dark, and continue so a good while. If you cut off a little Bit of it, and rub it strongly along a Piece of Paper with a Knife, it will actually enkindle the Paper.

The *Liquid Phosphorus* is made by digesting in Horse-dung a little Bit, or some Scrapings, of the Solid, for two Days, in Oil or Essence of Cloves, Oil of Turpentine, &c. For after it is dissolved in the Oil, it will impregnate it so, that as soon as ever you open the Bottle, the Matter will appear all in a Flame.

If you put a little of the *Solid Phosphorus* into a Viol, with a little Oil of Vitriol, that is very strong and well dephlegmated, and then add to it about half as much common Water as there was Oil of Vitriol, the Mixture will grow very hot, and smok; and if you carry the Viol into the Dark, you will see the *Phosphorus* enkindled, and sparkle in many Places of the Viol, like Meteors, or little Falling-stars: And if a small Quantity of Oil of Turpentine be added, it will produce an actual Flame.

Lemery mentions a New-invented *Phosphorus* of Mr. *Homburg's* being made of one Part of Sale Armoniack, and two of Quick-lime slack'd by the Air; which are fluxed together in a Crucible, into a kind of Gray Glais, which when it is struck with a Hammer, appears presently of a light Fire.

Phosphorus Balduini, called the *Hermetick Phosphorus*, is thus made:

Heat read-hot about two Pounds of Chalk, let it cool, and powder it. Then take a Pint of *Aqua-fortis*, and put into it a Spoonful of your powdered Chalk; a great Ebullition will arise: Repeat this 'till the throwing in of the Powder makes no Ebullition at all. After this, let the Liquor settle, and decant it into an Earthen Pan placed in Sand, and evaporate all the Liquor, so there will remain a kind of Salt at the Bottom. Put this Salt into a Coppel, or a strong Earthen unglazed Pan; set it in a gentle Sand-heat, and the Matter will swell. Continue this gentle Fire 'till it be sunk down a little towards the Bottom; then cover the Pan or Coppel with a Lid that hath two or three Holes in it, and encrease the Fire gradually, 'till it be strong enough to melt the Matter; and when 'tis melted, a yellow Vapour will exhale through the Holes in the Cover. Then take the Vessel presently off the Fire, and putting on another Earthen Lid, which hath no Holes in it, set it by to cool. Round about the

fides of the Pan you will find a Cruft of yellow Matter; that is the *Phosphorus*. It must be kept in a Box well stopp'd, in a dark place. When 'tis design'd to be render'd Luminous, you must expose it, like the *Bolonian Stone*, to the Light, for a small Space; and then removed into the Dark, it will shine there. If it be left in the Dark, exposed to the Air for about Fifteen Days, it will shine all that while; but after that go out, and never be Luminous more.

Mr. Boyle, in his *Aereal Noctiluca*, p. 102. describes a *Phosphorus Balduini* much like this; and in *Phil. Transf.* N° 199, there is of his a yet more accurate Process for this Thing.

The Learned Dr. Slare, in *Phil. Transf.* N° 150, makes an Ingenious Comparison between *Lightning*, and the Flashes which in warm Weather he had often observed (by Night) to arise from some Pieces of the *Solid Phosphorus*, kept in long Glass Bottles of Water about $\frac{2}{3}$ filled.

PHRENES. See *Diaphragma*.

PHRENESIS, the same with *Phrenitis*.

PHRENETICK Nerves, are those which are called also *Stomachick*, and spring from Dr. Willis's Eighth Pair, or from the common reckoned Six Pair: Those descend between the Membranes of the *Mediastinum*, and send forth Branches into them.

PHRENICK Vessels, are the Veins and Arteries that run through the *Diaphragm*, *Mediastinum*, and *Pericardium*.

PHRENITIS, or *Phrenzy*, is a Dotage with a continued Fever, often accompanied with Madness and Anger; proceeding from too much Heat in the Animal Spirits, not from the Inflammation of the Brain, as the Ancients thought. *Willis* thus defines it, namely, an Inflammation of the whole Sensitive Soul and Animal Spirits.

PHRICODES, is a dreadful Fever, in which Men are apt to fancy terrible Things.

PHROCYON, a Fix'd Star of the Second Magnitude, in the Constellation *Canis minor*, whose Longitude is 111 Degrees 23 Minutes, Latitude 15 Degrees 57 Minutes.

PTHARTICUM, is a Corrupting Medicine.

PTHIRIASIS, is the Lousy Disease; also a Scaly Scab on the Eye-brows. *Blanchard*.

PTHISIS, is a Consumption of the whole Body, rising from an Ulcer in the Lungs, accompanied with a slow continued Fever, ill scented Breath, and a Cough. *Blanchard*.

PTHOE, the same with *Phthisis*.

PHYGETHLON, is a Swelling proceeding from an Inflammation of the Glandules, wherein Nature expels something; as in the Plague, about the Groins. *Blanchard*.

PHILOSOPHERS Tree. See *Diana's Tree*.

PHYMA, is a Swelling: There are five Sorts, *Verrucae*, *Calli*, *Vari*, *Furunculi*, and *Hydrae*, or *Defudationes*; of which, see under those Words. Others reckon it a Tumour in the Glandules only, which quickly separates. *Blanchard*.

PHYEMA, an Inflammation in any part of the Body, as a Tympany. *Blanchard*.

PHYSICKS, or Natural Philosophy, is the Speculative Knowledge of all Natural Bodies, (and Mr. Lock thinks, That God, Angels, Spirits, &c. which usually are accounted as the Subject of *Metaphysics*, should come into this Sci-

ence,) and of their proper Natures, Constitutions, Powers, and Operations. See *Physiology*.

PHYSIOGNOMICKS, is a Term used by some Physicians and Naturalists for such Signs as are taken from the Countenance of Persons, to judge of their Dispositions and Tempers.

PHYSIOLOGY, *Physicks*, or Natural Philosophy, is the Science of Natural Bodies, and their various *Affections*, *Motions*, and *Operations*. This is either

General, which relates to the Properties and Affections of Matter or Body in general. Or,

Special and Particular, which considers Matter as formed or distinguished into such and such Species, or determinate Combinations.

PHYSIOLOGY, is by some also accounted a Part of *Physick*, that teaches the Constitution of the Body so far as it is found, or in its Natural State; and endeavours to find Reasons for its Functions and Operations, by the Help of Anatomy and Natural Philosophy.

Mr. Keil, in his *Introductio ad Physicam*, reckons Four Classes or Sorts of Philosophers which have treated of *Physicks* or Natural Philosophy.

1. Those who delivered the Properties of Natural Bodies under Geometrical and Numerical Symbols; as the *Pythagoreans* and *Platonists*.

2. The *Peripateticks*, who explained the Natures of Things by Matter, Form, and Privation; by Elementary and Occult Qualities; by Sympathies, Antipathies, Faculties, and Attractions, &c. And these did not so much endeavour to find out the true Reasons and Causes of Things as to give them proper Names and Terms; so that their *Physick* is a kind of *Metaphysics*.

3. The *Experimental Philosophers*, who by frequent and well-made Trials and Experiments, as by Chymistry, &c. sought into the Natures and Causes of Things: And to these almost all our Discoveries and Improvements are due; and much more would they have done, if they had not fallen into *Theories* and *Hypotheses*, which they forced oftentimes their Experiments to maintain, whether they could or not.

4. The *Mechanical Philosophers*, who explicate all the *Phenomena* of Nature by *Matter* and *Motion*, by the Texture of Bodies, and the Figure of their Parts; by *Effluvia*, and other subtle Particles, &c. And in short, would account for all Effects and *Phenomena* by the known and established Laws of *Motion* and *Mechanicks*: And these are, in Conjunction with the last named, *The Only True Philosophers*.

PIA Mater. See *Mater tenuis*.

PICA. See *Citta*.

PICATIO. See *Dropacismus*.

PIEDOUCHE, in Architecture, is a little Square Base smoothed, and wrought with Mouldings, which serves to support a *Base* or Statue drawn half way, or any small Figure in Relief.

PICKET, in Fortification, is sometimes used for a Stake, sharp at one End, to mark out the Ground and Angles of a Fortification, when the Engineer is laying down the *Plan* of it; these are usually pointed with Iron. There are also larger *Pickets*,

Pickets,

Pickets, which are drove into the Earth, to hold together *Fascines* or Faggots, in any Work cast up in haste. And *Pickets* also are Stakes drove into the Ground by the Tents of the Horse in a Camp, to tie their Horses to. And *Pickets* are also drove into the Ground before the Tents of the Foot, where they rest their Muskets or Pikes round about them in a Ring. When an Horseman hath committed some considerable Offence, he is often sentenced to stand on the *Picket*; which is, to have one Hand drawn up as high as it can be stretch'd, and then he is to stand on the Point of a *Picket* or Stake only with the Toe of his opposite Foot; so that he can neither stand or hang well, nor ease himself by changing Feet.

PICRA. See *Hiera picra*.

PIED-DROIT, in Architecture, is a Square Pillar, differing from a *Pillaster* in this respect, that it hath no Base nor Capital: It is taken also for Part of the Jaumbs of a Door or Window.

PIE-Powder-Court, is a Court held in Fairs, to yield Justice to Buyers and Sellers, and for Remedies of all Disorders committed in them.

PIGMENTS, are such prepared Materials as Painters, Dyers, &c. make use of, to impart to Bodies, or to imitate particular Colours. When Glass is stained or coloured, as in Painting on Glass, or for the Counterfeiting of Gems or Precious Stones, the *Pigment* is usually of a Metaline or a Mineral Nature.

PILE, in Heraldry, signifies an Ordinary, consisting of a Two-fold Line, formed after the Manner of a Wedge; being probably something like the Figure of the Roman *Pilum*, which was a tapering Dart, about five Foot long, and sharpened at the Point with Steel. The *Pile* is born *inverted*, engraved, &c. like other Ordinaries, and issues indifferently from any Point of the Verge of the *Escutcheon*.

He beareth a *Piles Gules*, by the Name of *Shandois*.

PILLAR, or *Column*, in Architecture, is one of the principal Things in which the Beauty and Proportion of a Fabrick doth consist. A *Pillar* hath three Parts, the *Pedestal*, the *Shaft* or *Pillar* it self, and the *Ornaments*: And each of these is again subdivided into three other Parts; the *Pedestal* hath its *Base*, *Dye*, and *Cornich*; the *Pillar* its *Base*, *Shaft*, and *Capital*; and the *Ornaments* have their *Architrave*, *Frieze*, and *Cornich*.

PILLASTERS, in Architecture, signify Square Pillars, that usually stand behind Columns to bear up Arches: They have the very same Dimension, Chapter, and Base, with the Columns, according to their several Order. When these *Pillasters* do not stand alone by themselves, they are usually made to jet out of the Wall, a third part or a quarter of their Breadth, with respect to the Variety of different Works: So that some of them project out only a sixth or an eighth part, and they are generally as broad at top as at bottom.

PILLOW, is that Piece of Timber in a Ship whereon the Boltspirit beareth or resteth at its coming out of the Hull, aloft, close by the Stem.

PINEALIS Glandula. See *Conarium*.

PINGUEDO, the same with *Adeps*, or the Fat of Animals. See *Adeps*.

PINION, in a Watch, is that lesser Wheel which plays in the Teeth of another. Its Notches (which are commonly 4, 5, 6, 8, &c.) are called *Leaves*, and not *Teeth*, as in other Wheels.

PINION of Report, is that *Pinion* in a Watch, which is commonly fixed on the Arbor of the Great Wheel, and in old Watches used to have commonly but four Leaves: It driveth the *Dial Wheel*, and carrieth about the *Hand*.

The Quotient or Number of Turns to be laid upon the *Pinion of Report* is found by this Proportion: As the Beats in one Turn of the Great Wheel, to the Beats in an Hour: So are the Hours of the Face of the Clock, (*viz.* 12 or 24) to the Quotient of the Hour-Wheel, or *Dial-Wheel*, divided by the *Pinion of Report*, *i. e.* the Number of Turns which the *Pinion of Report* hath in one Turn of the *Dial-Wheel*; that is, in Numbers.

26928 : 20196 :: 12 : 9.

Or rather thus:

As the Hours of the Watch's going, are to the Numbers of the Turns of the Fly :: so are the Hours of the Face, to the Quotient of the *Pinion of Report*.

If the Hours be 12, then 16 : 12 :: 12 : 9.

But if 24, the Proportion is 16 : 12 : 24 : 18.

N. B. This Rule may serve to lay the *Pinion of Report* on any other Wheel, thus:

As the Beats in one Turn of any Wheel to the Beats in an Hour :: so are the Hours of the Face, or *Dial-Plate* of the Watch, to the Quotient of the *Dial-Wheel*, divided by the *Pinion of Report* fixed on the Spindle of the aforesaid Wheel.

PINNA Auris, is the upper and broader Part of the Ear called the Wing.

PINNATA Folia, in Botany are such Leaves of Plants as are deeply jagged, cut, or indented in, and which have their Parts resembling Feathers.

PIONEERS, are such Kinds of Labourers as are taken up for use of an Army, to cast up Trenches, and undermine Forts.

PIPE, in Law, is a Roll in the Exchequer, otherwise called the *Great-Roll*. See *Clerk of the Pipe*.

PITHIAS, or *Pithites*, with some Writers, is the Name of a Comet, or rather Meteor, of Form of a Tub: Of these there are divers Kinds, *viz.* some of an Oval Figure, others like a Tun or Barrel set Perpendicular, and some like one inclined, or cut short off; others having a Hairy Train or Bush, &c.

PINTLES in a Ship, are those Hooks by which the Rudder hangs to the Stern-post.

PIN-Wheel. See *Striking-Wheel*.

PISCES, is the twelfth and last Sign of the *Zodiack*, being a Constellation consisting of 35 Stars.

PISCES

PISCES Meridianus, a Southern Constellation, containing 12 Stars.

PITUITA. Vid. Plegma.

PITUITARIA Glandula. Vid. Glandula Pituitaria.

PITIROIDES, a Settling in the Urinelike Branch. Blanchard.

PLACARD, is a License whereby a Man is permitted to shoot in a Gun, or use Unlawful Games.

PLACE, is that Part of Space which any Body takes up; and with relation to Space is either absolute or relative. As Mr. Lock observes.

PLACE also is sometimes taken for that Portion of Infinite Space, which is possessed by, and comprehended within the Material World, and which is thereby distinguished from the rest of the Extension.

PLACE is usually distinguished into *Internal Place*, which properly speaking, is that Part of Space which any Body takes up or fills; and *External Place*, which according to Aristotle, is determined by the Surfaces or Confines of the Adjoining or Ambient Bodies: But it is better divided into *Absolute*, which is the former *Internal Place*; and into *Relative Place*, which is the Apparent Secondary or Sensible Position of any Body, according to the Determination of our Senses, with respect to other Contiguous or Adjoining Bodies.

PLACE of Arms, when taken in the general, is a strong City which is pitch'd upon for the Magazine of an Army. But a

PLACE in Fortification usually signifies the Body of a Fortrels. And a

PLACE of Arms in a Garrison, is a large open Spot of Ground in the Middle of the City, where the great Streets meet, or else between the Ramparts and the Houses, for the Garrison to rendezvous in, upon any sudden Alarm, or other Occasion. And the

PLACE of Arms of a Trench, or of an Attack, is a Post near it, shelter'd by a Parapet or Epaulement, for Horse and Foot to be at their Arms, to make good the Trenches against the Sallies of the Enemy. These Places of Arms are sometimes covered by a Rideau or Rifing-ground, or else by a Cavin or Deep Valley, which saves the Trouble of fortifying them by Means of Parapets, Fascines, Gabions, &c. They are always open in the Rear, for their better Communication with the Camp. When the Trench is carried on as far as to the Glacis, they make it very wide, that it may serve for a Place of Arms. Also the

PLACE of Arms of a Camp, is a spacious Piece of Ground at the Head of the Camp, to draw out the Army in Order of Battle. But the

PLACE of Arms of a Troop of Horse, or of a Company of Foot in the Camp, is that Spot of Ground on which the Troops or Company draws out.

PLACE Geometrick, is a certain Bound or Extent wherein any Point may serve for the Solution of a Local or Indetermined Problem. All the Points of a Geometrick Place, have the same Relation to the Points of the Right Line correspondent thereunto.

PLACE Plane, is when the Point resolving the Problem, is in the Periphery of a Circle: And then 'tis called, *Locus ad Circulum*. Thus, v. gr.

A Circle and any one of its Diameters being given, to find a Point without it, but on the same Plane with it; from whence a Right Line being drawn to one of the Ends of the Diameter, that Line shall be bisected by the Circumference of the Circle.

PLACE simple, or *Locus ad Lineum rectum*, as the Geometers call it, is when the Point that resolves any Problem is in a Right Line. As, To find the Centre of a Circle, whose Periphery shall pass thro' the Ends of a Right Line given in Magnitude and Position: For such Centre will be in a Right Line. But a

PLACE Solid, is when the Point is in one of the Conick Sections: Thus, To find the Centre of a Circle which shall touch both a Line given in Position, and also another Circle given in Position and Magnitude: There must be a Point found in the Periphery of a Parabola, the Focus of which, is the Centre of the Circle given, when the given Line and Circle touch one another, Lastly, a

PLACE Sur-solid, is when the Point is in the Circumference of a Curve of an higher Gender than the Conick Sections; as having a Point and a Right Line given on a Plane, to find on that Plane another Point beyond that given Line; so that a Right Line drawn thro' those 2 Points, shall have its Part comprehended between the second Point and the given Line, also given it self.

PLACE of the Sun, Star, or Planet, is the Sign of the Zodiack, and Degree of it, which the Planet is in; or it is that Degree of the Ecliptick reckoned from the Beginning of Aries, which the Planets or Stars Circle of Longitude cutteth; and therefore is often called, The Longitude of Sun, Planet, or Star:

And 'tis found by this Proportion:

As Sine of Sun's greatest Declination is $23^{\circ} 30'$. — — — — — } 9.6006997

To Sine of this present Decl. $23^{\circ} 15'$ — 9.9963154

So is Radius — — — — — } 10

To the Sine of his Longitude $81^{\circ} 52'$ 9.9956157

Which if the Declination were North, will be in $20^{\circ} 52'$ of Gemini; but if the Sun had South Declination, his Place would be in $20^{\circ} 52'$ of Capricorn.

PLACENTA Uterina, called by some Hepar Uterinum, from its Colour, which is like that of the Liver, as it is also something in Substance: But it comes nearer to that of the Spleen. It is soft, and hath innumerable Fibres, and small Vessels, and its Parenchyma is Glandulous almost every where. In Women it is Circular, but with some Inequality in its Circumference; in the Middle it is about two Fingers thick, but is thinner towards the Edges, and is about a Span, or a quarter of a Yard over, from one Side to the other, when the Fetus is mature for the Birth: It is hollowed and smooth within, next the Fetus, and grows every where firmly to the Chorion; but without, next the Womb, 'tis very unequal, having many Protuberances, by which it adheres to the Womb, tho' to what Part of it, is not agreed. When there is more than one Fetus, 'tis sometimes double, treble, &c. and sometimes but one with so many distinct Partitions in it. It grows

grows not from the Womb originally, but its Rise is from the *Chorion*, which about the 9th Week, in Women, sends forth a downy Substance, which soon grows into Knobs, turns reddish, and then adheres to the Womb conspicuously, about the twelfth or thirteenth Week.

It hath Vessels from a double Original, some from the Womb, and some from the *Chorion*, immediately and mediately from the *Fetus*. From the Womb it receives Arteries, Veins, Nerves, and Lymphæducts; all which, tho' they be very large and conspicuous in the Womb, and even in that Place where the *Placenta* joins to it, yet they are but very small Capillaries in the *Placenta* itself, and are dispersed only thro' that Side of it which is next the Womb. The Vessels that come from the *Chorion* are Arteries and Veins; and, as Dr. *Wharton* saith, Lymphæducts also. From the *Fetus*, thro' the *Corion*, it receives the Umbilical Vessels of the *Fetus*: For the first Months of the Pregnancy it sticks most firmly to the Womb; but as the *Fetus* grows mature for the Birth, it loosens by Degrees, and at last, like ripe Fruit from the Tree, falls off from the Womb, and makes Part of the After-burden or Birth.

PLADAROSIS, are little soft Tumors which grow under the Eye-lids.

PLAIN Chart, is the Plat or Chart that Seamen sail by, whose Degrees of Longitude and Latitude are made of the same Length.

PLAIN Sailing, is the Art of finding all the Varieties of the Ship's Motion on a Plain, where all the Meridians are made Parallel, and the Parallels at Right Angles with the Meridians, and the Degrees of each Parallel equal to those of the Equinoctial; which, tho' notoriously false in itself, supposing the Earth and Sea to be a Plain Flat, and each Parallel equal to the Equinoctial; yet by laying down Places accordingly, and breaking a long Voyage into many short ones, a Voyage may pretty well be perform'd by it, near the same Meridian.

In *Plain Sailing* 'tis imagin'd, that by the *Rhumb-Line*, *Meridian*, and *Parallel of Latitude*, there always will be formed a Right-angled Triangle; and that so posited, as that the Perpendicular may represent part of the Meridian or North and South Line, containing the *Difference of Latitude*: The Base of the Triangle represents the *Departure*; and the Hypotenuse the *Distance sailed*; the Angle at the Top is the *Course*, and the Angle at the Base the *Complement of the Course*: Any two of which, with the Right Angle being given, the Triangle may be prorracted, and the other three Parts found: As in the following Examples.

CASE I.

The Course and Distance given, to find the Difference of Latitude, and Departure from the Meridian.

Admit a Ship from the Latitude $50^{\circ} 10'$ North, sails S. S. W. 43. 5 Miles: I require the Latitude she is in, and her Departure or Separation.

Geometrically.

Draw AC the South and North Line, and with 60 Degrees from the Line of Chords from C, (because the Ship sails Southward) describe DE, which make equal to 22 Degrees 30 Minutes the Course, and draw CB, which make also equal to 48.5 from any Line of Equal Parts: Then let fall from B, BA, perpendicular to the Meridian; so is the Triangle compleated, and the Lines CA, BA, may be measured from the same Scale.

By the Logarithms.

As the Radius	— — — — —	10.00000
Is to the Distance run, BC 48.5	— — — — —	1.68574
So is the Sine of the Course $22^{\circ} 30'$	— — — — —	9.58283
To the Departure Westing $18^{\circ} 56'$	— — — — —	1.26857

Then again:

As the Radius	— — — — —	10.00000
Is to the Distance BC 48.5 Miles	— — — — —	1.68574
So is Co-sine of the Course $S. 67^{\circ} 30'$	— — — — —	9.96561
To the Difference of Latitude 44.8	— — — — —	1.65135
From the Departed Latitude $50^{\circ} 10'$ North.		
Subtract the Difference of Lat. $00 45$		
Remainder is the present Latit. $49 25$		

By Gunter's Scale.

The Extent of the Compasses from S. 90 Degrees, to S. 22 Degrees 30 Minutes on the *Line of Sines*, will reach from 48.5 back to 18.6, on the *Line of Numbers*.

And,

The Extent from S. 90 Degrees, 00 Minutes, to the S. 67 Degrees, 30 Minutes, on the *Line of Sines*, reaches from 48.5 backwards to 44.8, on the *Line of Numbers*.

C A S E II.

The Course and Difference of Latitude being given ;
to find the Departure and Distance sailed.

Admit a Ship sail from Latitude 48 Degrees 30 Minutes S. S. E. $\frac{1}{2}$ Easterly till she be in Latitude 47 Degrees 21 Minutes : I demand the Departure and Distance sailed.

Geometrically.

Draw the North and South Line C. A. and subtracting the Latitudes one from another, it leaves 69 Minutes for their Difference ; makes C A equal to 69, from the *Line of Equal Parts* ; from C. with 60 Degrees from the *Line of Chords*, describe D E, which make equal to 25 Degrees 19 Minutes ; draw C D, and raise the Perpendicular A B, which compleats the Triangle B A C, whose required Parts may be measured by the Scale.

By the Logarithms.

As Co-sine of the Course S. 64° 41' — 9.956148
Is to the Difference of Lat. 69 Miles — 1.838849
So is the Radius — — — — 10.000000
11.838849
To the Distance sailed B C 76.3 — 1.882701

Then,

As the Radius — — — — 10.000000
Is to the Distance sailed C B 76.3 — 1.882524
So is the Sine of the Course 25° 19' — 9.631058
To the Departure A B 32.6 — — 1.513582

By Gunter's Scale.

The Extent from S. 64 Deg. 41 Min. to S. 90 Deg. 00 Min. on the *Line of Sines*, will reach from 69 to 76.3 on the *Line of Numbers*.

And,

The Extent from S. 90 Deg. 00 Min. to S. 25 Deg. 19 Min. on the *Line of Sines*, will reach from 76.3 to 32.6 on the *Line of Numbers*.

C A S E III.

The Difference of Latitude and Distance sailed given ;
to find the Course and Departure.

Admit a Ship sail from Latitude 42 Degrees 15 Minutes North, on some Point between the North and West 88 Miles, and then finds herself in Latitude 43 Degrees 30 Minutes : I demand her Course and Departure.

From	—	—	—	43°	30'
Subtract	—	—	—	42	15
Remains	—	—	—	1	15
				60	
				<hr/>	
				75 = Diff. Lat.	

Geometrically.

Geometrically.

Draw the Meridian AC , which let be made equal to 75, raise the Perpendicular BA ; from C with 88 cross BA in B ; draw BC from C , with 60 from the *Chords* describe DE , which measured on the *Chords* or *Rhumbs*, shews the *Course*; $2\frac{1}{2}$ Points from the North-westward, viz. N. N. W. $\frac{1}{2}$ Westerly.

Note, That the Sides of Plain Triangles are measured by the Line of Equal Parts, but the Angles, by the Line of Chords.

By the Logarithms.

As the Distance run BC 88 — — — 1.94448

Is to the Radius — — — — — 10.00000

So is the Difference of Lat. CA 75 — — — 1.87506

To the Co-sine of the Course $58^{\circ}27'$ — — — 9.933058

Whose Complement 31 Degrees 33 Minutes is $2\frac{1}{2}$ Points from the Meridian, which is N. N. W. $\frac{1}{2}$ Westerly.

By Gunter's Scale.

The Extent from 88 to 75 on the *Line of Numbers*, reaches from S. 90 Degrees 00 Minutes, to 58 Degrees 27 Min. on the *Line of Sines*.

Then,

As the Radius — — — — — 10.00000

Is to the Distance run CB 88 — — — 1.94448

So is the Sine of the Course $31^{\circ}33'$ — — — 9.71870

To the Departure AB 46 Miles West — — — 1.66318

By Gunter's Scale.

The Extent from S. 90 Degrees 00 Minutes to S. 31 Degrees 33 Minutes on the *Line of Sines*, will reach from 88 to 46 on the *Line of Numbers*.

CASE IV.

The Distance run, and Departure from the Meridian given; to find the Course and Difference of Latitude.

A Ship being in the Latitude of 59 Degrees 00 Minutes N. sails North Westward till her Distance run be 74.6 Miles, and the Departure 40.5: I demand the Course and Difference of Latitude, and consequently the Latitude the Ship is in.

Geometrically.

Draw the Meridian AC on A , (because the Ship sails Northward) raise the Perpendicular BA , laying thereon 40.5 Miles, the Departure from A to B ; then take 74.6 in your Compasses, from B cross the Meridian AC in C , and draw BC .

By Logarithms.

As the Distance run BC 74.6 Miles — — — 1.87273

Is to the Radius — — — — — 10.00000

So is the Departure BA 40.5 — — — 1.60745

To the Sine of the Course $32^{\circ}53'$ — — — 9.73472

By Gunter's Scale.

The Extent from 74.6 to 40.5 on the *Line of Numbers*, reaches from S. 90 Degrees 00 Minutes, to S. 32 Degrees 53 Minutes on the *Line of Sines*.

Then again:

As the Radius — — — — 10.00000
Is to the Distance B C 74.6 — — 1.87273
So is the Co-line of the Course 57° 7' — 9.92416

To the Difference of Latitude 62.6 — 1.79689

Which turned into Degrees, is 1 Degree 3 Minutes, and is to be added to 59 Degrees 00 Minutes, the Latitude she departed from, because she raises the Pole; the Sum 60 Degrees 3 Minutes the Latitude the Ship is in.

By Gunter's Scale.

The Extent from S. 90 Degrees 00 Minutes, to S. 57 Degrees 7 Minutes, on the *Line of Sines*, will reach from 74.6 to 62.6 on the *Line of Numbers*.

CASE V.

The Difference of Latitude and Departure, from the Meridian given; to find the Course and Distance.

A Ship from Latitude 59 Degrees 00 Minutes North, fails North Eastward till she has altered her Latitude 1 Degree 10 Minutes or 70 Miles, and is departed from the Meridian 51 Miles: I demand the Course and Distance.

Geometrically.

Draw A C, which make equal to 70 Miles; raise the Perpendicular A B, which make also equal to 51 Miles, draw B C.

By the Logarithms.

As the Difference of Lat. A C 70 Miles 1.845098

Is to the Radius — — — — 10.000000

So is the Departure A B 51 Miles — 1.707570

To the Tangent of the Course 36° 5' 9.862472

By Gunter's Scale.

The Extent from 70 to 51 on the *Line of Numbers*, will reach from Tangent 45 Degrees 00 Minutes, to the Tangent 36 Degrees 5 Minutes on the *Line of Tangents*.

Then,

As the Sine of Course 36° 5' — — 9.77008

Is to the Departure 51 — — — 1.70757

So is the Radius — — — — 10.00000

To the Distance 86.5 Miles — — 1.93749

By Gunter's Scale.

The Extent from S. 36 Degrees 5 Minutes, to the S. 90 Degrees 00 Minutes on the *Line of Sines*, will reach from 51 to 86.5 on the *Line of Numbers*.

CASE VI.

The Course and Departure given; to find the Distance and Difference of Latitude.

A Ship from the Latitude of 48 Degrees 30 Minutes N. fails N. E. by N. till her Departure from the Meridian be 48.5: What is the Distance sailed, and Difference of Latitude?

Geometrically.

Draw the Meridian A C, from C with 60 Degrees of the Chord describe D E, which make equal to 33 Degrees 45 Minutes, and let the Perpendicular A B be 48.5 from the *Equal Parts*.

By the Logarithms.

As the Sine of the Course $33^{\circ} 45'$ — 9.744739
 Is to the Departure A B 48.5 — 1.685741
 So is the Radius — — — 10.000000
 To the Distance C B 87.3 — 1.941002

By Gunter's Scale.

The Extent from S. 33° Degrees $45'$ Minutes, to S. 90° Degrees $00'$ Minutes on the Line of Sines, will reach from 48.5 to 87.3 on the Line of Numbers.

Then,

As the Radius — — — — — 10.000000
 Is to the Distance run 87.3 — — — 1.941001
 So is the Co-sine of the Course S. $36^{\circ} 15'$ 9.91984
 To the Difference of Latitude 72. — 1.86085

By Gunter's Scale.

The Extent from S. 90° Degrees $00'$ Minutes, to S. 36° Degrees $15'$ Minutes, on the Line of Sines, reaches from 87.3 to 72.6 on the Line of Numbers.

These are the Seven usual Cases of Plain Sailing, which you see are all performed by the Knowledge of Rectangl'd Plain Trigonometry. The Doctrine of Oblique Plain Triangles, is not of such Necessary Use in Sailing, as that of Right-angled ones is: But however, I have here singled out some of the most Useful Cases of it, as follows.

Plain Sailing, where the Application of Oblique Triangles is required.

Example.

Coasting along the Shore, I set an Head-land C, bearing off me S. S. W. I sail W. S. W. 51.5 Miles to B, and then the Head-land C bears S. E. from me: I demand my several Distances to the Head-land.

Geometrically.

From A draw a S. S. W. Line, as A C, and a W. S. W. Line, as A B, and make A B = 51.5 Miles; then from B, with 60 Degrees of the Chords, describe $e f$, which make equal to fix Points, and draw B f.

By the Logarithms.

In the Triangle B A C, given B A 51.5 Miles and all the Angles, viz. The Angle A 45° Degrees, Angle B 67° Degrees $30'$ Minutes, and the Angle C 67° Degrees $30'$ Minutes; required B C and C A.

As the Sine of the Angle C $67^{\circ} 30'$ — 9.956153
 Is to the Distance A B 51.5 Miles — 1.7118072
 So is Sine of the Angle at A $45^{\circ} 00'$ 9.8494850
 To the Distance B C 39.4 — 1.5956769

And since the Angle B, is equal to the Angle C, the Side A C, will be equal to the Side A B.

Example II.

A Ship in the Parallel of 46° Degrees North as B, descries a Head-land at C, distant from her 67 Miles; she Sails E. S. E. 63 Miles to D, and then the Head-land at C bears S. W. by W. from her: How did the Head-land bear from the Ship when she was at B? And how far is it distant from her, now she's at D?

Geometrically.

From B draw an E. S. E. Line B D, which make equal to 63, and from D with 60 of the Chords describe $e f$, which make equal to $56^{\circ} 15'$, draw D f C: Then from B with 67 Miles, cross D C in C, and draw B C.

4 D 2

B₂

By the Logarithms.

As the Distance B C 67 Miles *Ar. co.* = 8.17392
 Is to the Sine of the Angle D $56^{\circ} 15'$ = 9.91984
 So is the Distance failed B D, 63 Miles = 1.79934

To the Sine of the Angle C $51^{\circ} 26'$ = 9.89310

Now $56^{\circ} 15' + 51^{\circ} 26' = 107^{\circ} 41'$, whose Complement to 180° , is $72^{\circ} 19' =$ Angle B, $6\frac{1}{2}$ Points, which added to E. S. E. gives the Bearing of C to be S. $\frac{1}{2}$ Westerly near.

Then,

As the Sine of the Angle D, $56^{\circ} 15' = 9.919846$

Is to the Distance B C 67 Miles = 1.826074

So is the Sine of the Angle B $72^{\circ} 19' = 9.978978$

11.805052

To the Distance D C $76^{\circ} 8' = 1.885206$

Example III.

If I fail S. S. W. 50 Miles, then W. by N. 64 Miles; I demand the Course and direct Distance from the Place of Departure?

Geometrically.

Draw A B = 50 M. a S. S. W. Line, and from B with 60 of the Chords described *def*; make *de* = 7 Points, or *fe* = 9 Points, draw B C through *e*, which make equal to 64 M.

By the Logarithms.

In the Triangle C B A, there's given the two Sides C B and B A, and the contained Angle C B A, 7 Points, to find the Angles A and C, and the third Side C A.

C B = 64
 A B = 50

Sum. = 114

Diff. = 14

As the Sum of the two Sides A B and B C 114 = 2.656904

Is to their Difference 14 = 1.146128

So is the T. of $\frac{1}{2}$ Sum of the \angle L C and A, $50^{\circ} 37' = 10.085698$

11.231826

To the T. of $\frac{1}{2}$ their Difference $80^{\circ} 30' = 9.174922$

Which subtracted from 50 Deg. 37 Min. there remains 42 Deg. $7' = \angle C$; but 8 Deg. 30 Min. added to 50 Deg. 37 Min. makes 59 Deg. 7 Min. = $\angle A$; and since A B is a S. S. W. Line, A C is W. by S. $\frac{1}{2}$ Westerly.

Then for the Distance A C, say,

As the Sine of the Angle A $59.7 = 9.983399$

Is to the Distance B C 64 M. = 1.806180

So is the Sine of the \angle B, or its Complement to 180° , $78^{\circ} 45' = 9.991573$

11.797753

To the Distance A C 73.2 M. = 1.864158

Example IV.

Admit two Ports lying in the same Parallel or Latitude, to differ in Longitude 58 Miles; and a Ship having failed from the Westermost, between the South and East 65 Miles, to be then 46 Miles from the Eastermost: I demand the Course she steered, and her Course to the Eastermost Port?

Geometrically.

Having drawn A B an East and West Line, and made it equal to 58 M. then from A with 65 M. describe an Arch, and with 46 M. from B cross that Arch in C, draw A C and B C.

By the Logarithms.

As A C 65 Miles = 8.187086

Is to the Sum of the Distance A B and B C 104 Miles = 2.017033

So is their Difference 12 Miles = 1.079181

To A D 19.2 = 1.283300

Which

Which added to A C 85, makes 84.2, whose half is 42.1 is A E.

Then,

As A B 58 Miles, Ar. Compl. — — 8.236571
Is to the Radius — — — — 10.000000
So is A E 42.1. — — — — 1.624282

To the Co-sine of the Ang. A. $43^{\circ} 28'$ 9.860853

That is,

S. E. 1 Deg. 32 Min. Easterly, the Course she steered.

Example V.

Coasting along the Shore, I set two Head-lands, the one at C, bearing S. W. by W. the other at D, bearing W. by S. I sail away N. W. by N. to H. 40 Miles, and then the Head-land at C bears S. S. W. and that at D S. W. by S. I demand how far these Head-lands are asunder, and how they bear one from another.

Geometrically.

First draw $b A g$ a North and South Line, and with 60 of the Chords from A describe $b e g$; then make $g f = 5$ Points, $g e = 7$ Points, and $b c = 3$ Points; draw $A f C$, $A e D$, and $A H c$, make $A H = 40$ Miles.

Secondly, From H with 60 of the Chords describe $a d$, which make equal 6 Points; and also $a b$ equal 5 Points; draw $H b C$, $H d D$, and $D C$. Then is D one Head-land, and C the other.

By the Logarithms.

In the Triangle H A C given the Angle H A C $= 8$ Points, the Angle A H C 5 Points, and the Angle A C H $= 3$ Points, together with the Side H A 40 Miles to find the Side C H.

Therefore,

As the Sine of the Angle H C A } $33^{\circ} 45'$, Ar. Compl. — — — } 0.255261
Is to A H 40 Miles — — — — — } 1.602060
So is the Sine of $90^{\circ} = \angle H A C$ — — — } 10.000000

To the Side H C 72 Miles — — — 1.857321

Then in the Triangle D H A, there's given Angle H A D $= 6$ Points, the Angle A H D $= 6$ Points, and the Angle H D A $= 4$ Points, and the Side A H 40 Miles to find the Side D H. Thus :

As the Sine of the Angle H D A } $45^{\circ} 00'$, Ar. Compl. — — — } 0.150515
Is to the Side A H 40 Miles — — — } 1.602060
So is the Sine of the $\angle H A D 67^{\circ} 30'$ 9.965615

To D H 52.3 Miles — — — 1.718190

Then in Triangle D H C there's given two Sides, C H $= 72$ Miles, and D H 52.3; and their contained Angle C H D $= 1$ Point; to find the other two Angles H D C, H C D, and the third Side.

As the Sum of the Sides, H C } $+ H D 124.3$, Ar. Compl. — — } 7.905528
Is to their Difference 19.7 — — — } 1.294466
So is the Tangent of half the Sum } of $\angle H D C \& H C D 84^{\circ} 22'$ } 11.005954

To the Tangent of half their Dif- } ference $58^{\circ} 6'$ — — — } 10.209548

Now, 84 Deg. 22 Min. $+ 58$ Degr. 6 Min. $= 142$ Deg. 28 Min. Angle H D C.

But 84 Deg. 22 Min. $- 58$ Deg. 6 Min. $= 25$ Deg. 16 Min. Angle H C D $=$ N. one quarter Westerly.

Then,

As the Sine of the Angle H C D } $25^{\circ} 16'$, Ar. Compl. — — — } 0.369743
Is to D H 52.3 Miles. — — — — — } 1.718190
So is the Sine of the Angle D H C } $11^{\circ} 15'$ — — — — — } 9.290235

To D C 23.9 Miles the Distance } between the Head-lands — — — } 1.378168

PLAIN Scale, is a thin Ruler, either of Wood or Brass, whereon are graduated the Lines of Chords, Sines, Tangents, Secants, Leagues, Rumbs, &c. and is of ready Use in most part of the Mathematicks, chiefly in Navigation: A Description thereof see under the Word Scale.

PLAIN Table, is an Instrument used in Surveying of Land.

1. The Table it self is a Parallelogram of Wood, 14 Inches and a half long, and 11 Inches broad, or thereabouts.

2. A Frame of Wood fixed to it, so as a Sheet of Paper being laid on the Table, and the Frame being forced down upon it, squeezeth in all the Edges, and makes it lie firm and even, so as a Plot

Plot may be conveniently drawn upon it. Upon one Side of this *Frame* should be equal Divisions for drawing Parallel Lines both long-wise and cross-wise (as Occasion may require) over your Paper; and on the other Side the 360. Degrees of a Circle, projected from a Brass Centre conveniently placed in the *Table*.

3. A *Box* with a *Needle* and *Card*, to be fixed with two *Screws* to the *Table*; very useful for placing the *Instrument* in the same Position upon every *Remove*.

4. A *Three-legged Staff* to support it, the Head being made so as to fill the *Socket* of the *Table*, yet so as the *Table* may be easily turned round upon it, when 'tis not fixed by the *Screw*.

5. An *Index*, which is a large *Ruler* of *Wood*, (or *Brass*), at the least 16 Inches long, and two Inches broad, and so thick as to make it strong and firm; having a sloped Edge, called the *Fiducial Edge*, and two *Sights* of one Height, (whereof the one hath a *Slit* above, and a *Thread* below, and the other a *Thread* above, and a *Slit* below,) so set in the *Ruler*, as to be perfectly of the same Distance from the *Fiducial Edge*. Upon this *Index* 'tis usual to have many *Scales* of equal Parts, as also *Diagonals*, and *Lines* of *Chords*.

To take Quantity of an Angle by the Plain Table.

As suppose *AB* and *AC* were two *Hedges* or *Fences* of a *Field*, and it were required to take the *Angle A*.

Plant your *Table* (fitted with the *Sheet* upon it) as nigh to the *Angle* as you can, the *North End* of the *Needle* hanging directly over the *Flower-de-Lis*; then make a *Mark* upon the *Sheet* of *Paper* at any convenient Place for the *Angle A*, and lay the *End* of the *Index* to the *Mark*, turning it about 'till through the *Sights* you espy *B*; then draw the *Line AB* by the *Edge* of the *Index*. Do the same for the *Line AC*, keeping the *Index* upon the first *Mark*: Then will you have upon your *Table* an *Angle* equal to the *Angle* in the *Field*.

When you have more *Angles* to take, the Method is the same.

The *Distances* from the *Angles* to the *Instrument* are measured by the *Chain*, and set off on the *Table* with a *Scale* and *Compasses*.

Whence 'tis so easie to take the *Plot* of a *Field* at one *Station*, by the *Plain Table*, that there needs no other *Direction*. See *Surveying*.

PLAINTIFF, is he that sues or complains in an *Affide*, or in an *Action Personal*; as in an *Action* of *Debt*, *Trespafs*, *Deceit*, *Detinue*, and the like.

PLANCERE, in *Architecture*, is the under part of the *Roof* of the *Corona*; which is the superior part of the *Cornice*, between two *Cymatiums*. See those *Words*.

PLANE of a *Dyal*, is the *Surface* on which any *Dyal* is supposed to be described. See a *General Account* of all such *Planes* under the *Word Dyalling*.

PLANE Horizontal, in *Perspective*, is a *Plane* which is parallel to the *Horizon*, and which passes thro' the *Eye*, or hath the *Eye* supposed to be placed in it.

PLANE of *Gravitation* or *Gravity*, in any heavy *Body*, is a *Plane* supposed to pass thro' the *Centre* of *Gravity* of it.

PLANE, in *Fortification*, is the *Representation* of a *Work* in its *Height* and *Breadth*.

PLANE of the *Horopter*, in *Opticks*, is that which passeth thro' the *Horopter*, and is perpendicular to the *Plane* of the two *Optical Axes*.

PLANE Number, is that which may be produced by the *Multiplication* of two *Numbers* one into another; thus, 6 is a *Plane Number*, because it may be produced by the *Multiplication* of 3 by 2; for twice 3 makes 6. So also 15 is a *Plane Number*, arising from 5 being multiplied by 3: And 9 is a *Plane Number*, produced by the *Multiplication* of 3 by 3.

PLANE Problem, in *Mathematicks*, is such an one as cannot be solved Geometrically, but by the *Interfection* either of a *Right Line* and a *Circle*; or of the *Circumferences* of two *Circles*: As, Having the greatest Side given, and the Sum of the other Two, of a *Right-angled Triangle*; to find the *Triangle*. To describe a *Trapezium* that shall make a *Given Area* of Four *Given Lines*. And such a *Problem* can have but two *Solutions*, because a *Right Line* can cut a *Circle*, or one *Circle* another but into *Points*. *Oxanam*.

PLANE Geometrical, in *Perspective*, is a *Plane Surface*, parallel to the *Horizon*, placed lower than the *Eye*; wherein the visible *Objects* are imagined without any *Alteration*, except that they are sometimes reduced from a greater to a lesser *Size*.

PLANE of *Reflection*, in *Catoptricks*, is that which passeth thro' the *Point* of *Reflection*, and is always perpendicular to the *Plane* of the *Glass*, or *Reflecting Body*.

PLANE of *Refraction*, is a *Surface* drawn thro' the *Incident* and *Refracted Ray*.

PLANE Surface, is that which lies even between its bounding *Lines*; and as a *Right Line* is the shortest *Extension* from one *Point* to another, so a *Plane Surface* is the shortest *Extension* from one *Line* to another.

PLANE Vertical, in *Opticks* and *Perspective*, is a *Plane Surface* which passeth along the *Principal Ray*, and consequently thro' the *Eye*, and is perpendicular to the *Geometrical Plane*.

PLANETS, are the *Erratick* or *Wandering Stars*, and which are not like the *Fixed ones* always in the same *Position* to one another. We now number the *Earth* among the *Primary Planets*.

Planets, because we know it moves round the Sun, as *Saturn*, *Jupiter*, *Mars*, *Venus*, and *Mercury* do, and that in a Path or Circle between *Mars* and *Venus*. And the Moon is accounted among the *Secondary Planets*, or *Satellites* of the *Primary*, since the moves round the Earth, as *Jupiter's* Four Moons or *Satellites* do round him, and *Saturn's* Five round about him; if *Cassini's* Eyes may be credited. But I could never see myself, or meet with any else, who ever did see any but the *Hugenian Satellite*.

All the Planets, as far as we can find, have, besides their Motion round the Sun, which makes their Year, also a Motion round their own Axes, which makes their Day; as the Earth's revolving so, makes our Day and Night.

It's more than probable that the Diameters of all the Planets are longer than their Axes: We know 'tis so in our Earth; and Mr. *Flamsteed* and Mr. *Cassini* both found it to be so in *Jupiter*. And therefore 'twas a great Mistake in the Ingenious Dr. *Burnet*, to assert, as he doth in his *Hypothesis*, the Polar Diameter of the Earth to exceed the other.

Sir *Isaac Newton* asserts our Earth's Equatorial Diameter to exceed the other by about 34 Miles: And indeed else the Motion of the Earth would make the Sea rise so high at the Equator, as to drown all the Parts thereabout.

The Learned Mr. Whiston, Professor of Mathematicks in the University of Cambridge, in his New Theory of the Earth, accounts (from the Admirable Sir II. Newton's Principles) for the Motion and Revolution of the Planets, thus:

LEMMA X.

From the uniform Projectile Motion of Bodies in Straight Lines, and the universal Power of Attraction or Gravitation, the Curvilinear Motion of all the Heavenly Bodies does arise.

If a Body, as B, be moving uniformly along the Line D C, from D to C, and another Body A be present; this latter Body A must draw the former B from its Straight Line D C: And by doing so continually, while at the same time the Body B retains its Projectile Force along a Straight Line in every Point of its Course, must make the Line of its real Motion become a Bent one, and change its Rectilinear into a Curvilinear Trajectory.

Hence may be learnt what is that *Conatus recedendi a centro motus* in revolving Bodies, and in what Sense 'tis to be understood. For since all Bodies have a *Vis centripeta* or Propension towards one another, 'tis impossible they should of themselves, in as proper a Manner, have a contrary Propension, or *Vis centrifuga*, an Endeavour of avoiding one another. The true meaning therefore of this Attempt or Endeavour to get farther off the Centre of Motion is only this, That all Bodies being purely passive, and so incapable of altering their uniform Motion along those Straight Lines or Tangents, to their Curves, in which they are every Moment, do still tend onwards in the same Lines, and retain their Propension or Effort towards that Rectilinear Motion all the Time they are obliged to move in Curves; and consequently at every Point of their Course, endeavour to fly off by their Tangents. Now the Parts of the Tangent, to which this Endeavour is, being farther from the Centre than those of the Curves to which the Bodies are actually forced, an Attempt to go on in the Tangent may be, and is stiled an Attempt to go farther off, or recede from that Centre; tho' from no other Affection than that of Inactivity, or of persevering in a Rectilinear Motion: So that tho' the *Vis centripeta*, or Power of Gravitation, be an Active and Positive Force, continually renew'd and impress'd on Bodies; yet the *Vis Centrifuga*, or *Conatus recedendi a centro motus*, is not so, but the meer Consequence and Result of their Inactivity.

This is evident in Bodies revolving in *Ellipses* about one of the *Foci*, in their Descent towards it; where the Tangent being oblique to the Radius, or Line from the Point of Contact to the *Focus*, this very *Conatus recedendi a centro motus* carrying it along the Tangent, will for some time make it approach nearer to the *Focus*; tho' not so much near as by its revolving in the *Ellipses* it self.

For let a Stone be let loose from the Sling, or any Revolving Body be disengaged from the Force which retained it in its Curve, and it will not go from the Centre, but only pass along the Tangent in which it was moving, as if there were no such Centre near it at all.

When the Projectile Motion of the Planets is in its Direction perpendicular to a Line from the Sun, and in its Degree of Velocity, so nicely adapted and contemper'd to the Quantity of the Sun's Attraction there, that neither can overcome the other, (the Force of Gravitation towards the Sun, and the Celerity of the Planets proper Motions, being perfectly in *equilibrio*;) the Orbits of such Revolving Planets will be compleat Circles; themselves neither approaching to, nor receding from the Sun, the Centre of their Motions. And the Case is the same in the Secondary Planets about their Primary ones.

Thus 'tis supposable, That the Velocity of all the Planets about the Sun, was exactly accommodated originally to his Power of Attraction; and that their Primitive Orbits were Perfect Circles; from which at this Day they do not much differ. Thus, however, *Jupiter's* Four *Satellites* or little Moons have their Motions so exactly proportioned to their Gravitation to him, that their Orbits, as far as the most nice Observations can judge, are perfect Circles, they keeping at an equal Distance from his Centre in all the Points of their Courses about him.

When

When the Projectile Motion is not adapted to, but is either too swift or too slow for the Attraction towards the Central Body, the Orbits described will be *Ellipses*; and in the former Case, when the Projectile Motion is too swift, the Orbit will be bigger than the Circle; and the nearer *Focus* of the *Ellipsis* will be coincident with the Central Body.

And in the latter Case, the Orbit will be less than the Circle, and the farther *Focus* of the *Ellipsis* will be Coincident with that Central Body. Thus, if the Celerity of B be exactly correspondent to the Attractive Force of the Central Body A, neither will prevail; and the Body preserving an equal Distance from the Centre, will describe the Circle B e B b.

If the Celerity be greater, it will overcome the Attraction, and cast it self farther off the Centre for some time, and so revolve about it in the larger *Ellipsis* B H F G; the Central Body possessing that *Focus* A which is nearest the Point B, where the Attraction began. But if the Celerity be smaller, the Attraction of the Central Body A will be too hard for it, will force it for some time to come nearer, and to describe the lesser *Ellipsis* B K L I; the Central Body possessing that *Focus* A which is farthest from the Point B, where the Attraction began: As will be very plain from the Consideration of the Figure relating hereto.

'Tis indeed possible that the Celerity of Bodies may be so great, compared with the Force of Attraction to the Central Body, as to cast them off with such Violence, that the Attraction will never be able to bring them round, or make them revolve about it: In which Case the Orbits described will be one of the other Conick Sections, either *Parabolas* or *Hyperbolas*, according to the less or greater Violence with which the Bodies are thrown; and the Central Body will possess

the *Focus* of such a Figure. But no *Phænomena* of Nature persuading us that *de facto* any of the Heavenly Bodies do describe either of those Lines, (tho' Comets *Ellipses* come near to *Parabolas*;) several Bodies moving about the same Central one, tho' their Primitive Velocity were equal, and Direction alike, yet if they be at different Distances from it, they will describe Figurers of different Species about it. For when that determinate Degree of Velocity, which at one Distance were just Commensurate to the Central Bodies Attraction, and so would produce a Circular Orbit, must at a farther Distance be too hard for it, by reason of the Diminution of the Attraction there; an *Elliptical* Orbit must be described, whose nearer *Focus* would be coincident with the Central Body. In like manner, when the same determinate Degree of Velocity were at a nearer Distance, where the Central Attraction is augmented, it would be too little for the same; and an *Elliptical* Orbit must be described, whose farthest *Focus* would be coincident with the Central Body. This cannot be difficult, if you consider that the Species of the Planetary Orbits depends solely on the Proportion between the Attraction towards the Central Body, and the Velocity of the Projectile Motion; as that Proportion remaining at any Distance whatsoever, the Bigness of the Orbits will be various, but the Species the same: So when that Proportion is changed, the Species of the Figures must be changed also; which being done, the Velocity given, by the various Force of Attraction in several Distances from the Centre, as well as by the various Velocities at a given Distance, of which before; 'tis evident the Species of the Orbits will be different in this as well as in the former Case.

And the greater Disproportion there is between the Quantity of Attraction and the Velocity of the Revolving Bodies, the farther from a Circular; and the more Oblong and Eccentric will the Orbits described be. And the greater Approach to Correspondence there is, the nearer to Circular, and the less Oblong and Eccentric will the same Orbits be.

The Circular Orbits of Planets depend not only on the exact Adjustment of the Projectile Velocity to the Attractive Power of the Sun, but upon the Direction of the same Projectile Motion, at the Original Commencing of the Attraction.

Thus where the Planet is in its own Tangent, neither Ascending nor Descending, and the preceding Angle CBA is a Right one, which we have hitherto supposed; from the Correspondence of the Velocity to the Attraction, the Orbits will be perfect Circles. Otherwise, when the Direction of the Motion is Oblique, in any Measure ascending from or descending to the Central Body, and the preceding Angle CBA Obtuse or Acute; the Planet, tho' its Velocity were exactly adapted to the Attraction of the Central Body, would revolve in an *Ellipsis*; and the Point B, where the Attraction began, would be the End of the lesser Axis thereof.

If a Planet describe an *Ellipsis* about its Central Body in the *Focus* thereof, it will move fastest when 'tis nearest to, and slowest when 'tis farthest from the said Central Body or *Focus*, and agreeably in the intermediate Places. For seeing wheresoever the Revolving Body is, the Area is still proportionable to the Time, and so in equal Times

Times always equal; 'tis evident by how much the Distance is less, and the Line from the *Focus* is shorter, by so much must the Bodies Motion be swifter to compensate the same; and *vice versa*, by how much the former is longer, by so much must the latter be slower to allow for it.

If the Planet B describe an *Ellipsis* about the Central Body in the *Focus* H, as the *Area* described by the Line BH, will be exactly Uniform and Proportional to the Time of Description; so the Angular Motion, or Velocity of the Line from the other *Focus* B I, will be Proportional to the Time, and Uniform also, tho' not so Exactly and Geometrically.

The Law of Gravitation being supposed, if one Planet describe an *Ellipsis* about the Central Body in the *Focus* H, and another describe a Circle about the same in its Centre: If the Semi-diameter of the Circle be equal to H E, the middle Distance in the *Ellipsis* from the same Centre or *Focus*, their Periodical Times of Revolving will be the same; and when the Distances are equal, their Velocity will be so too.

Therefore, tho' the Planets revolve in *Ellipses* of several Species, yet their Periodical Times may be as well compared with one another, and with their Distances from the Central Bodies, as if they all revolved in Compleat Circles.

PLANIMETRY, the same with *Planometria*; which see.

PLANISPHERE, signifies the Circles of the Sphere described in *Plano*, or on a Plane; or it is a Plane or Flat Projection of the Sphere. And thus the Maps either of Heaven or Earth are called *Planispheres*; as also all other Astrolabical Instruments. And all Charts or Maps for the Use of Mariners, are called by Mr. Wright the *Nautical Planisphere*. See *Nautical*.

PLANOMETRIA, is the Mensuration of all Plane Surfaces or Figures.

PLANTARIS, is a Muscle of the *Tarsus*, so called from its Tendon expanded in the

PLANTA *Pedis*, like that of *Palmaris* in the Palm of the Hand. It arises Flethy from the Back-part of the outermost Tubercle of the lower Appendage of the Thigh-Bone, immediately under the External Beginning of the *Gastrocnemius Externus*; and descending obliquely between it and the *Gastrocnemius Internus*, soon becomes a thin flat Tendon; and which passing out from between their Flethy Bellies, descends internally la-

terally, by their great Tendon; and marching over the *Os Calcis*, expands it self on the Soal of the Foot, which it firmly adheres to, and to the Flethy Body of the *Musculus flexor digitorum perforatus*, and is inserted on both Sides the first Inter-node of each Lesser Toe. The Action of this Muscle is very obscure.

PLANTS.

The Learned and Experienced Botanist, Mr. John Ray, gives us the following Characteristick Notes of the chief Kinds of Plants; which make Twenty five Genders.

1. The Imperfect Plants, which do either totally want both Flower and Seed, or else seem to do so; there having yet no Seed or Flower been discovered to belong to them, or at least but to few of them; such as Corals, Sponges, *Alga Conserve*, Duck-meat, or the *Lens palustris*, the *Fungi*, *Tubera Terræ*, the Mosses, and some Liverworts.

2. Plants producing either no Flower at all, or an Imperfect one, and whose Seed is so small as not to be discernable by the naked Eye: Some of these bear their Seeds on the Back-part of their Leaves; as the Maiden-hairs, Spleen-worts, *Polypodium* and Ferns: Others bear it on the Stalk it self, adhering there by small single Foot-stalks; as the *Lichen Terrestris*, the *Licopodium*, or Wolfsc-law, the *Adiantum Aureum*, the *Lunaria*, *Equisetum*, &c.

3. Those whose Seeds are not so small as singly to be Invisible, but yet have an Imperfect or Stameneous Flower, i. e. such an one as is without the *Petala*, having only the *Stamina* and the *Perianthium*; as Hops, Hemp, *Mercurialis*, Nettles, Docks, Sorrels, Arsefmart, Knot-grals, Pondweed, Orach, Blite, Beet, Ladies Mantle, &c.

4. Such as have a Compound Flower, and emit a kind of White Juice or Milk, when their Stalks are cut, or their Branches broken off; such as Lettuce, Sow-thistle, Hawkweed, Dandelion, Succory, Goats-beard, Nipplewort, &c.

5. Such as have a Compound Flower of a Discous Figure, the Seed *Pappus*, or winged with Down, but emit no Milk as the former do; as Colts-foot, Fleabane, Golden Rod, Ragweed, Groundsel, Cudweed, &c.

6. The *Herba Capitata*, or such whose Flower is composed of many small long Fistulose or hollow Flowers gathered together in a round Burron, Ball, or Head, which is usually covered with a Squammose or Scaly Coat, of which Kind are the Thistle, the greater Burdock, Blue-Bottle, Knapweed, Saw-worth, &c.

These have all a Down adhering to their Seeds.

7. The *Corymbiferous* Plants, which have a compound Discous Flower, but their Seeds have no Down adhering to them: The Reason of the Name

Name you have under the Word *Corymbus*; of this kind, is Corn Marigold, Common Ox-Eye, Yarrow, the Daise, Camomile, Tanfie, Mugwort, Scabious, Teasel, Eryngo's, &c.

8. Plants with a perfect Flower, and having only one single Seed belonging to each single Flower; such are Valerian, Corn-faller, Agrimony, Burnet, Meadow Rue, Fumitory, &c.

9. The *Umbelliferous Plants*, which have a *Pentapetalous Flower*, (*i. e.* one having just 5 small *Petala* or *Leaves*.) and belonging to each single Flower there are two Seeds lying naked and joined together. They are called *Umbelliferous*, because the Plant, with its Branches and Flowers, hath an Head like a Ladies *Umbrella*, which they call *Umbella*.

This is a very large Genus of Plants, which therefore he thus subdivides into,

1. Such as have a broad flat Seed, almost of the Figure of a Leaf, or which are encompassed round about with something like *Leaves*; as Cow-Parfnep, Wild and Garden Parfnep, Hogs Fennel, (*Pucedanum*.) &c.
2. Such as have a longish Seed swelling out in the middle, and larger than the former; as Shepherds Needle, Cow-weed, Wild Chervil, Common Speignel or Meu, &c.
3. Such as have a shorter Seed; as *Angelica* and *Alexanders*.
4. Such as have a Tuberous Root, as the Earth Nut, Kipper Nut, or Pig Nut, Water Dropwort, and Hemlock Dropwort.
5. Such as have a small wrinkled channelled, or striated Seed; as Stone Parsley, Water Parsnep, Burnet, Saxifrage, Caraways, Smallage, Hemlock, Meadow Saxifrage, Sampire, Fennel, Rock Parsley, &c.
6. Such as have rough, hairy, or bristly Seed; as Mountain Stone Parsley, Wild Carrot, or Birdsnest, Hedge and Bastard Parsley, Hemlock, Chervil, Sea Parsnep.
7. Such as have their Leaves entire and undivided into Jags, &c. as *Perfoliata*, or Thorow-wax, Sanicle, the least Hares Ear, &c.
10. The *Stellate Plants*, which are so called, because their Leaves grow on their Stalks, at certain Intervals or Distances, in the form of a Radiant Star. Their Flowers are really *Monopetalous*, but divided into four Segments, which look like so many distinct *Petala*, or four Leaves; and each Flower is succeeded by two Seeds which grow at the bottom of it.

Of this Kind is Crows-wort, or Mugweed, with Madder, Ladies Bedstraw, Woodruff, Cleavers, &c.

11. The *Asperifoliae*, or Rough-leav'd Plants: They have their Leaves placed alternately, or in no certain Order on their Stalks; they have a Monopetalous Flower cut or divided into five

Partitions; and after every Flower there succeeds usually four Seeds; such as Cynoglossa, or Hounds Tongue, Wild Bugloss, Vipers Bugloss, Comfrey, Moule Ear, Scorpion Grass, &c.

12. The *Suffrutices* or *Verticillate Plants*: Mr. Ray, in his last Edition of his *Synopsis Methodica Stirp. Britann.* saith, The more certain Marks or Characteristick Notes of this kind of Plants are, That their Leaves grow by Pairs on their Stalks, one Leaf right against another, their Flower is Monopetalous, and usually in the form of an Helmet or Hood, there succeed four Seeds usually to each Flower, and which have no other Seed Vessel but the *Perianthium*: For that Mark of their Flowers growing in Whirls about the Stalk, as they do in the Dead Nettle, Hore Hound, &c. is not found in all Plants of this Genus. To this Head belong Mother of Thyme, Mint, Penny-Royal, Vervain, Wood Betony, Selfheal, Alehoof, Bugle, *Scordium*, Motherwort, &c.

13. Such as have many naked Seeds (at least more than four) succeeding their Flower, which therefore they call *Polyperme Plantae Semine nudo*. By naked Seeds, they mean such as are not included in any Seed Pod, or Cafe, out of which they spontaneously drop; but such as either have nothing at all covering their Seeds, or else drop off with their Covering upon them. Of this Kind are Pilewort, Crowfoot, Marsh-Mallows, Avens, Strawberries, Cinquefoil, Tormentil, Meadow-sweet, &c.

14. *Bacciferous Plants*, or such as bear Berries; as Briony, Dwarf, Honyfuckle, Butchers-broom, Solomon's Seal, Lilly of the Valley, Nightshade, Asparagus, Whorts or Whortle-berries, &c.

15. *Multisiliquous*, or *Corniculate Plants*; or such as have after each Flower many distinct, long, slender, and many times crooked Cafes, or *Siliqua*, in which their Seed is contained; and which, when they are ripe, open of themselves, and let the Seeds drop out: Of this Kind is the Common Houfleeke, Orpine, Navelwort, or Walpennywort, Bearsfoot, Marsh Marigold, Columbines, &c.

16. Such as have a Monopetalous Flower, either Uniform or Difform, and after each Flower a peculiar Vessel, or Seed Cafe, (besides the common Calix) containing the Seed, and this often divided or parted into many distinct Cells. These by some are called *Vasculiferous Plants*, such as common Henbane, Marsh Gentian, Bindweed, Throatwort, Rampions, Toad Flax, Fox Glove, Yellow and Red Rattle, or Cock's-comb, Eyebright.

17. Such as have an uniform Tetrapetalous Flower, but bear their Seeds in Oblong Siliquous Cafes; as your Stock-gilliflower, Wall-flower, common Whitloe Grass, Jack by the Hedge, or Sauce alone, common Mustard, Charlock or Wild Mustard, Radish, Wild Rocket, Ladies Smock, Scurvy-grass, Woad, &c.

18. *Vasculiferous Plants*, with a seemingly Tetrapetalous Flower, but of an Anomalous or Uncertain Kind: For this Flower, tho' it be deeply divided

divided in four Segments, is yet really Monoepalous, and falls off all together in one; such as Speedwell or Fluellin, Wild Poppy, Yellow Poppy, Loose Strife, Spurge, and Plantain, (according to Mr. Ray.)

19. *Leguminous Plants*, (or such as beat Pulse,) with a *Papilionaceous Flower*. Their Flower is Difform, and almost in the Form of a Butterfly and Wings expanded, (whence the Name *Papilionaceous*,) consisting of four parts, joined together at the Edges; these are Pease, Vetches, Tares, Lentils, Beans, Liquorice, Birdsfoot, Trefoil, Restharrow, &c.

20. *Vasculiferous Plants*, with a *Pentapetalous Flower*. These, as the 16th and 18th Kind, have besides the common Calyx or Cup of the Flower, a peculiar Case containing the Seed, and their Flower consisting of 5 Leaves; such as Maiden Pinks, Campions, St. John's-Wort, Male Pimpernel, Chickweed, Cranebill, Flax, Primrose, Periwinkle, Centory, Wood Sorrel, Marsh Trefoil, &c.

21. *Plants with a true Bulbous Root*. A Bulbous Root consists of but one round Ball or Head, out of whose lower Part or Basis there go many Fibres or Strings to keep it firm in the Earth. The Plants of this Kind, when the first appear, come up with but one Leaf, and the Leaves are nearly approaching to those of the Grass Kind of Plants, for they have no Foot-stalk, and are long and slender: The Seed Vessels are divided into three Partitions; their Flower is usually *Hexapetalous*, or seemingly divided into six Leaves or Segments; such as Garlick, Daffodil, Hyacinth, Saffron, &c.

22. Such as have their Roots approaching to a Bulbous Form. These emit at first coming up but one Leaf, and in Leaves, Flowers, and Roots, resemble the true Bulbous Plants; such as *Flower de Lis*, Cuckoo-pint, Orchis, Broom-Rape, Bastard Hellebore, Tway-blade, Winter-green, &c.

23. *Culmiferous Plants*, with a Grassy Leaf, and an Imperfect Flower. Culmiferous Plants are such as have a smooth hollow jointed Stalk, with one long sharp-pointed Leaf at each Joint, encompassing the Stalk, and set on without any Foot-stalk: Their Seed is contained within a Chaffy Husk; such as Wheat, Barley, Rye, Oats, and most Kinds of Grasses.

24. Plants with a Grassy Leaf, but not Culmiferous, with an Imperfect or Staminous Flower; as Cypress Grasses and Rushes, Cats Tail, Burr Reed, &c.

25. Plants whose Place of Growth is uncertain and various, but chiefly Water Plants, as the Water Lilly, Water Millfoil, Water-wort, Pepper-grass, Mouse-tail, Milkwort, Dodder, &c.

There is also another usual Division of Plants into *Trees, Frutices or Shrubs, Suffrutices and Herbs*; but this is rather Popular and Vulgar, than Just and Philosophical.

PLASM, the same with a Mould in which

any Metal, or such like running Matter, which will afterwards harden, is cast.

PLAT-Bastion. See Bastion.

PLAT-Band, in Architecture, is a Square-Mould which terminates the Architecture of the Dorick Order, or the Fascia which passeth immediately under the Triglyphs, and serves for the same Use in this Order, as the Cymarium in the others. It is also the Fascia of the Chambranes; And the same Name is also attributed to divers other Members of Architecture, which are destitute of Ornament, having only a certain Breadth without much Projection.

PLATES, a Term in Heraldry. See Balls.

PLATFORM, in Fortification, is a Place prepared on the Ramparts for the raising of a Battery of Cannon; or it is the whole Piece of Fortification raised in a re-entring Angle. See Battery.

PLATFORM, in Architecture, is a Row of Beams that support the Timber-Work of a Roof, and lie on the top of the Wall, where the Entablature ought to be raised. Also a kind of Terrass Walk, or even Floor on the Top of a Building; from whence we may take a fair Prospect of the adjacent Gardens or Fields. So an Edifice is said to be covered with a Platform, when it hath no Arched Roof.

PLATFORM, or Orlop, in a Man of War, is a Place on the Lower Deck of her, abaft the Main Mast, and round about the Main Capstan, where, in the Time of Service, Provision is to take care of the Wounded Men; 'tis between the Main Mast and the Cock-pit.

PLATISMA, is a broad Linen-cloth put upon Sores.

PLATONICK Bodies. See Regular Bodies.

PLATOON, corruptly from the French Word *Peloton*, is a small Square Body of Musketeers; such as is usually drawn out of a Battalion of Foot, when they form the Hollow Square to strengthen the Angles; and the Granadeers are generally thus posted.

PLATTS in a Ship, are flat Ropes made of Rope-yarn, and weaved one over another; their Use is to save the Cable from Galling in the Haule, or to wind about the Flukes of the Anchors to save the Pendant of the Fore-sheer from galling against them.

PLAYNT, in Law, is the propounding, or exhibiting of any Action Real or Personal in Writing; and the Party making this Playnt, is called *The Party Plaintiff*.

PLEA, in Law, signifies that which either Party alledgeth for himself in Court, and are either *Pleas of the Crown*, or *Common-Pleas*. *Pleas of the Crown*, are all of them Suits in the King's Name, against Offences committed against his Crown and Dignity, or against his Crown and Peace; and those seem to be Treasons, Felonies, Misdemeanors of either; and *Mathem*. *Common Pleas* be those that are held between Common Persons, yet by the former Definitions, they must comprise all other, tho' the King be a Party. *Plea* may farther be divided into as many Branches as *Action*; which see, for they signify all one.

Then there is a *Foreign Plea*, whereby Matter is alledged in any Court, that may be tried by another.

PLEADINGS, in Law, are all the Sayings of the Parties to Suits after the Count or Declaration;

to wit; whatever is contained in the Bar, Replication, and Rejoinder, and not in the Count itself; and therefore Defaults in the Matter of the Count, are not comprised within *Mispleading*, or insufficient *Pleading*, but only *Mispleading*, or insufficient *Pleading*, committed in the Bar, Replication, or Rejoinder.

PLEDGES, in Common Law, are Sureties, either real or formal, which the Plaintiff finds to prosecute his Suit.

PLEGIIS *acquietandis*, is a Writ that lies for a Surety, against him for whom he is Surety, if he pay not the Money at the Day.

PLEIADES, the same with those seven Stars in the Neck of the Bull, which are usually thus called,

PLENA *foris factura*, & *plena vita*. See *Forfeiture*.

PLENARTY, in Law, is when a Benefice is full directly contrary to *Vacation*, which signifies the being void of a Benefice.

PLENITUDE, is when a Man has too much Blood; the same with *Plethora*.

PLEONSAMUS, is a Figure in Discourse, when a Word not necessary is added, to express a Vehemency in us, and a greater Certainty in the Thing; as when we say, *I saw it with these Eyes*: Here, *saw it*, is really enough in Grammar, but *with these Eyes*, is added, to shew both the Certainty of the Fact, and our Zeal and Vehemence in asserting it.

PLEROTICA are Medicines that breed Flesh, and fill up Wounds.

PLETHORA, when there's more good Blood than is requisite: It happens either to the Vessels, when they are stretch'd out, and cannot hold all; or to the Strength, for sometimes, tho' the Vessels be not over full, the Strength is over-loaded.

PLEVIN, in Common Law, signifies a War-rant, or Assurance. See *Replevin*.

PLEURA, is the Skin or Membrane which covers the Inside of the Thorax, adhering to the Ribs.

PLEURITIS, a *Pleurisie*, is an Inflammation of the Membrane *Pleura*, and the Intercoastal Muscles, attended with a continual Fever, and Stitches in the Side, Difficulty of Breathing, and sometimes Spitting of Blood; and it's either a true *Pleurisie*, as this which we have described, or a Bastard *Pleurisie*, whose Symptoms are not so violent, and in some Things different from the former.

PLEXUS *choroides* seems to hang over the Pineal Glandule, as it were over a Button. It is an admirable Texture of small Arteries in the Brain like a Net.

PLEXUS *Nervosus*, is when two or three Nerves meet together, and jut out.

PLEXUS *reticularis*. Vid. *Choroides*.

PLICA, is an Epidemical Disease in Poland, when their Hairs grow together like a Cow's Tail; besides, they are Crooked-back'd, have loose Joints, it wrenches their Limbs, and loosens them, breeds Lice, with other Symptoms.

PLINTHUS, or *Plinthis*, in Architecture, is taken for that Square Member which serves as a Foundation to the Base of a Pillar: But *Vitruvius* calls the upper part, or *Abacus* of the *Tuscan* Pillar, a *Plinth*, because it resembles a square Tile.

Moreover, the same Denomination is sometimes attributed to a thick Wall, wherein there are two or three Rows of Bricks advanced in form of a *Plat-band*. This

PLINTH, *Palladio* calls the *Orle*, and *Blondell* the *Abacus*. The Word is also used for a like Member about the Capital of a Pillar; but then 'tis called always the *Plinth* of the *Capital*, and is placed just above the *Echinus* in the *Doric*, and above the *Ovolo*, or quarter Round, in the other Orders.

PLOW, is an Instrument made of Box or Pear-tree, used by Seamen to take the Height of the Sun or Stars, in order to find the Latitude: It admits of the Degrees to be very large, and is much esteemed by many Artists.

PLUMB-Line, the same with *Perpendicular*.

BLUMBUM *ustum*, is a Composition of two Parts of Lead melted in a Pot or Crucible, with one Part of Sulphur then added to it, and kept o'er the Fire till they be burnt all out; the Matter will then be turned into a Black Powder, which they properly call by this Name *Plumbum Ustum*.

PLUME, is the Term used by Botanists for that Part of the Seed of a Plant, which in its Growth becomes the Trunk; 'tis inclosed in two small Cavities formed in the Lobes for its Reception; and is not like the *Radicle*, an entire Body, but divided at its loose End into divers Pieces, all closely bound together like a Bunch of Feathers; whence *Dr. Grew* very properly gives it the Name of *Plume*. In Corn it is that Part, which, after the *Radicle* is shot forth, shoots out towards the smaller End of the Seed, and therefore is by some called the *Acrospire*.

PLURIES, is a Writ that goeth out in the third Place, after two former Writs that had no Effect: For first the Original *Capias* issues, and if that speed not, then goeth out the *Alias*, and if that also fails, then the *Pluries*.

PNEUMATICK Engine, the same with the *Air Pump*.

PNEUMATOCELE, is a Windy Rupture, when the Skin of the *Scrotum* is distended with Wind.

PNEUMATODES, is a short Breathing.

PNEUMATONIPHALUS, is a Swelling in the Navel, got by Wind.

PNEUMATOSIS, is the Generation of Animal Spirits, which is performed in the Cortical Substance of the Brain; the little Arteries there are emptied, and the Spirits distil, which after they are come as far as the Middle of the Brain, they Actuate and Invigorate all the Nerves.

PODAGRA. vid. *Arthritis*, The Gout in the Feet.

POETICAL, *Rising and Setting of the Stars*: This is peculiar to the Ancient Poetical Writers, for they refer the Rising and Setting of the Stars, always to that of the Sun; and accordingly make three Sorts of Poetical Rising and Setting. *Cosmical*, *Acronical*, (or as some write it, *Acronyctal*), and *Heliacal*. See those Words.

POINT, a Point in Geometry, is that which is supposed to have no manner of Dimensions, but to be Indivisible in every respect.

The Ends or Extremities of Lines are Points.

If a Point be supposed to be moved any way, it will by it Motion describe a Line.

POINT Blank, a Term in Gunnery, signifying that a Shot or Bullet goes directly forward to the Mark, and doth not move in a Curve as Bombs and highly elevated Random Shots do.

POINT

POINT, in Navigation, signifies 11 Degrees 15 Minutes, or one 32d Part of the Compass: The half of which is 5 Degrees 38 Minutes; which they call a *Half Point*; and the half of this, which is 2 Degrees 49 Minutes, they call a *Quarter Point*.

The Seamen also call the Extremity of any Promontory (which is a Piece of Land running out into the Sea) a *Point*; which is of much the same Sense with them as the Word *Cape*.

They say two Points of Land are one in another, when they are so in a Right Line one against another, as that the Innermost is hindered from being seen by the Outermost.

POINT of *Concourse*, in Opticks, is that Point where the *Visual Rays*, being reciprocally inclined, and sufficiently prolong'd, meet together, are united in the middle, and cross the Axis. This Point is most usually called the *Focus*; and sometimes the *Point of Convergence*.

POINT of *Concurrence*, a Term in Perspective. See *Principal Point*.

POINT of *Divergence*. See *Virtual Focus*.

POINT of *Incidence*, in Opticks, is that Point on the Surface of a Glass, or other Body on which any Ray of Light falls: And as some also word themselves, That Point of the Glass, which a Ray parts from, after its Refraction, and when 'tis returning into the *Rare Medium* again.

POINT of *Inflexion* of a Curve. See *Inflexion*.

POINT *Principal*, a Term in Perspective. See *Principal Point*.

POINT *Sensible*, according to Mr. Lock, is the least Particle of Matter or Space which we can discern; and to the sharpest Eyes, is seldom less than thirty Seconds of a Circle, whereof the Eye is the Centre.

POINTING the *Cable*, is when the Strands about two Foot from the End are untwisted, in order to make Sinner of the Rope-yarn, and then to lay them one over the other again, making it less towards the End, where all is made fast together with a Piece of Marlin, the Design of which is partly to keep the Cable from raveling out, but chiefly that none of the Cable may be cut off, and stole away.

POINT *In*, when two Piles are born in a Coat of Arms, so as to have their Points meet together in any part of the Escutcheon. They say, *He bedareth two Piles in Point*.

POINTS in *Heraldry*, are several Places in an Escutcheon, diversly named according to their Situation. See the Word *Escutcheon*.

POINT *Campion*,
POINT *Dexter*,
POINT *Plain*,
POINT *in Point*, } All Abatements of Honour; which see under that Word.

POINTS of *Station*, in Astronomy, are those Degrees of the Zodiack, in which a Planet seems to stand quite still, and not to move at all.

POLAR *Circles*, are two Circles supposed to be drawn parallel to the *Equinoctial* or *Equator*, thro' 23 Degrees 30 Minutes Distance from the *Polar Points*; and that about the *North-Pole* is called the *Arctic Circle*, and the other about the *South-Pole*, the *Antarctic Circle*, because opposite to the former.

POLAR *Dials*, are those whose Plane are parallel to some Great Circle that passes thro' the

Poles, or parallel to some one of the Hours; so that the *Pole* is neither elevated above, nor depressed below the Plane, therefore the Dial can have no Centre, and consequently its *Stile*, *Substile*, and *Hour Lines*, are parallel. This therefore will be an Horizontal Dial to those who live under the *Equator* or *Line*.

In a *Direct Polar Dial*, the Hour Lines must be drawn all parallel to the Hour Line of Twelve.

The *Stile* may be either a strait Pin set upright, or a Wyer made to lie parallel to the Plane, and must stand over the Hour-Line of Twelve.

The Length of the Plane may be taken in any Inches, or Parts of Inches, reckoning the Inch to be divided into 10, or 100 Equal Parts.

Then for the *Height of the Stile*, say,

As the Tangent of the Hour-Line 4 or 5, is to the Logarithm of their Distance from the Meridian in Inches and Parts.

So is the Radius, to the *Height of the Stile* in Inches and Parts.

For the *Hour-Lines*; say,

As the Radius is to the Logarithm of the *Stiles Height*, in Parts of Inches.

So is the Tangent of any Hour-Line, to the Logarithm of the Distance thereof from the Meridian Line.

Example.

Suppose your *Polar Plane* be 12 Inches long, and it be required to put on all the Hour-Lines from 7 in the Morning unto 5 in the Afternoon.

Here you have 5 Hours and 6 Inches on either Side of the Meridian; and before you work the Operation, the Hours and Inches must be reduced into Degrees or Parts, allowing for every Hour or Inch 15 Degrees, or 100 Parts, so you'll have 75 Degrees, and 600 Parts.

Then for the *Stiles Height*.

To the *Ar. Co.* of the Tangent 75° } 9.428053
(= 5 Hours.) — — — —

Add the Logarithm of the Distance } 2.778151
from the Meridian 600 Poles — — — —

Sum = the Logarithm of the *Stiles Height*, 161 Parts. — — — } 2.206204

That is, 1 Inch, and 61 Parts of an Inch.

For the *Hours Distance from the Meridian*.

To the Log of the *Stiles Heig.* 161 Pts. 2.206204
Add the Tang. 15° (for the 1st Hour) 9.428052

Sum = Radius = Logarithm of } 1.634256
the Hours Distance = 43 Parts — — — —

After the same manner may you find the other *Hours Distance from the Meridian*.

Then

Then draw them in a Table thus :

Hours.	Angles at the Poles.	Tangent.
H. H.	G. M.	Inch. Parts.
12	00 00	00 00
11	15 00	00 43
10	30 00	00 63
9	45 00	01 61
8	60 00	02 79
7	75 00	06 00
6	90 00	Infinit.

To project the Dial.

First Draw on the Plane the Meridian Line A B which crofs at Right Angles with $\mathcal{E} Q$, the Equator. Then from c , the Intersection of the Meridian and the Equator, set off those Parts from the Table both ways, and thro' these Points draw Lines parallel to A B, (or the Hour-Line of 12,) those shall be the Hour-Line I required.

POLAR Projection, is a Representation of the Earth, or of the Heavens, projected on the Plane of one of the Polar Circles.

POLARITY, is the Property of the Magnet, or of a Piece of Oblong Iron touch'd by a Magnet, to point toward the Poles of the World.

POLE, in Measuring, is the same with Perch or Rod, or as some call it, Lugg. By our Statute Law, (*Ann. 35 Eliz. Cap. 6.*) this Measure is, a Length of 16 Feet and an half, but it varies by the Usage of some Countries, being in some Places of 18 Feet, which they call *Woodland Measure*; in some Places of 21 Feet, which is called *Church Measure*, (*i. e.* of such Lands as did or do belong to the Church;), and in others of 24 Feet, and this is called *Forest Measure*.

POLE, in Mathematicks, is a Point 90 Degrees distant from the Plane of any Circle, and in a Line perpendicularly erected in its Centre; which Line is called the Axis. And from this Polar Point may Circles be described on the Globe or Sphere, as they are on the Plane from their Centre.

POLE Star, is a Star in the Tail of the Little Bear, (a Constellation of 7 Stars, which is called *Cynosura*), and is very near the exact North Pole of the World. The right Ascension of this Pole Star for this Year, 1700, is 0 Hours 35 Minutes 0 Seconds of Time; and it increases 1 Minute

16 Seconds every 10 Years: Therefore having at any time this Star's Right Ascension, and the Right Ascension of the Sun, (both in time,) if you Subtract the latter from the former, (adding 24 Hours to the Right Ascension of the Pole Star when it is less than the Sun's,) the Remainder will be the Time when the Pole Star is in the Meridian. Then hang up two Strings and Plummetts between the Pole Star and your Eye, and you will have a true Meridian Line, which will be of great Use to rectifie a Clock or Watch. And you may find the Meridian very nicely, if instead of the Strings above mentioned, you use the Sights of a good Circumferenter, or other Surveying Instrument.

Some Persons have been might apt to imagine, That the Height or Elevation of the Pole, and also the Position of the Circles of the Heavens, in respect of those on the Earth, hath much changed and varied: But Mr. *Cassini* is doubtless right in his Assertion, That there is no just Ground for any such Surmise: And that all the Difference which we find now in the Latitudes of Places, &c. in respect of the Ancient Accounts, arises from the former Observations not being well made; as indeed we may judge they cannot have been, since they had no such good Instruments to do it withal, as the Modern Astronomers have.

Yet he thinks it very probable, that there may be some little Variation in the Height of the Pole, in one and the same Place; but this not exceeding two Minutes, and which will in Process of Time quite vanish, after 'tis arrived to its highest Difference. Vid. *Memoires de Mathemat. & de Physique*, July, 1693.

POLE of a Glass (in Opticks) is the thickest part of a Convex, but the thinnest of a Concave Glass, and if the Glass be truly ground, will be exactly in the middle of its Surface: This is sometimes called, The Vertex of the Glass.

POLES of the World, are two Points in the Axis of the Equator, each 90 Degrees distant from its Plane; one pointing North, which therefore is called, The North or Arctic Pole; the other Southward, which therefore is called, The South or Antarctic Pole.

Whether any People live directly under the Pole or not, is a Question; but Mr. *Halley* hath proved, That the Solstitial Day, under the Pole, is as hot as under the Equinoctial, when the Sun is Vertical to them, or in their Zenith; because for all the 24 Hours of that Day under the Pole, the Sun's Beams are inclined to the Horizon with an Angle of $23\frac{1}{2}$ Degrees: Whereas under the Equinoctial, tho' he become Vertical, yet he shines no more than 12 Hours, and is absent 12 Hours: And besides, for 3 Hours 8 Minutes of that 12 Hours he is above the Horizon there, he is not so much Elevated as under the Pole.

POLES of the Ecliptick are Points in the Solstitial Colure 23 Degr. 30 Minut. distant from the Poles of the World; and thro' these all Circles of Longitude in the Heavens do pass, as the Hour Circles do thro' the Poles of the Equator.

To find the Pole of any Circle. See *Spherick Geometry*.

POLEMICAL, is a Word used in reference to that part of Theology which relates to Controversie; which because of the Wars, Jars, and Squabbles, that usually arise about Controverted Points, is called *Polemical Divinity*.

POLICY of *Affurance*, is a Form of Security; mentioned in 43 *Eliz. cap. 12*, & 14; and also in 14 *Car. 2. cap. 23*. and given by a certain Society of Men formed into a kind of Corporation, to any Person to Insure the safe Return of the whole or any part of a Ship; to Insure Houses against Fire; so that if they are burnt down, they shall be Rebuilt at the proper Charge of the Insurers; and to Insure Mens Lives in Offices when they have paid great Sums for the same; and lastly, to Insure to Persons paying so much Money at once, or becoming constant Contributors to the Office or Society of Assurance, a Remainder of so much Money after the said Contributor or Subscriber's Death. This Policy of Assurance is under the Seal of the Office, and entitles the Person Benefited by it, to make good his Claim according to the Tenor of the Articles or By-Laws of that Society of which he was a Member.

POLLUX, a fix'd Star in the *Twins*, of the Second Magnitude, whose Longitude is 108 Degrees 47 Minutes, Latitude 6 Degrees 38 Minutes.

POLYACOUSTICKS, are Instruments contrived to Multiply Sounds, as Multiplying-glasses or Polyscopes do Images of Objects.

POLYEDRON, the same with *Polyhedron*.

POLYGON, a Term in Geometry, signifying in the general any Figure of many Sides and Angles; tho' no Figure is called by that Name, unless it have more than four or five Sides.

And if all the Sides and Angles be equal, then 'tis called a *Regular Polygon*.

For its Superficial Content, see *Area*.

Every *Polygon* may be divided into as many Triangles as it hath Sides.

If you take a Point, as *a*, any where within the *Polygon*, and from thence draw Lines to every Angle, *a b*, *a c*, *a d*, &c. for they shall make as many Triangles as the Figure hath Sides.

The Angles of any *Polygon* taken together, will

make twice as many Right ones, except four, as the Figure hath Sides.

Thus, if the *Polygon* have six Sides, (as in the Figure above) the double of that is 12; from whence take 4, there remains 8. I say, that all the Angles *b, c, d, e, f, g*, of that *Polygon* taken together, are equal to 8 Right Angles.

For the *Polygon* having 6 Sides, is divided into 6 Triangles; and the 3 Angles of each, by 1. *Eucl.* are equal to 2 Right ones; so that all the Angles together make 12 Right ones: But each of these Triangles hath one Angle in the Point *a* and by it they compleat the Space round the said Point; and all the Angles about a Point are known to be equal to 4 Right ones; wherefore those 4 taken from 12, leave 8, the Sum of the Right Angles of the *Hexagon*.

So that 'tis plain, the Figure hath twice as many Right Angles, as it hath Sides, except 4. *Q. E. D.*

Every *Polygon* circumscribed about a Circle, is equal to a Rectangled Triangle, one of whose Legs shall be the Radius of the Circle, and the other the *Perimeter* (or Sum of all the Sides) of the *Polygon*.

Let the Line FA be equal to Radius fb , and to it at Right Angles draw the Infinite Line $ABCD$, &c. out of which take $Ab = ab$, $bB = bb$, $Bi = bi$, and $iC = ic$, &c. So that the whole Line $ABCDEA$, may be equal to the whole Compass or Perimeter of the Polygon $abcde a$.

Also draw FF parallel to AA ; so that all the Perpendiculars Fb, Fi, Fk , &c. may be equal to the Radius fb, fi, ik , &c.

'Tis then plain, That the Triangle AFB will be equal to the Triangle afb in the Polygon and the $\triangle BFC = \triangle bfc$, also the $\triangle CFD = \triangle cfd$, &c. So that all these Triangles taken together, will be equal to all these in the Polygon, or to the whole Polygon.

But the $\triangle FAA$ is equal to all the \triangle s within the Parallels; because drawing the Lines BF, CF, DF , &c. The $\triangle FAB$, will be equal to the $\triangle FbA$; the $\triangle FCB = \triangle fCB$, &c.

Wherefore the Triangle FAA is equal to the Polygon, which was to be proved.

COROLLARY I.

Hence every Regular Polygon is equal to a Right-angle Triangle, one of whose Legs is the Perimeter of the Polygon, and the other a Perpendicular drawn from the Centre to one of the Sides of the Polygon.

COROLLARY II.

And every Polygon circumscribed about a Circle, is bigger than it; and every Polygon inscribed, is less than the Circle, as is manifest; because the thing containing, is always greater than the thing contained.

COROLLARY III.

The Perimeter of every Polygon circumscribed about a Circle, is greater than the Circumference of that Circle; and the Perimeter of every Polygon inscribed is less.

Hence,

A Circle is equal to a Right Angled Triangle, whose Base is the Circumference of the Circle and its Height the Radius of it.

For this Triangle will be less than any Polygon circumscribed, and greater than any inscribed, (because the Circumference of the Circle, which is the Base of the Triangle, is greater than the Compass of any inscribed;) Therefore it will be equal to the Circle. For if this Triangle be greater than any thing that is bigger than the Circle, and less than any thing that is less than the Circle; it follows, that it must be equal to the Circle.

This is called the Quadrature or Squaring of the Circle; that is, to find a Right-lined Figure equal to a Circle; upon this Supposition, That the Base given, is equal to the Circumference of the Circle, but actually to find the Right Line equal to the Circumference of a Circle, is not yet discovered Geometrically.

To inscribe any Polygon in a Circle.

Divide ab , the Diameter of the Circle, into as many equal Parts as the Polygon is to have Sides; (viz. 5.) and then with the Length of that whole Diameter make two Arks intersecting each other above, as in z ; and lay a Ruler from z thro' g , the second Division of the Diameter, which will find below the Point p . So is the Chord ap the Side of the Polygon required; which here is a Pentagon.

POLYGON,

POLYGON *Exterior*, in Fortification, is the Distance of one Point of a Bastion from the Point of another, reckoned all round the Work.

POLYGON *Interior*, is the Distance between the Centres of any two Bastions, reckon'd all round as before.

POLYGONAL Numbers, are such as are the Sums or Aggregates of *Series* of Numbers in Arithmetical Progression, beginning with Unity; and so placed, that they represent the Form of a *Polygon*. Thus,

.
1	3	6	10	

are Triangular Numbers, because they are the Aggregates of a certain Number of Points placed in the Form of Triangles, &c.

.
1	4	9	16	

are Quadrangular Numbers, &c.

POLYGRAM, is a Geometrical Figure consisting of many Lines.

POLYHEDROUS Figure, in Geometry, is a Solid contained under or consisting of many Sides; which, if they are *Regular Polygons*, all Similar and Equal, and the Body be inscribable within the Surface of the Sphere, 'tis then called a *Regular Body*. See that Word.

POLYNOMIAL, or *Multinomial Roots*, in Mathematicks, are such as are composed of many Names, Parts, or Members; as,

$$a + b + d + c.$$

In *Philos. Transf.* N. 230. you have a curious Method of raising an Infinite *Multinomial* to any Given Power; or of extracting any Given Root out of such Power: Which was discovered from Sir Isaac Newton's Theorem for raising a *Binomial* to any Given Power, or Extracting the Root of the same, by that Ingenious and Excellent Algebraist Mr. *Abr. de Moivre*.

POLYPETALOUS Flower, is the Term in Botany for the Flower of a Plant which consists of more than Six distinct Flower-leaves set round to form it; and which fall off singly.

POLYPUS, is a Swelling in the Hollow of the Noftrils, and is Two-fold; either like a Tent, and then it goes by the general Name of *Sarcoma*; or such an one that has a great many distinct Branches or Feet, which extend either to the Outside of the Nose, or the Inside of the Mouth. Their Colour is White, oftentimes Reddish, and sometimes Black and Livid.

Excrescencies of this Nature happen not only in the Noftrils, but sometimes in the Heart, and in the Cavities of the thicker Membrane of the Brain. *Blanchard*.

POLYSCOPES, or *Multiplying Glasses*, are such as represent to the Eye one Object as many.

POLYSPASTUM, a Term in Mechanicks, the same with the *Trochlea* or *Pully*.

POLYSPERMÆ *Plantæ*, are such Herbs or Plants as have more than Four Seeds succeeding

each Flower, and this without any certain Order or Number.

These Mr. Ray makes to be a distinct kind of Herbs, calling them *Herbæ semine nudo Polyperme*: Where by *Semine nudo* he means such Seeds as do not put off, spontaneously the Integuments or Coverings which they either have, or appear to have, but fall covered with it from the Mother-Plant.

These kind of Herbs he divides into Two sorts.

I. Such as have a *Calyx* or *Perianthium* to their Flower; and this consisting either of,

1. *Three Leaves*; the Flower also being *Tripetalous*, or having but Three Leaves: As, the *Plantago Aquatica*, and the *Sagittaria*, both Water-Plants.

Or where the Flower is *Polypetalous*, and the *Calyx* falling together with the Flower; as in the *Chelidonium minus*; or remaining after the Flower is dropt, as in the *Hepatica Mobilis*.

2. *Five Leaves*; in some *Deciduous* with the Flower, as in the *Ranunculus*, In others *Perennial*, as in the *Helleborus niger ferulaceus*; or *Annual*, as in the *Flos Adonis*.

3. *Eight Leaves*; as the *Malva* and *Alcea*.

4. *Ten Leaves*; as the *Carrophylla*, *Fragraria*, *Pentaphyllum*, *Tormentilla*, *Argentina*, *Althea*, and *Pentaphylloides*.

II. Such as have no *Calyx* or *Perianthium*; as the *Clematis*, *Pilipendula*, *Ulmaria*, *Anemone Nemorum*, *Pulsatilla*, &c.

POMIFEROUS Herbs, are (according to Mr. Ray) such as have the largest of Fruit of any Plants whatever, and this covered with a thick hard Rind or Bark; by which they are distinguished from the *Bacciferous Herbs*, which only have a thin Skin over the Fruit.

These kind of Plants have a naked *Monopetalous* Flower, divided into Five Jaggs or Partitions, and growing on the top of the succeeding Fruit. And these either are,

1. *Capreolate*, or creeping along the Ground, &c. by means of their Tendrils, (*Capreoli*) as the *Cucurbita*, *Melo*, *Cucumis*, *Cepo*, *Belfamina*, *Anguria*, and *Colocynthis*. Or,

2. Without *Capreoli* or Tendrils; as the *Cucurbita Clypeata*, or *Melo-Cepo*, *Clypeiformis*.

POMIFEROUS Trees, (see *Trees*) are such as have their Flower on the top of the Fruit, and their Fruit in the Form of an Apple or Pear.

POMPHOLIGODES, Urine with many Bubbles upon it; which are frequent, if the Body be puffed up or painted. *Blanchard*.

POMUM *Adami*, is a Protuberance in the Fore-side of the Throat; so called, because 'tis foolishly thought a piece of the Apple stuck in *Adam's* Throat, as part of his Punishment, and hence derived to his Posterity. *Blanchard*.

In Reality 'tis only the Convex part of the first Cartilage of the *Larynx*, called *Scutiformis*. This is greater in Men than Women.

PONE, is a Writ, whereby a Cause depending in the County Court, or other Inferior Court, is removed into the Common-Pleas.

PONE *per Vadium*, is a Writ to the Sheriff to take Surety of one for his Appearance at a Day assigned.

PONENDIS *in Affisis*, is a Writ founded upon the Statute of *West. 2 cap. 38.* and upon the Statute *Articuli Super Chartas*, cap. 9. Which Statutes shew what Persons Sheriffs ought to impanel upon *Affises* and Juries, and what not.

PONENDUM *in Ballium*, is a Writ commanding a Prisoner to be bailed, in Cafes Bailable.

PONENDUM *Sigillum ad exceptionem*, is a Writ whereby the King willeth the Justices, according to the Statute of *Westm. 2.* to put their Seals to Exceptions laid in by the Defendant against the Plaintiff's Declarations, or against the Evidence, Verdict, or other Proceedings before the Justices.

PONS *Cerebri*, (by some) is a Congeries or Heap of innumerable Filaments divaricated out of the Solider Substance of the Brain, whence all the Nerves take their Rise.

PONTAGE, is a Contribution towards the Maintenance or Re-edifying of Bridges. It may also signifie Toll taken to this Purpose of those that pass over Bridges.

PONTIBUS *Reparandis*, is a Writ directed to the Sheriff, &c. willing him to charge one or more to Repair a Bridge, to whom it belongeth.

PONTON, in Fortification, is a Bridge made of two Boats, at some Distance one from another, both covered with Planks; as also the Internal Space berwixt them. They have Props and Rails on each side; and the whole Structure ought to be so solid, as to be able to transport the Horse, together with Cannon and Baggage, as well as the Infantry.

PONT *Volant*, or the *Flying Bridge*, used in Sieges, is made of two small Bridges laid one over another; and so contrived, by the means of Cords and Pulleys placed along the sides of the Under Bridge, that the Upper can be pushed forwards 'till it joins the Place where it is to be fixed; But however the whole Length of both these Bridges must not be above Four or Five Fathom long, lest they should break with the Weight of the Men. These are chiefly used to surprize Out-works or Posts that have but narrow Moats.

POOP of a Ship, is the Floor or Deck over the Round-house or Master's Cabin, being the highest or uppermost part of her Hull; *a-stern*.

POPLITEA *Vena*, is the Vein of the Ham, and sometimes reaches down the back of the Leg even to the Heel. This comes from the *Iliacal* Branches of the *Vena Cava*; which, after they descend as low as the Thighs, are called *Cruales*.

POPLITEUS, by some called *Subpopliteus*, is a Muscle of the Leg, which ariseth with a short strong Tendon from the External Head of the Inferior *Appendix* of the *Os Femoris*; from whence descending obliquely over the Juncture, becomes fleshy, and expanding it self, is so inserted to the Superior part of the *Tibia* internally, immediately below its Superior *Appendix*. This assists the other Muscles in bending the *Tibia*, and also Antagonizeth the *Biceps*, by turning the Foot and Toes outwards when we sit with our Knees bended.

PORES, are small Interstices, Spaces, or Vacuities between the Particles of Matter that constitute every Body, or between certain Aggregates or Combinations of them. Thus, for Instance, those little imperceptible Holes in the Skin, thro' which the Sweat and Vapours insensible breath out of the Body, are called *Pores*; and the having of such Holes or *Pores* in any Body, is called *Porosity* or *Porosity*.

The Honourable Mr. Boyle has written a Particular *Essay* on the *Porosity* of Bodies; in which he proves, That the most Solid Bodies that are, have some kind of *Pores*. And indeed, if they had not, all Bodies would be alike *Specifically* weighty.

PORIME, (Gr. *ποριμα*) in Geometry, is a Theorem or Proposition to easie to be demonstrated, that 'tis almost self-evident; as, *That a Chord is all of it within the Circle*. And on the contrary they call that an *Aporime*, which is so difficult as to be almost impossible to be demonstrated; as the *Quadrature of the Circle* is now, and as the Squaring of any Assigned Portion of *Hippocrates* his Lunes was, 'till a little while ago.

PORISME, *Proclus* and *Pappus* define this Geometrical Term to signifie a kind of Theorem, in the form of a Corollary, which is dependant upon, or deduced from some other Theorem already demonstrated. And 'tis commonly used to signifie some General Theorem, which is discovered from finding out some Geometrical Place: As, for Instance, if a Man hath found out by Algebra, or any other Method how to Construct a *Local Problem*; and from that Place so constructed and demonstrated, hath deduced some General Theorem, that Theorem is by the Geometrick Writers called a *Porism*. Of these *Porisms*, Mr. Ozanam, in his *French Mathematical Dictionary*, gives many useful Instances; which see.

PORISTICK Method, in Mathematicks, is that which determines *when, by what way, and how many different ways*, a Problem may be resolved.

POROCELE, is a Rupture proceeding from Callous Matter, or the Stone. *Blanchard*.

POROTICA, are Medicines, which, by drying, thickening, and astringent Qualities, turn part of the Nourishment into Brawny, Callous Matter. *Blanchard*.

POROSITY. See *Pores*.

PORTA, the same with *Vena Porta*.

PORT the Helm, a Sea-Term, signifying to put the Helm to the Left or Larboard side of the Ship; but however they never say *Larboard the Helm*, but always *Port it*; tho' they say *Starboard the Helm*, when it is to be put to the Right side of the Ship. A Ship is said to *Heel a-port*, when she swims not upright, but leans to the Left side. The Word

PORT, also signifies a Haven or Harbour; as also the Holes in a Ship's side thro' which her Great Guns are put out.

PORT-Last, the same as the *Gun-wale* of a Ship; therefore they say a *Yard is down a Port-Last*, when it lies down on the Deck.

PORTABLE Barometer, was first invented by the Honourable Mr. Boyle, and was effected by making the *Torriceilian* Experiment in a long Glass Tube, sealed at the top, and bent near the bottom up again, parallel to the longer Leg: For by this means the Quick-silver in the open and shorter Leg, supplied the Place of the stagnant Mercury in the *Bason* or *Cistern*. The Instru-

ment

ment was all of one piece, and might easily be carried from Place to Place without spilling the Mercury. By which means, Observations of the Weight of the Atmosphere might be readily made on the Tops of Hills, Bottoms of Mines, &c.

But this open Tube could not be carried about with so much Ease and Safety as those *Portable Barometers* which are now in Use, and which are made by Mr. John Partrick, Torricellian Operator in the *Old Baily*, with very great Exactness and Neatness: For in these there is an Invention to screw the Mercury quite up to the Sealed end of the Tube, by which means it will not swag up and down in the Carriage, and so by its great Weight endanger the breaking of the Tube.

PORTCULLICE, *Herse*, or *Sarazine*, in Fortification, signifies several great Pieces of Wood laid or joined across one another like an Harrow, and at the Bottom it is pointed at the end of each Bar with Iron. These formerly used to hang over the Gate-ways of Fortified Places, to be ready to let down in Case of a Surprise, when the Enemy should come so soon, as that there is no Time to shut up the Gates. But now a-days the Orgues are more generally used, as being found to be much better. See *Orgues*.

PORTICO, or *Porch*, in Architecture, is a long Place cover'd either with a vaulted Roof, or an even Floor, supported by Pillars. But this Word may be applied to signify all manner of Dispositions of Columns in a Gallery.

PORTIONER, where a Parionage is served sometimes by two, or sometimes by three Ministers alternately. The Ministers are called *Portioners*, because they have but their Portion, or Proportion of Tythes or Profits of the Living.

PORTMOTE, signifies a Court kept in Haven Towns, as *Swainemote* in the Forest, and is called the *Portmote Court*.

PORUS Biliaris, or *Meatus Hepaticus*, is a Pipe or Channel passing directly from the Liver to the *Ductus Communis*, and which transmits the Bile from the Liver, by the Intervention of some small Glandules. Within the Liver, its Trunk and Branches are invested with a double Coat: A *Proper* one which it retains also without the Liver; and another common to it and the *Porta*, called *Capsula Communis*, which it hath from the Membrane of the Liver. In this Common Coat, this *Porus* and the *Porta* are so closely enwrapped, that at first they appear but one Vessel; but if you hold them up to the Light, you will discover Vessels of two Colours; and then you may dexterously rip up the *Capsula*, and so lay them open. Its Roots within the Liver are equally divided with those of the *Porta* every where, except in that little Space where the Roots of the *Vesica* are spread in the Right side of the Liver; and they are both larger and more numerous than those of the *Vesica*, drawing Choler from all Parts of the Liver almost. And this *Porus Biliaris* seems to be a more necessary Part than the Gall-Bladder, or *Vesica*; because in many Creatures, as Red and Fallow Deer, Horses, &c. the *Vesica* is wanting, but none want this. Without the Liver, 'tis as wide again as the *Meatus Cysticus*, with which it joins at two Inches Distance from the Liver; and so both make up the *Ductus Choledochus Communis*. The *Porus* hath no Valve in its whole Progress; only the *Ductus Communis*, at its Entrance into

the Intestines, having pierced the Outer Coat, passes between *that* and the Middlemost Coat, for about the 12th part of an Inch; and then piercing *that* also, marches down farther between it and the Inner Coat of the Gut, for about half an Inch, and at last opens with a round Mouth into the Intestine: So that this Oblique Insertion (like that of the Ureters into the Urinary Bladder) serves instead of a *Valve*, to hinder any thing from Regurgitating out of the Guts into this Duct: And this is farther prevented also by the flaggy, loose Constitution of the Inner Tunick of the Guts; which, when any thing would enter, the Mouth of the *Porus* claps close upon it, and stops it. There are no *Anastomoses* between the Roots of this Duct and those of the *Porta*, as have been often said; For the Extreme Capillary Twigs of the *Porus* terminate in the *Parenchyma* of the Liver, out of whose Glandules, they imbibe the Choler, there separated from the Blood.

POSITION, or *Site*, is an Affection of Place, and expresses the Manner of any Bodies being in a Place: This therefore is not *Place*, nor indeed hath it any Quantity; as Sir Is. Newton well observes in *Princip. Mathem.* p. 6.

POSITION, or the *Rule of Position*, otherwise called the *Rule of Falshood*, is a Rule in Arithmetick, wherein any Number is taken to work the Question by, instead of the Number sought; and so by the Error or Errors found, we find the Number required.

This *Rule of False Position* is of two kinds, *viz.* *Single* and *Double*.

POSITION Single, is when there happens in the Proposition some Partition of Numbers into Parts Proportional; and then at one Operation the Question may be resolved, by this Rule.

Imagine a Number at pleasure, and work there^d with according to the Tenor of the Question, as if it were the true Number; and what Proportion there is between the False Conclusion and the False Position, such Proportion hath the Given Number to the Number sought: Therefore the Number found by Argumentation shall be the first Term of the *Rule of Three*, and the Number supposed shall be the second Term, and the Given Number shall be the third Term.

Example.

Three Men, *A. B.* and *C.* consent to buy a Ship for 220 *l.* So that *B.* must pay twice as much as *A.* and *C.* four times as much as *B.* How much must each Man pay?

Answer. Suppose *A.* paid 8 *l.* then (according to the Question) *B.* must pay 16 *l.* and *C.* four times as much, *i. e.* 64 *l.* But all these Numbers added together, make no more than 88 *l.* whereas there should be 220 *l.* Yet by the help of this Number, I say, If 88 *l.* come of 8 *l.* of what comes 220 *l.* wherein the Work is gain'd 20 *l.* for the Part of *A.* Then *B.* must pay 40 *l.* and *C.* 160; which added together, give 220 *l.* the Number propounded.

	<i>Position false.</i>	<i>Conclus. true.</i>
<i>Position</i> 8	88 l. : 8 l. : 220 l. : 20 l. <i>A.</i>	
<i>Double</i> 16		40 <i>B.</i>
<i>Quadruple</i> 64		160 <i>C.</i>
	88	220 <i>Proof.</i>

If there be a Fraction or Fractions in the Question, then for more Facility in Proceeding take such a Number for the *Position* as may be equally parted by the Parts exprest in the Question.

In Questions propounded, it happens sometimes that a Number stands unalterable by the Fractions given, and so may be subtracted from the Sum given, and let by 'till the Operation be made with the rest, and then restored again.

POSITION Double, is when there can be no partition in the Numbers to make a Proportion: Therefore you must make a Supposition twice, proceeding therein according to the Tenor of the Question; and if either of the supposed Numbers happens to solve the Proposition, the Work is done; but if not, observe the Errors, and whether they be greater or lesser than the Resolution requireth, and mark the Errors accordingly, with the Signs + or -

Then multiply contrariwise the one *Position* by the other Error; and if the Errors be both too great, or both too little, subtract the one Product from the other, and the one Error from the other, and divide the Difference of the Products by the Difference of the Errors.

But if the Errors be unlike, as the one +, and the other -, add the Products, and divide the Sum thereof by the Sum of the Errors added together: For the Proportion of the Errors is the same with the proportion of the Excesses or Defects of the Numbers supposed, to the Numbers sought.

Example.

Two Men, *A.* and *B.* discoursing of their Money; *A.* says to *B.* If I had two of your Pieces, I should have twice as many as you have; to which *B.* replies, If I had two of yours, I should have just as many as you have: How many had each?

Suppose *A.* had 16, to which 2 being added makes 18, which is twice 9; but having taken 2 from thence, it must be by this Supposition that *B.* had 11: Wherefore 2 taken from 16, and added to 11, makes 13 for *B.* and *A.* 14. But they should be equal; therefore the *Position* is erroneous, and the Error too much by 1.

Again, Suppose *A.* had 20, then $20 + 2 = 22$. that is twice 11; but from thence 2 being taken, *B.* must have 13. Now 2 from 20, and put to 13, gives 15 for *B.* and leaves 18 for *A.* which is not equal; therefore the Error again is 3 too much.

Then multiplying 16 the first *Position*, by 3 the second Error, and also 20 the second *Position*, by 1 the first Error; the Product 20 is taken from the Product 48, (because the Errors are both + and the remainder 28 is the Dividend; and the lesser Error 1 subtracted from the greater Error 3, leaves 2 for the Divisor; the Quotient of which Division will be 14, the Number sought for

A. and then by consequence *B.* must have 10: For 2 taken from 10, and added to 14, make 16 = twice 8; 2 taken from 14, and put to 10, makes 12 both alike.

<i>First</i>	<i>Second</i>
<i>Position</i> 16	20 <i>Position.</i>
Error 1+	3+ Error.
20	48

<i>Products</i> 48 - 20	= 28	(14 <i>A.</i>
<i>Errors</i> 3 - 1	= 2	10 <i>B.</i>

Proof.

14 + 2 = 16	} half.
10 - 2 = 8	
14 - 2 = 12	
10 + 2 = 12	} equal.

If the Suppositions had been 12 and 10, the Errors being both -, the Operation would have stood thus, as before, because the Errors are alike.

<i>First</i>	<i>Second</i>
<i>Position</i> 12	10 <i>Position.</i>
Error 1-	2- Error.
10	24

<i>Products</i> 24 - 10	= 14	(14 <i>A.</i>
<i>Error</i> 2 - 1	= 1	10 <i>B.</i>

But if the Suppositions are 20 and 16, then the Errors being found unlike; the Sum of the Products must be the Dividend, and the Sum of the Errors the Divisor.

<i>First</i>	<i>Second</i>
<i>Position</i> 20	10 <i>Position.</i>
Error 3+	2- Error.
30	40

<i>Product</i> 30 + 40	= 70	(14 <i>A.</i>
<i>Errors</i> 3 + 2	= 5	10 <i>B.</i>

Note. 1. That as well in the *Single* as in the *Double Rule of Position*, tho' the Number supposed be never so false, a Resolution may be had thereby: Yet for more Ease in the Operation, suppose a Number that may be parted equally into so many Parts as are necessary to the Resolution of the Question.

- Let the Second *Position* be always *Homogeneous*, or of the same kind with the first; that is, belong both to one Man, one Thing, &c.
- If both the Errors be equal in Numbers, and yet their Signs unlike, half of both the *Positions* is the Sum desired.
- All the Propositions resolved by *Single Position*, will be resolved by *Double Position*.

POSITIVE of Degree of Comparison in Grammar, is that which signifies the Thing simply and absolutely, without comparing it with others; it belongs only to *Adjectives*.

POSITIVE *Levity*. See *Levity*.

POSITIVE *Quantities* in *Algebra*, are such as are of a Real and Affirmative Nature, and either have, or are supposed to have the Affirmative or Positive Sign + before them, and 'tis always in opposition to the *Negative Quantities*, which are defective, and have this Sign— before them.

POSSE *Comitatus*, a Term in Law, signifying the Aid and Attendance of all Knights, Gentlemen, Yeomen, Labourers, Servants, Apprentices, and all others, above the Age of Fifteen Years within the County; except Women, Ecclesiastical Persons, and such as are decrepid, or labour of an Infirmary: And the Statute of 2 H. 3. cap. 8. says, *That Persons able to Travel, shall be assistant in this Service*, which is used where a Possession is kept upon a Forcible Entry, or any Force of Rescue used, contrary to the Command of the King's Writ, or in opposition to the Execution of Justice.

POSSESSION, in a Legal Sense, is taken twofold, *Actual* and *in Law*: *Actual Possession* is, when a Man actually enters into Lands and Tenements to him descended. *Possession in Law*, is when Lands or Tenements are descended to a Man, and he hath not as yet actually entered into them. As for Example.

Before or until an Office be found of Lands Escheared by an Attainder, the King hath only a *Possession in Law*, and not in *Deed*: There is also a Unity of *Possession*, which the *Civilians* call *Consolidationem*. If the Lord purchase the Tenancy held by *Heriot Service*, then the *Heriot* is extinct by Unity of *Possession*; that is, because the Seignior and the Tenancy are now in one Man's *Possession*.

POSSESSIVES, in Grammar, are such *Adjectives* as signify the Possession of, or Property in some Thing.

POSTEA in Law, is the Return of the Proceeding by *Nisi prius*, into the Court of *Common-Pleas*, after a Verdict, and there afterwards Recorded.

POST-Brachiale, vid. *Metacarpus*.

POST Diem, is the Return of a Writ after the Day assigned, for which the *Custos Brevirum* hath four Pence, whereas he hath nothing if it be returned at the Day; sometimes it is taken for the Fee it self.

POST Disseisin, is a Writ given by the Statute of *Westm. 2. cap. 26.* and lies for him that having recovered Lands or Tenements by *Præcipe quod reddat* upon the Default or Reddition, is again disseised by the former Disseisor.

POST Fine, in Law, is a Duty belonging to the King, for a Fine, formerly acknowledged before him in his Court, which is paid by the Cognisee, after the same is fully passed, and all things performed touching the same; the Rate thereof is so much, and half so much as was paid to the King for the Fine, and is Collected by the Sheriff of the County, where the Land, &c. lies whereof the Fine was levied, to be answered by him into the Exchequer.

POST Terme, is a Return of a Writ, not only after the Day assigned for the Return thereof, but after the Term also; for which, the *Custos brevium* takes the Fee of Twenty Pence; sometimes also it is taken for the Fee it self.

POSTERN, in Fortification, is a false Door usually made in the Angle of the *Flank*, and of the *Curtain*, or near the *Orillon* for private Sallies.

POSTICUM, is the *Postern-Gate*, or *Back-Door* of any Fabrick.

POSTULATES, or *Demands* in *Mathematicks*, &c. are such easy and self-evident Suppositions as need no Explication or Illustration to render them Intelligible. As,

That a Right Line may be drawn from one Point to another.

That a Circle may be described on any Centre given, of any Magnitude, &c.

POSTULATION, (in the Law) is made up on the Unanimous Voting of any Person to a Dignity or Office, of which he is not capable by the Ordinary Canons or Statutes, without special Dispensation.

POTANS, or *Potence*, a Part of a Watch; see under *Balance*.

POTENT, or *Potence*, the Term for a Cross in Heraldry, formed into this Figure.

He beareth Sable, a Cross Potent, Or, by the Name of *Aleyn*.

This form represents the upper end of a Crutch; for Anciently Crutches were called *Potenti*.

POTENT, *Counter Potent*, a Term in Heraldry: See *Vairy Copy*.

POTENTIAL Coldness, is a Relative Quality which some Drugs, Simples, or Compound Medicines are supposed to be endowed with: And therefore you will find frequently in some Old Books, or in the Writings of such as follow the Old Physicians, that such a Plant or Drug, is cold in the 2d or 3d Degree: The meaning of which, is, not that such a Plant is actually Cold to the Touch, but that it is Cold in its Effects and Operations, if taken Inwardly. And whenever such an Effect doth follow the taking of such Medicine, Mr. Boyle thus accounts for it according to the Mechanical Philosophy, viz. That this Body, which they call *Potentially Cold*, is made up of *Corpuscles* of such a Size, Shape, &c. that being disjoined and resolved by the *Menstruum* of the Stomach, or the Fluids it may elsewhere meet with, they do so intimately associate themselves with the small parts of the Blood and other Liquors, as by clogging and impeding them to lessen their wonted Agitation; and perhaps also to make them act in a peculiar way, as well as less briskly on the Nervous and Fibrous parts of the Body: The Perception of which *Imminution*, or perhaps *Change* of Motion in the Organs of Feeling, is that, which being referred to the Body that produced it, is called *Potential Coldness*.

Hence, if it be supposed that in Agues some Morbifick Matter of a viscid, or not easily dissolvable Texture, be harboured in some part of the Body, and requires such a Time to be made fluid and resolvable, which is an *Hypothesis* generally received, the Cold Fits in these Diseases, will be plausibly accounted for.

Also the Shiverings and Cold arising from the taking of most Poisons, may hence be solved; and that lesser Degree of it which seizes *Hypochondriack* and *Hysterical* Persons.

POTENTIAL Mood in Grammar, is the same, in form with the *Subjunctive*; but differs in this

. That

That it hath always Implied in it, either *Poffum*, *Volo*; or *Debeo*; as *Roget Quis*, that is, *Rogare poffe*, a Man may ask. 'Tis fometimes called, The *Permiſſive Mood*, becauſe it implies often a Permiſſion or Conceſſion to do a thing: As

Habeat, valeat, vivat cum illa.

Terent.

POUR *fair proclamee, que null inject fines ou ordures en foffes, en rivièrs pres Cityes*, &c. is a Writ directed to the Mayor, Sheriff, or Bailiff, of a City or Town, commanding them to proclaim, That none caſt Filth into the Ditches or Places near adjoining, and if any caſt already, to remove it.

POUR Party, is a Term in Law, contrary to *pro indiviſo*; for to make *Pour party*, is to divide and ſever the Lands that fall to *Parcener*, which before Partition they hold jointly, and *pro indiviſo*.

POUR Seisir Terres la feme que tient en Dowry, &c. was a Writ whereby the King Seized upon the Land, which the Wife of his Tenant that held *in Capite*, deceased, hath for her Dowry, if she Married without his Leave; and is grounded upon the Statute of the King's Prerogative.

POUR Suivant, ſignifies the King's Meſſenger attending upon him in his Wars, or at the Council Table, Exchequer, in his Court, or his Chamber, to be ſent upon any Occaſion or Meſſage; as for the Apprehending of a Perſon Accuſed, or Suſpected of any Offence: Thoſe that be uſed in Martial Cauſes, are called *Purſuivant at Arms*, others are uſed upon Meſſages in time of Peace, and eſpecially in Matters touching Jurisdiction.

POURVEYANCE, is the providing, Corn, Fuel, Victual, and other Neceſſaries for the King's Houſe.

POURVEYOR, ſignifies an Officer of the King or Queen, or other great Perſonage, that provideth Corn and other Victual for their Houſe.

POWCHES, ſo the Seamen call ſmall Bulkheads made in the Hold of a Ship, to ſtow Corn, Goods, or the like, that it do not ſhoot from one ſide to the other.

POWERS in Algebra, are Numbers ariſing from the Squaring or Multiplication of any Number or Quantity by it ſelf, and then that Product by the Root or firſt Number again; and this Third Product by the Root again; and ſo on *ad Infinitum*; as, 2, 4, 8, 16, 32, 64, 128, 256, &c. Where 2 is called the Root or Firſt Power, 4 is the Square or Second Power, 8 is the Cube or Third Power, 16 is the Biquadrate or Fourth Power, &c. And theſe Powers in Letters or Species, are expreſſed by repeating the Root as often as the Index of the Power expreſſes, thus; *a* is the Root or Firſt Power, *a a* the Square or Second Power, *a a a* the Cube, *a a a a* the Biquadrate or Fourth Power. And to avoid the tediousneſs of repeating the Root ſo often when the Powers are high, we only put down the Root with the Index of the Power over it, thus: *a*⁹, that is the ninth Power of *a*; *b*¹⁶, *b*⁹⁴, are the ſixteenth or the ninety fourth Powers of *b*.

POWERS, Mechanicks, are the Six Mechanical Faculties; the Balance, the Lever, the Wheel, the Pulley, the Wedge, and the crew; which are uſually ſtiled the Six Mechanical Powers. The Force alſo or Strength brought for the

moving of any Weight by any Engine, is called the Power. And the deſign of Mechanicks, is to teach Men how to add ſuch a fitting Supplement to the Power, as that it may move any Weight required, with facility and cheapneſs, and in as little room as may be. See Vol. II.

POWERS of Lines, or Quantities are their Squares, Cubes, &c. or other Multiplications of the parts into the whole, or of one part into another.

POYNING's Law, is an Act of Parliament made in Ireland by Hen. 7. and ſo called, becauſe Sir Edward Poyning was Lieutenant there, when it was made; whereby all the Statutes in England were made of Force in Ireland, which before that time were not, neither are any now in force there which were made in England ſince that time.

PRACTICE in Arithmetick, is a Rule which expeditiouſly and commodiouſly answers Queſtions in the Rule of Three, when the firſt Term is 1, or Unity, and 'tis ſo called from its readineſs in the Practice of Trade and Merchandiſe.

Of this Rule there are ſeveral Ways of Operation; As by

Reduction, or bringing the Price of the Pound, Ell, Yard, &c. into the Loweſt Denomination of uſual Money: The way to do which, ſee under the Word *Reduction*. And this way of Practice will be clear from theſe two Examples.

1. *At 1 s. 2 d. the Pound, what comes 152 Pounds to?*

Bring all into Pence, and ſay, 1 : 14 :: What ſhall 152 give?

Answer.

$152 \times 14 = 2128 \text{ d.}$ which reduced, gives 8 l. 17 s. 4 d.

2. *If 1 Pound coſt 3 s. 6. d. what ſhall the Great Hundred and 5 Pound coſt?*

Reduce 3 s. 6 d. into Six-pences, *i. e.* 7 Six-pences; and becauſe the Great Hundred is 112 l. the Pounds will be 117. Then the Queſtion will ſtand thus.

$1 : 7 :: 117 : 117 \times 7 = 819$ Six-pences; that is, 20 l. 9 s. 6 d.

The other more uſual way of Practice, is by Aliquot Parts. For if the Price fall out to be the Aliquot Parts, or even parts of a Pound, or a Shilling, then the Work may be ſhortened much; thus.

The Even parts of a Shilling are theſe: 6 d. the $\frac{1}{2}$, 4 d. the $\frac{1}{3}$, 3 d. the $\frac{1}{4}$ part, 2 d. the ſixth part, 1 d. ob. the $\frac{1}{8}$ part, and 1 d. the $\frac{1}{16}$ part.

Therefore if any Queſtion, wherein 1 is in the Firſt place, be propoſed, and if any of theſe parts be in the Second; you may find the Fourth Term, by taking the one part of the Third, as in this Example.

At 6 d. the Yard, Pound or Ounce, what comes 74 Yards to?

Answer.

Answer.

1 l. 17 s. By taking the half of 74, which is 37 s. or 1 l. 17 s.

At 3 d. the Tard, what comes 74 Yards to ?

Answer.

18 s. and 6 d. By dividing 74 by 4.

But if the Question fall not right upon any of these aliquot Parts, then you must work oftner ; as,

At 10 d. the Pound, what will 133 Pound give ?

Answer.

5 l. 10 s. 10 d. By dividing 133 by 2 (for 6 d.) it will be 66 s. and 6 d. And then by 3 (for 4 d.) which makes 44 s. 4 d. in all 110 s. 10 d. or 5 l. 10 s. 10 d.

And so for 8 d. take 4 d. twice ; for 9 d. take 3 d. thrice ; for 11 d. take 6 d. 3 d. and 2 d.

The same may be done with the Aliquot Parts of a Pound : And to make this more plain and easie, you have here a compleat Division of the even and uneven Parts of a Pound ; as also the even and uneven Parts of a Shilling.

Even Parts of a Pound.	Parts.	Uneven Parts of a Pound.	Divided into Even Parts.	Parts.
s. d.		s.	s.	
10 00	$\frac{1}{2}$	19	10 5 4	2 4 5
6 8	3	18	10 4 4	2 5 5
5 00	4	17	10 5 2	2 4 10
4 00	5	16	10 4 2	2 5 10
3 4	6	15	10 5	2 4
2 06	8	14	10 4	2 5
2 00	10	13	4 4 5	5 5 4
1 08	12	12	10 2	2 10
1 03	16	11	5 4 2	4 5 10

2	6	8	4 4	3 3
1	12	7	4 3	3 4
1 ob.	8	5	3 2	4 6

The Use of this Table is easily known from what hath been said before.

PRÆCIPE *in Capite*, was a Writ issuing out of the Court of Chancery, for a Tenant holding of the King in Chief, as of his Crown, and not as of any Honour, Cattle, or Mannor.

PRÆCIPE *Quod reddat*, is a Writ of great Diversity, both in its Form and Use ; for which, see *Ingressus* and *Entry*. This Form is extended as

well to a *Writ of Right*, as to other Writs of *Entry* or *Possession*. It's sometimes called a *Writ of Right Close*, as a *Præcipe in Capite*, where it issueth for a Tenant holding of the King in Chief, as of his Crown ; and not of the King, as of any Honour, Cattle, or Mannor : And sometimes a *Writ of Right Patent*, as when it issues out of the Chancery.

cery Patent, that is open to any Lord's Court, for any of his Tenants deforced against the Deforcer, and must be determined there.

PRECARIÆ, are Days Works, which the Tenants of some Mannors are bound, by reason of their Tenure, to do for their Lord in Harvest; called in some Places *Bind-days*, or *Bidden-days*.

PRÆCORDIA, are all the Intrails in the Chest or Thorax.

PRÆMUNIRE, in Logick, is a certain Class or Determinate Series or Order, in which Simple Terms or Words are ranged: Of these they usually account Ten Heads, *viz.* Substance, Accident, Quantity, Quality, Action, Passion, Relation, the Situation of Bodies as to place, their Duration as to Time, their Site or Position, and their Habit or External Appearance.

PRÆMUNIRE, is a Writ that lies where any Man sues another in the Spiritual Court for any thing that is determinable in the King's Court; for which great Punishment is ordained by divers Statutes, *viz.* That he shall be out of the King's Protection, and put in Prison without Bail or Mainprize, 'till he have made Fine at the King's Will, and that his Lands and Goods shall be forfeited if he come not within two Months: And his Providers, Procurators, Attorneys, Executors, Notaries, and Maintainers, shall be punished in the same manner. See the *Statute*. And upon divers other Offences is imposed, by Statutes lately made, the Penalty they incur who are attained in *Premunire*: As by 13 *Elix.* cap. 8. they who are aiding to make a corrupt bargain, whereupon Usury is referred for above Ten Pound in the Hundred for a Year, &c.

PRÆPARANTIA Vasa, in Anatomy, the Preparing Vessels, are the Spermatick Veins and Arteries which go to the Testicles and *Epididymes*: (which see.) They were so called by the Ancients, as thinking they prepared the Seed.

The Arteries are two, and spring from the Trunk of the *Aorta*, about two Fingers Breadth usually, beneath the *Emulgents*; and not from its Side, but out of its Fore-part: The Right whereof climbing over the Trunk of the *Vena Cava*, runs obliquely to the Vein on the same side; and the Left marches to the Vein of that side.

The Veins also are Two: The right arises usually from the Trunk of the *Vena Cava*, a little below the *Emulgent*; the Left from the *Emulgent* it self; for otherwise it must have gone over the *Aorta*, whereby it might have been in danger of being broken; or at least, by the continual Pulse of the Artery, the Recourse of the Venal Blood might have been hindered or retarded.

Both these Arteries and Veins, a little after their Origin, do meet together, and are included in one common Membrane made of the *Peritoneum*; and then they run straight through the Region of the Loins above the Muscles *Psoæ* on each side, and above the Ureters; and as they go, they bestow little Slips here and there on the *Peritoneum*, between whose Duplicatures they descend, and so arrive at its Processess.

The Veins divide very often into many Branches, and then inosculate and unite again; but the Arteries go along by one Pipe only on each side, until within three or four Fingers breadth of the Testicles, where each is divided into two Branches; the Less whereof runs to the *Epididymis*, the Larger to the Testicle: And as they

came down between the Membranes of the *Peritoneum*, so they pass into the *Scrotum* between them; not perforating the Inner in the Processess, as in Dogs and other Creatures, (wherein the Processess of the *Peritoneum* are hollow like a Quill) but in Man the inner Membrane of the *Peritoneum* shuts the Hole, lest the Intestines should fall down through it into the *Scrotum*.

It hath been formerly believed, that there are divers Inosculationes between these Veins and Arteries in their Passage, whereby the Venal and Arterial Blood are mixed together; but since the Circulation of the Blood hath been known, that is discovered to be impossible, because the Blood in the Arteries descends, and that in the Veins ascends. And indeed the Blood for the Elaboration of the *Semen*, and for the Nourishment of the Testicles, flows down by the Arteries only, and that in an even and undivided Course without any of those Vine-like Tendrils, those Turnings and Windings which have formerly so much been spoken of; as *De Graef* by his own frequent Inspection testifies. And the Veins bring back from the *Testes* what remains of the Blood after this; which Veins indeed do come out from their innermost Membrane with almost innumerable Roots, by which they imbibe the refluxent Blood; and they are most admirably interwoven and inosculated with one another 'till about four Fingers breadth above the Testicles, which Space is called *Corpus*, *Pyramidale*, *Plexus*, *Pampiniformis*, and *Varicosus*: But these Veins are so far from Preparing the *Semen*, that they only bring back what is Superfluous from the making of it. Nor indeed can the Arteries justly merit the Name of *Preparing Vessels*, because the Blood they convey to the Testicles acquires no sensible Alteration 'till it come thither. However the Old Names are continued, but 'tis necessary to give this Caution about the Use of these Vessels.

PRÆPOSITION, in Grammar, is an Indeclinable Word, by which a Noun and a Verb are joined together, in order to signify the Cause of any thing, the Time, Place, Conjunction, Privation, &c. 'Tis called *Præposition*, because 'tis most frequently in the Latin Tongue placed before other Words; and this either separately, as *Ad parrem*; or conjunctively, as *Admiror*.

PRÆSEPIA, the Holes of either Jaw, wherein are contained the Teeth.

PRAGMATICAL. A Word commonly in *English* taken in an ill Sense, and is spoken of a Medler, Busic body, or foolish Prater and Tattler about Impertinent Things that do not belong to him. But in Physics, or Natural Philosophy, the Word is sometimes used in a good Signification, and signifies the same as Practical, Mechanical, or Problematical. Thus *Stevinus*, in his *Hydrostatical Elements* calls some Mechanical or Practical Experiments, which he pretends to instruct his Reader how to make, by the Name of *Pragmatical Examples*; and in the same Sense 'tis sometimes used by other Naturalists.

PRAY-Age. See *Age-prior*.

PREAMBLE, in the General, is taken for the Introduction or Beginning of any Discourse: And by the Lawyers, the Beginning of an Act is called *The Preamble*.

PREBEND, is the Portion which every Member or Canon of a Cathedral Church receiveth in the Right of his Place for his Maintenance: And

And these *Prebends* are either *Simple*, or with *Dignity*. *Simple Prebends* are those that have no more but the Revenue towards their Maintenance. *Prebends with Dignity*, are such as have Jurisdiction annex'd to them, according to the divers Orders in every several Church.

PREBENDARY, is he that hath a *Prebend*, and is so called, a *Præbendo auxilium aut consilium Episcopo vel Decano*.

PRECE Partium, is when a Suit is continued by the Assent or Agreement of both Parties.

PRECEPT, in Law, is diversly taken, as sometimes for a Commandment in Writing sent out by a Justice of Peace, or other like Officer, for the bringing of a Person or Records before him. Sometimes it is taken for the Provocation, whereby one Man incites another to commit a Felony, as Theft, Murder, &c.

PRECESSION of the Equinox: In the New Astronomy, the Fix'd Stars are supposed to be immovable, and that the Earth turns round the Sun by its Annual Motion; so that its Axis makes always an Angle of 66 Degrees and an half with the Plane of its Orbit. Now if this Axis were always exactly directed to the same Point of the Heavens, or moved always precisely parallel to it self, as it doth nearly; then the Fix'd Stars would appear to have no other Motion but the Diurnal one. But because in Reality the Axis of the Earth doth a little vary from such an exact Parallelism, and doth not point always precisely to the same Star when it is in the same Place of its Orbit, but makes a small Angle with a Line imagined to lie in the Position it had formerly in the same Place: Hence it happens that the Equinoctial Points, or the common Intersections of the Equator and Ecliptick, do retrocede or move backwards from East to West, about 50 Seconds each Year; and this Motion backwards is by some called the *Recession of the Equinox*, by others the *Retrocession*; and the advancing of the Equinoxes forward by this means is called the *Procession* of them.

PRECIPITATE. Whatever is gotten out of the Pores of a Menstruum, in which it was dissolved, and by some means is precipitated or made fall down to the bottom of the Vessel, may properly be called *Precipitate*. See *Precipitation*. But the Chymists and Writers of Pharmacy commonly give this Name by way of Eminence to the Mercury dissolved in Acid Menstruums, and then afterwards precipitated down to the bottom in fine Powders, of which they reckon these following;

1. *White Precipitate*, which is Mercury dissolved in *Aqua-fortis*; or, which is better, Spirit of Nitre; and then precipitated to the bottom with Salt Water, and a little Spirit of Sal-Armoniack. But if instead of Salt Water, and that Volatile Spirit, you had used hot Urine, a Powder would have fallen down, which may be called,

2. *Rose Precipitate*, since it will be of a Pale Rose Colour.

3. *Red Precipitate*, is Mercury dissolved in Spirit of Nitre, and then the Moisture is evaporated in a Sand-Heat; and then the Fire being gradually encreased to the Third-Degree, the Matter turns Red. Tho' this be called a *Precipitate*, 'tis

improperly so here, being no Precipitation at all. If the Spirit of Vitriol be dropt into a little of this *Red Precipitate*, it presently turns it White; but Spirit of Sal-Armoniack will turn it Grey.

There is also another sort of *Red Precipitate* which the Chymists call *Philosophical Precipitate*, and often *Precipitate per se*; which is by including Running Mercury in a Matras, which is set in a Sand-Heat for Forty Days; or 'till all the Mercury be reduced to a Red Powder.

4. *Green Precipitate*, is made by mingling the Dissolutions of Mercury and Copper together, both made in Spirit of Nitre; the Mixture is evaporated to Driness, and then the Mass at the bottom is powdered, and hath distilled Vinegar poured upon it, and digested with it for Twenty four Hours, or 'till the Liquor looks Green; and a little Bluish; then the Liquor is poured off, and more Vinegar put on, and so repeated 'till all be dissolved: Then all these Dissolutions are mixed and evaporated in a Sand-Heat 'till the Matter be of the Consistence of Honey; then taken off the Fire, it will harden as it cools, and grow pulverizable. The Powder of it is this *Green Precipitate*, as improperly so named as the other *Red ones*.

5. *Yellow Precipitate*. See *Turbith Mineral*.

If Sublimate Corrosive be dissolved in Water, a little Oil of Tartar, *per Deliquium*, poured into the Solution, will make a *Red Precipitate*; and Spirit of Sal-Armoniack will give from some more of the same Solution a *White Precipitate*; and Lime-water will give the Solution a *Yellow Colour*, as you may see in the *Phagedenick Water*: And a little Spirit of Vitriol will clear off these Precipitates and Colours, and render the Liquor greatly transparent and colourless like Fair Water.

All these Precipitates, or any other, may easily be revived into Running Mercury, by mixing them with Quick-lime, and then distilling, as in Reviving Mercury from *Cinnabar*; which see.

PRECIPITATION, in Chymistry, signifies the Falling-down of the Particles of any Metalline or Mineral Body, which are kept suspended in that Menstruum which dissolved it, by the pouring in of some *Alkalizate*, or other contrary Liquor; or by putting something else into it, which is more easie for the Menstruum to dissolve. Thus if Silver be dissolved, and its Particles kept suspended in *Aqua-fortis*, Spirit of Nitre, &c. some Oil of Tartar *per Deliquium*, or even Salt Water, will presently make the Acid let go the Silver, and it will fall down or precipitate to the bottom in a White Powder: Or if into the Solution of Silver you had put a Plate of Copper, this Metal being easier to work upon than the Silver, the Acid will fall to dissolving of it, and consequently let go the Silver, which will soon precipitate or fall down to the bottom, and cover the Copper Plate all over with White Scales. See the Word *Deposuit*.

Mr. Boyle defines Precipitation in General to be an Agitation or Motion of an Heterogeneous Liquor, which in no long time will make the Parts of it subside, and that usually in the Form of a Powder or other Consistent Body.

This Noble Gentleman proposes, That the Corpuscles contained or kept suspended in any

Solvent or Menstruum, may be precipitated down by either or both of these two General ways: 1. By adding to the Weight or Bulk of the dissolved and floating Particles, and thereby rendering them unfit any longer to accompany the Particles of the Menstruum in their Intestine Motion: Or, 2dly, by weakening the Sustaining Power of the Menstruum, and thereby disabling it to keep the dissolved Particles from swimming any longer in it. See more in his Excellent Discourse upon the Mechanical Causes of Precipitation.

PREDIAL Tythes, are those which are paid of Things arising and growing from the Ground only, as Corn, Hay, Fruit of Trees, &c.

PREDICABLE, in Logick, is a common Term or Word that may be attributed to more than one Thing. Thus the Word Triangle refers to any Figure having but three Sides and Angles, whether it be Rectilineal or Spherical.

PREDY, a Sea-word, signifying the same with Ready. *Predy the Ship*, or *Predy the Ordnance*, is, as much as to make Things ready for a Fight. *Predy the Hold*, is lay or stow every thing there in its due order and proper place.

PRIEST's Cap, a Term in Fortification. See *Banner a Prestre*.

PRELUDE, in Musick, signifies any Flourish that is Introductory to Musick which is to follow after.

PREMISES. See *Habendum*.

PREMIUM. A Term used by Merchants for that Sum of Money which the Ensured gives, the Ensurer for the Ensuring the Safe Return of any Ship or Merchandise.

PRENDER, is the Power or Right of taking a Thing before it is offered.

PRENDER de Baron, is usually taken in Law for an Exception, to disable a Woman from pursuing an Appeal of Murder against the Killer of her former Husband.

PREPENSED, in Law, is when a Man is slain upon a sudden Quarrel; yet if there were Malice *prepensd* formerly between them, it makes it Murder; as it is called in some Statutes *prepensd Murder*.

PREROGATIVE Court, is the Court wherein all Wills are proved, and all Administrations taken that belong to the Archbishop by his *Prerogative*; that is, in Case where the Deceased had Goods of any considerable Value out of the Diocess wherein he died; and that Value is commonly 5 l. except it be otherwise by Composition between the said Archbishop and some other Bishop, as in the Diocess of London it is 10 l.

And if any Contention grow between two or more, touching any such Will or Administration, the Cause is properly debated in this Court; the Judge whereof is termed *Judex Curia Prerogativa Cantuariensis*, the Judge of the Prerogative Court of Canterbury.

The Archbishop of York hath also the like Court, which is termed *His Exchequer*; but far Inferior to this in Power and Profit.

PRESBITÆ, are those Men who by Old Age, or other Accidents, have the Globe of the Eye so flat, that the produced Visual Rays pass the *Retina* before they unite; whereby there can be no distinct Vision, since the distinct Base falls too far off beyond the *Retina*: Therefore this Defect is to be helped by Convex-Glasses or Spectacles,

which will make the Rays converge sooner, and, if they are well fitted, exactly on the *Retina*.

PRESCRIPTION, in Law, is when a Man claims any thing, because he, his Ancestors or Predecessors, or they whose Estate he hath, have had or used it all the time whereof no Memory is to the contrary. But one cannot prescribe against a Statute, except he have another Statute that serves for him.

PRESENTATION, a Term in Law, properly used for the Act of a Patron, offering his Clerk to the Bishop, to be instituted in a Benefice of his Gift.

PRESENTÉE, is the Clerk that is so presented by the Patron: Also the King's *Presentée* is he whom the King presents to a Church.

PRESENTMENT, in Law, is a meer Denunciation of the *Jurors* themselves, or some other Officer, as *Justice*, *Constable*, *Searcher*, *Surveyor*, &c. (without any Information) of an Offence Inquirable in the Court whereunto it is presented.

PRESSING to Death. See *Peine fort & dure*.

PREST, is used for a Duty in Money to be paid by the Sheriff, upon his account, in the *Exchequer*; or for Money left or remaining in his Hands.

PRESUMPTION, in Law, is of Three sorts; 1. *Violent*, which is many times a full Proof; as if one be killed in a House, and a Man is seen to come out of the House with a bloody Sword, and no other Person was at that time in the House: This, tho' but a *Presumption*, is as a Proof. 2. *Probable*, which hath but a small Effect. 3. *Levii, seu temeraria*, which is of no Prevalency at all. So in case of a Charter or Feoffment, if all the Witnesses to the Deed be dead; the *Violent Presumption*, which stands for a Proof, is Continual and Quiet Possession.

PRETENCE. See *Escutcheon of Pretence*.

PRETENSED Right or Title, is where one is in Possession of Lands or Tenements, and another who is out, claims and sues for it: Here the *Pretensed Right and Title* is said to him who doth so claim and sue.

PREVARICATE, in Law, is when a Man falsely and deceitfully seems to undertake a Thing, *ea intentione*, that he may destroy it.

PRICK. To *prick* the Chart or Plot at Sea, signifies to make a Point in their Chart whereabouts the Ship is now, or is to be at such a time, in order to find the Course they are to steer, &c.

PRIMA Naturalia, the same with *Atoms*, or *Minima Naturalia*; which see,

PRIMARIUM Latus, in Geometry, is a Right Line in any Conick Section, drawn through the Vertex of the Section, and parallel to the Base of the Cone.

PRIMARY Planets (according to some) are the Three Superior Planets, viz. *Saturn*, *Jupiter*, and *Mars*; but more properly a *Primary Planet* is one that moves round the Sun, as its Centre; whereas a *Secondary Planet* moves round some other Planet.

PRIME Figure, is that which cannot be divided into any other Figures more simple than it self; as a *Triangle in Planes*, the *Pyramid in Solids*: For all Planes are made of the First, all Bodies or Solids compounded of the Second.

PRIME Numbers, in Arithmetick, are those made only by *Addition*, or Collection of Unites, and

and not by *Multiplication*: So an Unite only can measure it; as 2, 3, 4, 5, &c. and is by some called a *Simple*, by others an *Uncompound* Number.

PRIME of the Moon, signifies the *New Moon*, at her first Appearing, or about three Days after the *Change*, at which time she is said to be *primed*.

PRIME Verticals, or *Direct Erect North or South Dials*, are those whose Planes lie parallel to the *Prime Vertical Circle*. But since every Plane hath that Pole raised or depressed thereon, which lieth open to it: Therefore this Plane (if a *Direct South*) hath the South Pole elevated, and consequently the Style (whose Height must be the Complement of the Latitude of the Place) will point downwards.

Wherefore, To find the Hour's Distance from the Meridian upon this Plane, the Proportion is,

As the Radius is to the Sine of the Style's Height, or Co-Latitude;
So is the Tangent of the Hour, or Angle at the Pole.

To the Tangent of the several Hours Distance from the Meridian.

By this Canon, the Hours requisite for the Plane, as also the Half Hours, Quarters, &c. being calculated and set in a Table; the *Dial* is described after the same manner as the *Horizontal Dial*; which see.

North Direct Erect Dials, are but the Backside of the *South*, because lying in the same *Azimuth* with it: Therefore, 'tis no more but turning the *South Dial* upside down, and leaving out the Superfluous Hours between 5 and 7, and 4 and 8, and the *North Dial* is made. Only note, That the Style must point upwards to the North Pole.

PRIMER Seisin. The First Possession or *Seisin* was heretofore used as a Branch of the King's Prerogative, whereby he had the First Possession; that is, the entire Profits for a Year of all the Lands and Tenements whereof his Tenant (that held of him *in Capite*) died *seised* in his Demesne as of Fee, his Heir then being at full Age, until he do his Homage; or if under Age, until he were of Age. But all the Charges arising by *Primer Seisin*, are taken away by the Statute made 12 Car. 2. cap. 24.

PRIMING Iron, is a small sharp Iron which is thrust into the Touch-hole of a Great Gun, and pierces into the Cartridge that holds the Powder, that so they may put in the Prime-powder or Touch-powder to fire off the Piece.

PRIMOGENITURE, in Law, is the Title of an Elder Brother in Right of his Birth.

PRIMORES Dentes, seu *Incisivi Dentes*, are the Four Foremost Teeth in each Jaw; they are pretty-broad, sharp at their Ends, a little convex outwards, and hollow inwards: They have each a pretty long Root, a little crooked, and divided into two, by which means they have the greater Force in cutting off the Aliments, which is their proper Use.

PRIMUM Mobile, in the *Ptolemaick Astronomy*, is supposed to be a vast Sphere, whose Centre is that of the World, and in Comparison of which

the Earth is but a Point: This they will have to contain all other Spheres within it, and to give Motion to them, turning its self and all them quite round in Twenty four hours.

PRINCIPAL, in Common Law, signifies the same with *Heirloom*.

PRINCIPAL Ray, in Perspective, is the Perpendicular one which goes from the Spectator's Eye to the Vertical Plane or the Table. And the Point where this Ray falls on the Table, is called from hence the

PRINCIPAL Point, which some Writers call the Centre of the Picture, and the Point of Concurrence.

PRINCIPLE, a Word very commonly and very variously used; sometimes it signifies the same as a Maxim, an Axiom, or a good Practical Rule of Action: Thus we say, a Person is a Man of Principles, when he always acts, according to the Eternal Rules of Morality, Virtue and Religion.

Sometimes it signifies a Thing Self-evident, and as it were Naturally known, and then 'tis usually called, a *First Principal*; as that, *Nothing can Exist and not Exist at the same time*: That, *Where there is no Law, there is no Transgression*: That a *Whole is greater than a Part*.

Sometimes it hath the same sense with *Rudiments* or *Elements*; as when we say, the *Principles of Geometry, Astronomy, Algebra*; we mean the Doctrine or Rules of those Sciences.

And in Chymistry particularly, 'tis taken for first Constituent and Component Particles of all Bodies, out of which they are made, and into which they are by Fire, as they say, resolvable again. Thus *Salt, Sulphur, and Mercury* are the three Famous Chymical Principles, which they call *Hypostatical*; and the Chymists did formerly pretend, that they could by their Art resolve all Natural Bodies into these; and that these Principles could be drawn Simple, Pure, and Uncompounded from Metals, &c. But since this Art hath been more commonly studied and consequently much better known, it is found to be a Fallacy, as Mr. Boyle excellently shews in his *Sceptical Chymist*; and Lemery hints in many places of his good *Course of Chymistry*.

The Modern Chymists agree that there are five kinds, or different sorts of Bodies, which may by Fire be drawn from many mix'd Natural Bodies, and therefore which may in a large sense be called *Principles*; as *Earth, Salt, Spirit, Phlegm, and Oil*, tho' these can never be drawn, perfectly Pure and Unmix'd; nor have we any reason to believe they are the Constituent Principles of the Bodies they are drawn from; and out of many Bodies hardly ever a one of them can be drawn; and therefore they are not truly and properly the Elements or Constituent Principles of natural Bodies, nor indeed do we know any such.

Of these the *Spirit, Oil and Salt*, are called the *Active* Principles; and the *Water* and the *Earth*, the *Passive* ones.

Mr. Boyle sheweth by many Experiments in his *Sceptical Chymist*, in the Discourse about the *Producibleness of Chymical Principles*, in his Chymical Paradox at the end of his *Noctiluca*, and in many other places that these Chymical Principles are Produci- ble and Destructible, and that they are manifestly Transmutable into one another. For

by distilling what the Chymists call Essential Oil of Aniseeds 36 times over, and some other Oils of Vegetable above 50 times, he found that there would be produced above half the first Weight of the Oil in the form of a Black Pitch. That an acid and volatile Spirit and Salt were to be gained in a considerable quantity; and upon the whole it appeared that these Resulting Bodies of such very different Forms were produced by the Action of the Fire transmuting part of the very Substance of the Oil into them.

That in general may be called a Principle which is the first cause of any Things *Existence*, or *Production*, or of its becoming *Known* to us.

The Aristotelian or Peripatetick Principles are the Four Elements, *Earth, Water, Air, and Fire*.

The Epicurean Principles, are Magnitude, Figure, and Weight.

Mr. Boyle thinks as the World now is (for they can't account for its Creation) that the Mechanical Principles, Matter, Motion, and Rest, are Principles sufficient to solve all the Phenomena of Nature.

The Cartesian Principles are these three following; *First*, A most Subtle Matter very swiftly agitated, fluid, and keeping to no certain Figure but which suits it self to the Figure of those Bodies that are about it; The *Second* are very small Globules, that is, Bodies exactly round, and very solid, continually whirling about, and which do not only like the First Principles, fill up the *Pores* of Bodies, but also constitute the purest Substance of the *Ether and Heaven*. The *Third Principle* is a Matter consisting of more thick and Branchy Parts, full of Angles and unfit for Motion, of which the Earth, Water, Air, and all mixed Bodies do consist.

Now they suppose these Three Elements to be thus produced: The whole World being a Plenum and the Particles, or Atoms, of all Matter solid, as soon as Motion was superinduced into the World, these Atoms being of several Shapes, and Sizes, would begin to rub and grind one against another.

By which means, some would come to be ground or turn'd round Globules; and these constitute their Second Element. The small Chips, Shavings, or Dust, that comes off in the forming of these Globules, is the Matter of their First Element; and these must needs be in a very rapid Motion. But those Particles which are not yet turned into Globular Figures, will be variously angled, and not so fit for Motion as the others; and therefore will constitute a Third Element very different from the others.

PRIORITY, in Law, signifies an Antiquity of Tenure, in comparison of another not so ancient, as to hold by Priority, is to hold of a Lord more anciently than of another.

PRISAGE, is that Custom or Share that belongs to the King, out of such Merchandise, as are taken at Sea by way of Lawful Prize.

PRISM, is a solid Figure, contained under several Planes, whose Bases are Polygons, equal, parallel, and alike situated. Also a Triangular solid glass, thro' which the Sun's Rays being transmitted are refracted into the vivid Colours of the Rain-bow.

The Surface of a Right Prism, is equal to a Parallelogram of the same height, having for its Base a Right Line equal to the Periphery of that

Prism. The same may be said of a Cylinder, because it is but a Prism of Infinite Sides.

The Solid Content of a Prism, is found by Multiplying the Area of its Base by its Perpendicular Altitude.

A Prism is a Triple of a Pyramid of the same Base and Height. See *Proportion of Solids*, where 'tis demonstrated.

PRISMOID, is a solid Figure, contained under several Planes whose Bases are rectangular Parallelograms, parallel and alike situate.

PRIVILEGE, is by Cicero defined to be *Lex private homini irrogata*. Others say it is, *Jus singulare*, whereby a private man, or a particular Corporation, is exempted from the rigour of the Common Law. It is used sometimes in the Common Law, for a place that hath any special Immunity.

PRIVILEGE, is either Personal or Real: A *Personal Privilege*, is that which is granted to any Person either against or beyond the Course of the Common Law: As for Example, A Member of Parliament may not be arrested nor any of his Servants, during the sitting of the Parliament; nor for a certain time before and after. A *Privilege Real*, is that which is granted to a place, as to the *Universities*. That none of either may be called to *Westminster-Hall*, upon any Contract made within their own Precincts, or prosecuted in other Courts. And one belonging to the Court of Chancery cannot be sued in any other Court, certain Cases excepted; and if he be, he may remove it by *Writ of Privilege*.

PRIVY, in Law, signifies him that is partaker, or hath an Interest in any Action or Thing, as *Privy of Blood*, be those that are linked in Consanguinity; every Heir in Tail is *Privy* to recover the Land intailed. The Author of the *New Terms of Law*, maketh divers sorts of *Privies*, viz. *Privies in Estate*, *Privies in Deed*, *Privies in Law*, *Privies in Right*, and *Privies in Blood*. Others mention four kinds of *Privies*, viz. *Privies in Blood*, as the Heir to his Father. *Privies in Representation*, as Executors or Administrators to the deceased. *Privies in Estate*, as he in the Reversion, and he in the Remainder, when Land is given to one for Life, to another in Fee, for that their Estates are created both at one time. The fourth is *Privy in Tenure*, as the Lord by escheat, that is, when the Land escheateth to the Lord for want of Heirs.

PRIVY-SEAL, is a Seal that the King useth to such Grants, or other things, as pass the *Great Seal*; first they pass the *Privy-Signet*, then the *Privy-Seal*; and lastly the *Great-Seal of England*. The *Privy-Seal* is sometimes used in things of less consequence, that never pass the *Great Seal*, no Writs shall pass under the *Privy-Seal*, which touch the Common Law.

PROBATE, of Testaments, is the exhibiting and proving Wills and Testaments before the Ecclesiastical Judge, delegated by the Bishop, who is Ordinary of the Place, when the party dies. And the Ordinary is known by the quantity of Goods that the deceased hath out of the Diocese wherein he departed; for if all his Goods be in the same Diocese, then the Bishop of the Diocese, or the Archdeacon, according as their composition leads, hath the *Probate of the Testament*: But if the Goods be dispersed in divers Diocesses, so that there be any sum of note (as five pounds ordinarily) out of the Diocese where the party lived; then is the

the Archbishop of *Canterbury* the Ordinary by *Prerogative*.

This *Probate* may be made in two sorts, in *Common form* or *per testes*. The proof in common form is only by the Oath of the Executor or Party exhibiting the Will, who sweareth upon his belief, that the Will exhibited by him, is the last Will and Testament of the deceased. The proof *per testes* is when over and besides his own Oath, he also produces Witnesses, or makes other proof to confirm the same, and that in the presence of such as may pretend any interest in the Goods of the deceased, or at least in their absence, after they have been Lawfully summoned to see such a Will proved, if they think good. And the latter course is taken most commonly when there is fear of strife or dispute about the deceased's Goods. For some hold that a Will proved in common form only may be called in question any time within thirty Years after: And where a will disposes of Lands and Tenements of Freehold, it is now frequently proved by Witnesses in *Chancery*.

PROBATOR, in Law signifies an Accuser, or Approver, or one who undertakes to prove a crime charged upon another.

PROBE, a Chirurgical Instrument to sound the Depth and Circumstances of Wounds or Ulcers.

PROBLEM, is a Proposition which relates to Practice; or which proposes something to be done; As to make a Circle pass through three given Points not lying in a Right Line: To find the Compass, &c.

PROCATARCTICA, is the pre-existent Cause of a Disease, which co-operates with others that are subsequent; whether it be external or internal, as Anger, or Heat in the Air, which beget ill Juice in the Blood and cause a Fever. *Blanchard*.

PROCEDENDO, is a Writ whereby a Plea or Cause formerly called from a Base Court to the *Chancery*, *Kings-Bench*, or *Common-Pleas*, by Writ of *Privilege* or *Certiorari*, is released and sent down again to the same Courts to be proceeded in there, after it appeareth that the Defendant hath no cause of *Privilege*, or that the matter comprised in the Bill not well proved.

PROCESSE, in Law, is the manner of proceeding in every Cause, being the Writs and precepts that go forth upon the Original upon every Action, being either Original or Judicial. Sometimes that only is called the *Process*, by which a man is called into the Court, because it is the beginning or principal part thereof, by which the rest of the business is directed. The difference between *Process* and *Precept*, or *Warrant* of the Justices, is this, the *Precept* or *Warrant* is only to attach and convey the party before any Indictment or Conviction, and may be made either in the name of the King or the Justice: But the *Process* is always in the King's Name, and usually after an Indictment.

PROCESS, in Chymistry signifies the whole exact Course of any Operation or Experiment.

PROCESSION, in Cathedral and Conventual Churches, the Members formerly had their stated Processions, wherein they walked two and two in their most Ornamental Habits, with Hymns, Musick and other suitable expressions of Solemnity, and respect to the occasion. In every Parish there was a Customary *Procession* of the Parish Priest, the Patron of the Church with the Chief *Flag*, or

Holy Banner, and the other Parishioners in *Ascension Week*, to take a Circuit round the Limits of the Mannor, and pray for a Blessing on the Fruits of the Earth. To this we owe our present Custom of *Perambulation*, which is still in most places called *Processioning*, and going in Procession, tho' we have lost the Order, and almost the Devotion, as well as the Pomp and Superstition of it.

PROCESSUM continuando, is a Writ for the continuance of a *Process*, after the Death of the Chief Justice, or other Justice in the Writ of *Oyer* and *Terminer*.

PROCESSUS, *vid. Apophysis*.

PROCESSUS Ciliaris. See *Ciliare Ligamentum*.

PROCESSUS Membrillares. See *Papillarum Processus*.

PROCESSUS Peritonæi, are as it were two oblong Pipes, or Channels, one on each side the *Os Pubis*, reaching to the Skin of the *Scrotum*, thro' the Holes of the Tendons of the Oblique and Transverse Muscles, in which Production, or *Didymi*, as the Ancients called them, the Seminary Vessels descend, and bestowing one Tunicle on the *Testes*, they contain them like a Bag. By the Holes of these *Processes*, the Muscles called *Cremasteres* do also descend.

PHROCESSUS Styloformis, or *Styloides*, is a kind of External Process of the *Ossa Temporum*, being small and long, having the Horns of the *Os Hyoides* tyed to it, it is a slender and long Appendix, and in Infants is Cartilaginous, but in Adult Persons, Bony.

PROCESSUS Zygomaticus or *Zugalis*, is an External Process of the *Ossa Temporum*, which runs forward, and is joined with the Bone of the upper Maxilla, from which juncture is formed that Bridge called the *Zygoma*, reaching from the Eye to the Ear, under which lie the Tendons of the *Crotaphite* Muscle.

PROCHEIN amy, in Common Law, signifies him that is next of Kin to a Child in his Nonage, and is in that respect allowed by Law to deal for him, in the managing his Affairs, as to be his Guardian, if he hold any Land in *Socage*, and in Redress of any Wrong done to him, and is in the Prosecution of any Action at Law *per Guardianum*, where the Plaintiff is an Infant, & *per proximum amicum*, where the Infant is Defendant.

PROCIDENTIA Ani, is a falling out of the Lower end of the *Rectum intestinum*, and is very usual in Children.

PROCIDENTIA uteri, is a relaxing of the inner Tunick of the *Vagina* of the Womb, and was cut off by Physicians formerly, and even still, some think the Womb it self may fall down; but the Ligaments are so strong as to hinder any such Fall. *Blanchard*.

PROCLAMATION, is a Notice publicly given of any thing, whereof the King thinks fit to advertise his Subject.

PROCLAMATION of a Fine, is a notice openly and solemnly given at all the Assizes held in the County, within one Year after the engrossing it. And these Proclamations are made upon Transcripts of the Fine, sent by the Justices of the Common-Pleas, to the Justices of Assize, and the Justices of Peace.

PROCLAMATION of Rebellion, is a Publick Notice given by the Officer, That a Man not appearing upon a *Subpena*, nor an Attachment in the Chancery

Chancery, shall be reputed a Rebel, unless he render himself by a Day assign'd in this Writ.

PROCONDYLI are the Bones of the Fingers next the back of the Hand.

PRO confesso, in Law, is when upon a Bill exhibited in Chancery, the Defendant appears, upon a *Habens Corpus* (which is granted by order) to bring him to the Bar, the Court Assigns him a Day to Answer; which being expired, and no Answer put in, a second *Habens Corpus* is granted, and a further Day assign'd; by which Day, if he answer not, the Bill upon the Plaintiff's Motion, shall be taken *pro confesso*, unless cause be shewed by a Day, which the Court usually gives, and for want of such cause shew'd upon Motion, the Substance of the Plaintiff's Bill shall be decreed, as if it had been confessed by the Defendant's Answer.

PROCTOR, is he who undertakes to manage another Man's Cause in any Court of the Civil or Ecclesiastical Law, for his Fee.

PROCTORS of the Clergy, are those who are chosen and appointed to appear for the Cathedral and other Collegiate Churches; as also for the Common Clergy of every Diocess at the Parliament, to sit in the Lower-house of Convocation.

PROCURATORY, is the Instrument by which any Person or Community did constitute or delegate their Proctor or Proctors to represent them in any Judicial Court or Cause.

PRODROMUS Morbus, is a Disease that comes before a greater, as the faintness of the Breast predicts a Consumption, or the Rickets. *Blanchard.*

PRODUCE, a Term in Geometry, signifying to continue a Right Line, or draw it out farther, till it have any assigned Length.

PRODUCT, is the Quantity Arising from, or Produced by the Multiplication of two or more Numbers, Lines, &c. into one another, thus, If 6 be multiplied by 8, the Product in 48. In Lines, 'tis always, (and sometimes in Numbers) called the Rectangle between the two Lines that are multiplyed one by another. See *Rectangle*.

PROEGUMENA, is an Antecedent Internal Cause of a Disease in the Body, occasioned by another, and so causing the Disease, that if it be taken away, the Disease may still continue; as a *Plethora*, or ill Juice in the Blood, produced by an ill way of Diet, whence proceeds an Obstruction of the Entrails. *Blanchard.*

PROFIL (*French*) a Term in Painting, signifying properly a Face or Head set sideways, as usually on Medals, and such a Face is said to be in *Profil*, or in a Side View. 'Tis also spoken of the View of a Building, or City, &c. in Opposition to the Plan or Ground-plot of it; and so appears to have much the same sense as a Prospect of any Place, City, or Piece of Architecture, viewed sideways, and expressed according to the Rules of *Perspective*. This is called the *Profil* of such a Place, City, &c. Some call the Out-lines of any Figure its *Profil*, but that way of speaking is improper.

PROFUNDUS, a Muscle, which bends the Fingers.

PROGNOSIS & Signa Prognostica, are Signs whereby we know what will become of the Patient, as to Recovery or Death.

PROGRESSION *Arithmetical*, or Continual Proportion *Arithmetical*, is when Numbers (or other Quantities) or proceed by equal differences (either increasing or decreasing.) As,

2, 4, 6, 8, 10, 12, 14, &c.
3, 5, 7, 9, 11, 13, 15, &c.
16, 14, 12, 10, 8, 6, 4, &c.

In the two former, is a continual Increase, in the latter a continual Decrease, by two in all of them; which is called the *Common Difference*, or *Common Excess*.

1. If three Quantities are in *Arithmetical Proportion Continued*, the Sum of the *Extremes* is equal to the Double of the *Mean*.

Let a be the first Term, and x the Common Difference; then will the three Quantities be $a, a+x, a+2x$; or $a, a-x, a-2x$, if the Progression descend.

Now $a+x$, doubled, is $= a+a+2x = 2a+2x$. Q. E. D.

2. If four Quantities are so, the Sum of the *Extremes* is equal to the Sum of the *Means*.

Let the four Terms be $a, a+x, a+2x, a+3x$.

'Tis plain, that the Sum of the *Means*, and of the *Extremes*, is $2a+3x$.

3. If never-so many Quantities are so proportional, the Sum of the *Extremes* is always equal to the Double of the *Mean*, if the Number of the Terms be odd, or to the Sum of any two Terms equally distant from the *Extremes*.

Thus, in the following Series,

2 4 6 8 10 12 14
a. $a+x$. $a+2x$. $a+3x$. $a+4x$. $a+5x$. $a+6x$.
16 18 20 22
 $a+7x$. $a+8x$. $a+9x$. $a+10x$.

The Sum of the *Extremes* $2a+10x$ is equal to $a+5x$ multiplied by 2; that is, the Double of the middle Term: As it is also to the Sum of any Two of them equally distant from both *Extremes*.

And this must ever be, because the last Term contains in it the first, and also the common Difference super-added as often as the Number of its Place is distant from the first Term: But the first Term hath no Addition of the Difference at all; and as the second Term hath one Difference or Ratio more than the first, the third one more than the second, &c. so the last save one, hath one less than the last of all; the last save two, one less than the last save one, &c. So that the Sum of any two of these equally distant from the *Extremes*, must be equal to the Sum of the *Extremes*; because one encreases as much as the other decreases.

Hence 'tis plain,

COROLLARIES.

1. That the Sum of any Number of Terms in such a Progression may be had, if the Sum of the *Extremes* be multiplied by half the Number of the Terms, or half that Sum by the whole Number of the Terms.

2. To gain the Sum of never so many Quantities in this *Progression*, there is nothing necessary to be given but the Extremes and the Number of Terms: So that if by having the *First Term* and *Common Excess*, one could get the *Last*, 'twould strangely dispatch Questions in *Progression*.

3. Which last Term in such a *Progression* may be had easily, by multiplying the Number of the Terms, lessened by one, into the Common Excess, and then to that Product adding the first Term.

Thus, if the last Term, in a *Progression* of 52 Places were desired, where the Common Difference is 3, and the first Term 5;

Multiply 51 by 3, it produces 153; to which adding 5 the first Term, you have 158 equal to the last Term in such a *Progression*.

4. Wherefore if the *Progression* begin with a Cypher, (which is the most Natural and Simple *Progression*; for when it begins with any other Term, 'tis in reality a Compound of two *Progressions*; one of Equals; as of $a, a, a, a, \&c.$ and the other of Arithmetical Proportionals, as $o, x, 2x, 3x, 4x, \&c.$) then I say, the Sum of all the Terms will be equal to half the Product of the last Term multiplied by the whole Number of the Terms: For by the First Corollary, the Sum of all the Terms will be equal to the Sum of the Extremes multiplied by half the Number of Terms.

Thus, suppose

$o, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20.$

Or,

$o, x, 2x, 3x, 4x, 5x, 6x, 7x, 8x, 9x, 10x.$

20 the last Term, multiplied by 11 the Number of the Terms, gives 220; the half of which, 110, is the Sum of all the Terms.

For, by *Corollary* the First, 20, the Sum of the Extremes, multiplied by 5, 5 half the Number of Terms, produces 110, the Sum of all the Terms.

5. Hence this very useful Theorem may be deduced, that the Sum of all the Terms in any such *Progression*, beginning from o , is *Subduple* of the Sum of so many Terms, all equal to the greatest. For let the first Term be o , and the last x , and the given Number of the Terms n ; then (by *N^o 1.*) will the Sum of all the Terms of the *Progression* be $\frac{1}{2} n x$, which is half or *subduple* of $n x$ equal to the Number of so many Terms equal to the greatest: Q. E. D.

6. The Sum of a Simple Arithmetical *Progression*, (*i. e.* ascending by the Cardinal Numbers) continued from Unity *ad Infinitum*, is subduple the Sum of the same Number of Terms, each of which is equal to the greatest; or, on the contrary, this latter Sum is double of the former. By prefixing a Cypher before unity, this would be but a Case of the last Corollary, the Sum of the *Progression* remaining still the same.

But that this is true in an infinite Series beginning from Unity, (for in a Finite or Determinate one, the Proportion of the Sum is always less than double; tho' it always approaches to it, and comes

so much the nearer by how much greater the Series is) we shall now thus demonstrate:

To the Sum of Three Terms, 1, 2, 3, *i. e.* 6, the Sum of as many equal in Number to the greatest, *i. e.* 9, has the same Proportion as 3 to 2; but to the Sum of Six Terms, 1, 2, 3, 4, 5, 6, *i. e.* 21, the Sum of as many equal to the greatest, *i. e.* 36, has the same Proportion as 3 to $1 + \frac{1}{2}$ that is 3 to $2 - \frac{1}{2}$, the Decrease being $\frac{1}{2}$; but to the Sum of Twelve Terms, which may be found by *Coroll. 1.* equal 78, the Sum of so many equal to the greatest, *viz* 144, has the same Proportion, (dividing both sides by 48) as 3 to $1 + \frac{1}{3}$ *i. e.* 3 to $1 + \frac{1}{3} + \frac{1}{9}$, (for 24 make $\frac{1}{3}$, and the Remainder $\frac{1}{9}$ is the same as $\frac{1}{9}$) that is, as 3 to $2 - \frac{1}{3} - \frac{1}{9}$, the Decrement being now $\frac{1}{9}$. Since therefore, by doubling the Number of Terms onwards, you'll find the Decrement to be $\frac{1}{2}$, and so onwards in double Proportion; the Sum of an Infinite Number of such Terms, in Arithmetical *Progression*, equal to the greatest, will be to the Sum of the *Progression*, from 1 *ad infinitum*; as 3 to $2 - \frac{1}{2} - \frac{1}{4} - \frac{1}{8}, \&c.$ that is, by *Coroll. 1* and 2, as 3 to $2 - \frac{1}{2}$, that is, as 3 to $1 + \frac{1}{2}$, or as 2 to 1. Q. E. D.

7. The Sum of any Duplicate Arithmetical *Progression*, continued from Unity *ad infinitum*, is subtriple of the Sum of as many Terms equal to the greatest, as is the Number of Terms: For any such Finite *Progression* is greater than the Subtriple Proportion, but approaches nearer and nearer to it continually, but how much the farther the Series of the *Progression* is carried on. Thus the Sum of Three Terms, 1, 4, 9, = 14, is to thrice 9 = 27, as $1 + \frac{1}{2}$ or $1 + \frac{1}{3}$ or $1 + \frac{1}{4} + \frac{1}{5}$ to 3, (dividing both sides by 9) the Sum of Six Terms, 1, 4, 9, 16, 25, 36, *&c. viz.* 91 to Six times 36, *i. e.* to 216, (dividing both sides by 72) is as $1 + \frac{1}{2} + \frac{1}{3}$ to 3, and the Sum of Twelve Terms 650, to 12 times 144, *i. e.* 1728, (dividing both sides by 576) is as $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4}$ to 3, *&c.* the Fraction, adhering to them thus constantly decreasing, some by their Half parts, others by Three quarters: (for $\frac{1}{2}$ is $\frac{1}{2}$; therefore the first Decrement is $\frac{1}{2}$, and $\frac{1}{3}$ is $\frac{1}{3}$; therefore the second Decrement is $\frac{1}{3}$, *&c.*) Wherefore the Sum of the Infinite *Progression* will be to the Sum of the like Number of Terms equal to the greatest; as,

$$\begin{array}{r} 1 + \frac{1}{2} + \frac{1}{3} \\ - \frac{1}{2} - \frac{1}{3} \\ \hline - \frac{1}{3} - \frac{1}{4} \\ \hline - \frac{1}{4} - \frac{1}{5} \\ \hline \end{array}$$

&c. to 3, by *Coroll. 2d* and 4th, in *Progression Geometrical*.

But the Sum of a Triplicate Arithmetical *Progression*, (*i. e.* ascending by the Cubes of the Cardinal Numbers) proceeding from 1 thro' 27, 64, *&c. ad infinitum*, is subquadruple of the like Number of Terms equal to the greatest: For the Sum of Four Terms, 1, 8, 27, 64, *i. e.* 100, to 4 times 64, *i. e.* 256, (dividing both sides by 64) will be found to be as $1 + \frac{1}{2} + \frac{1}{3}$ to 4; but the Sum of 8 Terms, 1, 8, 27, 64, 125, 216, 343, 512, *i. e.* 1296 to 8 times 512, *i. e.* 4096, (dividing both sides by 1024) will be found to be as $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4}$ to 4, *&c.* The adhering Fractions thus constantly decreasing, the one by their Half part, the others by Three quarters, (for $\frac{1}{2}$ is $\frac{1}{2}$ and $\frac{1}{3}$ is $\frac{1}{3}$, *&c.* Wherefore the Sum of the

Inf.

Infinite Progression will be to the Sum of a like (Infinite) Number of Terms, equal to the great-
est; as,

$$1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32} + \frac{1}{64} + \frac{1}{128} + \frac{1}{256} + \frac{1}{512} + \frac{1}{1024} + \frac{1}{2048} + \frac{1}{4096} + \frac{1}{8192} + \frac{1}{16384} + \frac{1}{32768} + \frac{1}{65536} + \frac{1}{131072} + \frac{1}{262144} + \frac{1}{524288} + \frac{1}{1048576} + \frac{1}{2097152} + \frac{1}{4194304} + \frac{1}{8388608} + \frac{1}{16777216} + \frac{1}{33554432} + \frac{1}{67108864} + \frac{1}{134217728} + \frac{1}{268435456} + \frac{1}{536870912} + \frac{1}{1073741824} + \frac{1}{2147483648} + \frac{1}{4294967296} + \frac{1}{8589934592} + \frac{1}{17179869184} + \frac{1}{34359738368} + \frac{1}{68719476736} + \frac{1}{137438953472} + \frac{1}{274877906944} + \frac{1}{549755813888} + \frac{1}{1099511627776} + \frac{1}{2199023255552} + \frac{1}{4398046511104} + \frac{1}{8796093022208} + \frac{1}{17592186044416} + \frac{1}{35184372088832} + \frac{1}{70368744177664} + \frac{1}{140737488355328} + \frac{1}{281474976710656} + \frac{1}{562949953421312} + \frac{1}{1125899906842624} + \frac{1}{2251799813685248} + \frac{1}{4503599627370496} + \frac{1}{9007199254740992} + \frac{1}{18014398509481984} + \frac{1}{36028797018963968} + \frac{1}{72057594037927936} + \frac{1}{144115188075855872} + \frac{1}{288230376151711744} + \frac{1}{576460752303423488} + \frac{1}{1152921504606846976} + \frac{1}{2305843009213693952} + \frac{1}{4611686018427387904} + \frac{1}{9223372036854775808} + \frac{1}{18446744073709551616} + \frac{1}{36893488147419103232} + \frac{1}{73786976294838206464} + \frac{1}{147573952589676412928} + \frac{1}{295147905179352825856} + \frac{1}{590295810358705651712} + \frac{1}{1180591620717411303424} + phery, that is (as before) half $rrab$: The former of which is equal to the Surface of the Given Cone, by the 4th Conf. of his Def. 18.) and the latter to the Area of the Circle, whose Radius is the Mean Proportion E F, (by the 2d Conf. of his Def. 15.) Q. E. D.

And from hence also flows naturally this other Proposition, That the Surface of the Cone, half $rrab$, is to its Base half ab ; as the Side of the Cone rrb , is to the Radius of the Base b . For

$$\frac{1}{2}rrab : \frac{1}{2}ab :: rrb : b.$$

PROPOSITION II.

If four Quantities are proportional, either continually or discretely, the Product of the Extremes is equal to the Product of the Means.

For if a, ra, ra, rra , &c. or 2. 4. 8. 16. &c. 'tis plain the Product of the Extremes and of the Means, is the same Quantity $rrraa$ or 32.

In discreet Proportionals, let $a : ra :: b : rb$; that is, 2 : 4 :: 15 : 30. The Product of the Extremes and of the Means can here be no other than $rab = 60$.

On which Proportion is grounded the Golden Rule, or Rule of Three in Arithmetick; so called, because having Three Numbers, (as 2. 4. 15.) it reaches how to find an unknown Fourth Proportional: For altho' this Fourth be unknown, yet its Product by 2 the First Term is known, because 'tis the same with the Product of the Means 4 and 15. Wherefore the Rule directs us to multiply the Third by the Second, that you may thereby obtain the Product of the Extremes; which divided by one of the Extremes, viz. the First, must needs give the other, that is, the Fourth sought.

COROLLARY.

Hence 'tis plain, That if two Products arising from the Multiplication of any two Pairs of Quantities, are equal; those four Quantities will be at least discretely proportional.

PROPOSITION III.

If there are never so many continual Proportionals, the Product of the Extremes is equal to the Product of any two of the Means that are equally distant from the Extremes, as also to the Square of the Mean or Middle Term, if the Number of the Terms be odd.

Thus in this Progression;

2 4 8 16 32 64 128.
a. ra. ra. rra. rrra. rrrra. &c.

It's plain the Product of the Extremes, and of any two Terms equally distant from them, and the Square of the middle Term, must always be $rraa$.

At the last Term but one, is multiplied into a Degree or Power of the Ratio less by one than the last; so the second Term is multiplied into one more than the first: And therefore the Rectangle of the Extremes must still be the same Quantity with that of the Product of any two Terms equally distant from that; and this also equal to the Square of the Middle Term, if the Number of them be odd.

PROPOSITION IV.

Having the first and last Terms, and the Ratio. To find the Sum of all the Terms in any Geometrical Progression, Mr. Oughtred gives this Method.

Let a be the first Term, and y the last; then let $z - y =$ all the Antecedents, and $z - a =$ all the Consequents. Therefore, by Composition of Proportion, it plainly follows, That $a. ra :: z - y. z - a$. That is, the first Term is to the second :: as the Sum of all the Antecedents is to the Sum of all the Consequents: Wherefore by Multiplication of the Extremes and Means, $za - aa = raz - ray$. Wherefore transfer za , and it will be $-aa = raz - ray - za$. Transpose ray , then will $ray - aa = raz - za$. Divide each Part by $ra - a$, and z will be equal to $\frac{ray - aa}{ra - a}$.

That is, Multiply the second and last Terms together, and from the Product subtract the Square of the first Term; and then divide the Remainder by the Difference between the first and second Term, and the Quotient will be the Sum of all the Terms.

Example, in this Series 2. 4. 8. 16. 32. 64. 128.

		2
		4
128		8
4		16
		32
512		64
4		128
<hr/>		
2) 504	(254 = 254

The z of all the Terms but the last, may be found very easily thus: From the last take the first, and divide the Remainder by the Ratio lessened by Unity; the Quotient is the Sum of all the Terms but the last, as will very easily appear if you multiply and divide Algebraically: Which Rule is in some Cases more ready than the former, and therefore 'tis sometimes referred to in the following Consuetaries, under the Name of Rule 2.

PROPOSITION V.

Having the Ratio of the Terms in any Geometrical Progression, To find any of the other Terms, or to find any Term sought.

As for Instance: In Progression, whose Ratio is 2, to find the 24th Term; or to answer expeditiously the common Question of the Price of an

4 H Horse

Horie sold at a Farthing a Nail (of his Shooe) and doubled every time.

Begin and double, as tis ealie to do, for 6 or 8 times, thus,

0	1	2	3	4	5	6	7	8
1.	2.	4.	8.	16.	32.	64.	128.	256.

And then over the Geometrical Numbers place a Series of Arithmetical ones, beginning with 0, as you see: These are Indexes or Exponents of the other, and shew every where how often the Ratio is multiplied into its self, to produce any particular Term. Thus over 64, the 7th Term, there stands the Index or Exponent 6; which shews that 64 is the 6th Power of the Ratio 2, (since the Series begins with Unity.) Now the Addition and Subtraction of the Indexes answers to the Multiplication and Division of the Numbers they stand over: For $3 + 5 = 8$, which is the Index of 256, the Product of 8 into 32; and $7 - 4 = 3$, which is the Index of 8, the Quotient of 128 divided by 16. This being the admirable Property and vast Use of these Indices, (which is the Reason and Foundation of the whole Business of the *Logarithms*, as you may see under that Word) 'tis very ealie by their help to come at any Term, tho' never so remote either way. For supposing I would have the 16th Place in this Progression, since $8 + 8 = 16$, I find, that if I multiply 256 by it self, or square it, it will give me 65536, which is the 16th place; and since $16 + 7 = 23$, if I multiply that Number by 128, it will produce 8388608, which is the 24th Place or Nail; (for the Indices begin with 0) and therefore that doubled, according to the Condition of the Question, will give 16777216 Farthings, which reduced, is 17476 l. 5 s. 4 d.

From which *Propositions* about Geometrical Proportionals, these wonderful *Corollaries* may be deduced.

1. That 'tis possible by these Rules to collect an Infinite Series of Proportional Terms into one Sum, altho' it is impossible to run over all the Terms separately, because Infinite. Thus, in a continu'd Series of Fractions decreasing in a double Proportion, $\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \frac{1}{32}, \text{ \&c. ad infinitum}$, if you take them backwards, you may justly reckon a Cypher, or 0, for the first Term; (for between $\frac{1}{2}$ and 0, there may be an Infinite Number of such Terms) and the Infinite Sum of these Terms will be precisely equal to Unity: For subtracting the first 0 from the last $\frac{1}{2}$, and the Remainder $\frac{1}{2}$ being divided by the Name of the Reason less'n'd by 1, that is by 1, which divides nothing; the Quotient $\frac{1}{2}$ is the Sum of all the Terms, excepting the last, (by Rule 2.) and to the last $\frac{1}{2}$ being added, the Sum of all in that Series will be 1. Now if the last is not $\frac{1}{2}$, but 1, the Sum of all will necessarily be 2; and if 2 be the last, the Sum of all will be 4: In a Word, it will be always double the last Term.

2. And since in this Case the Sum of all the preceding Terms is equal to the last Term, the one being subtracted from the other, there will remain nothing, i. e. $\frac{1}{2} - \frac{1}{2} = 0$; and also, $1 - \frac{1}{2} = \frac{1}{2}$, $\text{ \&c. in infinitum}$, is = 0; and also, $1 - \frac{1}{2} = \frac{1}{2}$, $\text{ \&c. or } 2 - 1 = \frac{1}{2} = \frac{1}{2}$, $\text{ \&c.} = 0$.

3. In like manner the Sum of Infinite Fractions

decreasing in tripple Reason in an Infinite Series, $\frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \frac{1}{81}, \text{ \&c.}$ will be equal to $\frac{1}{2}$: For if from the last $\frac{1}{81}$ (again in an inverted Order) you subtract the first 0, and the Remainder $\frac{1}{81}$ be divided by the Name of the Reason less'n'd by Unity, that is by 2, the Quotient $\frac{1}{162}$ will be the Sum of all the Antecedent Terms; and adding to this last $\frac{1}{81}$ or $\frac{2}{162}$, the Sum of all will be $\frac{1}{81}$ or $\frac{1}{2}$.

But had the Fractions decreas'd from $\frac{1}{4}$ in a Quadruple, or from $\frac{1}{5}$ in a Quintuple Proportion, \&c. the Sum of the whole Series would have been accordingly $\frac{1}{3}$ or $\frac{1}{4}$, and so any Series of this kind is equal to a Fraction, whose Denominator is less by an Unite than the Denominator of the last Fraction in that Series, (supposing the Series to be numbred backward, as before.)

4. Generally also, any Infinite Series of Fractions decreasing according to the Proportion of the Denominator of the last Term, and having a common Numerator less by an Unite than the Denominator of the last Term, (as $\frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5}, \text{ \&c.}$ or $\frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6}, \text{ \&c.}$ or $\frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \frac{1}{7}, \text{ \&c.}$ is equal to Unity, after the same way as the Series, *Coroll. 1.* which may be comprehended under this kind, and which may be demonstrated in all its particular Cases by the same Method we have hitherto made use of, or also barely subsumed from *Coroll. 3.* For since $\frac{1}{2} + \frac{1}{3} + \frac{1}{4}, \text{ \&c.}$ is equal to $\frac{1}{2}$; $\frac{1}{3} + \frac{1}{4} + \frac{1}{5}, \text{ \&c.}$ will be equal to $\frac{1}{3}$ or 1; and so in the rest.

And particularly the Sum $\frac{1}{27} + \frac{1}{81} + \frac{1}{243}, \text{ \&c.}$ decreasing in a Quadruple Proportion, is equal to $\frac{1}{18}$; and the Sum of $\frac{1}{25} + \frac{1}{125} + \frac{1}{625}, \text{ \&c.}$ is equal to $\frac{1}{12}$; and the Sum of $\frac{1}{24} + \frac{1}{96} + \frac{1}{384}, \text{ \&c.}$ decreasing in an Octuple Proportion, is equal to $\frac{1}{6}$: For subtracting the first Term 0, and dividing the Remainder by the Name of the Ratio less'n'd by Unity, that is by 3, the Quotient $\frac{1}{72}$, gives the Sum of all, except the last.

This therefore (*viz.* $\frac{1}{72}$) being added, the Sum of all will be $\frac{1}{72}$ or $\frac{1}{72}$: In like manner $\frac{1}{72}$ being divided by the Name of the Reason less'n'd by Unity, the Quotient will give $\frac{1}{48}$; and adding the last, the Sum of all will be $\frac{1}{48}$, i. e. $\frac{1}{48}$: So that hence 'tis evident, that $\frac{1}{2} - \frac{1}{2} = 0$, $\frac{1}{3} - \frac{1}{3} = 0$, \&c. or $-\frac{1}{2} + \frac{1}{2} + \frac{1}{2} + \frac{1}{2}, \text{ \&c. in infinitum}$, will be equal to nothing; and $\frac{1}{2} - \frac{1}{4} = \frac{1}{4}$, $-\frac{1}{4} + \frac{1}{4} = 0$.

5. The Sum of an Infinite Progression, whose greatest Term is a Square Number, the others decreasing according to the odd Numbers 1, 3, 5, 7, \&c. is in Subsequalteran Proportion of the Sum of the like Number of equal Terms, i. e. as 2 to 3. For the Sum of three such Terms, as 9, 8, 5. i. e. 22 to thrice 9, i. e. 27, is (dividing both sides by 9) as 2 $\frac{2}{3}$, *viz.* $\frac{2}{3}$ to 3, or $2 + \frac{1}{3} - \frac{1}{3}$ to 3. But the Sum of Six such Terms, 36, 35, 32, 27, 20, 11, i. e. 161, to six times 36, i. e. 216 (dividing both sides by 72) is as $2 + \frac{1}{4} - \frac{1}{4}$, \&c. the adhering Fractions thus always decreasing, some by half, others by three Quarters, as in *Coroll. 7. Progression Arithmetical:* Wherefore the Sum of the Infinite Progression will be to the Sum of the like Number of Terms equal to the greatest, as,

$$2 + \frac{1}{2} - \frac{1}{2} \\ - \frac{1}{4} + \frac{1}{4} \\ - \frac{1}{8} + \frac{1}{8}, \text{ \&c.}$$

to 3; that is, by *Coroll. 2d* and 4th, as 2 to 3. Q. E. D.

PROHI-

PROHIBITIO *de vasso directa parti*, is a Writ Judicial directed to the Tenant, prohibiting from making Wast upon the Land in Controversie, during the Suit. It is sometimes made to the Sheriff.

PROHIBITION, is a Writ to forbid any Court, either Spiritual or Secular, to proceed in any Cause there depending, upon Suggestion that the Cognisance thereof belongeth not to the same Court: But is now most usually taken for that Writ which lieth for one that is impleaded in the Court Christian, for a Cause belonging to the Temporal Jurisdiction, or the Conisance of the King's Court; whereby as well the Party and his Council, as the Judge himself, and the Register, are forbidden to proceed any further in that Cause.

PROJECTILES, are such Bodies, as being put into a violent Motion by any great Force, are then cast off or let go from the Place where they received their Quantity of Motion, and do afterwards move at a Distance from it; as a Stone thrown out of ones Hand, or by a Sling, an Arrow from a Bow, a Bullet from a Gun, &c.

There hath been a great Dispute about the Cause of the Continuation of the Motion of *Projectiles*, or what it is that makes them move after they part from the Force that began the Motion. The *Peripateticks* will needs have it, That the Air being by the Motion of the Hand of the Slinger, &c. put into a most violent Agitation, and forced rapidly to follow the Motion of the Stone, while 'tis accelerated in the Hand of the Slinger, doth to prevent a *Vacuum*, press with all due Velocity after the Stone when it parts from the Hand, and thrusts it forwards as long as it can. But this Account seems very unconceivable; and there needs nothing more to solve the Motion of *Projected Bodies*, but only to consider, That all Bodies being indifferent to Motion or Rest, will necessarily continue the State which they are put into, unless they are forced to change if by some other Force impressed upon them. Thus if a Body be at rest, so it will eternally abide, if nothing move it; or if it be in Motion, so it will eternally move uniformly on in the same right Line, if nothing stop it. Wherefore, when a Stone is put into any Degree of Motion, by the Rotation of the Arm of the Man that slings it, whatever Degree of Velocity it had acquired when it parted from the Hand, the same would it ever after keep if it moved in *Vacuo*, and had no Gravity: But because it hath a Tendency, as all Bodies (by the Law of Nature) have, towards the Centre of the Earth, and is also resisted by the Air all along as it goes, in proportion to its Velocity; it plainly follows, that it must needs be both continually drawn downwards, and also continually retarded in its Progressive Motion forwards, and consequently at last fall down to the Earth, and stop.

The Line of Motion which a Body *projected* describes in the Air, (abstracting from the Resistance of the Medium) is, as hath been proved by *Gallileus*, and many Others, and particularly by our Sir *Isaac Newton*, *Prop. 4. Cor. 1.* of his Second Book, the Curve of a Parabola: Which Line is also described by every Descending Body.

He shews also, That if the Line of Direction of the Projectile Motion of any Body, the Degree of its Velocity, and at the Beginning, the Resistance of the Medium being given, the Curve which it will describe may be discovered, and *vice versa*; he saith also in *Schol. Prop. X. Lib. 2.* That the

Line which a *Projectile* describes in a Medium uniformly resisting the Motion, rather approaches to an *Hyperbola* than a *Parabola*.

The Learned Capt. *Halley* proves all *Projectiles* to describe a *Parabola* thus:

Let the Line *G R F* be the Line in which the *Project* is directed, and in which, by the first *Axiom*, under the Word *Descent*, it would move equal Spaces in equal Times, were it not deflected downwards by the Force of *Gravity*. Let *GB* be the *Horizontal Line*, and *GC* a *Perpendicular* thereto. Then the Line *G R F* being divided into equal Parts, answering to equal Spaces of Time; let the *Descents* of the *Project* be laid down in *Lines* parallel to *GC*, proportioned as the Squares of the Lines, *GS, GR, GL, GF*, or as the Squares of the Times; (*i. e.*) let them be drawn from *S* to *T*, from *R* to *U*, from *L* to *X*, and from *F* to *B*, and draw the Lines *TH, VD, XY, BC*, parallel to *GF*; I say, the Points *T, V, X, B*, are Points in the Curve described by the *Project*, and that That Curve is a *Parabola*.

That the Points are in the Curve, is evident by *Axiom 2.* under the Word *Descent* of *Heavy Bodies*: and the Parts of the *Descent* *GH, GD, GY, GC = ST, RV, LX, FB*, being as the Squares of the Times, (by *Prop. 2.* under the Word *Descent*) that is as the Square of the *Ordinates* *HT, DV, YX, BC = GS, GR, GL, GF*, the Spaces measured in those Times; and there being no other Curve but the *Parabola*, whose Parts of the Diameter are as the Squares of the *Ordinates*, it follows that the Curve described by a *Project* can be no other than a *Parabola*: And saying, as *RV* the *Descent* in any Time; as *RG* or *VD* the direct Motion in the same Time; so is *VD* to a Third Proportional, or the *Parameter* of the *Parabola* to the Diameter *GC*, which is always the same in *Project*s cast with the same Velocity: And the Velocity being defined by the Number of Feet moved in a Second of Time, the *Parameter* will be found, by dividing the Square of the Velocity by 16 Foot 1 Inch, the Fall of a Body in the same Time.

PROJECTION, in Chymistry, is putting any Matter to be calcined or fulminated into the Crucible Spoonful by Spoonful. The pretended Casting of the Powder of the Philosopher's Stone into a Crucible of melted Metal, in order (as they boast they can do) to transmute it into Gold or Silver, is called also *Projection*; and the Matter they cast in, the *Powder of Projection*.

PROJECTION of the Sphere in Plano, is a true Geometrical Delineation, of the Circles of the Sphere, or any assigned Parts of them, upon the Plane of some one Circle; as on the *Horizon*, *Meridian*, *Equator*, *Tropick*, &c. And this is either *Stereographick*, which supposes the Eye to be but 90 Degrees distant from, and perpendicular to the Plane of the Projection; or *Orthographick*; when the Eye is at an Infinite Distance.

By what hath been taught in our Doctrine of *Spherical Geometry*, (see that Word) it will be very easie to project the Sphere on any Plane. For the *Analemma*, see that Word. And here follows an Example of the *Stereographick Projection* of the Sphere on the Plane of the *Meridian*, *Equinoctial*, and *Horizon*, which gives good Light into the Knowledge of *Spherical Triangles*, the Doctrine of the Sphere, *Dialing*, &c.

The Stereographick Projection on the Plane of the Meridian.

Let ZQNE be the Meridian.

Z and N the Poles, as also the Zenith and Nadir.

EQ the Equinoctial and Horizon.

ZN the Equinoctial Colure, and Prime Vertical Circle.

Z 15 N, Z 30 N, Z 45 N, &c. are Hour-Circles or Meridians, and also Azimuths, because the Pole is in the Zenith.

And to describe these Circles, find the Points 15, 30, 45, 60, &c. in the Equinoctial, by setting the Half Tangent of their Distance from V; and then their Centres are found by setting their Co-secants both ways from their Points of Intersection with the Equator.

Q, S, and W, W, are the Northern and Sou-

thern Tropicks, which are described by setting the Half Tangent of 23 Deg. 30 Min. from V each way: Then the Tangent of its Complement, viz. 66 Deg. 30 Min. each way from thence on the Colure produced, gives their Centres. By this Method all Parallels, of Declinations may be drawn.

Or you might have set the Co-secant of the Parallel from the Centre of the Primitive, which would have also found the same Point for the Centre of the Parallel, whose Radius is equal to the Tangent of its Distance from its Pole, by Cor. 1. and 2. of Probl. 2. of Spherick Geometry.

These Parallels in this Projection, are also Almucanters, or Parallels of Altitude.

S, W, is the Ecliptick, which must be divided from the Division on the Scale of Half Tangents, but denominated according to the Signs of the Zodiac, reckoning 30 Degrees to each Sign.

The Stereographick Projection on the Plane of the Equinoctial.

Let SC be the Meridian and Solstitial Colure, EN the Equinoctial Colure and Hour-Circle of 6.

P the North Pole.

S S the Northern Tropick.

E S N the Northern Half of the Ecliptick, (whose Centre is found by setting off the Secant of 23 Deg. 30 Min. from S) And its Pole is at a the Intersection of the Polar Circle and Meridian; and is the Place through which all Circles of Longitude must pass.

E Z N the Horizon of London, which is described thus: Set the Half Tangent of the Co-latitude from P to Z; then the Tangent of the same, set from P to O, or its Secant from Z to O, gives its Centre; and its Pole will be at b, 38 Deg. 30 Min. (in the Half Tangents) distant from F, where b is at the Zenith.

To draw any other Circles in this Projection.

1. For Circles of Longitude, which must all pass thro' *a*, and the several Degrees of the *Ecliptick*; set therefore the Tangent of 66 Deg. 30 Min. from *a*, downwards, on the Meridian, produced; which will find a Point, through which a Perpendicular drawn to the Meridian, shall contain in it the Centres of all the Circles of Longitude, whose Distances set off to the Radius *P x*, shall be the Tangents of the Degrees of their Distances from the Meridian, *S P C*, (which is that belonging to 180. Deg.)

2. All Parallels of Declination are drawn by setting the Half-Tangents of their Distances from *P*.

3. All Azimuths, or Vertical Circles, must pass thro' *b* at the Zenith; Since therefore the Zenith is 38 Deg. 30 Min. distant from *P*, set the Co-secant of that (or the Secant of 51 Deg. 30 Min.) from *b* on the Meridian extended below, and that shall find the Point *x*, the Centre of the Azimuth of East and West, viz, *E b N*; and the Centres of all the rest are in a Line that's perpendicular to the Meridian, and drawn through *x*.

4. Circles of Altitude, or Almicanter are lesser Circles, whose Poles are not in the Plane of the Projection, and may be described by our Third Case of Probl. 9. of Spherick Geometry. Thus the Circle *O e* is a Parallel of Altitude 50 Degrees above the Horizon.

5. All Hour-Circles are straight Lines from the Centre to the Limb.

The Stereographic Projection on the Plane of the Horizon.

First, Draw a Circle representing the Horizon, and quarter it with two Diameters.

Then will

z be the Zenith of the Place.

12 z 12 the Meridian.

6 z 6 the Prime Vertical, or Azimuth of E, & W.

Make

$z P = \frac{1}{2}$ Tangent of 38° 30' (or Tangent of 19° 15')

P shall be the Pole of the World.

Make

$z A = \frac{1}{2}$ Tangent of 51° 30' (or Tangent of 25° 45')

And

$A e = \text{Secant}$ } of 38 Deg. 30 Min.
 $z o = \text{Tang.}$ }

Then shall

o be the Centre of the Equinoctial, 6 *A* 6.

In this Projection, Almicanter are all parallel to the Primitive Circle.

And Azimuths are all Right Lines, passing thro' (z) the Centre of the Primitive, to the equal Divisions in the Limb.

Parallels of Declination, are all Lesser Circles, and parallel to the Equinoctial; and their Intersection with the meridian are found by setting the Half Tangent of their Distance from the Zenith Southward and Northward, or both ways from z .

Their Centres are found by bisecting the Distance between those two Points; for the Middle shall be the Centre of the Parallel.

Thus,

$z S = \frac{1}{2}$ Tangt. of 28° 00' = Distance of the Tropick of S from the Zenith, Southward
And
 $z W = \frac{1}{2}$ Tangt. of 75° 00' = Distance of the Tropick of W from the Zenith, Northward

And the Intersection again with the North of the Meridian, is at

105° 30' } for $z W$ to the Northwards, or upwards from z .
152° 0' }

For the Hour-Circles,

Make $z e = \text{Tangent of } 51^\circ 30'$, or $P o = \text{Secant of } 51^\circ 30'$. Draw *G C T* perpendicular to the produced Meridian. Wherefore, if from *c*, with the Radius $z c$, you set off the Tangents of 15°, 30°, 45°, &c. both ways, you'll have the Centres of the several Hour Circles, 7 and 5, 8 and 4, &c.

Note, In all Stereographic Projections, all Diameters are measured on the Scale of Half Tangents: The Reason of which you have in Prop. 2. of our Spherick Projection. And this is the Ground of all Dyalling, or the True Projection of the Hour-Circles of the Sphere on any Given Plane.

PROJECTURE, a Term in Architecture signifying the Jutting or Leaning-out of any Part of a Building, the Copping of a Wall, &c. These the Italians call *Sporti*, and the Greeks, *Echphoras*; and in the General, all Margents which hang over beyond

yond the *Scapus* of a Column, are called *Projections*.

PRO in Diviso, is a Possession or Occupation of Lands or Tenements, belonging to two or more Persons, whereof none knows his several Portion, as *Co-parceners* before Partition.

PROLABIA, the utmost prominent Parts of the Lips.

PROLEPSIS, is a Figure in Rhetorick, by which we prevent what might be objected by the Adversary.

PROLAPSUS Uteri. See *Uteri Prolapsus*.

PROLEPTICUS, is a Disease always anticipating; so as if the Age came to day at Four of the Clock, then to Morrow one Hour sooner, and so on. *Blanchard*.

PROLOCUTOR of the Convocation House, is an Officer chosen by Persons Ecclesiastical, publicly assembled by Virtue of the King's Writ, for every Parliament: And as there be two Houses of Convocation, so there are two *Prolocutors*, one of the Lower, and one of the Higher House. He of the Lower House, presently upon the first Assembly, by the Motion of the Bishops, being chosen by the Members of the said Lower House, is presented to the Bishops for *Prolocutor*, that is, the Person by whom they intend to deliver their Resolutions to the Higher House, and to have their own House especially ordered and governed. His Office is to cause the Clerk to call the Names of such as are of that House, when he sees Cause to read all things propounded, gather Suffrages, and the like.

PROMOTERS, or *Promoters*, are those who in Popular and Penal Actions do prosecute Offenders in their own Name and the King's; having Part of the Fines or Penalties for their Reward. They do belong especially to the *Exchequer* and *King's Bench*.

PROMULGE a Law, is first to make a Law, and then to declare, publish, and proclaim the same to Publick View; and so *Promulgated*.

PRONOS, or *Pronaus*, a Term used by Architects for a Church-Porch, or a *Portico* to a Palace, great Hall, or spacious Building.

PRONATOR Radii Quadratus, is a Muscle of the *Radius*, which ariseth broad and fleshy from the Lower and Inner part of the *Ulna*; and passing transversely over the Ligament that joins the *Radius* to the *Ulna*, and is so inserted to the Superior and External part of the *Radius*: It helps with the *Pronator Teres* to move the *Radius* inwardly.

PRONATOR Radii Teres is a Muscle of the *Radius*, by some called *Pronator Superior Rotundus*: It ariseth fleshy from the Internal Exuberance of the *Os Humeri*, where those bending the *Carpus* and Fingers do arise; and firmly adhering to the *Flexor Carpi Radialis*, it descends obliquely downwards to its fleshy Insertion, a little above the middle of the *Radius* Externally: Its Use is to move the *Radius* inwards.

PRONOTARY, or *Protonotary*, is a Chief Officer of the *Common Pleas* and *King's Bench*. He of the *King's Bench* records all Actions Civil sued in that Court, as the Clerk of the *Crown-Office* doth all Criminal Causes. Those of the *Common Pleas* do enter and enrol all manner of Declarations, Pleadings, Affidavits, Judgments and Actions: Also they make out all Judicial Writs, as the *Venire facias*, after Issue joined; and *Habeas Corpus*, for bringing in of the Jury; and *Distingas Furator*. They

also make out Writs of Execution and Seisin; Writs of *Superfedeas*, for Appearance to *Exigents*: as well as the *Exigents* and *Writ of Privilege*, for removing Causes from other Inferior Courts of Record, where the Party hath Cause of Privilege; Also Writs of *Procedendo* and *Scire facias* in all Cases, and Writs to enquire of Damages, and all Process upon Prohibitions, and upon Writs of *Audita Querela*, and *Falsè Judgment*; with many other. Lastly, They enrol all Recognizances acknowledged in that Court, and all Common Recoveries; and they make Exemplifications of any Record in the same Term, before their Rolls are made up and delivered into the Treasury of the Records of that Court.

PRONOUN, in Grammar, is a Variable Word, often used as a Noun, and nearly of a like Signification with it: And these *Pronouns* they divide into such as are,

1. *Finite*; as, *I, Thou, He*, &c.
2. *Infinite*; as *Quis, Cujus*, &c.
3. *Demonstrative*, which shew a present Person or Thing; as, *I, You, He*. &c.
4. *Relative*, which refer to some Antecedent Word; as, *who, which*, &c.
5. *Interrogative*; as when *who* and *which*, &c. are used in asking Questions.
6. *Possessives*; as, *Mine, Thine*, &c.
7. *Gentiles*, which express a Nation or Country; as, *Nostros, Vestros, Cujas* in the Latin Tongue.

PRO Partibus Liberandis, is a Writ for the Partition of Lands between Co-heirs.

PROPER Fraction, is such an one as hath its Numerator less than the Denominator; as $\frac{1}{2}$, which is really less than Unity, and therefore properly speaking, a Fraction.

PROPER Navigation, is the guiding of a Ship to any Port desired, where the Voyage is to be performed in the vast Ocean; and requires not only the Lead-Line, and Ordinary compass, but *Azimuth Compass*, *Charts*, *Log-board*, and *Half Minute Glass*; with Instruments for Celestial Observation, as the *Quadrant*, *Fore-staff*, &c. And the Navigator must be able by these to find at any time in what Place the Ship is; which is done by comparing it with any known Place; that is, how much the same known Place is situate from the Ship, either towards the North or South, which is called the *Difference of Latitude*; or towards the East or West, which if in proper Degrees, is called the *Difference of Longitude*.

PROPERTY, or *Propriety*, strictly speaking, is the highest Right that a Man hath or can have to any thing, and no ways depending upon any other Man's Courtship: And this, none in our Kingdom can be said to have in any Lands or Tenements, but only the King in the Right of his Crown; because all the Land throughout the Realm is in the Nature of Fee, and held either mediately or immediately of the Crown.

This Word nevertheless, is used for that Right in Lands and Tenements that Common Persons have, because it importeth as much as *utile Dominium*, tho' not *Directum*. And there are Three manners of Rights of *Property*, that is, *Property Absolute*, *Property Qualified*, and *Property Possessory*.

PROPHASIS, is a Fore knowledge in Diseases, also an Occasion or Antecedent Cause. *Blanchard*.

PRO-

PROPHYLATICA, is a Part of that Part of Physick called *Hygicina*, (or what respects the Preservation of Health) which gives notice of future but imminent Diseases. *Blanchard*.

PROPLASM, the same with a Mould in which any Metal or soft Matter, which afterwards will harden, is cast.

PROPORCITAS, in Law, signifies the Declaration or Deliverance of an Assise; otherwise called *Verdictum Assise*, the Verdict of an Assise; because the Assisors are sworn to declare the Truth, and therefore are called *Juratores* or *Jurors*.

PROPORTION, 1. When two Quantities are compar'd one with another, in respect of their Greatness or Smallness, that Comparison is called *Ratio*, *Reason*, *Rate*, or *Proportion*: But when more than two Quantities are compared, then the Comparison is more usually called the *Proportion* that they have to one another. The Words *Ratio* and *Proportion* are frequently used promiscuously.

2. When two Quantities only are compared, the former Term is called the *Antecedent*, and the latter the *Consequent*.

3. And the *Proportion* or Relation of two Numbers one to another, is found by dividing the *Antecedent* by the *Consequent*; and the Quotient is the Exponent or Denominator of the *Proportion*.

As, if the Quotient be 2, the *Proportion* is Double; if 3, Treble; if 4, Quadruple; if $\frac{1}{2}$, Subduple, or one Half; if $\frac{1}{3}$, Subtriple, or one Third part; if $\frac{1}{4}$, or $\frac{1}{2}$, Sesquilateral, or the *Proportion* denominated by one and an Half; if $\frac{2}{3}$, or $\frac{1}{2}$, Sesquitercian, or once with a Third part; and universally, the *Proportion* of A to B, is that denomi-

nated by $\frac{A}{B}$, that is by the Quotient of A divided by B.

4. These *Proportions*. so many of them as are Rational, or between Number and Number, have particular Names given them by *Greek* and *Latin* Writers.

If after the *Antecedent* be divided by the *Consequent*, the Quotient be 1, it is called *Proportion of Equality*, or *Simple Proportion*.

If the Quotient be 2, 3, 4, (or such other Integer Number) it is called *Multiple Proportion*, (viz. Double, Treble, Quadruple, &c.) And the Contrary to those are called *Submultiple*, (viz. Subduple, Subtriple, Subquadruple, &c.) or One half, a Third part, Fourth part, or such other *Aliquot* Part.

If the Quotient be $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, &c. it is called *Superparticular*, (viz. Sesquilateral, Sesquitercian, Sesquiquartan, &c.) And the Contraries hereunto are called *Subsuperparticular*, (viz. Subsesquilateral, Subsesquitercian, &c.)

If such Quotient be 2, 3, 4, (or such other Integer greater than Unity) with such an *Aliquot* Part, it is called *Multiple-superparticular*, (as $2\frac{1}{2}$, Duple-sesquilateral; $3\frac{1}{3}$, Triple-sesquitercian; $4\frac{1}{4}$, Triple-sesquiquartan, &c.) And the Contraries thereunto are *Submultiple-superparticular*, as *Subduple-sesquilateral*, *Subtriple-sesquitercian*, &c.

If the Quotient be 1, with some Number of *Aliquot* Parts, as $1\frac{1}{2}$, $1\frac{1}{3}$, $1\frac{1}{4}$, &c. it is called *Superpartient*, (as *Superbipartient tertias*, *Supertripartient quartas*, *Superbipartient quintas*, &c.) And the Contraries hereunto are *Subsuperpartient*, as *Subsuperbipartient tertias*, &c.

If such Quotient be some greater Integer Number, (as 2, 3, &c.) with such Number of *Aliquot* Parts, as $2\frac{1}{2}$, $3\frac{1}{3}$, $3\frac{1}{4}$, &c. it is called *Multiple-superpartient*, (as *Duple-superbipartient tertias*, *Tripla-supertripartient quartas*, *Tripla-superbipartient quintas*, &c.) And the Contraries thereunto, *Submultiple-superpartient*, (as *Subduple-superbipartient tertias*, *Subtriple-supertripartient quartas*, &c.) As that of 31 to 7 , (because $\frac{31}{7} = 4\frac{3}{7}$) is *Quadruple-supertripartient septimas*; and its Contrary, 7 to 31 , is *Subquadruple-supertripartient septimas*.

And under some of these Compellations all Proportions will fall, which are as one Integer Number to another.

But notwithstanding all this add, (tho' that the Ancient Geometers may be understood, I thought fit to explain these long, barbarous, and hard Words here) tis much better, and more Intelligible, to express these Proportions, as the usual manner now is, by the Numbers themselves, than by these Names; and briefly and clearly to say, as 31 is to 7 , or as 7 is to 31 , rather than to say *Quadruple-supertripartient septimas*, or *Subquadruple-supertripartient septimas*.

5. If when Four Quantities are considered, you find that the First hath as much Greatness or Smallness, in respect of the Second, as the Third hath in respect of the Fourth: Those Four Quantities are called *Proportionals*, and are thus expressed,

$$8 : 2 :: 16 : 4.$$

$$a : b :: c : d.$$

That is, As 8 contains 2 four times, so 16 contains 4 four times; and therefore 8 is just as big in respect of 2, as 16 is in respect of 4.

Here therefore, the *Ratio* between the First Pair, is equal to the *Ratio* between the other Pair of Numbers; and consequently, these Four having equal *Ratios*, are *Proportionals*.

But if you encrease or diminish any one of these Four Numbers, the *Ratio* will grow unequal, and then they will not be *Proportionals*: As if instead of 8 you should put 9 or 7, letting all the rest remain as they were; 'twill then be plain, that 9 hath more Magnitude, and 7 hath less in respect of 2, than 16 hath in respect of 4; for 9 contains 2 above four times, and 7 doth not contain it so often as four times; whereas 16 contains 4 exactly four times: Wherefore these latter Numbers, 9, 2, 16, 4, or 7, 2, 16, 4, are not *Proportionals*: And 'twould be the same, if any other Member of the first Four Numbers had been altered; for the *Proportion* would necessarily be destroyed.

6. The annexed Figure will serve very well to explain *Proportion*.

Let the Radius cC be suppos'd to move quite round on its Centre C , 'till the Point c come to the same Place it was at before it began to move; then will that Point c have described the Circumference of a Circle, which let be $HdZe$. Then at the same time, any other Point of the Radius, as suppose f , will also have described the Inner Circle $fbgX$. Draw the two Diameters HZ , and ed , cutting each other at Right Angles in C , which will divide both Circles into four Quadrants. 'Tis plain from hence, that the same Proportion which the outer Circle (Z) bears to its fourth (or any other) part A ; the same must the inner Circle (X) bear to B ; the same Part of its Circumference. For when the longer Radius cC hath moved over the fourth part of the Circle Z , and the Point c is come to H ; then will the Point f also be come to h , and will have gone over a Quadrant of its Circle X ; and when c is come to d , f also will be come to g , and will as well as the other have described a Semi-circle: So that as the Circle Z is to any Part of its Periphery, or as it is to the Ark A ; so will the Circle X be to a like Part of its Periphery, or to the Ark B . That is,

$$\begin{array}{cccc} 12 & 3 & 8 & 2 \\ Z : A :: X : B. \end{array}$$

7. And from these Considerations may all the several Species of Proportion be demonstrated from the Nature of the Thing. For if

$$\begin{array}{cccc} 12 & 3 & 8 & 2 \\ Z : A :: X : B. \end{array}$$

It will certainly follow by *Inversion*, that

$$A : Z :: B : X.$$

That is, If Z be, as big in respect of A , as X is in respect of B ; then must A be as little in respect of Z , as B is in respect of X .

Or if 12 contain 3 as often as 8 contains 2, then will 3 be contained in 12 as oft as 2 is contained in 8.

8. Since $Z : A :: X : B$, it will follow, by *Alternate Proportion*, that $Z : X :: A : B$; that is, Antecedent is to Antecedent, as Consequent is to Consequent: Which is plain, if the former Figure be well considered.

For suppose the outer Circle Z to be Double, Triple, Quadruple, &c. of the inner Circle X ; then must the Ark A (or any other Part of it) be Double, Triple, &c. of the Ark B , a like Part of the Circle X . Therefore, as the Whole is to the Whole, so the Parts must be to the Parts; that is, $Z : X :: A : B$. $Q. E. D.$

9. If you compare the *Differences* (which is what remains when one is subtracted from the other) between the Antecedents and their Consequents, with those Consequents; another Species of *Proportion* will be found, which is called *Proportion by Division*, and ought to be thus express'd,

$$Z - A : A :: X - B : B.$$

Now undoubtedly, if from the whole Circle Z you take a Quarter, (or any other Part) as A ; and also from the whole Circle X you take a Quarter, or any like Part, as B ; the remaining three Quarters of the outer Circle, must be to its other Quarter A , as the remaining three Quarters in the inner Circle are to its Quarter B . That is,

$$\begin{array}{cccc} Z - A : A :: X - B : B. & Q. E. D. \\ 9 : 3 :: 6 : 2 \end{array}$$

10. Or if you add the Antecedents and Consequents together, and then compare the Sums with the former Consequents; another Species arises, called *Proportion by Composition*; and 'tis thus express'd,

$$Z + A : A :: X + B : B.$$

And 'tis certain, since $Z : A :: X : B$, by the Supposition, and also $Z : X :: A : B$. by *Alternate Proportion*: Z and A together will be to A , as X and B together are to B . That is,

$$\begin{array}{cccc} Z + A : A :: X + B : B. & Q. E. D. \\ 15 : 3 :: 10 : 2 \end{array}$$

11. If you compare the Antecedents with the Differences between them and their Consequents, another Species of *Proportion* arises, which is called *Conversion of Proportion*: And is thus express'd,

$$\begin{array}{cccc} 12 : 9 :: 8 : 6 \\ Z.Z - A :: X.X - B \end{array}$$

Which is very plain from the Consideration of the Figure; for no doubt the whole Circle Z is to its $\frac{3}{4}$ (*viz.* $Z - A$) as the whole lesser Circle X is to its $\frac{3}{4}$ (which is $X - B$.)

12. If when $Z : A :: X : B$, you compare the Consequents A and B with two other Quantities, so as to make two Rows of Proportionals, standing thus, $Z : A :: X : B$
 $A : d :: B : I$

Then will Z be to d as X to I , which is another Species of *Proportion by Equality*, or *ex aequo ordinata*: And follows from this Figure very plainly,

plainly, for no doubt the whole Circle Z is to its $\frac{3}{2}$, which is 9 or $d ::$ as the whole Circle X is to its, which is 6 or b .

13. IF Z be taken as often as X, *ex. gr.* 3 Z and 3 X, you may conclude, That $Z : X :: 3 Z : 3 X$, or as 10 Z to 10 X; or also as $12 \frac{1}{2} Z$, to $12 \frac{1}{2} X$. And so on, in whatsoever Proportion the two Magnitudes Z and X are multiplied, so they are multiplied equally, or that you take one as often as you take the other. For then there will be the same Proportion between the Magnitudes thus equally multiplied, as there was between the Simple Magnitudes, before such Multiplications.

And these Magnitudes thus equally multiplied, are called *Equi-multiples* of the simple Magnitudes Z and X: Hence we say, that *Equi-multiples* are in the same Proportion as such simple Magnitudes, out of which they are compounded.

14. IF Z be divided in the same manner as X is; and *ex. gr.* you take a fourth Part of Z, and the like of X; or the tenth, or any other Part of Z, and the same of X: Then will these Parts be proportional to their Wholes, $Z : X :: \frac{1}{4} Z$ (or $\frac{1}{10} Z$) $:\frac{1}{4} X$ (or $\frac{1}{10} X$). All which is self-evident.

15. A Proportion is said to be *Compounded* of other Proportions, when the Exponent of That is made by the Multiplication of the Exponents of These, one into another. Thus, the *Compound of the Treble and Double*, (whose Exponents are 3 and 2) is the *Treble of the Double*, (whose Exponent is 3×2) that is, the *Sextuple* (because $3 \times 2 = 6$) which is manifestly a Work of Multiplication.

16. The *Products*, or the *Quotients* of any Two Quantities or Numbers *Multiplicated* or *Divided* by the same Third Numbers, are in the same Proportion as the Numbers were before they were *Multiplicated* or *Divided*.

E. gr. 1. Let 8 and 12 be multiplied by 4; then will $8 : 12 :: 32 : 48$.

2. Let 8 and 12 be divided by 4; then will $8 : 12 :: 2 : 3$.

The Reason of which is very plain; because one Number is just as much increased by Multiplication, or diminished by Division, as the other is.

PROBLEMS.

To Two Lines A and B, to find D a Third Proportional.

Make any Right-lined Angle, as $\angle a e e$. Then set off in it $a d = A$, and $a b = B$. Set off also B again from d to e ; then join b and d , and to $b d$, draw a Parallel thro' the Point e , so shall $b c$ be the Line sought for, $A : B :: B : D$, by 2 e 6 *Euclid*.

To Three given Lines, A B and C, to find a Fourth Proportional D.

Make any Angle, as $\angle a c e$; then from a , take $a b = A$, and $b c = B$, and $a d = C$, join $b d$, and thro' c draw a Parallel to $b d$; so shall $d e$ be the Line sought: For $A : B :: C : D$. 2 e 6 *Euclid*.

Of the Proportion of Figures.

1. To find the Proportion that one Rectangle hath to another, both Length and Breadth must be considered.

For Rectangles are to each other as the Products of their respective Lengths multiplied by their Breadths.

Thus, if there be two Rectangles, the former of which hath its Length 5 Inches, Yards, &c. and its Breadth 3 Inches, Yards, &c. and the latter had its Length 8 Inches, Yards, &c. and its Breadth 4 Inches, Yards, &c. Then the Rectangles will be to each other, as $3 \times 5 (= 15)$ is to $4 \times 8 (= 32)$ *i. e.* as 15 is to 32. So that all Rectangles are to one another in a Ratio compounded of that of their Sides.

PRO

2. When Rectangles have their Sides proportionable, (so that $ab:eb::ad:ef$) then is the Rectangle A, to the Rectangle B, in a duplicate Proportion to the Ratio of the Sides.

For the Ratio of A to B, is compounded of the Ratio of ab to eb , and of the Ratio of ad to ef .

But in this Case ab is to eb , in the very same Ratio as ad is to ef ; and therefore the Proportion of A to B being compounded of those two equal Ratios, must be duplicate of the Ratio of their Sides to each other; that is, duplicate of the Ratio of ab to eb , or of ad to ef . Q. E. D.

COROLLARY:

Hence all Triangles, Parallelograms, Prisms, Parallelepipeds, Pyramids, Cones and Cylinders are to one another respectively compared, in a Proportion compounded of that of their Heights and Bases.

3. All Triangles, and Parallelograms, Pyramids, Prisms, and Parallelepipeds; also all Cones and Cylinders, each Kind compared among themselves: If they have equal Altitudes, are in the same Proportion as their Bases: If they have equal Bases, as their Heights.

For the Bases, or Heights, will severally be common Efficient or Multipliers; and therefore must make the Products be in the same Proportion as the Multiplicand was before.

Thus, if the equal Altitude of any two Triangles, Parallelepipeds, Cones, &c. be called a , and their unequal Bases b and d : Then by the 13th of Proportion (above) $b.d::a.b.a.d$.

This Problem being of constant Use, ought to be placed among the Elements of Geometry.

CASE I.

To find Two Right Lines, whose Sum and Difference is given, reciprocally proportional to Two given Lines.

PRO

Let the two given Lines be b and c , and let the Sum of the two Lines sought, be Z : 'Tis required to find a Point where Z may be so divided, as that $b.a::e.c$.

First find m a mean proportional between b and c , which erect perpendicularly at either End of Z : Draw d parallel to Z , and where it cuts the Circle let fall m , and draw R : Then, I say, a and e are the Segments required: For $ae=mm=bc$. Q. E. D.

CASE II.

Where the Difference $= X$ is given, find m as before, which erect perpendicularly at either End of X : Then draw R from the middle Point of X , and with it, as a Radius, describe a Semi-circle on the Center d : So shall $a + X$ be the greater Line, and a the lesser sought: For $a + X$, multiplied by $a = mm = bc$, Q. E. D.

That is, in other Words, if you have the Extreams, and the Sum and Difference of 4 Proportionals, you may find the Terms severally.

PROBLEM II.

To find Two Squares, whose Sum or Difference is given reciprocally proportional to Two given Squares.

CASE

CASE I.

Let b and c be the Sides of the Squares given, and let S be equal to the Sum of the Squares required.

Find a fourth proportional to S b and c ; which suppose to be d : Then, by the former Problem find 2 Lines reciprocally proportionable to b and c , whose Sum is S : As suppose the Segments g and h , and draw the Lines a and e , which shall be the Sides of the Squares sought. For since $Sb::cd$. (or m): Therefore by Similar Triangles, $Sa::e.m$. Wherefore *ex aquo* reciprocally $b.a::e.c$. Wherefore their Squares will be also in the same Ratio. $Q: E. F.$

CASE II.

If d , the Side of a Square, which is the Difference of the Squares required, were given; make as $d.b::c.f$. a fourth Proportional; and, by the former Problem, find 2 Lines reciprocally proportional to b and c ; which suppose to be g and $d+g$, whose Difference is d : Then erect f at Right Angles, and on $d+g$, describe a Semi-circle: After which drawing a and e , they shall be the Sides of the Squares required.

Of the Proportion of Solids.

Every Parallelepiped, as ag , is to a Pyramid, $gkmnb$ of the same Base and Height, as 3 to 1.

For if you suppose the Altitude bg , to be divided into any Number of equal Parts, by Plains parallel to the Base; then because of the Pyramids $bn g k m b$, $b F D B H b$, &c. being similar, the Bases $m n g k$ and $H B D F$, will be in a Duplicate Ratio of their Altitudes bg , $D b$. That is, These Bases diminish towards the Vertex in the Proportion of the Squares of Numbers in Arithmetical Progression.

But it was proved above in *Numb. 7. of Arithmetical Progression*, That a Rank of such Quantities are Subtriple to as many, equal to the greatest; *i. e.* to such as compose, or are the Elements of the Parallelopiped: Wherefore the Parallelopiped to the Pyramid, is as 3 to 1, or the former is triple of the latter.

And this must hold in all Prisms of what Figure soever; in reference to a Pyramid of the same Base with them.

And so also in the Proportion of Cones to Cylinders; for a Cone being composed of Circles whose Peripheries decrease Arithmetically, the Planes of those Circles must be a Rank of *Secundans*, (for they are as the Squares of their Radius) and consequently the whole Rank, or the Cone, will be Subtriple of the Cylinder, which is a Rank of as many Terms equal to the greatest.

A Cylinder, Spheroid, and Cone, of the same Base and Height, are as 3, 2, and 1:

Let the Semispheroid $ATSBh c$ be divided into 3 equal Parts, as in the Figure. Then the

412

Ellipsis;

Ellipsis, as well as in the Circle) the $\square AD : \square SH :: \square GDB : \square GHB$; that is, as 3×3 (or 9) is to 5×1 (or 5). Also $AD : \square TI :: 9 : 8$. And thus it will be, if you make never so many new Bisections; that is, you'll find the Squares of the Ordinates, and consequently the Circles made on them do decrease by a Progression of odd Numbers. But a Series of such a Progression is to as many equal to greatest as 3 to 2 (by Corol 5. of *Progression Geometrical*) wherefore the Cylinder to the Spheroid is as 3 to 2, and being to the Cone as 3 to 1. The Cylinder, Spheroid, and Cone, are as 3, 2, and 1. *Q. E. D.*

PROPORTIONAL Spiral Lines. See *Spiral Lines*.

PROPOSITION, (in General) is a Thing proposed to be proved, made out, or demonstrated: And in Mathematicks, is either a *Theorem*, or a *Problem*; which see.

PROPRIETATE Probanda, is a Writ that lies for him that would prove a *Property* before the Sheriff: For where a *Property* is alledged, a *Replegiare* lieth not.

PROPTOSIS, is the Falling-down of some Part; as of the Eye, the Cawle, &c.

PRO Rata. See *Oneranda pro rata portionis*.

PROROGUE, signifies to prolong, or put off to another Day. The Difference between a *Prorogation* and an *Adjournment*, or Continuance of the Parliament, is, That by the *Prorogation* in open Court, there is a Session; and then such Bills as passed in either House, or both Houses, and had not the Assent to them, must at the next Assembly begin again: For every Session of Parliament is in Law a several Parliament; but if it be but *Adjourned* or Continued, then there is no Session, and consequently all Things continued in the same State they were in before the *Adjournment*.

PROSECUTOR, in Law, is he that follows a Cause in another's Name. See *Promoters*.

PROSODIA, is that Part of Grammar which teaches the Quantity of Syllables, distinguishing into Long and Short, &c.

PROSOPOEIA, is a violent Rhetorical Figure, wherein the Speaker addresses himself to inanimate Things as if they were living, and makes them speak as if they had Souls.

PROSPHYSIS, is a Coalition, or growing together, as when two Fingers are connected to each other.

PROSTAPHERESIS, in Astronomy, is the same with the Equation of the Orbit, or simply the Equation; and is the Difference between the *True* and *Mean Motion* of a Planet. The Angle also made by the Lines of the Planets *Mean* and *True Motion*, is called the *Prostapheresis*.

PROSTATÆ, *Adstantes*, or *Corpora Glandulosa*, are two Glandules placed near the Passage of the Seed; which (as may be guess'd) lubricate the common Passage of the Seed and Urine, and afford a kind of a Vehicle to the Seminal Matter, and are said to provoke the Titillation in Coition: Their Moisture being conveyed by certain little Tubes, which terminate in the Passage near where the Seed is ejected, and is emitted at the same time with it. The Learned *Bartholinus* has observed some such thing in Women.

PROSTASIS, a Part of Surgery, which fills up what is wanting; as we see in hollow and fistulous Ulcers filled up with Flesh by Surgery. *Blanchard.*

PROSTHESIS, in Grammar, is in the General

a Metaphism, and in particular an Addition of some Letter or Letters to the Beginning of a Word; as *Gnavus pro navus*. This is also called *Apposition*.

PROSTOMIA, the Red-tinctured Part of the Lips. *Blanchard.*

PROTECTION, in Law, hath a general and a special Signification: In the general, it is used for that Benefit and Safety which every Subject, Denison or Alien, especially secured, hath by the King's Laws. *Protection*, in the special Signification, is used for an Exemption or Immunity given by the King to a Person against Suits in Law, or other Vexations, upon Reasonable Causes moving him thereto. Of this *Fitz-Herbert* maketh two Kinds; the First he calls a *Protection, cum clausula volumus*, whereof he mentions Four Particulars: 1. A *Protection quia profecturus*, for him that is to pass over Sea in the King's Service. 2. A *Protection quia moraturus*, for him that is Abroad in the King's Service upon the Sea, or in the Marches. 3. A *Protection* for the King's Debtor: that he be not sued or attached till the King be paid his Debt: This the *Civilians* call *Moratorium*. 4. A *Protection* in the King's Service beyond Sea, or in the Marches of Scotland.

The Second Form of *Protection* is *cum clausula volumus*, which is granted most commonly to a Spiritual Company for their Immunity, from taking their Cattle by the King's Ministers: But it may be granted also to one Man Spiritual or Temporal.

PROTEST, in Law, hath two divers Applications; One is by way of Caution, to call witness, (as it were) or openly to affirm, That he doth either not at all, or but conditionally yield his Consent to any Act, or unto the Proceeding of any Judge in a Court wherein his Jurisdiction is doubtful, or to answer upon his Oath further than by Law he is bound. The other is by way of Complaint, to *Protest* a Man's Bill. For Example: If I give Money to a Merchant in France, taking his Bill of Exchange to be repaid in England by one whom he assigneth; if at my coming, I find not my self satisfied, but either delay'd or deny'd, then I go the Exchange, or other open Concourse of Merchants, and *Protest*, That I am not paid: And thereupon, if he hath any Goods remaining in any Man's Hands within the Realm, the Law of Merchants is, That I be paid out of them to my full Satisfaction.

PROTESTATION, in Law, is a Defence of Safeguard to the Party which maketh it, from being concluded by the Act he is about to do, that Issue cannot be joined by it.

PROTOPATHIA, is a Primary Disease, not caused by another.

PROTRACTING-Pin, is a fine Needle fastned in a Piece of Wood, Ivory, &c. used to prick off any Degrees and Minutes from the *Protractor*.

PROTRACTOR, is an Instrument used in Surveying: It is commonly made of a well polish'd thin Piece of Brass, and consisteth of a *Semi-circle* divided into Degrees, and a *Parallelogram* with Scales upon it, and may be of any Bigness desired. But this Instrument is so well known, that there needs no further Description.

Its Use is chiefly, To lay down an Angle of any assigned Quantity of Degrees: Or, an Angle being *Protracted*, to find the Quantity of Degrees it contains

contains readily; which is of great Use in Plotting, and making of Draughts; &c.

PROVISO, is a Condition inserted into any Deed, upon the Observance whereof the Validity of the Deed depends; but sometimes it is only a Covenant. It hath also another Signification in Matters Judicial, as if the Plaintiff or Demandant desist in prosecuting an Action, by bringing it to a Trial; the Defendant or Tenant may take out a *Venire facias* to the Sheriff, which hath in it these Words, *Proviso quod*, &c. to this End, That if the Plaintiff take out any Writ to that Purpose, the Sheriff shall summon but one Jury upon them both: In which Case, we call it going to Trial by *Proviso*.

PROW of a Ship, is that Part of her *Fore-castle* which is *Aloft*, and not in the *Hold*; and is properly that which is between the *Chase* and the *Loof*.

PRUNELLÆ Sal. See *Sal Prunella*.

PRUNIFEROUS-Trees or Shrubs, are such whose Fruit is pretty large and soft, with a Stone in the middle; in this kind the Flower adheres to the Bottom of the Base of the Fruit.

PSAMMISMUS, a Bath of dry and warm Sand, wherewith the Feet of Men in the Dropsy are dried. *Blanchard*.

PSEUDODIPTERON, is an Ancient Form of a Temple, compassed about with but one Row of Pillars, and which Row from the Wall, is at the Distance usually of two Rows of Pillars.

PSEUDOSTELLA, in Astronomy, signifies any kind of Comet or Phenomenon newly appearing in the Heavens like a Star.

PSOAS Magnus, or *Lumbalis*, is a Muscle of the Loins, which proceeds from all the Vertebrae of the Loins and their transverse Processes internally and laterally, within the Cavity of the *Abdomen*; from thence descending over the superior Part of the *Os Sacrum* and Spine of the *Ilium*, where it's joined with the fleshy Fibres of the *Iliacus Internus*, with which it's inseparably united to their partly fleshy and partly Tendinous Insertions in the inferior Part of the lesser *Trochanter* of the Thigh-Bone: It's Use is, together with the *Iliacus Internus*, to move the Thigh forwards.

PSOAS Parvus, is a Muscle of the Thigh, which arises fleshy from the superior Part of the first *Vertebra* of the Loins, internally and laterally within the *Abdomen*, immediately below the Cavity of the *Diaphragm*, whence descending obliquely inwards towards the *Pelvis Abdominis* (where it ceases to be fleshy) in a manner embracing the *Psos Magnus*, and is inserted with a thin, broad, strong Tendon, to that Part of the *Os Pubis*, where it is join'd to the *Os Ilium*: This Muscle, with its Partner Acting, assists the *Recti Abdominis* in drawing the *Ossa Pubis* upwards, as in raising our selves from a decumbent Posture. Thus Rope-Dancers hang by their Hands, and raise the inferior Parts of their Bodies, to take hold of a Rope with their Feet. Tho' their proper Action is to bend the Loins, yet their Tendons embracing the *Psos Magnus* and *Iliacus Internus*, (which we have frequently observed to extend over the inferior Parts) not unlike the *Fascia Tendinosa Cubiti* and *Lata* of the Thigh, do also Corroborate them in their Action. *Cowper*.

PSOROPHTHALMY, an *Ophthalmy*, or Inflammation of the Eyes with itching. *Blanchard*.

PSYOTICA, are cooling Medicines against the Scab. *Blanchard*.

PTARMICA, or *Sternutatoria*, are those things

which being endowed with a more piercing Acrimony than the Erthinnaceous Medicines, do so extremely irritate and shivel up the Membranes of the Brain, that it sends forth the pituitous Humour at the Nostrils, in an extraordinary Measure, and so cause Sneezing. *Blanchard*.

PTERIGOPALATINUS, or *Sphænopterygopalatinus*, is a Muscle of the *Gargareon*, whose former Appellation intimates its Progress and Insertion; the latter its Origin also. This arises from the Process of the *Os Sphenoides*, and descends according to the Length of the Interstice made by the internal *Ala* of the *Os Sphenoides* and *Musculus Pterigoidæus Internus* of the lower Jaw; and becoming Tendinous, marches over the *Processus Pterigoides*, and is inserted to the Fore-part of the *Gargareon*. The Tendon of this passes over the Pterigoidal Process, which, like a Pulley, gives it a different Power from that of the *Sphænopalatinus*, tho' they have both their Origin from the same Place. Wherefore, contrary to that, This draws the *Gargareon* downwards; which Contrivance in Nature is no less remarkable, than any of those where the like Artifice of a *Trochlea* is made use of.

PTERIGOPHARYNGÆUS, is a Muscle which arises thin and fleshy from both the Pterigoidal Processes of the *Os Cuneiforme*; also from the Root of the Tongue, and Extremities of the *Os Hyoides*; from these Places its fleshy Fibres run in a Semi-circular manner, embracing the superior and back Part of the glandulous Membrane of the *Fauces*, where they meet in a middle Line. When this Muscle acts, it brings the middle or back Part of the *Fauces* towards a Plain, by which means the *Tonsilla*, together with the rest of the Glandules, are compressed in the Evacuation of their *Mucus*, to join with the Aliment in its Descent into the *Stomach* in *Deglutition*; and at other times to promote *Screation*, in which this Muscle is the chief Instrument: That the *Tonsilla* approach towards each other, is observable, when we inspect these Parts in living Persons.

PTERIGOSTAPHYLINUS Externus, is a Muscle which moves the *Uvula*, arising from a small Protuberance upon the under Side of the Body of the *Os Sphenoides*; and goes directly to be inserted into the hinder Part of the *Uvula*.

PTERIGOSTAPHYLINUS Internus, is a Muscle which moves the *Uvula*; arising from a small Protuberance of the *Os Sphenoides*, and growing into a small round Tendon, which passes over a small Process like a Hook, of the *Processus Pterigoidæus*; from thence reverting, it's inserted into the Fore-part of the *Uvula*.

PTERYGIUM, is the Wing or round rising of the Nose or Eye, or the Process of the Bone *Sphænoïdes*, which is like a Wing. Also a membranous Excrecence above the horny Tunic of the Eye, call'd *Unguis* and *Ungula*, growing from the most part from the inner Corner, towards the Apple of the Eye, and often obscuring it. *Blanchard*.

PTERYGOIDÆUS Internus and Externus, are two Muscles arising from the *Processus Pterigoides*, or *Aliformis* of the *Os Sphenoides*. Their Use is to move the Jaw from Side to Side.

PTERYSTAPHYLINI, are Muscles of the *Uvula* or *Gargareon*, and were so named by *Riolanus*; but the Accurate Dr. *Croon* changed their Names into *Sphænopalatinus* and *Pterigopalatinus*, or *Sphænopterygopalatinus*. (See those Words.) Their Use is to give various Motions to the *Uvula*.

PTISANA, *Ptisana*, is a Decoction of Pearl-Barley, Liquorish, Raisins, &c. being a cooling pleasant Drink for one in a Fever, and much used by the French.

PTYLOSIS, is a Disease when the Brims of the Eye-lids being grown thick, the Hairs of the Eye-brows fall off. *Blanchard*.

PUBIS OS. See *Pectinis Os*.

PUDDINGS, in a Ship, are Ropes nailed to the Arms of the Main and Fore-Yards, near the Ends, and then at 3 or 4 due distances inwards one from another, in order to keep the Robbins from galling or wearing asunder upon the Yards, when the Top-sail-Sheets are haled home.

They call also those Ropes which are wound about the Rings of Anchors to save the Clinch of the Cable from being galled with the Iron, by this Name. So that when the Ring is so served, 'tis called the Pudding of the Anchor.

PUDICÆ Plantæ, the same with sensitive Plants; which see.

PUGILLUS, is an handful of any Herbs. Others interpret it, as much as may be taken up with the Thumb and two Fingers.

PUISNE, or *Puny*; the Lawyers term for Younger.

PULMONARIA Arteria, or *Vena Arteriosa*, is a Vessel in the Breast, arising immediately out of the Right Ventricle of the Heart; its Mouth is not so large as that of the *Cava*: It has three Valves, called *Segmentales* or *Semilunares*. Its Use is to carry the Blood from the right Ventricle of the Heart to the Lungs, and its Coat is double, like that of the Arteries.

PULMONARIA Vena, or *Arteria Venosa*, is a Vessel of the Heart, which discharges it self thro' the left Auricle into the Ventricle of the same side; for after it has accompanied the Wind-pipe and *Arteria Pulmonaris* in all their Branchings in the Lungs; and by its small Twigs has received the Blood out of the Artery, all these Twigs are united first into two Trunks (*viz.* the Right and Left) afterwards into one, which opens into the Left Ventricle of the Heart. This *Vein* hath no Valve in it, except that at its opening into the Left Ventricle, where at its Orifice are placed two Membranous Valves, called *Mitrales* from their Form resembling, when joined, something of a Mitre. These are very strong and firm, to sustain the violent Motion of the Blood, and to hinder it from returning back again into this Vein, and to direct its Course to the *Aorta*, whose Orifice opens in the *Systole* of the Ventricle.

PULMONARY Vessels, are those which carry the Blood from the Heart to the Lungs, and back again, being two in Number, *viz.* the *Pulmonary Vein*, and the *Pulmonary Artery*; which see.

PULPA, is the fleshy Part of Fruits, Roots, or other Bodies, which is extracted by Infusion or Boiling, and passing through a Sieve; as the Pulp of *Tamarinds*, *Alibes*, *Dates*, &c.

PULSE, by the Mathematical Naturalists, is the Term used for that Stroke with which any Medium is affected by the Motion of *Light*, *Sound*, &c. through it.

And the Admirable Sir *Isaac Newton* demonstrates, *lib. 2. prop. 48. Princip.* That the Velocities of the Pulses, in an Elastic Fluid Medium (whose Elasticity is proportionable to its Density) are in a Ratio, compounded of half the Ratio of the Elastic Force directly, and half the Ratio of the Den-

sity inversely. So that in a Medium, whose Elasticity is equal to its Density, all Pulses will be equally swift.

PULSUS, the Pulse, is the immediate Index of the Heart, by the Mediation whereof the Blood is diffused through the whole Body, and is differently affected thereby, according to the different Influx of the Animal Spirits; the Motion whereof is chiefly to be attributed to the circular and direct Fibres. Others affirm it to be the Dilatation and Contraction of the Heart and Blood. A Pulse is either natural or preternatural: of the former we have spoken already; the latter is such as is different, according to the different Circumstances of the Fibres and Animal Spirits; to wit, *strong*, *weak*, *swift*, *slow*, *equal*, *unequal*, *intermittent*, &c.

PULSES, according to Dr. *Abercromby*, are either,

Pulse Unequal, is either in respect of Time or Strength; that is, either it strikes quicker and slower, or else stronger and weaker.

Pulse Interrupted, is when the Strokes are much smaller than usual, or their Intervals much greater.

Pulse Intense, is that whose Stroke is very hard, (the Parts as it were upon a bent) or else this Strength is made up with the Multiplicity and Frequency of less Mications, as in the Heights of Fevers.

Pulse Remiss, is that whose Strokes are less quick, or less strong, and in Sickness shews more Danger than the other.

Pulse Superficial, is that which shews an exact Temperament of Body, as also a free and merry Temper of Mind.

Pulse Deep, shews a Disposition to Melancholy, Asthma's, Lethargy, &c. and is more frequent in the Aged than the Young.

Pulse Leaping, is said to portend no great Danger.

Pulse Trembling, shews great Extremity.

Pulse Wandring, is that which is sometimes felt in one place, and sometimes in another, and sometimes no where, and is never but a few Minutes before Death.

PULSION, is the driving or impelling of any thing forward. See *Attraction*.

PULVERIZATION, is reducing any Body into a fine Powder, which is done by beating *Frangible* Bodies in a Mortar; but to Pulverize *Malleable* ones, or such as will spread under the Hammer, some other Helps and Artifices must be made use of. To Pulverize Tin and Lead, proceed thus: Get a round wooden Box, which rub well with Chalk all over on the Inside; then melt the Metal, and pouring a little of it nimbly into the Box, shut the Lid, and shake the Box strongly and quick, and the Metal will be reduced by it into a Powder. And this is a very useful thing to know, tho' it be plain and easy; because by this means, these Metals are rendered fit for several Operations, and will easily be mixed with Salts or other Things.

PULVIS Fulminans. Mix well together three Parts of common Salt-petre, two Parts of Salt of Tartar, and one of common Brimstone, all finely powdered. Take half a Dram or a Dram of this Mixture, put it upon a Fire-shovel over a gentle Fire, so that it may heat, and appear to melt and change Colour gently, and in about half a quarter of an Hour it will go off with a terrible Noise, as great

great as that of a Musket, and yet without danger to any Person in the Room; for its Force is chiefly downwards. The Reason of this Effect appears to be, that the fix'd Salt of Tartar doth so lock up the Spirits of the Nitre and Sulphur, that they cannot get loose without breaking their Prisons, which when the Fire hath assisted and enabled them to do, they do it with very great Violence and Noise.

PUMP Brake, at Sea, is the Handle of the Pump, as,

PUMP Can, is the Bucket whereby they pour Water into the Pump to fetch it, and make it work when they intend to use it. And

PUMP Vale, is the Trough by which the Water runs from the Pump along the Ship-sides, that it may go out at the *Scoper-holes*.

PUNCTUM Lachrymale. See *Lachrymale Punctum*.

PUNCTUM Salient: In the Growth of an Egg, you see a little Speck or Cloud, as it were, in the innermost Tunic of it, called *Amnios*, which growing gradually thicker, acquires a kind of slimy Matter, in the middle whereof you see first this *Punctum Salient*, (a little Speck that seems to leap) afterwards the rude Body of an *Embryo*, which tends every day more and more to Perfection. *Blanchard*.

PUNY. See *Puifns*.

PUPILLA, or *Pupula*, is the opening of the Tunic of the Eye, called *Uvea*, or *Choroides*; it is round in a Man, and is capable of being contracted or dilated like a Muscle, according to the different Degree of Light the eye is Exposed to.

PUPPIS Vena, is that Vein which spreads it self about the hinder Part of the Head.

PURCHASE: This Word hath the same Sense at Sea, as *Draw* has a-Shore; thus they say, *The Capstan Purchases apace*; that is, draws in the Cable apace. And when they cannot draw or hale in any thing with the Tackle, they say, *The Tackle will not Purchase*.

PURFLEW; the Term in Heraldry to express *Ermines*, *Peau*, or any of the Furs when they compose a *Bordure* round a Coat of Arms. Thus they say, he Beareth *Gules*, a *Bordure Purflew*, *Verry*; meaning that the *Bordure* is *Verry*.

PURGATION, *Purging*, is an Excretory Motion quick and frequent, proceeding from a quick and orderly Contraction of the Carneous Fibres of the Stomach and Intestines, whereby the Chyle and Excrements, and corrupted Humours, either bred or sent there from other Parts, are protruded from Part to Part, till they be quite excluded the Body. *Blanchard*.

PURGATION, in Law, is the clearing of a Man's self of a Crime whereof he is generally suspected, and of the same accused before the Judge; and is either *Canonical* or *Vulgar*. The *Canonical*, is that which is prescribed by *Canon-Law*, the Form thereof is usually thus in the Spiritual Court: The Man suspected takes his Oath, that he is clear of the Fault objected, and brings so many of his Honest Neighbours, being not above Twelve, as the Court shall assign him, to swear upon their Conscience and Credulity, that he Swaereth truly. *Vulgar Purgation* was by *Fire* or *Water*, or by *Combat*, used both by Infidels and Christians, till by the *Canon Law* abolished: But *Combat* may be still practised by the Laws of the Realm in Causes doubtful, and where there is want of Evidence and other Proof, if the Defendant chuse rather the Combat than other Tryal.

PURIFICATION of a Metal, in Chymistry, signifies its being purged or cleaned from the Mixture of all other Metals.

'Tis chiefly used about Gold and Silver. The best

Purification of Gold, is by Antimony, in this manner: Put the Gold in a Crucible, make it red hot; and when it begins to melt, pour upon it by degrees four times its Weight of Antimony in Powder; the Gold will presently melt; continue a very strong Fire, till you perceive the Metal to sparkle; then take the Crucible out of the Fire, and knock it, that the Gold may sink to the Bottom; break it when 'tis cold, and separate the fine Gold, which is called the *Regule*, from the drossy Part.

After this, melt the *Regule* again over a strong Fire in a Crucible; and when it begins to melt, throw into it, by little and little, three times its Weight of *Salt-Petre*; continue a very strong Fire to keep the Matter in constant Fusion; and when the Fumes are all gone, and the Metal appears bright and clear, cast it into an Iron Mortar greased and warmed; or else if you don't value the Crucible, leave it in that to cool, and break the Crucible before 'tis quite cold; and then separate the *Regule* from its Dross remaining at the Top, the Gold will be very pure.

There are several other ways of Purifying Gold, as the *Depart* and *Cementation*, which see under those Words: But this is the best of all.

Red Gold is less valuable, as containing most Copper; the Yellow is better, and it should remain Yellow while 'tis in the Fire.

Purification of Silver, is made in the Coppel thus:

Heat the Coppel gently and by degrees, till it grow red hot; then cast into it four or five times as much Lead as you design to purify Silver: The Lead will soon melt, and fill the Sides of the Coppel; then put the Silver into the midst of the melting Lead, and it also will presently melt; then lay Wood all about and over the Coppel, and blow the Flame so that it may reverberate on the Matter, the Impurities of which will by this means mix with the Lead, and the Silver will remain pure and unmixed in the middle of the Coppel; and the Lead, mixed with the drossy Parts of the Silver, will lie on the Sides like a Scum: This Scum is to be taken off with a Spoon, or other Instrument, and is what is called *Litharge*; which, according to the degree of the Calcination it hath endured, is of divers Colours, and sometimes is called *Litharge* of Gold, and sometimes *Litharge* of Silver.

PURLUE, or *Purlieu*, from the *French* *Pur*, i. e. *Parus*, and *Lieu*, i. e. *Locus*, is all that Ground near any Forest, which being anciently made Forest, is afterwards, by Perambulations, severed again from the same, and exempted from that Servitude that was formerly laid upon it: And he that Walketh or Courseth within that Circuit, is not liable to the Laws and Penalties incurred by them which hunt within the Precincts of the Forest.

PURPURE, the Heralds Term for a Colour consisting of much Red and a little Black: And this Term is used in the Coats of all Persons below the degree of Noble; but in the Coats of Noblemen, 'tis called *Anetbist*; and in those of Sovereign Princes, 'tis called *Mercury*. 'Tis expressed in Engraving by

Lines

Lines drawn athwart the Esclutcheon, beginning at the *Dexter Point*.

PURSER, an Officer in the King's Ship, who receives her Victuals from the Victualler, and is to take care that it be in good Condition, and well laid up and stowed: His Office is also to keep a List of the Men and Boys belonging to the Ship, and to set down exactly the Days of each Man's Admittance into Pay, that so the Pay-Master, or Treasurer of the Navy, may issue out his Disbursements, and Pay Men off according to the *Purser's Books*.

PURSUIVANT. See *Poursuivant*.

PURVEYANCE. See *Purveyance*.

PURVEYOR. See *Purveyor*.

PUTREFACTION, is a slow kind of Corruption in Bodies, wrought generally by the Moisture of the Air, or some other ambient Fluid, which penetrating unto the Pores of Bodies, and being agitated in them, doth fetch or force out some of the more subtil and agile Parts of Bodies, loosen and dislocate the Parts in general one from another, and thereby quite change the Texture, and sometimes the Figure of the *Mixt*, from what it was before.

PUTTOCKS, or *Puttock Shrowds*, are small Shrowds which go from the Shrowds of the Main-Mast, Fore-mast, and Mizen-Mast, to the Top-Mast Shrowds. And if there be any Top Gallant-Masts on the Top-masts, there are *Puttocks* to go from the Top-Mast Shrowds into those. These *Puttocks* are at the Bottom seized to a Staff, or to some Rope which is seized to a Plate of Iron, or to a Dead-man's Eye, to which the Laniards of the Fore-Mast Shrowds do come.

PYCNOSTYLE, in Architecture, is a Building where the Pillars stand very close one to another, one Diameter and a half of the Column being only allowed for the *Intercolumniation*.

PYLORUS, or *Janitor*, is the lower Orifice of the Ventricle, which lets the Meat out of the Stomach into the Intestines; Dr. *Willis* calls the Beginning of the Pylorus, where its Coats are thickest, the *Antrum*.

PYRAMID, in Geometry, is a Solid Figure whose Base is a Polygon, and whose Sides are plain Triangles, their several Tops meeting together in one Point.

The Solid Content of

A *Pyramid*, is $=$ to $\frac{1}{3}$ of the Perpendicular Altitude multiplied by the Base; because a Pyramid is $\frac{1}{3}$ of a Prism of the same Height and Base. 7^e. 12. *Eucl.* which see also proved under the Word *Parallelopiped* (the same with Prism.)

The superficial Area of a *Pyramid*, is found by adding the Area of all the Triangles, whereof the Sides of the *Pyramid* consist, into one Sum: For the whole external Surface (except the Base) of any *Pyramid*, is nothing but a System of as many Triangles as the *Pyramid* has Sides.

If a *Pyramid* be cut with a Plane Parallel to the Base, the Surface of that Truncated *Pyramid* comprehended between the Parallel Lines, is found by

Subtracting the Surface of the *Pyramid* cut off from the Surface of the whole *Pyramid*.

Also the external Surface of a right *Pyramid*, that stands on a regular Polygon Base, is equal to a Triangle, whose Altitude is equal to the Altitude of one of the Triangles which compose it, and its Base to the whole Circumference of the Base of the *Pyramid*.

Whence therefore the Surface of a right *Cone*, (for a *Cone* is but a *Pyramid* of infinite Sides) is equal to a Triangle, whose Height is the Side of the *Cone*, and the Base equal to the Circumference of the Base of the *Cone*.

PYRAMIDALIA, are Vessels which prepare the Seed; of which in their proper place. Also Muscles of the Nostrils, and of the *Abdomen*, called *Pyramidales*, or of a Pyramidical Figure. Also two Strings of Marrow about the Basis of the oblongated Marrow.

PYRAMIDALIA Corpora. See *Corpora Pyramidalia*.

PYRAMIDALIS, *sive Succenturiatus Musculus*, one of the Muscles of the Abdomen, lying on the Rectus, helping in Conjunction with the rest, to compress the Abdomen, and to exclude its Contents: Mr. *Cowper* thinks it to have also a peculiar Use in compressing the Bladder.

PYRAMIDOID. See *Parabolick Pyramidoid*.

PYRIFORMIS, *sive Iliacus externus*, is a Muscle of the Thigh, which receives its first Name from its Figure, the second from its Situation; Its Beginning is round and fleshy from the inferior and internal Part of the *Os Sacrum*, where it respects the *Pelvis* of the *Abdomen*, and defending obliquely in the great *Sinus* of the *Os Ilium*, above the acute Process of the *Iscium*, and joining with the *Gluteus Medius*, it's inserted by a round Tendon to the superior Part of the Root of the *Great Trochanter*. This moves the *Os Femoris* somewhat upwards, and turns it outwards.

PYROTECHNICK-ART, is the Art of Chymistry, so called from the Greek *πῦρ* Fire, and *τεχνή* Art; because Fire is the chief Instrument the Chymist makes use of in the separating and collecting the purer Substances of mixt Bodies.

PYROTECHNIA, the same with *Chymia*.

PYROTICA, or *Urenia*, are Medicines virtually Hot, which being applied to Human Bodies, grow extremely hot; because that having Particles and Pores so ordered, that Vapours and Humours insinuate into them, the subtil Matter finds such Passages, that it being moved extreme violently, forces certain earthy, hard, and acute Particles, which float in the Passages upon the Neighbouring Parts with great Imperuosity, and so excites an Heat which corrupts or changes differently, according to the Diversity of its Motion and the Particles that are moved. Such are things that cause Redness, that Blister, that Ripen or Rot, that close up, and bring Wounds to a Crust, and that pull Hairs out of the Body. *Blanchard*.

PYRRICHIUS, is the Foot of a *Latin Verse* consisting of two Syllables, and both short.

PYTHAGOREAN System, is the same with the *Copernican*, but is so called, as being maintained by *Pythagoras* and his Followers, and therefore is the most ancient of any. In this the Sun is supposed at Rest in the Centre of our System of Planets, and the Earth to be carried round him annually in a Track or Path between *Venus* and *Mars*. I shall only add here an account how

The *Phænomena* of Day and Night, and the *vicissitudes* of Seasons are accounted for, according to the *Pythagorean* System, where the Earth moves round the Sun.

Let $\Gamma \Theta \Xi \Psi$ represent the Earth's Annual Orbit round the Sun at \odot . The Plane of which Orbit if infinitely produced among the Fix'd Stars, will describe that Circle which we call the *Ecliptick*. In this Orbit, let the Earth be supposed to move from Γ to Θ , next to Π , &c. and let the Earth be represented by the *Epicycles* $NA \Xi SQN$, in which N and S are the North and South Poles, and the Line NS the Earth's Axis always keeping Parallel to it self; and ΞQ , the Equator, whose Plane is inclined to the *Ecliptick* with an Angle of $23^{\circ} 30'$, which is the Complement of $66^{\circ} 30'$, the Angle that the Earth's Axis (perpendicular to the Plane of the Equator) makes with the *Ecliptick*.

Suppose then the Earth in Ξ (then will the Sun appear to be in Γ , the first Point of its Annual

Orbit) and the Earth so turning it self to the Sun, that the Axis of its Motion may be Perpendicular to a Line drawn from the Center of the Sun to that of the Earth, then will the Earth's Equator appear Coincident with the Celestial Equinoctial; and the Sun will appear to be just in the middle between the two Poles, and to send his Light equally towards both of them, and as far as both of them (for the Sun always illuminates one half of the Globe.) Wherefore as that Hemisphere of it (*viz.* $TNLCP$) which is now turned towards him, is *Enlightened*, so the other (behind) is now supposed to be in *Darkness*. And because the Earth revolves round its Axis NS in 24 Hours, which Axis is now at Right-Angles with the Line $\Gamma \odot \Xi$ connecting the Centres of the Earth and Sun, every Point of the Equator ΞQ , and of the Tropicks TC and OP , and of all other Parallels to the Equator, will be as much in the Light as in the Dark, in every Diurnal Revolution; and consequently the Days and Nights will be Equal, at that Time, all over the Earth.

But as the Earth moves further on in the Annual Orbit towards Π and χ , the Plane of the Terrestrial Equator will be then no more direct to the Sun, but will subside towards the South, and therefore the Sun will appear to go as much toward the North Pole, and as it were from the Equator in the Heavens; for the Earth being ap-

parently at Rest, its Equator will be so too, and consequently the Celestial Equinoctial will appear to change from its Position by a diurnal Motion, and the Sun will appear to move also, because it changes its Position in respect to the Equinoctial in the Heavens. And the Sun's Light which before reached just as far as the Poles N and S, will now go beyond N, and will fall as much short of S.

But when the Earth is come to ϖ , the Sun then will appear to be in \odot , where he will seem most of all to decline from the Equator towards the North, viz. as much as is the Angle of Inclination between the Plane of the Equator and that of the Ecliptick; and the Sun will then seem to move all Day in the Circle TC, which is a Parallel to the Equator at $23^{\circ} 30'$ distance, and is called the Tropick of \odot . The Earth being thus posited, 'tis apparent that the Sun's Rays enlightening always one half of it, will now reach beyond the Pole N, as far as L, and fall short of the Southern Pole S, by the Ark SM = to LN = to $23^{\circ} 30'$ the Inclination of the Ecliptick to the Equator; and therefore if 2 lesser Circles are imagined to be there drawn on the Earth, they will be the Polar Circles as AL and MG: And 'tis plain that that Part of the Earth which lies between the Polar Circle AL and the Pole, will enjoy perpetual Day, notwithstanding the Earth's diurnal Motion, as the opposite Part within the Antarctick Circle MG will be in continual Darkness. The Earth being thus in ϖ , and the \odot appearing in \odot , 'tis plain also that of every Circle parallel to the Equator in the North-

ern Hemisphere, the greatest Part, or more than a Semicircle, will be Illuminated; but from the Equator towards the South Pole, the greatest Part of every Parallel will be in Darkness: Wherefore in all Places lying to the Northward of the Equator, the Days will be longer than the Nights; that is, it will be Summer; as in the Southern Hemisphere the Nights will be longer than the Days, where it will be Winter; and this in Proportion to the Place's Distance from the Equator: But to those who live under the Equator, or the Line, (as the Seamen call it) the Days and Nights will be equal now, and at all Times of the Year.

The Earth moving on its Annual Orbit from ϖ into \mathfrak{X} , and so to Υ it will arrive at the other Equinoctial Point, and then the Sun will appear to be in \mathfrak{X} , and all Things will be the same as when the Earth was in \mathfrak{X} , which hath been above deliver'd.

The Earth going on in its Orbit from Υ , to Π , and so to \odot , the Sun will then appear to be in ϖ , and consequently in the Winter Tropick, as we call it in reference to our Position toward the Sun: And now the State of Things with us will be the Reverse of what it was when the Earth was in ϖ , our Nights will be longer than our Days, &c. as appears from the Figure; and it will fare with us Inhabitants of the Northern Hemisphere, in all respects, as it did then with the Inhabitants of the Southern.

PYXIS, is the Cavity of the Hip-Bone, which is called *Acetabulum*.

QUA

QUADRANGLE, or *Quadrangular Figure*, in Geometry, is that which hath no more than four Angles.

QUADRANT, is an Arch which is the fourth Part of a Circle, containing 90° deg^r. And oftentimes the space contained between a Quadrantal Ark, and two Radius perpendicular one to another in the Centre of the Circle, is called a *Quadrant*; from the Figure of which the following Instrument takes its Name, which is called a

Quadrant, and is a very useful and ready Instrument, when well made, for many Operations. The Limb of it is divided into 60 Degrees, and as many Parts of a Degree as the Signess of the Instrument will bear, and this by means of a String and Plummer, (or Label, if it be a screw'd Limb) gives you the Sun's Altitude, or that of any Star or other Object above the Horizon, reckoned from that Edge of the Quadrant where the Sights are not placed. In *Collin's* Quadrant, this Limb is also divided into Time, and numbred accordingly, and then it serves very readily to find the Sun's right Ascension either in Degrees or Time, and to shew the Hour of the Day there to a Minute, by his Altitude. Next to the Limb, in *Center's* Quadrant, is the Calendar of the Months placed; but in *Collin's* 'tis put in four little Quadrantal Arks next the Center of the Instrument, having an Ark also of the Sun's Declination fitted thereunto; so that the String laid to the Day of the Month, will shew the Declination; or laid to the Declina-

QUA

tion, will give the Day of the Month, in the Quadrantal Ark proper for that Season of the Year. Next below this, in *Mr. Collin's* Quadrant (which I judge to be the best) is the Projection, which is a 4th Part of *Stoffler's Astrolabe*, inverted and fitted to the Latitude of London; of which those Lines which run from the Right Hand towards the Left are Parallels of Altitude, and those which cross them are Azimuths. In the Projection are drawn the two Eclipticks, with the Characters of the Signs upon them, and the two Horizons, all issuing from the same Point; and up and down in the Projection are placed such eminent fixed Stars, as are between the Tropicks. Next below the Projection is the *Quadrat* and Line of Shadows, being only a Line of Natural Tangents to the Arks of the Limb; and by its help, the Heights of Towers, Steeples, &c. may be pretty exactly taken.

QUADRANT of Altitude, is part of the Figure of an artificial Globe, being a thin Brass Plate divided into 90 Degrees, and marked upwards with 10, 20, 30, &c. being rivetted to a Brass Nut which is fitted to the Meridian, and hath a Screw in it, to screw upon any Degree of the Meridian; when it is used, 'tis most commonly screw'd to the Zenith. Its Use is for measuring Altitudes, to find Amplitudes and Azimuths, and describing Almucantars.

QUADRANT Astronomical, see *Astronomical Quadrant*.

QUADRANT *Triangular.* See *Triangular Quadrant.*

QUADRANTAL Triangle, is a Spherick Triangle, one of whose Sides (at least) is a Quadrant, and one Angle Right.

QUADRAT, and Line of Shadows on a Quadrant, are only a Line of natural Tangents to the Arks of the Limb, and are placed there in order to measure Altitudes readily, for it will always be; as the Radius to the Tangent of the Angle of Altitude at the Place of Observation; (that is, to the Parts of the Quadrat or Shadows cut by the String) :: so is the Distance between the Station and Foot of the Object to its Height above the Eye.

Quadratick Equations.

QUADRATICK Equations, are such as retain on the unknown Side, the Square of the Root or Number sought; and are of two sorts.

I. *Simple Quadraticks*, where the Square of the unknown Root is equal to the absolute Number given, as $aa = 36$, $ee = 146$, $yy = 133225$. And for the Solution of those, there needs only to Extract the Square Root out of the known Number, and that is the Value of the Root or Quantity sought: Thus the Value of a in the First Equation is equal to 6, in the Second $e = 12$ and a little more, it being a Surd Root. And in the Third Example $y = 365$.

II. *Affected Quadraticks*, are such as have between the highest Power of the unknown Number and the absolute Number given, some intermediate Power of the unknown Number, as $aa + 2ba = 100$.

And this Equation is properly called *Affected*; because the unknown Root a is Multiplied into the Coefficient $2b$.

The Original of *Affected Equations*, the Ingenious Mr. Harriot thus derives: Let a be $= +b$, or $a = -c$, then by Transposition will $a - b = 0$, and $a + c = 0$. And then multiplying one by another, the Product is $aa - ab + ca - bc = 0$.

And this he properly calls an *Original Equation*. From which, or others of the same Kind, Transposing bc over to the other Side with a contrary Sign, he gains such an Equation as this, $aa - ab + ca = bc$, which he calls a Canonical Equation.

And from hence, by putting Examples in all Cases, he shews, that every possible Quadratick Equation hath two real Roots, according to the Dimensions of the highest Power; as being made up by the Multiplication of two simple Equations. And that these two Roots may be either both Affirmative, or both Negative; and that sometimes they are equal to each other, and sometimes not. And from hence he finds, that the absolute Number bc is always the Rectangle of the two Roots b and c , (or of the two Values of a): And that if it have a positive Sign, the two Roots have like Signs, but if a Negative one, unlike.

And, That the Coefficient of the middle Term is always the *Aggregate of both the Roots with contrary Signs*; and consequently their *Difference*, when without its Sign. See more in his *Second Section*, and in *Wallis's Algebra*, p. 132, §7c.

And when in such Kind of Quadraticks as these, the Index or Exponents of the Dimensions of the unknown Root are in Arithmetical Proportion, that is, as in this Equation, $aa + 2ba = 100$, the Index of aa is 2, the Index of $2ba$ is 1, and the Index of 100 is 0; then may the Root be easily found out by the following Method.

All Equations of this Rank will be in one of these three Forms.

$$\begin{array}{l} aa + a = dR \\ aa - a = dR \\ as - aa = R \end{array} \quad \left\{ \begin{array}{l} * \text{ Some make four Forms;} \\ \text{but at long run it comes} \\ \text{to the same Thing.} \end{array} \right.$$

In all which Forms, R , the absolute Number given, is a Rectangle or Product made out of the two Quantities or Roots sought, a Greater and a Lesser.

Of which in the *First Form*, where all is Affirmative, the Coefficient d is the Difference between those two Quantities or Roots; and a is the Lesser of them, as is plain if you suppose the two Roots (as *Oughtred* doth) to be a the greater, and e the Lesser. For then let $d = x$ be the Difference between them: So that $e + x = a$. If then you multiply each Part by e , it will be $ee + ex = ae$; from whence it appears also plainly, that ae is equal to R , the absolute Number given, or equal to the Rectangle of the two unknown Roots a and e , of which in this Form, the Coefficient x or d is equal to the Difference between them, and e is the Lesser of them.

In the *Second Form*, The Coefficient d is the Difference of the two Roots as before, but a there represents the Greater of them, as is plain by putting (because the Sign is Negative) $a - x = e$, and multiplying each Part by a , it produces $aa - ax = ae$, the second Form, where x or d the Coefficient is the Difference of the two unknown Roots; and a represents the greater of them.

In the *Third Form*, where the highest Power is Negative, the Coefficient s is the Sum of the two Quantities or Roots sought; and a the Affirmative Root sought, may be either the Bigger or the Lesser of them. For let (because the highest Power is Negative) $z - a = e$; then multiplying both by a it will $za - aa = ae = R$. or if $z - e$ had been put equal to a , then it would have been $ze - ee = ae$, by multiplying all by e .

So that this Method shews you the Original Constitution of these Forms, and the Nature and Office of each Member of them.

From all which may be found this general Canon for the Solution of Quadratick Equations, according to this Method.

Multiply the absolute Number by 4, and to the Product add the Square of the Coefficient, then Extract the Square Root of that Sum: Which Root shall be the Sum of the two Numbers sought. Then to or from the half of that Root, add and subtract half the Coefficient, and the Sum and Remainder are the two Roots required.

For the particular Solution of affected Quadratics there are three Ways.

I. *That of Oughtred, who proceeds in this Method.*

In all the three Forms, there is given either the Rectangle and Sum, or the Rectangle and Difference of the two unknown Quantities; whence 'tis very easy to find either the Difference in the former, or the Sum in the latter Case: And then having the Sum and Difference of any two unknown Quantities, the Quantities themselves will soon be known.

Thus in the first Form, let $aa + da = R$.

Here is given R the Rectangle of the Roots, d their Difference; and 'tis known that a represents the lesser of them. Let S stand for the Sum to be sought.

Let $a + e = S$ and $a - e = d$, Then $aa + 2ae + ee = SS$, and $aa - 2ae + ee = dd$, Subtract the latter from the former, and there remains only $4ae = 4R$. Wherefore $SS - dd = 4R$.

You may therefore by simple Algebra find that $4R = SS - dd$, and consequently that $4R + dd = SS$, and therefore S is known; and then having S and d , a the lesser Root will be known too, for $\frac{1}{2}S - \frac{1}{2}d = a$.

Again, in the second Form. Let $aa - ad = R$.

Here d and R (as before) the Difference and Rectangle of the two Roots are given; and a the greater of them; wherefore 'tis easy to find S the Sum, and then $\frac{1}{2}S + \frac{1}{2}d = a$.

In the third Form, where $Sa - aa = R$.

There is given the Coefficient S = Sum of the unknown Roots, A the Rectangle between them; and a may be either the bigger or lesser of them; Here therefore to find d the Difference.

Because $SS - dd = 4R$, therefore $SS + 4A = dd$, and consequently d is known; and then $\frac{1}{2}S + \frac{1}{2}d =$ greater, and $\frac{1}{2}S - \frac{1}{2}d =$ lesser.

II. *The Solution of Adjected Quadratick Equations, by the Method of Compleating the Square.*

Which is by Mr. Harriot, thus: Since in every one of the three Forms of Quadraticks, one quarter of the Square of the Coefficient will make the unknown Side of the Equation a Compleat Square, whose true Root will be $a + \frac{1}{2}d$ (or whatever Letter else be the Coefficient.) 'Tis plain by this means, an Adjected Quadratick Equation, may be reduced to a Simple one.

Wherefore,

In the first Form, where all the Species are Affirmative.

$$\text{Let } aa + da = R$$

If $\frac{1}{4}d$ be added to the unknown Side, it will be a perfect Square $aa + da + \frac{1}{4}dd$, whose true Root is $a + \frac{1}{2}d$.

Add then, $\frac{1}{4}dd$ to R, and $R + \frac{1}{4}dd$ will be a perfect Square Number and known: Whose Square Root extracted in Numbers, will be equal

to $a + \frac{1}{2}d$; and consequently, a will be equal to that Root, when d is taken from it, and so a will be known.

The Practical Rule is this,

To the absolute Number, add $\frac{1}{4}$ of the Square of the Coefficient, (or the Square of half the Coefficient) and extract the Root of the Sum; then from that Root found in Numbers, subtract $\frac{1}{2}$ the Coefficient, and the Remainder is a , the lesser of the two Roots, or Values of a .

Example.

$$\begin{aligned} aa + da &= R \\ \text{or } aa + 16a &= 36 \\ \text{to } 36 &= R \\ \text{add } 64 &= \frac{1}{4}dd \\ \hline \sqrt{100} &= 10 = a + \frac{1}{2}d \\ \text{but } \frac{1}{2}d &= 8 \end{aligned}$$

therefore $2 = a$.

In the Second Form.

$$\text{Let } aa - da = R.$$

Proceed in all respects as in the first Form, only you must at last add $\frac{1}{2}$ the Coefficient to the Root Extracted out of the absolute Number instead of taking it from it, as before: because here a represents the greater Root; and thus, if $aa - 16a = 36$, a will be found = to 18.

In the Third Form.

$$\text{Let } Sa - aa = R.$$

Here because the highest Power is Negative, 'tis impossible any such Root can be found that will produce $-aa$; wherefore you must imagine all the Signs changed, and then it will stand thus; $-Sa + aa = -R$, or putting the highest Power first, $aa - Sa = -R$.

In this Form, the Coefficient is the Sum of the two Roots, and a may be either of them.

And here the absolute Number is so determined as that it cannot be greater than the Square of half the Coefficient: For,

If the absolute Number be = to the Square of half the Coefficient, the Roots are equal.

The Practical Rule then is this:

From the Square of half the Coefficient, take the absolute Number given; and extract the Square Root of the Remainder; which Root either added to, or subtracted from half the Coefficient, will give accordingly the greater or lesser Value of a .

$$\begin{aligned} \text{Thus: If } 20a - aa &= -36 \\ \text{or } Sa - aa &= -R \\ \text{From } 100 &= \frac{1}{4}SS \\ \text{take } 36 &= R \\ \hline \sqrt{64} &= 8 \\ \text{now } 10 + 8 &= 18 \text{ the greater Root,} \\ \text{and } 10 - 8 &= 2 \text{ the lesser Root.} \end{aligned}$$

III. To

III. To Solve Quadratick Adfected Equations, by taking away the Second Term.

In any of the Three Forms, if the Coefficient have a Negative Sign, put $e + \frac{1}{2}d$; but if it have an Affirmative Sign, put $e - \frac{1}{2}d$; instead of a , the Root of the highest unknown Power.

$$\text{Then will } ee + ed + \frac{1}{4}dd = aa \\ \text{also } \overline{e + \frac{1}{2}d} + \frac{1}{4}dd = \overline{a}d.$$

And these two Quantities added together, must be equal to the Absolute Number given, and the Equation will become a Simple one.

In the First Form,

$$aa + da = R, \text{ or } aa + 16a = 36. \\ \text{Let } e - \frac{1}{2}d = a,$$

$$\text{Then will } ee - ed + \frac{1}{4}dd = aa \\ \text{and } ed - \frac{1}{4}dd = ad \\ \text{which added together make } ee - \frac{1}{4}dd = R \\ \text{Therefore } ee = R + \frac{1}{4}dd$$

$$\text{And consequently } e = \sqrt{R + \frac{1}{4}dd}$$

$$\text{But } e - \frac{1}{2}d = a, \\ \text{Therefore } e = a + \frac{1}{2}d$$

$$\text{Consequently } a + \frac{1}{2}d = \sqrt{R + \frac{1}{4}dd}$$

$$\text{Wherefore } a = \sqrt{R + \frac{1}{4}dd} - \frac{1}{2}d. Q.E.D.$$

And since $a + \frac{1}{2}d = \sqrt{R + \frac{1}{4}dd}$: If each part of the Equation be Squared, there will arise,

$$aa + ad + \frac{1}{4}dd = R + \frac{1}{4}dd$$

Which is the other common Canon for Solving Quadraticks, by adding to each Part the Square of half the Coefficient, in order to compleat the Square.

In the Second Form,

$$aa - ad - R. \\ \text{Let } e + \frac{1}{2}d = a.$$

$$\text{Then is } ee + ed + \frac{1}{4}dd = aa \\ \text{and } -ed - \frac{1}{4}dd = ad$$

$$\text{These added make } ee - \frac{1}{4}dd = R \\ \text{Therefore } ee = R + \frac{1}{4}dd.$$

$$\text{and } e = \sqrt{R + \frac{1}{4}dd}.$$

$$\text{but } e + \frac{1}{2}d = a \\ \text{Therefore } e = a - \frac{1}{2}d.$$

$$\text{And consequently } a - \frac{1}{2}d = \sqrt{R + \frac{1}{4}dd}.$$

$$\text{Wherefore } a = \sqrt{R + \frac{1}{4}dd} + \frac{1}{2}d. \\ Q. E. D.$$

And since $a - \frac{1}{2}d = \sqrt{R + \frac{1}{4}dd}$; if each Side of the Equation be Squared, you will have,

$$aa - ad + \frac{1}{4}dd = R + \frac{1}{4}dd.$$

Which is the common Canon for Solving Equations by completing the Square.

In the Third Form,

$$da - aa \geq R.$$

Which Form must be thus changed,

$$aa - da = -R.$$

$$\text{Then make as before, } e + \frac{1}{2}d = a \\ \text{and then } ee + ed + \frac{1}{4}dd = aa \\ \text{and } -ed - \frac{1}{4}dd = -ad.$$

$$\text{Whose Sum is } ee - \frac{1}{4}dd = -R \\ \text{Then is } ee = \frac{1}{4}dd - R.$$

$$\text{And } e = \sqrt{\frac{1}{4}dd - R}.$$

$$\text{And since, } e + \frac{1}{2}d = a \\ e = a - \frac{1}{2}d = (\sqrt{\frac{1}{4}dd - R}).$$

Wherefore (because there are two Positive Roots in this Form)

$$a = \sqrt{\frac{1}{4}dd - R} + \frac{1}{2}d.$$

But the Value of a is Ambiguous, and you must generally try both Roots before you can find which will Solve the Question; Whereas in the other two Forms, the first a found, will be that required.

N. B. In this way of Solving *Quadraticks*, the known Quantity added to, or Subtracted from e , must be always half the Coefficient.

Construction of Adfected Quadraticks.

The Construction of *Simple Quadraticks*, you have before under *Simple Equations*: That of *Adfected* ones, is easily done many ways.

I. In the First Form of Quadraticks, let $aa + da = R$. Then by the common Method of Solution, $a = \sqrt{R + \frac{dd}{4}} - \frac{d}{2}.$

Where

Wherefore describe a Circle whose Radius shall be $CT = \frac{1}{2}d$, and make the Tangent $TE = \sqrt{\frac{1}{2}R}$, drawing also the Secant SCE ; then will $CE =$

$$\sqrt{\frac{1}{2}R + \frac{d^2}{4}} \text{ (by 47. e. 1. Euc.) and consequently}$$

$$nE = \sqrt{\frac{1}{2}R + \frac{d^2}{4}} - \frac{1}{2}d = a.$$

II. In the Second Form, where $aa - da = R$,

a will be equal to $\sqrt{\frac{1}{2}R + \frac{d^2}{4} + \frac{d}{2}}$. And consequently, The same Construction and Diagram will serve here, which was used in the first Form: And the Root will be represented by $SE = \sqrt{\frac{1}{2}R + \frac{d^2}{4}} + R \frac{1}{2}d$.

III. In the Third Form, where $Sa - aa = R$,

a will be equal to $\frac{S}{2} + \sqrt{\frac{SS}{4} - R}$, and here the Root a hath two real Values; make $CT (= \frac{1}{2}S)$ the Radius of a Circle, and erect the

Perpendicular $ET = \sqrt{\frac{1}{2}R}$; then draw EQ Parallel to CT , and NO Parallel to ET , draw also the Radius CN . Then will (by

$$47. e. 1 \text{ Euclid.}) CO = \sqrt{\frac{SS}{4} - R}, \text{ and}$$

$$\text{consequently, } BO = \frac{S}{2} + \sqrt{\frac{SS}{4} - R} =$$

the greater Root a , and $OT = \frac{S}{2} - \sqrt{\frac{SS}{4} - R}$. Or the two Roots will be QN , and NE ; equal to the two former.

Dr. Wallis's way of Construing the Three Forms of all Quadratick Equations, according to Mr. Oughtred's Method of Solution.

Draw two Concentrick Circles, and let the Diameter of the greater be called S , and the Diameter of the lesser D , the Sum and Difference of the Roots found. Wherefore H and d will represent the half Sum and half Difference of the Roots.

Since therefore Oughtred's Theorem, as is shew'd above, is, That $SS - DD = 4R$. Wherefore $SS - DD = R$

fore, : divide all by 4 : $\frac{SS - DD}{4} = R$. Let

$\frac{1}{2}R$ be made a Tangent to the lesser, or a Right-Sine to the greater Circle, as you see in the Figure according as D , or S , is given: And draw also the Hypotenuse H . Then will the Base of the Triangle be d . And $HH - dd = R$ (by 47. e. 1.)

That is, $\frac{SS - DD}{4} = R$. Wherefore by Trans-

position, $\frac{4}{4}HH = R + dd$, and therefore $H = \sqrt{\frac{1}{2}R + dd}$. And consequently, if it had been in the first or second Forms, where d and R were given, H will also be found. Or if H had been given, and d required as in the third Form, since, $HH = R + dd$: Therefore, $HH - R = dd$; And $\sqrt{HH - R} = d$: And having thus found A and d , the $\frac{1}{2}$ Sum and $\frac{1}{2}$ Difference of the two Roots: Then $H + d (= op)$ will be the greater Root a , and $H - d (= pn)$ will be the lesser, which will be Affirmative or Negative, according to the Form and Circumstances of the Equation.

A Question and Problems in Affected Quadratick Equations.

QUESTION.

Two Men have each a certain number of Crowns, whose Sum Subtracted from the Sum of their Squares, leaves $R = 78$: But their Sum added to the Product of the two Numbers, makes $39 = S$. How many Crowns had each?

For the unknown Sum of the Numbers put $2a$. And for their Difference $2e$.

For then the Numbers may be thus Noted, $a + e =$ the greater, and $a - e =$ the lesser.

Then

Then,

	1	$2aa + 2ee = \text{Sum of their Sq.}$
$x - 2a$	2	$2aa + 2ee - 2a = R: \text{ by the State of the Question.}$
$2 \div 2$	3	$aa + ee - a = \frac{R}{2} \quad 39 = S.$
by Transp.	4	$39 - aa + a = ee \text{ which Step will at last help to find } e.$
$\square + 2a$	5	$aa - ee + 2a = S. \text{ Their Product added to their Sum.}$
by Transp.	6	$aa + 2a - S = ee.$
$4 \cup$	7	$39 - aa + aa = aa + 2a - 39 (S) = ee.$
by Transp.	8	$78 = 2aa + a.$
	9	$aa + \frac{1}{2}a = 39 = S, \text{ which is a Quadratick of the first Form.}$
Comp. \square	10	$aa + \frac{1}{2}a + \frac{1}{4} = 39 + \frac{1}{4}.$
u	11	$a + \frac{1}{4} = \sqrt{39 + \frac{1}{4}}.$
	12	$a = \sqrt{39 + \frac{1}{4}} - \frac{1}{4} = 6.$
	13	Therefore $2a = 12.$

And (a) being known, the value of (e) will be found from the fourth Step. Where $e = 3$.
Now by our Supposition at first, the greater Number was $a + e$, that is 9; and the lesser was $a - e$; that is 3: Which numbers 3 and 9, will Answer the Question.

For 12, their Sum, taken from 9c, the Sum of their Squares, leaves 78; and added to 27, their Rectangle, makes 39.

N. B. By this Method of putting $a + e$ and $a - e$ for the two Numbers sought, instead of a and e as in the Common way; many Questions producing Affected Quadratick Equations, when that way manag'd, may be solv'd as easily, and in the manner of Simple Equations. Especially when the Sum and Difference, or Sum or Difference of the Squares of the Quantities sought, are among the Data.

PROBLEM I.

The Difference of both the Legs of a Right angled Triangle being given from the Hypothensuse; to find the Sides severally, and to Form the Triangle.

Let the Difference of the lesser Side from the Hypothensuse be (b) and that of the greater (d).

For the greater Side sought put (a)

Then will,

	1	$a + d = \text{Hypothensuse, and}$
$x - b$	2	$a + d - b = \text{to the lesser Side.}$
47. e. 1.	3	$aa + 2ad + dd = 2aa + 2ad - 2ab - 2bd + dd + bb.$
	4	$aa - 2ab - 2bd + bb = 0.$
		by Comparison and Transposition of the last Step.
Transp.	5	$aa - 2ab = 2bd - bb. \text{ which is a Quadratick Equation of the Second Form.}$
Comp. \square	6	$aa - 2ab + bb = 2bd.$
	7	$a - b + \sqrt{2bd} = a = \sqrt{2bd} + b.$

Geometrical Construction.

Find a mean Proportional between d and b , which let be DF : to which, place at Right-angles $FG \perp$ to DF , Draw GD , and cut off $HD = GD$. Then will BH , be the greater Side sought. And this being

produced to C (so that $CH = ED$) will give $CD (= AC)$ the lesser Side of the Triangle required, for $a + d - b =$ lesser Side; Draw a Semi-circle on CB and apply $AB = HB$. Then draw AC , and the Triangle is found, which is ACB .

PROBLEM II.

Having in the Square $ABCD$, the Difference between the Sides and Diagonal $= 6$, or a , to find the Side of the Square.

Let the Side sought be called x , and $6 = a$.

Then $x + a = AC$ the Diagonal.

But (by 47. e. 1. Eucl.) $AC^2 = 2AD^2$, or to $2xx$.

That is $xx + 2xa + aa = 2xx$.

Expunge then xx on both Sides, and it will be $2xa + aa = xx$, and then by Transposition, $xx + 2ax - aa$. Compleat the Square, and it will be $xx - 2ax + aa = 2aa$.

Wherefore $x - a = \sqrt{2aa}$.

And consequently $x = \sqrt{2aa} + a = 14 \frac{1}{2}$.

PROBLEM III.

Given one Segment of the Base of a Right-angled Triangle, as also the Side of the Triangle Adjacent to the other Segment of the Base; 'tis required to find the rest, and to form the Triangle.

Suppose

Suppose it done; and let the Segment b , and the Side c , be both known or given. Let x , the other

Segment of the Base, be sought; which is all that is necessary to solve the Problem.

Here therefore, since P is supposed to be a true Perpendicular;

- 1 $cc + xx = pp$. 47 e I Euclid.
- 2 And because the Angle at the Top is a Right one, therefore $pp = bx$, which gives another way of expressing pp . So that,
- 3 $cc - xx = bx$, and consequently by Transposition,
- 4 $cc = xx + bx$. which is an Affected Quadratick of the first Form. Wherefore,
- 5 $cc + \frac{bb}{4} = xx + bx + \frac{bb}{4}$ by completing the Square. And,
- 6 $\sqrt{cc + \frac{bb}{4}} = x + \frac{bb}{2}$, by Evolution.
- 7 Lastly, $\sqrt{cc + \frac{bb}{4}} - \frac{b}{2} = x$.

Geometrical Construction.

Join together at Right-angles $eE - \frac{1}{2}b$ and $EA = C$, Then with the Radius eE Describe the Circle BED , and thro' the Centre e Draw the Line AD . Erect then at D the Perpendicular DK ,

which Limit, by Describing a Semi-circle on BA , that Semi-circle shall cut the Perpendicular in the Point K , the Vertex of the Triangle required, whence draw the two Legs BK and KA . So is BKA the Triangle sought.

QUADRATRIX (in Geometry) is a Curve Line thus generated.

Let there be a Radius of a Circle, as AD , which imagine to move on the Centre A down the Circumference of the Quadrant DB , and at the same time let the Side of the Square CD move equally downwards, so that the Radius AD and the Side of the Square CD , may come to the Line AB together. Or let the Right Line DA , and the Quadrantal Ark DB , be both divided into a like Number of equal Parts, as in this Case they are each into 8. And to the Divisions of the Quadrant let as many Radii be drawn from the Centre A , and through the Divisions in AD as many Parallels to CD ; for then if a Curve Line be drawn neatly connecting the Points of Interfection of these Radii and Parallels, it will be that Line which is called the *Quadratrix* (as DE). From this Genesis of the Quadratrix arise these Corollaries.

1. That if through any Point, as H in this Quadratrix, you draw a Radius AHI , and the two Perpendiculars Hb and He , it will be, as the whole Quadrantal Ark DB , is to the Part IB :: so will the whole right Line DA be to the Part of it cut off bA , or its equal He , as is plain from considering the equal motion of the Radius AD , and the side of the Square DC , which intersect each other in H .

2. Wherefore any Ark of the Quadrant as IB , or any Angle as $IA B$, may by this Quadratrix be easily divided into 3 equal Parts, or any other Number at Pleasure, or according to any given *Ratio*, by only drawing the Radius AI , and then from the Point of the Quadratrix H letting fall the Perpendicular He : for if He be divided into 3 or any given Number of equal Parts, Lines drawn from A the Center through those Divisions, shall divide the Ark or Angle after the same manner. For as the parts of He , are to the whole Line :: so will the parts of the Ark IB be to the whole Ark: By the former Corollary,

3. I say, That the Base of the Quadratrix AE is a Third Proportional to the Radius AD , and the Quadrant BD .

For $DB : DA :: IB : He$, as follows (alternately) from Cor. 1.

And $IB : He :: bA : eA$, by the Triangles being Similar.

Now if you conceive the Ark IB to grow infinitely small, it must at last come to the same as its right Sine Ib , and both will coincide in the Point B ; and at the same time as HE and He coincide in the Point E , (by the Genesis of the Curve;) so that at last Ae and AE , Ab and AB will be coincident; And therefore at last $DB : DA :: IB$ (i. e. Ib)

(i. e. I b) H e. That is, as A b . A e . or which is the same at last, as A B (or A D) to A E.

Wherefore D B . D A :: D A : A E . Q . E . D :

4. Wherefore if on the Base of the Quadratrix A E, a Quadrantal Ark be described; it will be equal in length to D A the Side of the Square: And consequently the Semicircle will be double, and the Periphery Quadruple, of D A.

5. Hence may a Right Line be found equal to D B or any other Quadrant of a Circle, by only making as A E . A D :: A D to a Third Proportional, which will be equal to the Quadrantal Ark, by Cor. 3:

6. After the same manner may a Right Line be found equal to I B, or any other Ark of a Circle less than a Quadrant, if it be made as D A . H e :: D B . D B to a fourth Proportional by Cor. 1.

7. So that the Quadrature of the Circle, and the Trisection of an Angle might Geometrically be effected, if this *Quadratrix* were a true Geometrical Curve, as indeed it is not.

QUADRATURE of any Figure in Mathematics, is the Finding a Square equal to the Area of it. See *Lunes*.

QUADRATURE of the Parabola. See *Parabolic Space*.

QUADRATURES of the Moon, are the Middle Points of her Orbit, between the Points of Conjunction and Opposition: And they are so called, because a Line drawn from the Earth to the Moon, is then at Right Angles, with one drawn from the Earth to the Sun. When the Moon having been either in Conjunction with the Sun, at C, or in Opposition to him at Q, is come to Q, then she is in the Quadratures.

QUADRATUS *Femoris*, a Muscle of the Thigh, so called from its Figure; it ariseth broad and fleshy, from the *Apophysis* of the *Os Ischium*, and passes transversely with an equal breadth and thick-

ness to its partly fleshy; and partly Tendinous Insertion at the Posterior part of the *Os Femoris*, partly below the great *Trochanter*. This assists the *Marfupialis*, in turning the Thigh-bone outwards.

QUADRATUS *Genæ*, seu *Tetragonus*, is a great Square Muscle lying under the Skin of the Neck, and is spread over the whole inferior Region of the Face. It ariseth thin and membranous, from the Spines of the *Vertebrae*, the Skin on the Superior Part of the *Cucullaris*, and Pectoral Muscle, from hence ascending under the Skin of the Neck, becomes fleshy, and one part adhering to the *Os Hyoides*, is soon inserted to the Middle of the lower Jaw; the other broader portion proceeding farther to its Implantation in the Cheeks below the Angle of the Lips: It serves to draw down each Angle of the Mouth, together with the Cheeks, which Posture of the Face is the proper expression of Sorrow. But if the inferior Parts of these Muscles (which lie on the Neck) A& alone, they distend the Superincumbent Skin, by making it approach to a direct Line with the *Clavicula* and lower Jaw-bone, which otherwise is Indented according to the Formation of the Part, whereby a double Skin (as they call it) is represented.

QUADRATUS *Lumborum*, is a short thick, fleshy Muscle, situated in the Region of the Loins, or between the last Rib and Spine of the *Os Ilium*; it ariseth from the Posterior part of the Spine of the *Os Ilium*, and is inserted to all the Transverse Processes of the *Vertebrae* of the Loins internally, under the *Psoas* Muscle. This like the *Musculus Rectus Abdominis*, either moves the *Vertebrae* of the Loins nearer the *Os Ilium* laterally, when we are standing on both Legs firm, or else moves the *Os Ilium* nearer the said *Vertebrae* on the contrary side, when we stand upon one Leg only.

QUADRIGEMINI, according to some Anatomists, are four small Muscles that turn the Thigh toward the outside, and are placed upon the Articulation, or jointing of the Thigh one by another.

QUADRILATERAL Figures, are those whose Sides are four right Lines, and those making four Angles; and they are either *Parallelogram*, *Trapezium*, *Rectangle*, *Square*, *Rhombus*, *Rhomboides*.

Parallelogram, is a *Quadrilateral* Figure, whose opposite Sides are Parallel and Equal.

Trapezium, is a *Quadrilateral* Figure, whose Sides are unequal, as in this Figure.

Rectangle, is a *Parallelogram* whose four Angles are Right, and is also called a *Rectangled Parallelogram*.

Square, is a *Quadrilateral* Figure having its Angles Right, and the Sides all Parallel and Equal, as in the Figure.

Rhombus, is a *Parallelogram*, having its opposite Angles and all its Sides equal, as in this Figure.

Rhomboides, is a *Parallelogram*, having neither its Angles nor Sides all equal.

PROPOSITION.

In a *Quadrilateral Figure* inscribed in a Circle (as $abcd$) the Rectangle under the two Diagonals (ac and bd) is equal to both the Rectangles made by the opposite Sides of the Figures $ab \times cd$, and $bc \times ad$.

That is, $ac \times bd = bc \times ad + ba \times cd$. Make the Angle $abe = \angle cbd$.

DEMONSTRATION.

1. The Triangles abd and bce will be similar, for $\angle bda$ is equal to the $\angle bca$, (being in the same Segment) and the $\angle abd = \angle ebc$, by the Addition of the common Angle ebd , to the two equal ones abe and dbc .

Then will $bc : ce :: bd : da$. and consequently $bc \times da = ce \times bd$. That is, the Rectangle under the opposite Sides $a d$ and bc , is equal to the Segment ec multiplied by the Diagonal bd .

2. The Triangles abe and cbd are Similar, because the $\angle abe = \angle cbd$ (by construction) and the $\angle bae = \angle bdc$, being in the same Segment.

Therefore $ae : ab :: cd : bd$.

Consequently $ae \times bd = ab \times cd$. That is, the \square under the remaining Segment ae , and the former Diagonal $bd = \square$ under the opposite sides ab and cd .

But $ac = ae + ce$.

Wherefore $ac \times bd = bc \times ad + ac \times ab$.

Q. E. D.

PROPOSITION.

The opposite Angles of any *Quadrilateral Figure* Inscribed in a Circle, are always equal to two right ones.

I say $O + k + f = 2L$. Draw the Lines RL and EQ .

The Angles $O + p + c = 2L$, by the 32 e. 1.

But $\angle p = \angle k$, and $\angle c = \angle f$ per 21. e. 3.

Therefore $O + K + f = 2L$. q. e. d.

COROL.

Hence the external Angle of such a Figure, as $E = k + f$, the Internal and Opposite one.

For $O + e = 2L = O + k + f$.

Therefore take away O from both, and E will remain equal to $k + f$, q. e. d.

QUADRIPARTITION, is to divide by 4, or to take the fourth Part of any Number or Quantity.

QUADRUPLE, that is, Fourfold.

QUE Plura, was a Writ that lay, where an Inquisition had been made by an Escheator in any County, of such Lands or Tenements as any Man died seized of, and all that was in his Possession, was imagined not to be found by the Office: It differs

differs from the Writ called *Melius Inquirendum*, because this is granted, where the Escheator formerly proceeded by Virtue of his Office; and the other, where he found the first Office by virtue of the Writ named *Diem clausit extremum*.

QUÆ Servitia; see *Per qua Servitia*.

QUALE jus, is a Writ judicial, that lies where a Man of Religion hath Judgment to recover Land, before Execution be made of the Judgment; for this Writ must go forth to the Escheator, between Judgment and Execution, to enquire whether the Religious Person hath any Right to recover, or whether the Judgment be obtained by Collusion between the Demandant and the Tenant, to the intent that the true Lord be not defrauded.

QUALITY, signifies in the general the Properties or Affections of any Being, whereby it affects our Senses so and so, and acquires such and such a Denomination.

The Four *First Qualities*, as they are accounted by some, are *Heat, Cold, Moisture, and Dryness*.

The Four *Second Qualities*, or as they may be called, Chymical Qualities, are *Volatility and Fixity, Corrosiveness and Corrosibility*.

Sensible Qualities, are such as are the more Immediate Objects of our Senses.

Occult Qualities, were by the Ancients named such, of which no rational Solution in their way of according to their Principles could be given.

Mr. John Keill, in his *Introductio ad Physicam*, thus proves that all Qualities are *Remitted*, or have their Power or Efficacy abated, in a *Duplicate Ratio* of the distance from the Centre of the *Radiation*, or Exertion of the Quality.

Let A be a Centre from whence any Quality exerts itself round about, according to the right Lines *Ae, Af, AG, &c.* The Efficacy of the Quality, be it *Heat, Cold, Odour, &c.* will be (at equal Distances from A) as the *Spissitude* or Thickness of the Rays *Ab, Ae, Af.* But the Rays within the Inner Circle, or rather Spherical Superficies *bcdH*, when they come to be extended to the outer Spherical Surface, *efGK*, will be much less thick than before; and that in

proportion *reciprocally*, as the Spaces they take up: That is, if the outer Surface be double of the inner, the Rays there will be but half as thick: But since Spherical Superficies are as the Squares of their Radii, therefore the Efficacy of the Quality in the inner Surface will be to that of the outer, as *Ae* Square to *Ab* Square. *q. e. d.*

QUAM diu se bene gesserint, is a Clause often used in Letters-Patent of the Grant of Offices, as in those of the *Barons* of the *Exchequer*, which must be intended only as to Matters concerning their Office; and is nothing but what the Law would have implied, if the Office had been granted for Life.

QUANTITY, signifies whatsoever is capable of any sort of Estimation or Mensuration, and which being compared with another Thing of the same Nature, may be said to be *greater* or *less* than, *equal* or *unequal* to it.

Quantity may have these Four Divisions:

1. *Natural Quantity*; is what Nature furnishes us with in Matter and its Extensions, and in the Powers and Forces of natural Bodies; such as *Gravity, Motion, Light, Heat, Cold, Rarity and Density, &c.*
2. *Moral Quantity*, which depends on the Manners of Men, and the free Determination of their Wills; as the Prizes and Values of Things, Dignity and Power, Good and Evil, Merit and Demerit, Rewards and Punishments, &c.
3. *Notional Quantity*, arising from the Operation of the Understanding only; such as the Largeness or Smallness of the Mind's Capacity, and of its Conceptions: In *Logick, Universals, Predicaments*, and all such Terms: In *Grammar*, the *Quantity and Measure of Syllables, Accents, Tones, &c.*
4. *Transcendental Quantity*, as *Duration*, the Continuation of any Being's Existence, *Time, &c.* Quantity is divided also into *Continued* and *Discrete*, which see:

The *QUANTITY* of Matter in any Body, is its Measure arising from the joint Consideration of its Magnitude and Density: As if a Body be twice as Dense, and take up twice as much Space as another, it will be four Times as great. And this Quantity of Matter is best discoverable by the Weight of Bodies, which Sir *Is. Newton* found by his Nice Experiments on Pendulums, so exactly proportional to the Matter of Bodies. *Newton. Princip.*

The *QUANTITY* of Motion in any Body, is its Measure arising from the joint Consideration of Quantity of Matter in, and the Velocity of the Motion of that Body. For the Motion of any Whole is the Sum or Aggregate of the Motion in all the several Parts: And tho' in a Body twice as great as another, moved with an equal Velocity, it will be double; yet if the Velocity be double also, the Quantity of the Motion will be *Quadruple*. *Newton. Princip.*

In *Philosophical Transactions*, Numb. 195. is an Account by the Learned Captain *Halley*, of the several Species, or Kinds of *Infinite Quantity*.

Where he proves, That besides *Infinite Length*, and *Infinite Area*, in which there are great Varieties;

There are also no less than three sorts of *Infinite Solidity*. See *Infinite Quantities*.

QUANTUM Meruit, is an Action of the Case so called, grounded upon a Promise to pay a Man for doing any Thing, so much as he should Deserve, or *Merit*.

QUARE ejecit infra terminum; is a Writ that lieth for a Lessee, where he is cast out of his Farm, before his Term be expired, against the Feoffee or Lessor that ejecteth him: And it differs from *Ejecti-one firma*, because this lieth where the Lessor, after the Lease made, infeoffeth another, which ejecteth the Lessee: And the *Ejectione firma*, lieth against any other Stranger that ejects him, But the Effect of Both is all one; that is, to recover the residue of the Term.

QUARE Impedit, is a Writ that lies for him that hath purchased a Manor with an Advowson thereto belonging, against him that disturbs him in the Right of his Advowson, by presenting a Clerk thereto, when the Church is void: And it differs from the Writ called, a *Darrein presentment*, *Assisa ultima presentationis*, because that lies where a Man, or his Ancestors formerly presented: and this for him that is the Purchaser himself: Note, That where a Man may have an *Assise Darrein Presentment*, he may have a *Quare impedit*, but not contrariwise.

QUARE Incumbavit, is a Writ that lieth against the Bishop who within six Months, after the Vacation of a Benefice, conferreth it upon his Clerk, while two others are contending in Law for the Right of Presenting. This Writ always lies depending the Plea.

QUARE intrusit Matrimonio non satisfacto, is a Writ that lies where the Lord proffers convenable Marriage to his Ward, and he refuses, and enters into the Land, and Marries himself to another; then the Lord shall have this Writ against him. But all Wardships being taken away by the Statute 12 Car. 2. cap. 24. this Writ is become useless.

QUARE non admittit, is a Writ that lies against a Bishop, refusing to admit his Clerk that hath recovered in a Plea of *Advowson*.

QUARE non permittit, is a Writ that lies for one that has Right to present for a Turn, against the Proprietary.

QUARE obstruxit, is a Writ that lies for him who having Liberty to pass through his Neighbours Ground, cannot enjoy his Right, for that the Owner has so Strengthened it.

QUARENTINA habenda, is a Writ that lies for a Widow to enjoy her *Quarentine*.

QUARENTINE, is a Benefit allowed by the Law of England, to the Widow of a Man Dying Seized of Land; whereby she may challenge to continue in his Capital Messuage or chief Mansion-house (so it be not a Castle) by the Space of Forty Days after his Decease, and if the Heir, or any other attempt to eject her, she may have the Writ *de quarentina habenda*.

QUARTATION, is a way of Purifying of Gold, used by Refiners who melt three Parts of Silver with one of Gold (whence the Name) and then cast the Mixture into *Aqua fortis*, which will dissolve the Silver, and leave the Gold in a blak Powder at the Bottom.

QUARTER in Heraldry, signifies a Partition made of just a fourth Part of the Field, by Two Right Lines, thus;

He beareth *Argent*, a *Quarter Gules*.

QUARTER of a Ship, is that Part of the Ship's Hull which lieth from the Steerage Room to the Transom.

QUARTER-deck. See *Deck*.

QUARTER, in a Military Sense, sometimes is used to signify the good Treatment given to a vanquish'd Enemy: Thus say they, *The Enemy asked Quarter*; *We gave no Quarter*, &c.

QUARTER signifies the Ground a Body of Men is Encamp'd upon; as when they say, Such a Quarter is well fortify'd; and oftentimes the Troops themselves that are there Quartered; for they say also, *We beat up the Enemies Quarters*.

QUARTERS (Winter). Winter Quarters sometimes is used for the Interval between two Campaigns, but more generally for the Place or Places where Troops are lodged during the Winter.

QUARTERS of Refreshment, are such Places as Troops which have been much fatigued and harassed, are put into, to recover their Strength or Health, during some time of the Summer or Season of the Campaign.

QUARTER-Master, in the Land Forces, is either the Quarter-Master General of an Army, who is to see out for good Quarters for the whole; or of any Regiment of Foot, or Troop of Horse; whose Office it is to do the same for those Bodies.

QUARTER-Master, is an Officer Aboard a Ship (of which there are more or fewer according to her Burthen) whose Business is to rummage in the Hold on all Occasions, to overlook the Steward in this Delivery of Victuals to the Cook, and in his Pumping and Drawing out the Beer; and in general to take care there be no Waste: He is also to mind the Ship's Loading, in which he is usually employed.

QUARTER at a Siege, is an Encampment upon one of the most principal and important Passages round about the Place besieged, to prevent Relief and Convoys: This is either commanded by the General of the Army, and then is called, the General's Quarters, or by a Lieutenant-General.

QUARTERING, is spoken of a Ship when she sails upon a Quarter Wind: 'Tis also spoken of a Piece of Ordnance, when 'tis so Traversed that it will shoot on the same Line, or on the same Point of the Compass, as the Ship's Quarter bears.

QUARTERS in a Clock, or Movement, are little Bells which sound the Quarters, or other Parts of an Hour. The Way of making any Clock strike them, see in *Watch-Work*.

QUARTILE, is an Aspect of the Planets, when they are 3 Signs, or 90 Degrees distant from each other, and is marked thus □.

QUAVER, a Note in Musick so called: See the Words *Notes* and *Time*.

QUE Estate, in common Law, signifies a Plea, whereby a Man Entitling another to Land, &c.

Latin,

faith, That the same Estate he had, he hath from him.

For Example: In a *Quare Impedit*, the Plaintiff alleges, That such four Persons were seized of Lands whereunto the Advowfor in question was appendant in Fee, and did present to the Church, and afterwards the Church became void, *Que estate del*, &c. that is, *Which Estate* of the four Persons he has now during the Vacation, by Vertue whereof he presented, &c.

QUE est Mesme, a Law Term used in an Action of Trespass, or such like, for a positive Justification of the very Act complained of by the Plaintiff, as a Wrong.

For Example: In an Action upon the Case, the Plaintiff says, That the Lord threatned his Tenants at Will, in such sort, that he forced them to give up their Tenures. The Lord, for his Defence pleadeth, That he said unto them, That if they would not depart, he would sue them at Law: This being the same Threatning that he used, or to speak Artificially, *Que est le Mesme*, The Defence is good.

Queüe d'yronde, a Term in Fortification, being what we call Swallows Tail; and signifies a Detached or Out-work, whose Sides open towards the Head, or Campaign, or draw narrower or closer towards the Gorge. Of this kind are either single or double Tenailles, and some Horn-works, whose Sides are not parallel, but are narrow at the Gorge and open towards the Head; like the Figure of a Swallow's Tail.

When these Works are cast up before the Front of a Place, they are defective in this Point, that they do not sufficiently cover the Flanks of the opposite Bastions, but then they are very well Flanked by the Place, which covers all the length of their Sides the better.

QUEM redditum reddit, is a Writ Judicial, that lies for him to whom a Rent-seek, or Rent-charge is granted, by Fine levied in the King's Court against the Tenant of the Land that refuseth to Attorn to him, thereby to cause to Attorn.

QUENE, as the Heralds write it, (but it should be *Queüe*) the Word in Blazon for a Tail of a Beast, thus: If a Lyon have a forked or double Tail, they say he is *Double Quened*.

QUERELA, an Action preferred in any Court of Justice, in which the Plaintiff was *Querent*, or Complainant, and his Brief, Complaint, or Declaration, was *Querela*.

QUERELA freshe fortice, is a Writ of *Fresh-force*; which see.

QUERELA coram Rege & concilio discutienda & terminanda, is a Writ whereby one is called to justify a Complaint of a Trespass, made to the King himself, before him and his Council.

QUERENS non invenit per legum, is a Return made by the Sheriff upon a Writ directed to him, with this Condition inserted, *Si A. fecerit B. securum de clamore suo prosequendo*.

QUEST, or *Inquest*, an Inquisition or Enquiry made upon Oath of an Impannell'd Jury.

QUEST-Men. See *Sidemen*.

QUESTUS, or *Quæstus*, in Law, is taken for that Land which does not descend to us by Hereditary Right, but is gain'd by our own Labour and Industry: this is called *Purchased Lands*.

QUESTUS est nobis, is the Form of a Writ of *Nuisance* which lies against him to whom the House,

or other thing, that breeds the *Nuisance*, is alienated.

QUIA improvide, is taken to be a *Super sedens* granted in the behalf of a Clerk of the Chancery, sued against the Privilege of that Court in the Common-Pleas, and pursued to the *Exigent*, or in many other Cases, where a Writ is erroneously sued out.

QUID juris clamat, is a Writ Judicial, issuing out of the Record of the Fine, which remaineth with the *Custos brevium* of the Common-Pleas, before it be engrossed; and it lies for the Grantee of a Reversion or Remainder, when the particular Tenant will not Attorn.

QUID pro quo, in Law is used for the Reciprocal Performance of both Parties to a Contract, and thereupon the giving of one thing of a Value for another thing of like Value, as 10*l*. for a Horse, &c.

QUIETUS, is a Word used by the Clerk of the Pipe, and Auditors in the Exchequer, in their Acquittances or Discharges given to Accomptants, usually concluding with an *abinde recessit quietus*, which is called a *Quietus est*, and mentioned in the Act of General Pardon, 12 Car. 2. 11. and 14 Car. 2. Cap. 21. A *Quietus est*, granted to the Sheriff, shall discharge him of all Accounts due to the King.

QUINCUNX, that Position, or Aspect, that the Planets are said to be in, when distant from each other 150 Degrees, or 5 Signs, and is mark'd thus, *Vc. or Q.*

QUINDECAGON, is a plain Figure of 15 Sides and Angles, which if they are all equal to one another, is called a Regular Quindecagon; which how to describe in a Circle, *Euclid* shews Prop. 16. e. 4th

The Side of a Regular Quindecagon, so described, is equal in Power to the half Difference between the Side of the Equilateral Triangle, and the Side of the Pentagon, and also to the Difference of the Perpendiculars let fall on both Sides, taken together.

Make the Pentagon *abcde*, and parallel to any one Side of it, set the Base of the Equilateral Triangle *fga*. Then (by 16. e. 4 *Eucl*) will *fo* be the Side of the Quindecagon, *fb* = $\frac{1}{2}$ the Difference between the Side of the Triangle and Pentagon; and *bc* = to the Difference of the Perpendiculars

pendiculars let fall from the Centre *o*, to both the Sides of the Figures.

But $\square f c = \square f b + \square b c$; by 47 *e. Euclid*. Wherefore the Proposition is true, *Ecce*.

QUINQUEANGLED, in Geometry, is a Figure consisting of five Angles.

QUINSIE, or rather *Squinancy*, a Disease so called. See *Angina*.

QUINTESSENCE, is a Medicine made of the Energetical and Active Particles of its Ingredients, separated from all Fæces or Dregs.

QUINT *Exact*, in Law, is the last Call of a Defendant, who is sued to the Outlawry, where, if he appear not, he is by the Judgment of the Coroners returned *Outlawed*; if a Woman, *Waved*. See *Exigent*.

QUINTILE, an Aspect of the Planets when they are 72 Degrees distant from one another, and noted thus, *C* or *O*.

QUINTUPLE, Five-fold or five times as much as another thing.

QUITE *Claim*, is a Release or Acquitting of a Man from any Action he hath, or might, or may have against him.

QUIT *Rent*, is a certain small Rent, payable yearly, by the Tenants of most Mannors; upon the payment whereof they are to quit, till it becomes due again.

QUO *Jure*, is a Writ that lies for him that has Land, wherein another challengeth *Common of Pasture*, Time out of Mind: And it is to compel him to shew by what Title he Challenges it.

QUO *Minus*, is a Writ that lies for him that hath a Grant of Houfe-bote and Hey-bote in another Man's Woods, against the Grantor, making such Waste as the Grantee cannot enjoy his Grant. This Writ lies also for the King's Farmer in the Exchequer, against him to whom he selleth any thing by way of Bargain touching his Farm, or against whom he hath any Cause of Personal Action: For he supposeth by the Vendees detaining any Due from him, he is made *less able* to pay the King's Rent; and under this pretence; any one who pays the King a Fee-Farm Rent, may have this Writ against any other Person, for any Debt or Damage, and bring the Cause to Trial in the Exchequer.

QUO *Warranto*, is a Writ that lies against him that Usurps any Franchise or Liberty against the King; as to have Waife, Stray, Fair, Market, Court-Baron, Leet, or such like, without good Title: Or else against him that intrudeth himself as Heir into Land.

QUOD *Clerici noneligantur in Officio Ballivi, &c.* is a Writ that lies for a Clerk, which by reason of some Land he hath, is made; or in doubt to be made Bayliff, Beadle, Reeve, or some such like Officer.

QUOD *Clerici beneficiarii de Cancel*, is a Writ to

exempt a Clerk of the Chancery from Contribution towards the Proctors of the Clergy in Parliament.

QUOD *ei deforeat*, is a Writ that lies for the Tenant in Tail, Tenant in Dower, or Tenant for Term of Life, having lost by Default against him that Recovered, or against his Heir.

QUOD *permittat*, is a Writ that lies for the Heir of him that is disseised of his Common of Pasture, against the Heir of the Disseisor being Dead.

QUOD *Persona nec Prebendarii, &c.* is a Writ that lies for Spiritual Persons that are distrained in their Spiritual Possessions, for the Payment of a Tithteenth with the rest of the Parish.

QUOILE, or *Coile*, at Sea; is spoken of Cables or Ropes, when they are placed in a round or Oval Ring one *Fake* (or Turn) upon another: that so they may the more easily be stowed out of the way, and also run out free and smooth, without *Knecks* or *Keuks* as they call them; *i. e.* without Twistings or Doublings: Then the Cable is said to be *Quoiled* up.

QUOIN, a Sea Word, the same with *Coin*; which see.

QUORUM, a Word often used in our Statutes; as also in Commissions, both of Justices of the Peace, and others. As for Example, where a Commission is directed to seven Persons, or to any three of them, *wherof* A. B. and C. D. to be two, there A B C D. are said to be of the *Quorum*, because the rest cannot proceed without them: So a *Justice of the Peace*, and *Quorum*, is one, without whom the rest of the Justices, in some Cases cannot proceed.

QUOTIDIAN *Ague*, is that, whose Fits return every Day.

QUOTIENT, is that Number in Division which arises by dividing the Dividend by the Divisor: And is called Quotient, because it answers to the Questions *Quoties?* Or how often one Number is contained by another?

Thus:

If 360 be to be divided by 24, the Quotient will be 15, and the Numbers will stand thus:

24) 360 (15.

Where 15 is the Quotient.

QUOYLE, a Sea Word: They say a Cable is *Quoyled*, when 'tis laid round in a Ring on the Deck, or Floor of a Ship; in the middle of which Ring, or *Quoyle*, is a good Place to lay Shot in; which is more safe there than in Lockers along the Side; for there the Enemies Shot may fall into it, and beat it about among the Men.

RABANET. See *Rabinet*.

RABBETTING in a Ship, is the letting in of her Planks to the *Keel* which in the *Rake* and *Ruh* of the Ship, is hollowed away, that the Planks may join the better and closer, and this hollowing away, is called the Rabber of the Keel.

RABDOIDES, the same that *Sutura sagittalis*.

RABINET, a sort of Ordnance, whose Diameter at the Bore is $1 \frac{1}{2}$ Inches, Weight 300 Pound; Length 5 Foot, Load $\frac{1}{2}$ of a Pound, Shot something more than an Inch and a quarter Diameter, and $\frac{1}{4}$ a Pound Weight.

RACHITÆ, and *Rachiai*, are Muscles belonging to the Back; so called by some Foreign Anatomists, and seem to be the same with what we call *Semispinati*.

RACHITIS. See *Rhachitis*.

RADIALES Internus & Externus, are Muscles of the Wrist, the one serves to bend it, and the other to extend it. *Blanchard*.

RADIATION, signifies the casting forth of Beams, or Rays of Light; and in Opticks it is considered as threefold, viz. *Direct*, *Reflected*, and *Refracted*. See *Ray*.

RADICAL Moisture, is a Term used by some, for the Fundamental Juice of the Body, which they will have to nourish and preserve the natural Heat, as the Oil in a Lamp preserves and feeds the Flame. *Blanchard*.

RADICLE, a Word used by Botanists, to denote that Part of the Seed of a Plant, which upon its Vegetation becomes its Root: This in Corn is that which Masters upon its shooting forth, call the *Cume*. 'Tis not easily to be discerned in many Seeds, by the naked Eye: but in that of Fenugreek, 'tis as big as one of the Lobes: And in the Garden-bean it appears visible on the Separation of the Coats, it is of a White Colour, more Glossy than the Main Body, and stands at the greater End without the Lobes: Therefore this End in setting Seeds, should always be placed lowermost.

RADIUS, in Geometry, is the Semi-diameter or half the Diameter of a Circle: See under the Word *Circle*.

RADIUS, is the left Bone of the Cubit, called *Focile minus*; it is more oblique than the great Bone, called *Ulna*, and is distant a little from it in the middle, where there occurs a small Ligament above the *Ulna*, which receives the *Radius*, and below the *Radius* receives it. The upper Part of the *Radius* is jointed with the outward Process of the Arm by *Diarthrosis* (which see); the lower by way of Appendix with the Wrist Bone, at the Middle Finger. It's upper end is small, and the lower thick. The greater Bone of the Leg also is called *Radius*. *Blanchard*.

RAGGULED, the Heralds Term for any Ordinary, *Ex. gr.* a Cross whose out Lines are of this Form.

He beareth *Sable*, a Cross *Ragguled Or.* by the Name of *Stoway*.

This differs from Indented, because that is regular, and this is not so, but rather ragged.

RAINBOW or *Iris*: the very Learned and Ingenious Mathematician, Mr. *Edward Halley*, in a Discourse de *Iride* in *Phil. Transact.* No. 267, gives the best Account that we have ever had, of the Cause of the various Colours of the Rainbow, and the Solution of their several Phenomena. He tells us there, that the Ingenious *Des Cartes* was the first, that by applying Mathematicks towards the Investigation of this surprizing Appearance, ever gave a Theory of the *Iris*: And he found the Laws of Refraction, which the Lucid Rays suffer in passing thro' any Diaphanous Bodies: And clearly demonstrated the *Primary Iris* to be only the Sun's Image, reflected from the Concave Surfaces of an Innumerable Quantity of small spherical Drops of falling Rain: With this necessary Circumstance, that those Rays, which fell on the Objects, Parallel to each other, should not after one Reflection, and two Refractions, (viz. At going into the Drop, and coming out again) be dispersed, or made to Diverge, but come back again also to the Eye, parallel to each other.

He shewed also, that the Colours, in the Rays of Light were produced by those Refractions as they are by passing through a Triangular Glass Prism. The *Secondary Iris*, he supposes produced by those Rays of the Sun, which fall more Obliquely, but after the same Manner as before, only in these there are two Reflections, before the Sun's Rays refracted a second time, and tending towards the Eye, in a parallel Position, can get out from the Aqueous Globules. The Magnitude of the *Iris*, he makes to depend on the Degrees of Refraction; which is different, in different Liquors, or Transparent Solids: But supposing the Ratio of the Sines of Incidence, to those of the refracted Angles, to be in Water as :: 250. to 187, he determined thence the Semi-diameter of the *Iris*, near enough to Observation, viz. The Primary one to be 41 Degrees 30 Minutes, and the secondary one to be 51 Degrees 54 Minutes. See the 8 Chap. of his *Met*-

teors. Mr. *Halley* observes, that *Des Cartes* using only a Tentative and Indirect Method, in determining his Angles, seems not to understand the Easiness of solving his own Problem.

Wherefore because hardly any one hath written well on this Subject, since *Des Cartes*, he shews you there how to determine the Angle, by which the *Iris* is distant from the opposite Point of the Sun; and the Ratio of the Refraction being given Geometrically, or *vice versa* the *Iris* being given, to determine the Refractive Power of the Liquor.

And first he saith, It is plain from *Des Cartes*'s Demonstrations, That the *Primary Iris* is made by the Sun's Rays, where the Excess of the two Refracted Angles above the one of Incidence, is the greatest possible.

And the *Secondary Iris* is formed by those Rays, where the Excess of three Refracted Angles above one of Incidence, is also the greatest possible.

And thus you may go on to 3, 4, 5, or 6 *Iris*'s, which will all be formed where the Rays Emerge out of the Watery Cloud after 3, 4, 5, or 6 Reflections; but none but the Second will be ordinarily visible in the Heavens, because the Rays of the Sun

Sun grow at last very much attenuated and weakened.

Now if you double this greatest possible Excess of the refracted Angles above that of Incidence, (if the Number of Reflections be odd) it will give the Distance of the Iris from the Point opposite to the Sun.

But if the Number of Reflections be even, then the double of the greatest refracted Angle, will be the Distance of the Iris from the Sun himself.

Now to gain these Greatest Excesses, having the Refraction of any Liquor, or the Ratio of the Sine of the Angle of Incidence to the Sine of the refracted Angle, you must observe, that the Excess of two refracted Angles, above one of Incidence, will be Greatest where the Momentaneous Augment or Fluxion of the Angle of Incidence, is precisely double to the Momentaneous Augment of the the refracted Angle. And if there be three refracted Angles, the Greatest Excess will be where the Momentaneous Augment of the Angle of Incidence is Triple of the Moment of the refracted Angle, and so on, which is sufficiently evident.

But in order to find the Angles themselves, Mr. Halley premises the following Lemma.

Let there be a Triangle ABC, whose Vertex is at A; its Legs BA and CA, and the Base BC; on which produced, let fall the Perpendicular AD. Then let the Vertical Angle BAC be supposed to be increased by a Quantity infinitely small, as suppose by the Moment CAc: Then drawing the Lines BCc, and cD, they will be only imaginarily different from BCD and CD.

This done, I say, That if the Legs of the Plane Triangle BAC, (or any other) continuing the same, the Vertical Angle be imagined to be encreased by any infinitely small Moment or Fluxion, then will the Moments of the Angles at the Base, be reciprocally as the Segments of the Base: That is, CBc, is to the Moment of the Angle ACB, or ACD :: as CD is to BD.

For since the external Angle ACD = to ABC + Angle BAC, its Moment must also be equal to the Sum of their Moments, or to CBc + CAc: but now because the Triangle ACD is right-angled at D, AC may be the Diameter of a Circle, whose Periphery will pass through A, D, C, and c, and consequently the Angles CAc, CDc being in the same Segment are equal. So that the Sum of the two Fluxionary Angles CBc, and cDC

(i.e. the external Angle Dcd) will be the Moment of the Angle ACD, or ACB. But those CBc, and Dcd, being infinitely small, will be to each other, as the Sides opposite to them, or as cD or CD is to BD: That is, reciprocally as the Segments of the Base. Q. E. D.

If B and C had been both Acute, the way of Proof is the same, all Things considered.

COROLLARY.

Hence it follows, That the Moments of the Angles at the Base, are to one another directly as the Tangents of these Angles.

By the help of this Lemma he shews how to obtain the Diameter of any Iris, either Geometrically, or by Calculation.

Let there be any Right Line as AC, and let it be so divided in D, that CA may be to CD :: according to the Ratio of Refraction; that is, in Water :: as 250 is to 187, or more nicely :: 529 is to 396. Then let it be divided again in E, so that CE shall be to AE :: as Unity is to the Number of Reflections which the Solar Rays must undergo in producing the Iris proposed: This done; on the Diameter AE let the Semicircle ABE be described; and on the Centre with the Radius CD, draw the Ark BD, cutting the Semi-circle ABE in the Point B. Then drawing the Right Lines CB, AB, let the Perpendicular CF, be let fall on AB produced to F; and to that Perpendicular draw the Parallel EB.

I say the Angle CBF is the Angle of Incidence, CAB is the refracted Angle, both required for the producing the proposed Iris.

DEMONSTRATION.

Since the Triangles ACF, AEB are Similar, AF will be to BF :: as AC to EC :: that is, as the

the Number of Reflections augmented by Unity, is to Unity; by the Construction.

Wherefore the Moment of the Angle CBF, is to the Moment of the Angle CAF in the same Ratio, by the Lemma.

But the Sine of the Angle CBF, is to the Sine of the Angle CAF:: in the Ratio of their Sides CA, CB: That is, in the Ratio of the Refraction given.

By the Construction also, the Angle of Incidence RBF, hath its corresponding Refracted Angle RAF: Wherefore since their Moments are in the Ratio proposed, those are the Angles sought or required. Q. E. D.

Now therefore multiplying the Refracted Angle by the Number of Reflexions augmented by Unity, and from the Product Subtracting the Angle of Incidence, you will have half the distance of the *Iris* from the Sun, if the Number of Reflexions were even; but if they were odd, from the opposite Point of the Sun, as was said before.

And from hence, by a very easy, short, and elegant Construction, he shews how to exhibit to the Eye, the Incidences of all manner of *Iris's*, as they will appear in any Liquor whose Refraction is given. For, if the Line A C in the last Figure, bisected in E, have a Third part cut off from it in *e*, a Fourth part in E, a Fifth part in *n*, &c. And then there be Semicircles described on the Diameters AE, A *e*, AE, A *n*, &c. all which shall be cut by the Circular Ark D B b, and *v*, described on the Centre C with the Radius CD, (which Radius CD is to AC in the Ratio of the given Refraction) in the Points B *b*, B *v*, &c. I say, the Lines AB, A *b*, AB, A *v*, shall make with the Line AC, Angles equal to the refracted Angles, and with the Radii CB, C*b*, CB, C*v*, respectively Angles equal to those of Incidence required; that is, ABC (or rather its Complement to a Semicircle) for the *Primary Iris* A b C for the Secondary one, ABC for the Third, and A v C for the Fourth, &c. and so on as far as you please.

He shews also, that the Reader, if skill'd in Algebra, may easily find these Angles by Accurate Calculation, derived from the same Fountain: Thus, Let the Radius be = 1. and the Ratio of Refraction, as *r* to *s*; then will the Sine of Inci-

dence be $\sqrt{\frac{4}{3}} - \frac{1}{2} \frac{r}{s}$ but the Sine of the Re-

fracted Angle will be $\sqrt{\frac{4}{3}} \frac{SS}{rr} - \frac{1}{2}$; from which Angles the *Primary Iris* will be found.

For the Second *Iris* $\sqrt{\frac{2}{3}} - \frac{1}{2} \frac{r}{s}$ will be the

Sine of Incidence; and $\sqrt{\frac{2}{3}} \frac{SS}{rr} - \frac{1}{2}$ will be the Sine of the refracted Angle. And so on, as he further shews.

And if you proceed to Calculate according to D. Cartes his Proportion, the *Primary Iris* will be distant *ab Opposito Solis* 41° 30', the Secondary one 51° 55'. But the Third and Fourth will be distant 40° 20', and 45° 33' from the Sun himself; but probably no one can ever see either of these, for the reasons above given.

As to the Colours with which this wonderful Bow is adorned, he observes, That our most Sa-

gacious Sir *I. Newton* was the first who shewed by most plain Experiments, that the Rays of Light do not come uniform and simple out of the Luminous Body; but that the pure white Light which we see, is compounded of the Corpuscles of all manner of Colours, blended one with another, by the most rapid Motion; and, That the Colours of all Bodies arise from their different Disposition to refract or reflect some peculiar Species of Light. This is principally proved from *Refractions*, by which these distinct Species are separated one from another; for Blue or Purple Light is, for Instance, more refracted in passing through a Diaphanous Body, than Yellow or Red. See the Words *Light and Colours*, where I have given you a large Account of Sir *I. Newton's* Experiments, as mentioned in his Letter in the *Phil. Transf.* N. 80, &c.

It being therefore certain that all kind or degrees of blue Light, are a little more refracted than any reddish Light whatsoever, 'Tis plain, saith Mr. *Halley*, that from this difference the breadth of the *Iris* must arise; but which, is hardly to be determined by Observation, by reason of the uncertain Limits of the Colours in the Clouds. But the greater the Ratio of Inequality between CA and CD, or the greater the Refraction is, by so much the greater will the Distance be of any *Iris* from the Sun; so that those which are more remote from the Sun, are always more adorned with a Purple Colour, but the more near ones with a Red one, as is apparent in the *Primary Iris*, which vanishes or disappears in *Opposito Solis*, if the Sine of Incidence to that of the refracted Angle be as CA to CE:: or as 2. to 1. And if the Ratio be greater than this, the *Primary Iris* will not be at all visible, or no *Primary Iris* at all can be seen.

It is to be observed also, That the *Secondary Iris* will go off in a Point, in *Opposito Solis*, whenever the Ratio of Refraction is as 1. to $\sqrt{2} + \sqrt{2}$ or as 1 to 0.837487. And from thence will turn back towards the Sun himself, and there disappear, if the aforesaid Ratio be as 2 to 1, or as CA to C*e*.

But in the Intermediate Proportions, (which are found in all known Fluids, except Air) the greater the Ratio of Refraction, the further is the *Iris* distant *ab Opposito Solis*, or rather from the Sun himself, the Ark being numbered beyond the Semicircle, and therefore the Colours will appear to be found in an Order diverse from that in the *Primary Iris*, unless you thus reckon the distance of the *Secondary* one from the Sun himself, which must also be taken notice of in the other *Iris*.

The Third *Iris* in *Opposito Solis* is quite confused; the Ratio of the Refraction being as 1 to 91855, and from thence it runs back in the Ratio of 1 to 68250; from whence again, the order of the Colours being restored, in the Ratio of 4 to 1, or of CA to C*e*, it ends in *Opposito Solis*.

But the Fourth *Iris* beginning from the Sun in the Ratio of Equality, passes off in the Points opposite to him in the Ratio of 1 to 94895, and thence returns to the Sun again, if the Ratio be as 1 to 4; and from thence is again dispersed or scattered towards the Parts opposite to the Sun, in the Ratio of 1 to 56337, within which Bounds are the Refractions of all known Fluids contained.

Lastly, if the Ratio were as 5 to 1, or as CA to C*n*, the *Iris* will vanish into the Sun himself; and the Colours to appearance will be inverted at

its Regress to the Sun, as they were right or direct at their Egress.

And from hence it is that the Primary and Fourth Iris in Watry Clouds obverts a reddish Colour towards the Sun, but the Secondary and Third, a Purple one.

After this, Mr. Halley shews how, having the Distance of the Iris from the Sun, to find the Ratio of the Refraction; and this by a very easy, but most accurate Observation.

Take a small Glass Tube, and erecting it perpendicular to the Horizon, suspend in its lower Orifice a small drop of Water, or some such clear Fluid; and then at some time when the Sun is near the Horizon, and shines very bright, let it be observed under what Angle *cum Opposito Solis*, the Colours of the Iris are seen in the pendulous drop; for then the Ratio of the Refraction may be had by an easy Calculation. And its Investigation forms a Cubick Equation, having only one Root, by which the Primary Iris being given, the Ratio may be found. The Equation is this, $T^3 - 3T^2t - 4trr = 0$. In which, T is the Tangent of the Angle of Incidence sought, and t is the Tangent of half the Distance of the Iris *ab Opposito Solis*, to the Radius $r = 1$. Whence, according to Cardan's Rules, there arises this Theorem, *viz.*

From the Cube t, let there be taken the Product of $2tr$ into the Excess of the Secant of the same Ark above the Radius, the remainder of difference shall be the lesser Cube: But the Sum of them, adding $4trr$ shall be the greater Cube. The Sum of the Sides of both Cubes added to t, will be equal to the Tangent of the Angle of Incidence; and the half of that Sum, the Tangent of the refracted Angle. Whence the *Ratio* of the Refraction is known.

Of this he gives the following Example.

In a drop of Oil of Turpentine, the distance of the Primary Iris *ab Opposito Solis*, was observed to be $25^{\circ} 40'$.

The Ratio of the Refraction was required.

$$\begin{aligned} t &= \text{Tangent } 12^{\circ} 50' = 0.2278063 \\ s &= \text{Secant of the same} = 1.0256197 \\ ttt &= 0.01182217 \\ s - r \text{ into } 2rt &= 0.01167265 \end{aligned}$$

Difference, Cube of the less 0.00014952 whose

$$\begin{aligned} \sqrt[3]{0.053773} & \\ \text{The Sum} &= 0.02349482 \\ \text{Adding } 4trr &= 0.91122525 \end{aligned}$$

The Cube of the greater 0.93472007 whose

$$\begin{aligned} \sqrt[3]{0.9777486} & \\ t &= 0.2278063 \end{aligned}$$

1.2586322 = Side of the Cube of lesser. = T The natural Tangent of the Angle of Incidence $51^{\circ} 32'$ and its Half,

viz. 0.6293161 is the natural Tangent of the Refracted Angle, *viz.* $32^{\circ} 11'$.

Lastly, as $\sqrt{T^2 + 4} : \sqrt{T^2 + 1} :: r.s.$ or so, is 1 to 68026. Which Ratio comes very near to that which by Experiment is found to be in Glass and most diaphanous Solids.

Only, indeed, a Diamond exceeds the rest of Pellucid Stones, in this Power of Refraction; for

its Ratio is nearly as 5 to 2, or more accurately, as 100 to 41. See Vol. 2.

RAKE of a Ship, is so much of her Hull as overhangs at both ends of her Keel. That part of it which is before, is called her *Rake forward on*; and that part which is at the setting on of the Stern-Post, is called her *Rake aft-ward on*: When a Ship hath but a small *Rake forward on*, but is built with her Stern too fair up, she is called *Bluff-headed*.

The common Proportion for a Ship's *Rake forward on*, is more than a Third, but less than $\frac{1}{2}$ the length of her Keel: and the *Rake aft* is about a 4th or 5th of her *Rake before*. Tho' in this Proportion, there is no certainty, some Nations, and some Carpenters building with longer Rakes than others. A Long *Rake forward on*, if a Ship have also a good fat Bow, gives her a good Way, and helps her to keep a good Wind; but then this makes her apt to pitch under Water in a Head-Sea, and besides is a great Strife and Charge to a Ship, because she overhangs to a Head. Therefore the middle Proportion is best, considering all things.

RAKE of the Rudder. See *Rudder*.

RAKED Table, a Term in Architecture. See *Table*.

RAM Head, is the Name of a great Block (a-board a Ship) belonging to the Fore and Main-Halliards; it hath in it 3 Shivers, into which the Halliards are put, and at its Head the Tyes are reeved into an Hole made there for that Purpose.

RAMIFICATION, is a Collection of small Branches issuing out from one large one. Thus in Anatomy, the several Branches of the Aorta or Great Artery, by which the Arterial Blood is convey'd to all the extrem Parts of the Body, are called the *Ramifications* of the Artery: and when they are exceedingly small, they are called *Capillary Arteries*; which see.

RAMMER, is a Staff with a round piece of Wood at one end, in order to drive home the Powder to the Breech of the Great Gun, as also the Shot and the Wad, which keeps the Shot from rowling out. At the other end of these *Rammers*, are usually rolled in a certain Piece of Ships-skin fitted to the Bore of the Piece, in order to clear her after she has been discharged: And this is called Spunging the Piece.

RAMPANT: The Term in Heraldry for a Lion, or any Beast of Prey, in a Posture of Climbing, or Standing upright on his hinder Legs, and rearing up his Fore-feet. 'Tis different from *Salient*, which is a Posture not so erect. See *Salient*.

RAMPART, in Fortification, is the Mass of Earth which is raised about the Body of any Place, to covert it from Great Shot, and consists of several *Bastions* and *Curtains*; having its *Parapet*, *Platform*, *interior* and *exterior Talus*, and *Berme*, as also sometimes a Stone Wall, and then they say it is Lined. The Soldiers continually keep Guard here, and Pieces of Artillery are Planted for the Defence of the Place.

The Height of the *Rampart* must not exceed three Fathom, as being sufficient to cover the Houses from the Batteries of the Cannon: Neither ought its Thickness to be above ten or twelve, unless more Earth be taken out of the Ditch, than can be otherways bestowed.

The *Ramparts* of Half-Moons are the better for being low, that the small Fire of the Defendants may the better reach the Bottom of the Ditch; but yet

yet it must be so high, as not to be commanded by the Covert-way.

RAMUS Anterior, *Sc. Vena Subcutanea*, is a Branch of the *Subcutaneous Vein*, (which takes its Name from its shallow running just under the Skin) and is itself a Branch of the *Basilica*; it goes under the Muscles of the *Ulna* to the little Finger, where it joins a Branch of the *Cephalica*.

RAMUS Posterior, another Branch of the *Subcutaneous Vein* of the Arm, running near the Elbow; it sends out a Branch which goes to the Wrist, then it unites with the *Cephalica Interior*, and forms the *Mediana*.

RANDOM-Shot, is a Shot made when the Muzzle of a Gun is raised above the Horizontal Line, and is not designed to shoot directly or Point-blank. The utmost *Random* of any Piece, is about ten times as far as the Bullet will go Point-blank; and the Bullet will go farthest when the Piece is mounted to about 45 Degrees above the Level-Range. The Distance of the *Random* is reckoned from the Platform to the Place where the Ball first Grazes.

RANGE, a Term in Gunnery, signifying the Line a Shot goes in from the Mouth of the Piece. If the Bullet go in a Line parallel to the Horizon, that is called the *Right or Level-Range*; if the Gun be mounted to 45 Degr. then will the Ball have the highest or utmost Range, and so proportionably all others between 00 Degr. and 45°, are called the *Intermediate Ranges*.

RANGES, in a Ship, are two Pieces of Timber going a-crofs from Side to Side; one aloft on the *Fore-Castle* a little abaft the *Foremast*; and the other in the *Beak-Head* before the *Woudings* of the *Bow-Sprit*.

That in the *Fore-Castle*, is fastened into the Timbers of the Ship's-Sides, and hath two Knees about the Middle, on either Side the *Fore-Mast*, fastened to the Deck and the Timber, in which the *Top-Sail-Sheets* run in a Shiver: In it also are several *Wooden Pins* to belay the *Fore-bowling*, the *Fore-Tack*, and the *Fore-loof Hook*.

That in the *Beak-Head* lies in the Form of the other, and hath the *Sprit-Sail*, and *Sprit-Sail-Top-Sail-Sheets* and Ropes belayed about its Pins.

RANGER, is a Sworn Officer of the Forest, whereof there are Twelve: His Business chiefly consists in three Points; To walk daily through his Charge, to see, hear, and enquire, as well of Trespasses, as Trespassers in his Bailiwick; To drive the Beasts of the Forests, both of Venerly and Chase, out of the Disforested into the *Fore-Red Lands*; And, To prevent all Trespasses of the Forest. This *Ranger* is made by the King's Letters-Patent, and hath yearly Pension out of the *Exchequer*.

RANULA. See *Hypoglossum*.

RANULARES, are those Branches of the external Jugular Veins which run to the Tongue, and are very apparent under it.

RAPHE. See *Satura*.

RAPINE, in Law; to take a Thing in private against the Owner's Will, is properly Theft; but to take itroperly, or by Violence, is *Rapine*.

RAPSODY, originally signifies a Connection together, or a Repetition of a vast Number of Heroick Verses, such as those of *Homer*, &c. But now we usually understand by it, a long, tedious, impertinent spinning out of a Discourse to little or no Purpose, or Benefit to the Reader.

RAPTU Hæredis; is a Writ lying for the taking

away of an Heir holding in Socage; of which there are two Sorts; one when the Heir is Married, the other when he is not. Of both these, see the *Reg. Orig. Fol. 163*.

RARE Bodies, are such as have more Space, or take up more Room in Proportion to their Matter, than other Bodies do.

RAREFACIENTIA, rarifying Remedies; are such as by dissipating a little the Vapours and Humours, make the Pores of Bodies larger. *Blanchard*.

RAREFACTION, of any natural Body, is when it takes up more Dimensions, or a larger Space than it had before.

There are three Ways of Explicating of Rarefaction.

1. That of the *Aristotelians*, which is called the Rigorous Way, who suppose the same Body doth not only obtain a greater Space in Rarefaction, but also adequately fill it; and acquires larger Dimensions, without either having any Pores or Vacuities between its Corpuscles, or admitting any other Body or subtle Matter to be joined with them.

2. That of the *Cartesians*, which was also the Opinion of many of the Old Philosophers, who assert, That in Rarefaction the Pores of the rarefied Body are dilated, and replenished with some fine subtle and ethereal Substance, which insinuates it self freely into the Interstices between its disjointed Particles.

3. That of the *Atomists or Vacuists*, who suppose the Parts of the rarefied Body to be disjointed and removed farther from each other, and yet no other Body (necessarily) comes in between them. See this explained under *Air*.

RASANT Line of Defence, in Fortification, is a Line drawn from the Point of the Bastion along the Face, and prolonged till it come to the Curtain, and therefore shews how much of the Curtain will clear or scour the Face: This is called also the Second Flank, the Hanking, or Stringent Line.

RASETA, the same with *Carpus*.

RASH. See *Ratch*.

RASPATORIUM, or *Scalprum Rasorium*, is a Chirurgion's Instrument to scrape or shave filthy or scabby bones with.

RATCH, is a sort of a Wheel of 12 large Fangs, that runneth Concentrically to the Dial Wheel, and serveth to lift up the *Dentes* every Hour, and make the Clock strike: and are by some called *Rab*.

RATCHET, in a Watch, are the small Teeth at the Bottom of the Fusey or Barrel, that stop it in winding up.

RATE-Tythe, is when Sheep or other Cattle are kept in a Parish for a less Time than a Year, the Owner must pay *Tyths* for them *pro rata*, according to the Custom of the Place.

RATIFICATION, a Law-Term, used for the Confirmation of a Clerk in a Prebend, &c. formerly given him by the Bishop, &c. where the Right of Patronage is doubted to be in the King.

RATIO. When two Quantities are compared one with another in respect of their Greatness or Smallness. That Comparison is called *Ratio*, and signifies the *Rate*, *Reason* or *Proportion* in Quantity, that one hath to the other. Though some, indeed, confine *Ratio* or *Reason* only to two Numbers, and call it *Proportion*, when it is between 3, 4, or more Numbers or Quantities. But the Word *Proportion* is often used instead of *Ratio* or *Reason*, to express the Comparison of one single Quantity to another, by very good Authors.

RATIOCINATION, a Rational way of Arguing.

RATIONABILI parte bonorum, is a Writ that lies for the Wife against the Executors of her Husband, denying her the third Part of her Husband's Goods.

RATIONABILIBUS divisis, is a Writ that lies where two Lords, in divers Towns, have Seignories joining together, for him that findeth his Waste by little and little to have been encroached upon, against the other that hath Encroached, thereby to rectify their Bounds. And this is a King of *Justices*, and may be removed by a *Pone*, out of the County to the Common Bench. By the *Civilians* it is called *Judicium finium Regundorum*.

RATIONAL Horizon. See *Horizon*.

RATIONAL Quantities. Any Quantity being proposed, (for which we may always put 1.) and which *Euclid* (Book 10.) calls *Rational*, there may be infinite others which are Commensurable, or Incommensurable to it; and that either Simple, or in Power. Now, all such as are Commensurable any how to the given Quantity, he calls Rational Quantities, and all the others Irrational.

RATLINES, (or as the Seamen call them, *Ratlings*) are those Lines which make the Ladder Steps, to get up the Shrouds and Puttocks; therefore they are called the Ratlings of the Shrouds.

RAVELIN, in Fortification, is a small Triangular Work composed only of two Faces, which make a Salient Angle, without any Flanks. It is generally raised before the Curtains or Counterfarp, and commonly called a Half-Moon by the Soldiers.

A *Ravelin* is like the Point of a Bastion with Flanks cut off. The reason of its being placed before a Curtain, is to cover the opposite Flanks of the two next Bastions. 'Tis used also to cover a Bridge or a Gate; and 'tis always placed without the Moat.

What the Engineers call a Ravelin, the Soldiers generally call a Half-Moon, which see.

RAY Common, is a right Line drawn from the Point of the Concourse of the two Optical Axes, through the Middle of the right Line which passeth by the Centre of the Pupil of the Eye.

RAY Direct, is that which is carried from a Point of the visible Object directly to the Eye, through one and the same Medium.

RAY of Incidence, or Incident Ray, in Catoptricks, is a right Line which falls from some Point of an Object upon the Surface of the Looking-Glass or polished Metal.

RAY of Incidence, or Incident Ray, in Dioptricks, is the Ray of Light which goes in a right Line from a certain Point of the visible Objects in one Medium, until it meet with a Second Medium.

RAY in Opticks, is a Line imagined to pass from the Eye toward the Object, or from the Object toward the Eye, and is called a Visual Ray. But there is also a Pyramid of Rays, which strike the *Tunica Retina* of the Eye, and are broken or refracted in the Crystalline.

RAY Principal, in Perspective, is the perpendicular Distance between the Eye and the Vertical Plane, or Table, as the *French* call it.

RAY of Reflection is the right Line whereby the Reflection is made.

RAY of Refraction, or broken Ray, is a right Line whereby the Ray of Incidence changeth its re-

gitude, or is broken in traversing the Second Medium, whether it be thicker or thinner.

RAYS, or Beams of the Sun, or Rays of Light, are either according to the Atomical Hypothesis, those very minute Particles or Corpuscles of Matter, which continually issuing out of the Sun, do thrust on one another all around in Physically short Lines; (and that this is the right Opinion, many Experiments do evince, particularly the Incomparable *Sir Is. Newton* about Light and Colours) or else as the *Cartesians* assert, they are made by the Action of the Luminary on the Contiguous Ether and Air, and so are propagated every way in strait Lines, through the Pores of the Medium.

RAYS Convergent, are those which going from divers Points of the Object, incline towards one and the same Point tending to the Eye.

RAYS Divergent, are those which going from a Point of the visible Object, are dispersed, and continually depart one from another, according as they are removed from the Object.

RAYS Parallel, are those that keep an equal Distance from the visible Object to the Eye, which is supposed to be infinitely remote from the Object.

RAZANT Line of Defence. See *Rasant Line of Defence*.

REACH, is the Distance between any two Points of Land, that lie in a right Line one from another.

REALGAL, or *Sandaracha*, is red Arsenick.

REAL Horizon. See *Horizon*.

REAR-Guard, is that Part of an Army which follows the main Body, to hinder and stop Defectors.

REASON, in Mathematicks, the same with Proportion; 'tis better called by the *Latin* Name *Ratio* (which see) to avoid confounding it with the common Signification of the word *Reason*.

REATTACHMENT, is a Second *Attachment* of him that was formerly attached and dismissed the Court without Day, as by the not coming of the Justices, or some such Casualty. And is said to be either General or Special. General-Reattachment, is where a Man is reattached for his Appearance upon all Writs of Assize lying against him: Special-Reattachment, must be for one or more certain.

REBUSSES, are in Heraldry such Coats of Arms as bear an Allusion to the Surname of the Person, as 3 Conies for *Comisby*, 3 Cups for *Butler*, 3 Castles for *Castleton*: And such Bearings are very ancient.

REBUTTER, in Common-Law, when a Man grants Land to the use of himself, and the Issue of his Body, to another in Fee with Warranty: And the Donee leaseeth out his Lands to a Third for Years; the Heir of the Donor impleadeth, the Tenant alledging, That the Land was in Tail to him: The Donee comes in, and by virtue of the Warranty, made by the Donor, repelleth the Heir, because tho' the Land was Entailed to him, yet he is Heir to the Warrantor likewise; and this is called a *Rebutter*. And if I grant to my Tenant, to hold *Sine impetitione vassii*, and afterwards implead him for Waste made; he may debar me of this Action, by shewing my Grant; and this is also a *Rebutter*.

RECAPTION, is a Second Distress of one formerly distrained for the same Cause, and also during the Plea-grounded on the former Distress: It likewise

likewise signifies a Writ lying for the Party thus Disfrained.

RECEIVER. See *Recipient*.

RECEPTACULUM *Chyli*, was first found out by *Pocquet*, A. D. 1651, 'tis a Cavity into which all the Lacteal Veins empty themselves: it is of a Vesicular Substance, which is thicker in Men than in Beasts, but the Cavity is larger in Beasts than Men: Out of it goes the *Ductus Thoracicus*; which see.

RECESSION of the *Equinoxes*, is the going back of the Equinoctial Points every Year about 50 Seconds. The Reason of which is, That the Axis of the Earth, after many Annular Revolutions round the Sun, really deviates from that Parallelism, which it seems to keep with it self all the time of one Annular Revolution: By this Aberration it describes a Conical Superficies; and the Earth's Equator moving round the Sun; together with the Earth's Axis, the Intersections of the Celestial Equator with the Ecliptick, will run back, or move in *Antecedentia*, as will all other Points of the Ecliptick, (as well as those Equinoctial ones.) And therefore the Signs or Fix'd Stars that make the 12 Zodiacal Constellations, will appear to move forward, or in *Consequentia*; as they now seem to have done by the Quantity of a whole Sign; for which Reason, you find the Picture of the *Ram* painted on our Globes at the beginning of the Sign *Taurus*, &c.

Dr. *Gregory* in his Excellent *Astronomia Physica & Geometrica*, Prop. LXIV. Lib. 1. makes the Prolate Spheroidal Figure of the Earth, to be the Primary Occasion of this Recession of the Equinoctial Points; and withal shews that the Earth's Axis in every Annual Revolution round the Sun, twice changes its Inclination to the Ecliptick, and as often returns again to its former Position.

RECIDIVUS *Morbus*, a Relapse, is when the Morbifick Matter, that was left in the first Distemper, begins to work and ferment again.

RECIPIENTS, or *Receivers*, are those Vessels, which in Distillation, are Luted to the Beak, or Nose of Alembick, Retort, &c. to receive the Matter which is raised or forced over the Helm, by the Fire. That Glass also which is exhausted of Air by Mr. *Boyle's* Air-Pum, and within which any Animal or other Bodies, are included to make Experiments upon, is by him usually called the *Receiver*.

RECIPROCAL Figures in Geometry, are such as have the Antecedents and Consequents of the Ratio in both Figures.

Here A : B :: C : D;
z. e. 12 : 4 :: 9 : 3.

A

B

That is, as much longer as the Side A in the first Rectangle is than B : so much deeper is the Side C in the second Rectangle, than the Side D in the first; and consequently the Length of one is compensated by the Depth of the other; and also as the Side A is $\frac{1}{3}$ longer than the Side C, so the Side B is one 4th longer than D. Wherefore the Rectangles must needs be equal.

And this is the Foundation of the *Catholick Theorem*; That the Rectangle of the Extreams must always be equal to that of the Means: And consequently the Reason of the Rule of Three, or Golden Rule; for suppose there was given any three Numbers, or Quantities Geometrically proportional, as A, B, and C, and that it were required to find a fourth D proportional to them.

Since it is that A : B :: C : D therefore $A \cdot D = B \cdot C$, and consequently $D = \frac{B \cdot C}{A}$; that is, the Fourth Term is equal to the Quotient of the Second, multiplied by the Third Term, divided by the First:

Or thus in Numbers.

Suppose given 12, 4, and 9; required a fourth Proportional.

Now as 12 : 4 :: 9 : Q

But $12 \cdot Q = 4 \cdot 9 = 36$.

Therefore $Q = \frac{4 \cdot 9}{12} = 3$, by dividing both Sides by 12.

COROLLARY.

And from hence 'tis plain, That if any two Triangles, Parallelograms, Prisms, Parallelopipeds, Pyramids, Cones, or Cylinders, have their Bases and Altitudes Reciprocally proportional, those two Figures or Solids are equal to one another; and vice versa, if they are equal, their Bases and Altitudes are Reciprocally proportionable.

RECIPROCAL Proportion, is when in four Numbers, the Fourth is lesser than the Second, by so much as the Third is greater than the First, and vice

vice versa; on which is founded the Inverse or Indirect Rule of *Trees*, thus:

4 : 10 :: 8 : 5.

See the *Corollary* after Reciprocal Figures.

There is great use made of this *Reciprocal Proportion*, by Sir *Isaac Newton*, and others, in their Demonstrations of the *Laws of Motion*, &c. and indeed without a clear knowledge of it, they cannot be understood.

RECLINATION of a Plain, is the Quantity of Degrees which any Plain, on which a Dial is supposed to be drawn, lies or falls backwards from the truly upright or vertical Plain.

RECLINING, in Dyalling, the Plane that leans from you when you stand before it, is said to be a *Reclining Plane*.

RECLINING Declining Dyals. See *Declining Reclining Dyals*.

RECOGNIZANCE, in Law, is a Bond or Obligation of Record, testifying the *Recognisor* to owe to the *Recognisee* a certain Sum of Money, and is acknowledged in some Court of Record, or before some Judge, Master of the Chancery, or Justice of Peace; and those that be meer *Recognisances*, are not Sealed but Enrolled, and Execution by force thereof, is of all the *Recognisor's* Goods or Chattels, (except Draught Beasts and Implements of Husbandry) and the Moiety of his Lands.

RECOGNISEE, is he to whom one is bound in a *Recognisance*.

RECOGNITIONE adnullanda per vim & duritiam facta, is a Writ to the Justices of the Common Bench, for the sending of a Record touching a *Recognisance* which the *Recognisor* suggests to have been acknowledged by force and duress, that if it be so, it may be annulled.

RECOGNITORS, is a Word often used for the Jury Impannelled upon an Assize: The reason why they are so called, is, because they acknowledge a *Diffelsin* by their Verdict.

RECOLLECTION, is a Mode of Thinking, whereby those Ideas sought after by the Mind, are with Pain and endeavour found, and brought again to view.

RECORD, in Law, signifies an Authentick and Uncontroulable Testimony in Writing, contained in Rolls of Parchment, and preserved in Courts of Record; and they are said to be *vetustatis & veritatis vestigia*. An Act committed to Writing in any of the King's Courts, during the Term wherein it is Written, is alterable, being no Record; but that Term once ended, and the Act Enrolled, it is a *Record*, and of that Credit, that admits no alteration or proof to the contrary. Lawyers reckon three sorts of Records, viz. *Record Judicial*, as Attainder, &c. *Record Ministerial* upon Oath, as an Office or Inquisition found. And a *Record* made by Conveyance, and Consent, as a Fine or Deed Enrolled, or the like.

RECORDARE facias, or *Recordari facias*, is a Writ directed to the Sheriff, to remove a Cause depending in an Inferior Court, as Court of ancient Demesne, Hundred or County, to the King's Bench, or Common-Pleas; it seems to be called *Recordare*, because it commands the Sheriff to make a Record of the Proceedings by himself and others, and then to send up the Cause.

saiv

RECORDER, is he whom the Mayor, or other Magistrate of any City, or Town Corporate having Jurisdiction, or a Court of Record within their Precincts, by the King's Grants, doth associate unto him for his better Direction in Matters of Justice and Proceedings according to Law; and is therefore for the most part a Man versed and experienced in the Law.

RECORDO & processu Mittendis, is a Writ to call a Record together, with the whole Proceeding in the Cause, out of an Inferior Court into the King's-Bench Court.

RECORDO utlagare Mittendo, is a Judicial Writ; which see in *Reg. Judic. fol. 32.*

RECOVERY, in a Legal Sense, signifies an obtaining any thing by Judgment or Tryal at Law, as *Evictio* doth among the *Civilians*.

And there is a *True* and a *Feigned Recovery*: A *True Recovery* is an actual or real Recovery of any thing, or the Value thereof by Judgment; as if a Man sue for any Land, or other thing moveable or immoveable, and have a Verdict and Judgment for him.

A *Feigned Recovery*, is, (as the *Civilians* call it) *Quadam fictio juris*, a Certain Form or Course set down by Law, to be observed, for the better assuring of Lands and Tenements unto us; and the end and effect thereof is to discontinue and destroy Estates Tail, Remainders and Reversions, and to bar the Intails thereof.

And in this Formalty are required three Persons, viz. The *Demandant*, *Tenant*, and *Vouchee*.

The *Demandant*, is he that brings the Writ of Entry, and may be termed the *Recoverer*.

The *Tenant*, is he against whom the Writ is brought, and may be termed the *Recoveree*.

The *Vouchee*, is he whom the Tenant voucheth, and calls to Warranty for the Land in demand.

A *Recovery with double Voucher*, is, where the Tenant voucheth one, who voucheth another, or the common Vouchee.

And a *Recovery with treble Vouchers*, is where three are vouched: As when a Man that is desirous to cut off an Estate Tail in Lands or Tenements, to the end, to sell, give, or bequeath it, causes a *Feigned Writ* of Entry, *Sur disseisin en le poit*, to be brought for the Lands of which he intends to cut off the Entail, and in a *Feigned Count*, or Declaration thereupon made, pretends he was disseised by him, who by a *Feigned Fine* or Deed of Bargain and Sale, is named and supposed to be the Tenant of the Land. This *Feigned Tenant*, if it be a *Single Recovery*, is made to appear and Vouch the *Bag-bearer* of Writs for the *Custos brevium*, in the Common Pleas, (for there only can such Recoveries be suffered) who makes Default. Whereupon the Land is recovered by him that brought the Writ, and a Judgment is by such fiction of Law entred, that the Demandant shall recover the Value of the Lands against the Lands of the *Vouchee*.

Bag-bearer is a Poor Unlanded and Illiterate Person, which is feigned to be a Satisfaction to the Heir in Tail, tho' he is never to have or expect it.

This *Feigned Recovery*, is also called a *Common Recovery*, because it is a beaten and common Path to that end for which it is appointed, viz. to cut off the Estates above specified. But a *True Recovery* is as well of the Value as of the Thing: As if a Man buy Land of another with Warranty, which Land

a third

a third Person afterwards by Suit of Law recovereth against me, I have my Remedy against him that sold it me, to recover in Value; that is, to recover so much in Money, as the Land is Worth; or so much other Land by way of Exchange.

RECOUPE, in Law, is a quick and sharp Reply to a peremptory Demand, and used by Lawyers to defalk or discount; as if a Man hath Ten Pounds issuing out of certain Lands; and he disseises the Tenant of the Land in an Assise brought by the Disseisee, the Disseisor shall *Recoupe* the Rent in the Damages.

RECREMENT, any Superfluous Matter in the Blood or Body, or any of its Parts.

RECREMENTS, a Word used by the Physicians and Anatomists, for such Juices as are separated in the several Glands of the Body for proper and peculiar Uses; as the Spirits, the Lympha, the Gall, the Pancreatic Juice, the proper Ferments of the Stomach, Guts, &c. and these are distinguish'd from Excrements, which are expelled out of the Body, as being of no further Use to it.

RECTANGLE, in Arithmetick, is the same with Product; which see.

RECTANGLES in Geometry, are Parallelograms, whose Sides are unequal, but Angles right. Their Area is found by multiplying the two unequal Sides one into another, for then the Product is the Superficial Content or Area.

RECAINGLED Triangle, the same with Right-angled Triangle.

All Rectangles, (as A and B) which have the same Height, are to one another as their Bases.

That is,

$$\square A : \square B :: ab : bc.$$

For A is made by the Multiplication of ba its Base by the Line be ; and B is also made by multiplying cb its Base by the same Line be (or its equal cf).

But the Product of any two Numbers Multiplied by the same Third Number, are as those Numbers were to each other before Multiplication. Therefore,

$$A : B :: ab : bc. \quad Q. E. D.$$

Hence all Rectangles, or Parallelograms, between the same Parallel Lines, or which have the same Height, must be to one another as their Bases are.

For they are all equal to Rectangles, on the same or equal Bases with themselves, and consequently must have the same Proportion to each other, as such Rectangles; that is, be to each other as their Bases. *Q. E. D.*

And the same Thing must be true of all Triangles that are between the same Parallels, or which have the same Height, because they are the halves of those Parallelograms. See the Figure.

RECTANGULAR, or Right-angled, is spoken of a Plain Figure in Geometry, when one or more of its Angles are right: Of Solids, 'tis spoken in respect of their Situation: For if their Axes be perpendicular to the Plane of the Horizon, they are therefore Rectangular, or Right Cones, Cylinders, &c.

RECTANGULAR Section of a Cone; by this the Ancient Geometers always meant a *Parabola*, which Conick Section, before *Apollonius*, was only considered in a Cone, whose Section by the Axe would be a Triangle, Right-angled at the Vertex: And hence it was that *Archimedes* entituled his Book of the *Quadrature of the Parabola*, (as 'tis now called) by the Name of *Rectanguli Coni Sectio*.

RECTIFIE, or Rectification, in Chymistry, is the Distilling over again of any Spirit, in order to a more fine and pure State; and to separate from it any Heterogeneous Parts, that might rise with it before.

RECTIFIE, is a Word used in the Description and Use of Globe, or Sphere. For the first Thing to be done before any Problems can be wrought on the Globe, is to *Rectify it*. That is, to bring the Sun's Place in the Ecliptick on the Globe, to the graduated Side of the Bras Meridian, to elevate the Pole above the Horizon, as much as is the Latitude of the Place, and to fit the Hour Index exactly to Twelve at Noon, screwing also the Quadrant of Altitude, (if there be Occasion) to the Zenith. All this is comprehended under the Word *rectify the Globe*: And when this is done, the (Celestial) Globe represents the true Posture of the Heavens, for the Noon of that Day it is Rectified for.

RECTIFIER (in Navigation) is an Instrument consisting of two Parts, which are two Circles either laid one upon, or let into the other, and so fastened together in their Centers, that they represent two Compasses, one fixed, the other moveable; each of them divided into the 32 Points of the Compass, and 360 Degtees, and numbred both Ways, both from the North and the South, ending at the East and West, in 90 Degrees.

The Fixed Compass, represents the Horizon, in which the North, and all the other Points of the Compass are fixed and immoveable.

The Moveable Compass represents the Mariners Compass, in which the North, and all the other Points are liable to Variation.

In the Centre of the Moveable Compass is fastned a Silk Thread, long enough to reach the out-side of the Fixed Compass. But if the Instrument be made of Wood, there is an Index instead of the Thread.

Its Use is to find the Variation of the Compass, to rectify the Course at Sea; having the Amplitude or Azimuth given.

RECTIFYING of Curves, (in Mathematicks) is to find a Strait Line, equal to a Curved one; or a Plane equal to a curved Surface.

Of this Dr. Wallis gave the first Hint to the World, in his Arithmetick of Infinites, *Prop. 28. §3. Scholium.*

Soon after which, Mr. William Neil applied those Considerations to the *Semi-cubical Paraboloid*, where the Cubes of the Ordinates are as the Squares of the Diameters: And shewed that, there the small Segments of the Curve, cut by the Ordinates at equal Distances, are as the Ordinates in a Parabola, and therefore their Squares increased by Equals, in Arithmetical Progression: Wherefore that Curve must be to a Right Line :: as the Trunk of a Parabola, to the Parabola: Which, the Quadrature of the Parabola being known, is a known Proportion; and this was the first Attempt of this Nature. But it was afterwards soon demonstrated also by Sir Christopher Wren, my Lord Brouncker, and by Dr. Wallis. And the Year following, viz. 1658, Sir Christopher Wren shewed the Curve of the Cycloid, to be Quadruple of its Axis: Which was the second Demonstration of a Straight Line equal to a crooked one. Of which see Dr. Wallis's *English Algebra*, p. 292, &c. See more also in his Excellent Book of *Cycloide*.

RECTILINEAL, or Right-lined, in Geometry, is spoken of such Figures as have their Extremities all Right Lines.

RECTI Minores, are two small Muscles of the Head, appearing both in Sight at once: They arise fleshy from the Posterior Part of the first *Vertebra* of the Neck; and are so inserted to the middle Part of the *Os Occipitis* in two shallow Depressures of the said Bone: These from their Use, may be called *Rementes* or Noddors backward, and are Antagonists to those we call *Annuentes*.

RECTO, is a Writ of Right, and is of so high a Nature, that whereas other Writs in real Actions are only to recover the Possession of Lands or Tenements in Question, which have been lost by our Ancestors or our selves; this aimeth to recover both the Seisin, which some of our Ancestors or we had, and also the Property of the Thing whereof the Ancestor died not Seized, as of Fee, and whereby are Pleaded and Tried both their Rights together, viz. as well of Possession as Property: So that if a Man once lose his Cause upon this Writ, either by Judgment, Affize, or Battle, he is without all Remedy, and shall be excluded *per exceptionem rei Judicatae*.

It is divided into two Kinds, *Rectum Patens*, a Writ of right Patent; and *Rectum Clausum*, a Writ of right Close. This the *Civilians* call *Judicium Pettitorum*. The Writ of right Patent is so called, because it is sent upon, and is in Nature the highest Writ of all others, lying always for him that hath Fee-simple in the Lands or Tenements sued for, and not for any other. And when it lieth for him that Challengeth, Fee-simple, and in what Cases, see F. N. B. Fol. 1. 6. This Writ is also called, *Brevé magnum de recto*. A Writ of right Close, is a Writ directed to a Lord of *Ancient Demesne*, and lieth for those which hold their Lands and Tenements by Charter in Fee-simple, or in Fee-Tail, or for Term of Life, or in Dower, if they be ejected out of such Lands, &c. or disseised. In this Case, a Man or his Heirs may sue out this Writ of right Close, directed to the Lord of the *Ancient Demesne*, commanding him to do him right, &c. in his Court. And this is called, *Brevé parvum de recto*.

RECTO de Advocacione Ecclesie, is a Writ of Right lying where a Man hath right of Advowson,

and the Parson of the Church dying, a Stranger presents his Clerk to the Church, and he not having brought his Action of *Quare Impedit* nor *Darrein Presentment* within Six Months, but suffered the Stranger to Usurp upon him. And this Writ he only may have, that claimeth the *Advowson* to himself, and to his Heirs in Fee; and as it lies for the whole *Advowson*, so it lies also for the half, third or fourth Part.

RECTO de Custodia terra &c. hereditis, was a Writ that lay for him whose Tenant holding of him in Chivalry, died in Nonage, against a Stranger that entered upon the Land, and took the Body of the Heir; and is now become useless as to Lands holden in *Capite*, or by *Knights Service*, but not when there is Guardian in *Socage*, or appointed by the last Will and Testament of the Ancestor.

RECTO de Dote, is a Writ of Right of Dower, which lieth for a Woman that hath received Part of her Dower, and purposes to demand the Remainder in the same Town, against the Heir, or his Guardian, if he be a Ward.

RECTO de dote unde nihil habet, is a Writ of Right, which lies in case where the Husband having divers Lands or Tenements, hath assured no Dower to his Wife; and she thereby is driven to sue for her Thirds, against the Heir or his Guardian.

RECTO de rationabili parte, is a Writ that lies always between Privies of Blood; as Brothers in *Germskind*, or Sisters, or other Coparceners, as Nephews or Nieces, and for Land in Fee-simple; as if a Man lease his Land for Term of Life, and afterwards dies, leaves issue two Daughters, and after that the Tenant for Term of Life dieth also, the one Sister entrench upon all the Land, and so deforming the other, the Sister so deformed shall have this Writ to recover part.

RECTO quando Dominus remisit, is a Writ of Right, which lies in case where Lands or Tenements being in the Seigniorship of any Lord, are in Demand by a Writ of Right; for if the Lord hold no Court, or otherwise, at the Prayer of the Demandant, or Tenant, shall send to the Court of the King his Writ, to put the Cause thither for that Time, (saving to him at other Times the Right of his Seigniorship) then the Writ issues out for the other Party, and hath the Name from the Words contained, being the true Occasion thereof. This Writ is *Close*, and must be returned before the Justices of the *Common-Bench*.

RECTO sur Disclaimere, is a Writ that lies when a Lord in the King's Court of *Common-Pleas* avows upon his Tenant, and the Tenant disclaimeth to hold of him; upon which disclaimer he shall have this Writ; and if the Lord aver and prove, That the Land is held of him, he shall recover the Land for ever.

RECTUM Intestinum, is the strait Gut which begins at the first *Vertebra* of the *Os Sacrum*, and passeth strait downward to the Extremity of the *Rump*, or utmost End of the Back-bone. It is about a Foot in length, and not so wide as the *Colon*; but its Membranes are thicker.

RECTUS Femoris, is a Muscle of the Leg, so named from its streight Progress and Situation; it riseth fleshy from the Tubercle of the *Os Ilium*, that is in the Mid-way between the fore-part of its Spine and the *Acetabulum*, from thence descending directly between the *Vastus Externus* and *Internus*, and over the *Crureus*. Its Fibres externally descend from a middle Line obliquely Laterally: Internally

nally they run according to the Length, and become entirely Tendinous four Fingers breadth above the *Patella*, where it is united with the Tendons of the *Vastus Externus* and *Internus*, and *Cru-reus*, and inserted together with 'em at the Upper part of the *Tibia*. It serves to help to extend the *Tibia*.

RECTUS in Curia, signifies one that stands at the Bar, and no Man objects any thing against him. Also, when a Man hath reversed the Outlawry, and can participate of the benefit of the Law, he is *Rectus in Curia*.

RECTUS Internus Major, is a Muscle of the Head which arises Tendinous, but chiefly Fleshy, from the fore-part of all the Transverse Processes of the *Vertebrae* of the Neck, except the first and second, and in its Ascent becoming Fleshy, passes over those two superior *Vertebrae*, and is inserted to the Anterior Appendix of the *Os Occipitis*, near the great *Foramen*, that transmits the *Medulla Oblongata*. This manifestly bends the Head forwards, and therefore may be called *Flexor Capitis*, from its Use.

RECTUS Internus Minor, is a Muscle of the Head, which with its Partner appears on the Fore-part of the 1st *Vertebra*, like the *Recti Minores* on the Back-part, and arise near its Transverse Processes, and ascending directly, are inserted to the Anterior Appendix of the *Os Occipitis* immediately under the former. These nod the Head forward, and are Antagonists to the *Recti Minores*. Wherefore they may be called *Annenies*.

RECTUS Lateralis, is a short, thick, fleshy, Muscle of the Head, arising from the superior part of the Extremity of the Transverse Process of the first *Vertebra* of the Neck, between the former and *obliquus Superior*, thence ascends directly to its Insertion to the *Os Occipitis* in the Interspace made by the *Processus Mammillaris* and *Styloides*. This nods the Head to one side.

RECTUS Major, is a Muscle of the Head, which ariseth partly Tendinous, but chiefly Fleshy, from the superior Part of the double Spines of the second *Vertebra* of the Neck, and in its ascent becomes broader and Fleshy, and is so inserted to the posterior Part of the *Os Occipitis*: This Muscle with its Partner acting, pulls the Head directly back on the first *Vertebra*.

RECTUS Musculus, one of the Muscles of the *Abdomen*, so called from the Uprightness of its position. Its Use in common with the other Muscles of this Part, is to help to exclude the *Feces* and *Urine*, by the compression of the *Abdomen*.

RECTUS Palpebrae Superioris, is a Muscle which lifts up the upper Eye-lid.

RECURRENT Nerves, by some called *Vocal*, because they are spent upon the Instruments of Speech, and which *Galen* saith he tried to cut, and by that means rendred the Animal Mute. This *Dr. Willis* takes to be a distinct Pair by it self, but 'tis usually reckoned a Branch of the *Par-vagum* or 8th Pair, springing out of their Trunks, and so called, because first they descend, and then ascend again to supply the Muscles of the *Larynx*.

REDDENDUM, a Word used substantively for the Clause in a Lease, &c. whereby the Rent is reserved to the Lessor.

REDDITION, is a Judicial Confession and Acknowledgment, that the Land or thing in Demand, belongs to the Demandant, or at least not to the Person so surrendering.

REDENT, in Fortification, is a Work made in Form of the Teeth of a Saw, with *Sahani* and *Reentring-Angles*, to the end that one part may defend another. These sort of Works are usually erected on that side of a Place which looks towards a Marsh or River.

REDINTEGRATION, a restoring any Mixt Body or Matter whose Form is destroyed, to the same Nature and Constitution, and that it shall have the same Properties it had before.

The Honourable Mr. Boyle, hath a particular Treatise about the *Redintegration* of Salt-petre; in which he proves, that after Nitre had been fluxed in a Crucible over a strong Heat, and after all its volatile Parts had been forced away by the injection of lighted Coals so often into the Crucible, that no farther Detonation would happen; by which means the Salt-petre was turned into that Body which is called *Fixt Nitre*, and which is very nearly akin, in all its Properties, to fixt Salt of Tartar; yet he could very speedily, by pouring in this fixt Salt-petre, either diluted with a due proportion of Water, or let run *per se* into a Deliquium, a sufficient quantity of Spirit of Nitre, (which by the by amounted nearly to the quantity of that volatile Part which was burnt off) he could, I say, suddenly reproduce true Crystals of Salt-petre of the common Form and Virtue.

REDISSEISIN, is a *Disseisin* made by him that once before was made and adjudged to have *Disseised* the same Man of his Lands or Tenements; for which there lies a special Writ, called a Writ of *Redisseisin*.

RED-Lead, how made. See *Minium*.

REDOUBT, in Fortification, is a small Fort of a square Figure, having no Defence but in the Front, its use being to maintain the *Lines of Circumvallation*, *Contravallation*, and *Approach*. In Marly Grounds, these *Redoubts* are often made of Mason's Work for the Security of the Neighbourhood. Their *Face* consists of from ten to fifteen Fathom; the Ditch round about being from eight to nine Foot broad and deep, and their *Parapets* having the same thickness.

REDUBBORS, are those which buy stolen Cloth, knowing it such, and change it into some other Form or Colour that it may not be known.

REDUCING Scale, is a thin broad piece of Box with several different *Scales* of equal Parts, and Lines to turn Chains and Links into Acres and Rods, by Inspection; and is used by Surveyors to reduce any Map or Draught. It is sometimes called, the *Surveying-Scale*.

REDUCT, a Military term, signifying an advantageous piece of Ground, entrenched and separated from the rest of the Place, to retire to in case of surprize.

REDUCTION, in Astronomy, is the difference between the Argument of Inclination and the Eccentricity Longitude; that is to say, the Difference of the two Arches of the Orbit, and the Ecliptick, intercepted between the Node and the Circle of Inclination.

REDUCTION of Decimals. See *Decimals*.

REDUCTION of Equations, in Algebra, is the clearing of them from all superfluous Quantities, and the separating of the known Quantities from the unknown, to the end that at length every respective Equation may remain in the fewest and simplest Terms, and so disposed, that the known Quantity or Quantities may possess one

part thereof, and the unknown the other. See *Equation*.

REDUCTION of Fractions. See *Fractions*.

REDUCTION of Money, Weights, Measure, &c. is of two kinds. 1. When a Quantity is to be brought from any higher Denomination into a lower, and this is done, by considering how many of the next lesser Denomination are contained in the next greater before, and by that number multiplying the greater; as *Pounds* are brought into *Shillings* by Multiplying by 20, *Shillings* into *Pence* by 12, and *Pence* into *Farthings* by 4. Also, *Troy Weight* may be reduced into Grains, by Multiplying by 12, 20, and 24. And *Averdupois Great Weight* into Ounces, by 4, 28, and 16.

2. If it be to bring the lower to a higher, then divide the least by so many of its Denominations as are contained in the next greater. Thus 24720 Pence is 103 Pounds: But if there remains any thing after Division, they are the odd Pence and Shillings; as 6713 Pence Reduced, gives 27 l. 19 s. 5 d.

Note, That the way to reduce Shillings into Pounds, is to cut off the last Figure, and take half of the rest, as in the last Instance.

13) 6713 (551 | 9 (27 l. 19 s. 5 d.

71

113

5 d.

After the same manner may *Troy Weight*, *Averdupois Weight*, or any other Weight or Measure be reduced.

Likewise *Foreign Coin* may be reduced into *English*, by turning the Value into *English Coin* of any Part: As, what is the value of 223 *Scotch Marks*, each equal to 13 d. $\frac{1}{2}$ *English*? which is 54 Farthings, and 223 by 54 = 12042 Farthings, which reduced backwards to Pounds, Shillings, and Pence, makes 12 l. 18 s. 10 $\frac{1}{2}$ d.

REDUPPLICATIVE Propositions, are such wherein the *Subject* is repeated: Thus, Men, as Men, are Rational; Kings, as Kings, are subject to none but God.

RE-ENTRING Angle, a Term in Fortification. See *Angle*.

RE-ENTRY, in Law, signifies the resuming and retaking that Possession which we had lately forgoe: As if I make a Lease of Land or Tenement, I do therefore forego the Possession; and if I do condition with the Lessee, That for Non-payment of the Rent at the Day, it shall be lawful for me to *Re-enter*; this is as much as if I condition'd to take again the Lands, &c. into my own Hands, and to recover the Possession by my own Fact, without the assistance of Judge, or other Process.

REEF, a Term in Navigation: When there is a great Gale of Wind, they commonly roll up part of the Sail below, that by that means it may become the narrower, and so not draw so much Wind. And this contracting or taking up the Sail, they call a *Reef* or *Reefing* the Sail; and when it is done, they say the Sail is *Reefed*.

Also, when a Top-Mast is *Sprung*, as they call it, i. e. crackt or almost broken in the Cap, they

cut off the lower piece that was near broken off, and setting the other part, now much shorter, in the Step again, they call it a *Reeft* Top-Mast.

REEVE, is to put a Rope through a Block; and to pull a Rope out of a Block is called *Unreeving*.

REFLECTION, in general, is the regress or return that happens to a moving Body, because of the meeting of another Body, which it cannot penetrate. Thus the material Rays of Light are reflected variously from such Bodies as they cannot pass through.

REFLECTION, in *Metaphysics*, Mr. Lock defines to be, That Notice which the Mind takes of its own Operations, and the Manner of them; by reason whereof there come to be Ideas of those Operations in the Understanding.

REFLECTION of the Rays of Light. Sir Isaac Newton, finding by Experiment that Light was an Heterogeneous Body, consisting of a Mixture of differently refrangible Rays; and consequently concluding no further Improvement could well be made in Optical Instruments in the Dioptrick way, he took *Reflections* into Consideration, and tells us, that by their help, Optick Instruments might be brought to any degree of Perfection, if we could but find a reflecting Substance which would Polish as finely as Glass, reflect as much Light as Glass transmits, and be formed into a Parabolical Figure.

An Experiment of which he made in the kind of a Catoptrick Telescope, (which I have seen at Gresham College) and by which, tho' not above two Foot long, he could (he saith) discern the jovial Satellites, and the Phases of Venus. *Phil. Transf.* N. 18. See Vol. 2.

REFLECTED Ray, or *Ray of Reflection*, is that whereby the *Reflection* is made upon the Surface of a reflecting Body.

REFLECTING, or *Reflexive Dyals*, are made by a little piece of Looking-Glass-Plate, duly placed, which reflects the Sun's Rays to the top of a Ceiling, &c. where the Dial is drawn. This Glass should be as thin as can well be ground. For the making of these Dyals, there are many Methods: Of the two following, the 1st is Mr. Collins's, the 2d Dr. Clark's.

First, Determine the most convenient Point in the Window, where to place the *Reflecting Glass*, as near the Ceiling as you can conveniently, provided it be not so near as that the Cornish of the Window will shade the Glass when the Sun is high in Summer; suppose within about 10 or 11 Inches of the Ceiling, at least of that Ceiling which belongs to the Window it self; then from that Point draw a true Meridian upon a plane Horizontally placed against the determined Point in the Window, and to that Meridian fit an Horizontal Dial; but invert it so, that the Axis or Stile may point downward, and be under the Horizontal Plane, according to the Elevation of the Pole, which Stile must be placed truly also in the Plane of the Meridian; then by the help of a Thread running from the Centre along the Stile, find where that Stile would cut the Floor, or any other Place, if it were produced, and drive a Nail into that Point, and fasten also a Thread there long enough to be extended to any part of the Ceiling,

Fasten

Fasten also another long Thread to the Centre of the Horizontal Dial, which let it be extended Horizontally, as the Plane will direct, and exactly over every Hour-Line in order, whilst in the mean time you extend the Thread which was fastened to the Nail in the Stile, to the Ceiling, but so as it may touch the other Horizontal Thread: Then mark that Point in the Ceiling which the extended Thread toucheth, and make more such Marks, whereby to draw the Hour-Lines upon the Ceiling; and do this in like manner for the rest of the Hours, Half-Hours, and Quarters.

Then take all away, and place your Glass Horizontally; and because your Glass hath some Thickness, place it a little under the determined Point, that the Centre of the Glass may be just in the imaginary Axis, which goes to the Nail; for wheresoever you place it, in that it will go true.

But because it may be troublesome to place an Horizontal Dial fast enough and exactly, as also to find the Point where the Nail is to be driven, I will shew you another Method, which may be more easily practised.

First, Draw an Horizontal Dial upon the back of some Table or Floor, and draw a Meridian upon the Bay-board of the Window, by a Thread or perpendicular black Line, passing through the Point where you intend your Reflecting Glass shall be, and by a Plumb-Line translate it from the Bay-board to the Ceiling. Take the nearest Distance between the Glass and the Ceiling; with this Distance come to the Horizontal Dial, and set one end of it on that Part of the Axis where the other will just touch the Meridian; that Point in the Axis may be called the Glass Point; from which erect a Perpendicular; and where it cuts the Meridian, make a Point, which will be the Equinoctial Point, from which also erect a Perpendicular, which will be a Tangent; then at some Distance on which Side of the Equinoctial Point you find most convenient, erect another Tangent there, two Tangents will cut the Hour-Lines in Points, which may be called the Hour-Points.

Then take the Distance betwixt the Glass-Points, and the Equinoctial-Point, and extend it from the Glass toward the Meridian, and where it toucheth, that is the Equinoctial-Point upon the Ceiling.

Lastly, Set off correspondent Tangent-Lines upon the Ceiling, and make like Hour-Points, draw the Hour-Lines, you need not blot out the Equinoctial Tangent, it being pleasant to see how the Sun will go in that Line all Day, when it is in the Equinoctial. Besides, the Equinoctial-Point will tell you on that Day whether your Glass lie Horizontally, which is somewhat difficult otherwise to determine. Or upon any Day you may Calculate the Sun's Meridian Altitude, and see whether it falls just upon that Point in the Meridian at 12 a Clock.

This Dial is nothing but an Horizontal Inverted, the Center whereof is in the Air without, except you make a North Dial, and then it will be upon the Ceiling, which you must find by its Distance from the Equinoctial-Point, and let that Centre govern your Tangents. The Ground of this Dial is, that the Angles of Reflection are equal to the Angles of Incidence.

Sometimes, instead of two Tangents, you may use two Circles, especially when the Centre of the Dial is upon the Ceiling, or when your Glass is

near the Window-Ceiling, then the Equinoctial Point will be upon that Ceiling, and you may project the Hour-Lines upon the Chamber Ceiling, or the Walls, by one Thread extended over the Hour-Lines, and another Thread touching that, and extended from the Equinoctial-Point, or any Point in the imaginary Axis to the Ceiling or Wall.

REFLECTING Telescope. See *Telescope*.

REFLEXION of the Moon, is (according to *Bullialdus*) her 3d Inequality of Motion: This *Tycho* calls by the Name of her *Variation*, which see.

REFLUX of the Sea, is the *Ebbing* of the Water off from the Shore; as its coming on upon it, or Tide of Flood, is called the Flux of the Sea. See *Tide*.

REFRACTED Angle, in Opticks, is the Angle contained between the refracted Ray and the Perpendicular.

REFRACTED Dials, may be made thus: Stick up a Pin, or assign any Point in any Concave Bowl, and make that the Center of the Horizontal Dial, assigning the Meridian-Line on the Edges of the Bowl, and taking away the Horizontal Dial, elevate a String or Thread from the end of the said Pin fastened thereto, over the Meridian-Line, equal to the Elevation of the Pole or Latitude of the Place; then with a Candle, or if you bring the Thread to the Shade upon any Hour-Point formerly marked out on the Edges of the Bowl, at the same time the Shade in the Bowl is the Hour-Line.

And if the Bowl be full of Water, or any other Liquor, you may draw the Hour-Lines, which will never shew the true Hour, unless filled with the said Liquor again.

REFRACTION, in general, is the Incurvation or change of Determination in the Body moved, which happens to it, whilst it enters or penetrates any Medium.

In Dioptricks, it is the Variation of a Ray of Light, from that right Line which it would have passed on in, had not the Density of the Medium turned it aside.

Dr. *Hook* discovered by Experiment, That the *Sines* of the Angles of Incidence of the Rays of Light, are proportionable to the *Sines* of Refraction. See the Preface to *Micrographia*, where his Instrument is described, by which he made the Discovery.

Sir *Isaac Newton* found that the Rays of Light are Incurvated or Refracted in their Motion, whenever they come near the Edges of any Body, tho' it be not Diaphanous. See *Light*.

And he thinks that the Errors of Refraction in Optick Glasses might be corrected, if two Spherical Glasses were combined together with Water included between them. And such Glasses he judges preferable to Elliptical or Hyperbolical ones, because (besides that they can be more easily ground) they do more accurately refract the Pencils of Rays posited without the Axis of the Glass.

Dr. *Wallis* in *Philos. Trans.* N. 187, saith, That tho' Refraction by Vapours near the Horizon, may make a thing appear higher; yet it cannot make it appear broader; whereas in Refraction by Glasses, the thing is apparently enlarged every way.

From whence it is, that the diverse Power of Refraction in Fluids arises, is not easy to determine, tho' it would be of great Advantage if it could be discovered. Pure clear Water, of all Fluids

ids, refracts the Rays of Light the least; and if it be impregnated with Salts, it increases the Refraction in Proportion to the Quantity and Weight of the Salts dissolved in it.

The *Aqua Stygia*, or corrosive Menstruums, such as *Aqua fortis*, &c. which are Salt dissolved and rendered Corrosive by the Violence of the Fire, do yet much more refract the Sun's Rays; which need not be wondered at, because these are much denser and heavier Fluids than the former. But then why in such light fine Fluids as Spirit of Wine and other Ardent Spirit; in Oil of Turpentine, which is so light and fine a Fluid, as to be generally called, an *Ethereal Oil*; why these, I say, should produce so great a Degree of Refraction, as is known they do, is a thing of great Difficulty to account for, and well deserves a farther Enquiry into.

Dr. Gregory in his Astronomy, very well accounts for the Oval Figures which the Sun near the Horizon (especially in high Latitudes) is sometimes seen to put on from Refraction. For having before demonstrated, That because of the Earth's Atmosphere all Bodies near the Horizon, will appear something higher in the vertical Circle than they really are, and this the more, the nearer they are to the Horizon: He shews that the upper Margin of the Sun's Disk being raised a little more than it ought to be, and the lower one a great deal more, the Sun's Vertical Diameter will seem to be contracted, but the Horizontal one will not, and therefore he will appear Oval. And for the same Reason, the observed Distance of two Fix'd Stars, is sensibly less (when measured by an Instrument) if they are in the same Vertical Circle, and one of them near the Horizon, than when they both have a considerable Altitude.

After this he shews how to determine the Quantity of the Refraction in any given Degree of Altitude, and to make a Table of it; thus.

Let some Fix'd Star having no sensible Parallax, and much elevated above the Horizon, be chosen, whose Place he shews how to determine at *P. 164. Prop. 26.* by Observations made when the Star is so high as to have no sensible Refraction. Then let the Time be noted when this Star hath any known Altitude, (as taken by an Instrument) and Calculation made for the true Altitude, (according to the Star's known Place) the Excess of the observed Altitude above this is the Refraction.

REFRACTION Astronomical, is that which the Atmosphere produceth, whereby a Star appears more elevated above the Horizon than really it is.

REFRACTION Horizontal, is that which causeth the Sun or Moon to appear on the Edge of the Horizon, when they are as yet somewhat below it.

REFRACTION from the Perpendicular, is when a Ray falling, inclined from a thicker Medium into a thinner, as from Glass into Air, in breaking, departs farther from that Perpendicular.

REFRACTION to the Perpendicular, is when a Ray falling inclin'd from a thinner or more diaphanous Medium, upon a thicker or less transparent, as from Air upon Water, in breaking, comes nearer the Perpendicular, drawn from the Point of Incidence at Right Angles, on the Surface of the Water wherein the Refraction is made.

REFRANGIBLE, is whatever is capable of being Refracted.

REFRIGERATORY, is that Part of an Alembick or Distilling Vessel which is placed about the Head of the Still, and filled with Water to cool the Head of the Alembick, that the Spirituous Vapours may the sooner and the more easily condense into Drops. Cold Water must continually be put into the Refrigeratory, as the Vessel grows hot. Most Apothecaries, Distillers, &c. that have Occasion for drawing off large Quantities of Spirits, do now-a-days use the *Vesica* or Copper Body with its *Moors-Head* of the same Metal and without any Refrigerations about the Head of the Still. But there is below, a long Worm or Serpentine in a Tub of Water, where the Spirituous Vapours are very easily condensed into a Liquor. And this may as well be called a Refrigeratory as the former.

REFUTATIO *Foeth*, a Term in Civil-Law signifying the Loss of a *Feudal Tenure* by Forfeiture; which is of two Kinds, either by not performing the Service required, or by committing some villanous Act against the Lord or Sovereign.

REGALIA, the Royal Rights of a King, reckoned by the *Civilians* to be Six. 1. Power of Judicature. 2. Power of Life and Death. 3. Power of War and Peace. 4. Miterless Goods. 5. Assessments. 6. Minting of Money. Also, the Crown, Scepter with the Cross, Scepter with the Dove, St. Edward's Staff, four several Swords, the Globe, the Orb with the Cross, and such other like Things used at the Coronation of our Kings, are called *Regalia*.

REGARDANT, the Heralds Term for a Lion or such kind of Beast of Prey, born in a Posture of looking back behind him.

REGEL, or *Rigel*, a fix'd Star of the first Magnitude in *Orion's* left Foot; its Longitude is 72 deg. 19 min. Latitude 30° 10'.

REGIMENT, is a Body of Troops of Horse, or Companies of Foot, commanded by a Colonel, but the Number is as undetermin'd as that of the Men in a Troop or a Company. There are Regiments of Horse that are not above 300 Men; and there are some in *Germany* of 2000; and the Regiment of *Picardy* in *France* consists of 6000 Men.

REGIO *Assensu*, is a Writ whereby the King gives his Royal Assent to the Election of a Bishop.

REGION: *Fernelius* with some Anatomists, distinguish the Cavities of an Animal Body into several Regions or Parts, which they specify into *Publick* and *Private*. The Publick are Three. The first includes the *Vena Porta*, and all Parts to which its Branches reach. 2. The Second begins at the Roots of the *Vena Cava*, and ends in the small Veins before they become Capillary. The Third they make to contain the Muscles, Bones, and Bulk of the Body: But this is not much received. The *Aridamen* is usually distinguished also into three Regions, the *Uppermost*, *Middle*, and *Lower*.

REGION, is also taken for our *Hemisphere*, or the Space within the Four Cardinal Points of the Heavens, or of the Air, &c.

— In Geography, it signifies a large Extent of Land inhabited by many People of the same Nation, and enclosed within certain Limits or Bounds.

REGION *Elementary*, according to the *Aristotelians*, is a Sphere terminated by the Concavity of the Moon's Orb, comprehending the Earth's Atmosphere.

REGION

REGION *Aethereal*, in Cosmography, is the vast Extent of the Universe; wherein are comprized all the Heavens and Celestial Bodies.

REGIONS of the Air, are distinguished into *Upper, Middle, and Lower.*

REGISTERS, in a Chymical Furnace, are Holes purposely left in the Sides of the Furnace with Stopples to them, to let in or keep out the Air, according as the Fire is required to be greater or less.

REGIUS *Morbus*. See *Icterus*.

REGULATOR, signifies him that Buys and Sells any Wares or Victuals in the same Market or Fair, or within five Miles thereof. In the *Civil Law*, such an one is called *Dardanarius*.

REGULAR Body, is a Solid whose Surface is composed of *Regular* and *Equal* Figures; and whose Solid Angles are all equal. Such as the,

1. *Tetrahedron*, which is a Pyramid, comprehended under Four Equal and Equilateral *Triangles*.

2. *Hexahedron*, or Cube, whose Surface is composed of six equal *Squares*.

3. *Octahedron*, which is bounded by eight Equal and Equilateral *Triangles*.

4. *Dodecahedron*, which is contained under 12 Equal and Equilateral *Pentagons*.

5. *Icosihedron*, consisting of 20 Equal and Equilateral *Triangles*.

That there can be no more *Regular Bodies* besides these, may be thus proved.

1. Of Equilateral *Triangles*, there must be three at least to make a Solid Angle; and three of them joined together will make the *Tetrahedron*; for those three *Triangles* meeting in a Point, do form a Triangular Base similar and equal to the Sides; as appears by the bare Composition of the Figure. Four such *Triangles* joined together in a Point, make the Angle of the *Octahedron*.

By joining five such *Triangles* together, the Angle of the *Icosihedron* is formed.

But six such *Triangles* joined in a Point, cannot make a Solid Angle; because they make four right ones; (for every Angle of an Equilateral Triangle is $\frac{1}{3}$ of two; or $\frac{2}{3}$ of one right Angle; either of which Fractions multiplied by Six, gives four right Angles) whereas every Solid Angle is made up of four such plane Angles as all together must be less than four right ones: So that with *Triangles* 'tis impossible to form any more *Regular Bodies* than these three.

If you take *Squares* and join three of them together, they will make the Angle of a *Cube*; and there can no other *Regular Body* but a *Cube* be made with *Squares*; for four *Squares* joined together, will not make a Solid Angle, but a Plane.

If you join the Angles of three *Pentagons* together, you will constitute the Angle of the *Dodecahedron*. But four such Angles cannot make a Solid one.

And three *Hexagons* joined together, do make

just four right Angles, and therefore they cannot make a Solid Angle. And as for three *Heptagons*, or other Figures yet of more Sides, they can much less do it; because their Angles being very obtuse, three of them will exceed four right ones. So that upon the whole, 'tis plain, that of these Five *Regular Bodies*, three are made of *Triangles*; one of *Squares*, and one of *Pentagons*, and there can be no other.

The Proportion of the Sphere, and of the Five Regular Bodies inscribed in the same; from Peter Horrigon, Cursus Matth. Vol. 1. P. 779, And Barrow's Euclid, Lib. 13.

The Diameter of the Sphere being 2.

The Circumf. of the greatest Circle	6. 28318
Superficies of the greatest Circles.	3. 14159
Superficies of the Sphere	12. 56637
Solidity of the Sphere	4. 18859
Side of the Tetrahedron	1. 62299
Superficies of a Tetrahedron	4. 6188
Solidity of a Tetrahedron	0. 15132
Side of a Cube or Hexahedron	1. 1547
Superficies of the Hexahedron	8.
Solidity of the Hexahedron	1. 5396
Side of an Octahedron	1. 41421
Superficies of the Octahedron	6. 9282
Solidity of the Octahedron	1. 33333
Side of the Dodecahedron	0. 71364
Superficies of the Dodecahedron	10. 51462
Solidity of the Dodecahedron	2. 78516
Side of the Icosihedron	1. 05146
Superficies of the Icosihedron	9. 57454
Solidity of the Icosihedron	2. 53615

If one of these Five *Regular Bodies* were required to be cut out of the Sphere of any other Diameter, 'twill be as the Diameter of the Sphere 2 is to the Side of any one Solid inscribed in the same, (suppose the Cube 1. 1547) so is the Diameter of any other Sphere (suppose 8.) to 9. 2376, the Side of the Cube inscribed in this latter Sphere.

Let dr be the Diameter of any Sphere, and da $\frac{1}{2}$ of it. $= ab = br$. Erect the Perpendiculars ae , ef , and bg , and draw de , df , er , fr , and gr .

Then

Then will

1. *re* be as the Side of the Tetrahedron.
2. *df* is the Side of the Hexahedron.
3. *de* is the Side of the Octahedron.
4. Cut *de* in extrem and mean Proportion in *b*, and *db* will be the Side of the Dodecahedron.
5. Set the Diameter *dr* up perpendicularly at *r*, and from the Centre *c*, to its Top, draw the Line *cg* cutting the Circle in *g*. Let fall the Perpendicular *gb*. So is *br* the Side of the Icosihedron.

REGULAR Figures, in Geometry, are such whose Sides, and consequently their Angles, are all equal to one another.

Whence all **Regular Multilateral Planes** are call'd **Regular Polygons**.

The Area of such Figures is speedily found by multiplying a Perpendicular let fall from the Centre of the Inscribed Circle to any Side by half that Side, and then that Product by the Number of the Sides of the Polygon.

REGULAR Fortification. See *Fortification*.

REGULAR Curves, are such *Curves* as the Perimeters of the Conick Sections, which are always curved after the same Regular Geometrical manner.

But **Irregular Curves**, are such as have a *Point of Inflexion*; and which being continued, do turn themselves a contrary way, as the *Conchoid*, and the Solid *Parabola* which hath a Square for its *Parameter*.

REGULATOR, a small Spring belonging to the Balance, in the new Pocket-Watches.

REGULUS. See *Basilicus*.

REGULUS, or *Regule*. When any Metal or Mineral is separated in a Crucible, by Purification, from its more gross and terrene Parts, the finer and metalline Parts will sink to the Bottom of the Crucible. And this the Chymists call *Rex* or *Regulus*, the Royal or Noble Part of the Mixt.

REGULUS of Antimony, is thus made. Mix together 16 Ounces of Antimony, 12 of Crude Tartar, and 6 of Salt-petre, all well powdered; then heat a large Crucible red hot, and throw into it a Spoonful of the Mixture, presently Covering the Crucible with a Tile; repeat this Spoonful by Spoonful till all the Matter is thrown in. Then make a great Fire about the Crucible, and when the Matter hath been a while melted, pour it into an Iron Mortar greased a little with Suet, and warm'd; knock the Mortar on the Side with the Pestle, to make the *Regulus* precipitate to the Bottom. When 'tis cold separate it from the Dross, then Powder it, and melt it again in another Crucible, with a little Salt-petre thrown on it when 'tis in Fusion. Cast it out as before into a greased Mortar, or mould it into Pills, Cups, &c.

For of this *Regulus* is made the *Antimonial Cup*, and the *Regulus*. If you powder four Ounces of it, and Calcine it in an Earthen Pan, unglazed, over a small Fire, stirring the Powder all the while with a Spatula; a Fume will arise; for about an Hour and half or two Hours, the Powder will turn grey, and at the End of that small Time, will Weigh near two Drams and an half, more than the Powder did at first, tho' it fumed all the time; which may satisfy us, that some Bodies have their Pores so adapted, that they can detain the very Particles of Fire themselves, and Incorporate with

them. An Augmentation of Weight happens in making the Calx of Lead, and some others, but not in such a degree, nor so soon as this.

If an Ounce of the Dross of the *Regule of Antimony*, be boiled in a Pint of Water, and then set to stand and cool without stirring it, it will coagulate into a Substance very like to Blood, but not so red.

The Chymists make much ado about a *Regulus of Antimony* made with Steel, because of a kind of Star that appears in the Bottom of it: But it hath no other Virtues than this described above. You may see the way of making it in *Lemery*, p. 265. last Edit. and in many other Chymical Authors.

If Antimony be cakined in an Earthen Pot unglazed, and continually stirring till no more Fumes arise, and afterwards the Matter be put into a Crucible, and in a very violent Fire melted and kept an Hour in Fusion, it will be turned into a reddish Opake Glass, which they call Glass of Antimony, and is a most violent Emetick.

REJOYNDER, in Law, signifies an Answer or Exception to a Replication: for first the Defendant puts in an Answer to the Plaintiff's Bill, which is sometimes called, *An Exception*, the Plaintiff's Answer to that is called, a *Rejoinder*, especially in Chancery. 'Tis by the Civilians called *Duplicatio*.

RELAIS, a French Term in Fortification, the same with *Berne*.

RELATION Inharmonical, a Term in Musical Composition, signifying a harsh Reflection of Flat against Sharp, in a cross form, viz. When some harsh and displeasing Discord is produced, in comparing the Present Note of another Part.

RELATIVE Gravity, the same with *Specifick*, which see.

RELATIVE Propositions, are those that include some Comparison, and some Relation, thus: Where the Treasure is, there is the Heart: As much as thou hast, so much art thou worth.

RELAXANTIA. See *Chalastica*.

RELAXATION, is a Dilatation of parts or Vessels.

RELEASE, in Law, is an Instrument whereby Estates, Rights, Titles, Entries, Actions, and other things, be sometimes extinguished, sometimes transferred, sometimes abridged, and sometimes enlarged; and is either in *Fact* or in *Law*.

A *Release in Fact*, is that which the very Words expressly declare.

A *Release in Law*, is that which doth Acquit by way of Consequence or Intendment of Law.

RELEGATION, in Law, signifies a Banishment for a certain time.

RELEIFE, or *Releivo*, is the Protuberant jetting or standing out of any Figures or Images above the Plain on which they are formed. And whatever Figures or Representations are thus cut, stamped, or otherwise wrought, so that not the entire Body, but only part of it is raised above the Plain, is said to be done in *Releife*; and when the Work is low, flat, and but a little raised, 'tis called *Basse Releife*, or *Low Releife*. When a Coin or a Medal hath its Figure low and thin, and hardly distinguishable from the Plain, we say its *Releife* is low and weak; but when 'tis much raised, we say 'tis Bold, and its *Releife* is Strong.

RELEVISH, in Law, signifies to let one to Mainprise upon Surety.

RELICTA Verificatio, is when a Defendant hath Pleaded, and the Issue entered of Record, and after that the Defendant *Relicta Verificatio*, (*que est son Plea*) acknowledges the Action, and thereupon Judgment is entered for the Plaintiff.

REMAINDER, in Law, is an Estate limited in Lands, Tenements, or Rents; to be enjoyed after the Expiration of another particular Estate. As a Man may let to one for Term of his Life, and the Remainder to another for the Term of his Life; and this Remainder may be either for a certain Term, or in Fee-simple, or Fee-tail; the Difference between a Remainder and Reversion, is this, That by a Reversion, after the appointed Term the Estate returns to the Donor, or his Heirs, as the proper Fountain; whereas by Remainder, it goes to some third Person, or a Stranger.

REMEMBRANCE, is when the Idea of something formerly known, recurs again into the Mind, without the Operation of the like Object on the External Senses.

REMEMBRANCERS of the Exchequer, are three Officers or Clerks there, viz. *The King's Remembrancer, the Lord Treasurer's Remembrancer, and the Remembrancer of the first Fruits.*

The King's Remembrancer enters into his Office all Recognizances, taken before the Barons for any of the King's Debts, for Appearance, or for observing Orders; and maketh out Process against the Collectors of Customs, Subsidies, and Fifteenths for their Accounts: All Informations upon Penal Statutes, are entered in this Office, and there all Matters upon *English Bills* in the Exchequer-Chamber remain: He makes the Bills of Composition upon Penal Laws, takes the Stalment of Debts, has Delivered into his Office all manner of Indentures, Fines and other Evidences whatsoever, that concern the assuring of any Lands to the Crown: He every Year in *crastino annuarum* reads in open Court, the Statute for Election of Sheriffs, and gives them their Oath: and he reads in open Court the Oath of all the Officers of the same, when they are admitted, besides many other Things.

The Lord Treasurer's Remembrancer, upon whose Charge it lies, to put the Lord Treasurer, and the rest of the Judges of that Court, in Remembrance of such Things as are to be called on, and dealt in for the King's Benefit. He makes Process against all Sheriffs, Escheators, Receivers and Bailiffs, for their Account: He makes Process of *Fieri facias* &c. *Extent*, for any Debts due to the King either in the Pipe or with the Auditors; makes Process for all such Revenues as are due to the King, by reason of its Tenures: He makes Record, whereby it appears whether Sheriffs, and other Accountants, pay their *Profers* due at *Easter* and *Michaelmas*. He makes another Record, whether Sheriffs, and other Accountants, keep their Days of Prefixion. All *Estreats* of Fines, Issues, and Amerciaments, set in any Courts at *Westminster*, or at the Assizes, or Sessions, are certified into this Office, and are by him delivered to the Clerk of the *Estreats*, to write Process upon them, &c.

The Remembrancer of the First Fruits, takes all Compositions and Bonds, for First Fruits, and Tenths, and makes Process against such as do not pay the same.

REMINISCENCE, is the Power which the Humane Mind hath of recollecting it self, or calling again to its Remembrance such Ideas or Notions which it had really forgot: In which it dif-

fers from *Memory*, which is a treasuring up of things in the Mind, and keeping them there without forgetting them.

REMISSION, is a Word used by Physical Writers, to signify the Abatement of the Power or Efficacy of any Quality, as when it is increased, they say 'tis Intended; and all Qualities are thus capable of *Intension* or *Remission*.

See in the Word *Quality*, a Demonstration that the *Intension* of all Qualities decreases, as the Squares of the Distance from the Centre of Action reciprocally.

REMITTER, in a Legal Sense, is to restore one that hath two Titles to Lands or Tenements, and is seized of them by a latter Title which is discovered to be defective, to the former and more ancient Title, that so he may continue in Quiet Possession.

RENAL Artery, is said by some, to come out of the *Aorta*, and to enter into the Kidneys, bringing to it the Serosity of the Arterial Blood.

RENALIS. See *Adiposa Vena*.

RENDER, in Law, is a Word used in levying of a Fine, which is either single, whereby nothing is granted or rendred back again by the Cognisee to the Cognisor, or double, which containeth a Grant or tender back again of some Rent, Common, or other Thing out of the Land it self to the Cognisor, &c.

Also, there be some Things in a Manner that lie in *Prender*; that is, which may be taken by the Lord or his Officer, when they change, without any Offer made by the Tenant, as Escheats, and the like; and some that lie in *Render*; that is, must be delivered or answered by the Tenants, as Rents, Reliefs, Heriots, and other Services. Also some Service consists in Seisance, some in *Render*.

RENDS in a Ship, are the same as the Seams between her Planks.

RENES, the *Reins* or *Kidneys*; there are always two of them, and placed in the *Abdomen* between the two Membranes of the *Peritonaeum*, and adjoining to the Sides of the *Aorta* and *Vena Cava*; the Right Kidney lies lower in Men, and is something less than the left: They are covered with a double Membrane; of which the outwardmost is common, proceeding from the *Peritonaeum*; and is called the *Membrana Adiposa*, from its being covered with Fat, in Fat and Corpulent People; into this the *Arteria Adiposa* enters from the *Aorta*; and the *Vena Adiposa* goes out from it, which the right Kidney usually sends into the *Emulgent Vein*, rarely into the *Cava*, but the left Kidney generally into the *Cava*. By means of this Membrane, both the Kidneys are joined to the *Loins* and *Diaphragma*: The right one to the *Cecum Intestinum*, and sometimes to the Liver, and the left is connected by it to the Spleen and Colon.

Its Interior Membrane or Tunick, and which is proper to it, is taken from the External Root of those Vessels which enter the Kidneys, (and which do enter it but with a single Coat;) and this hath some small Nerves from a Branch of the sixth Pair, and from the *Stomachick Branch*, which give the Kidneys but a dull small Sense, but afterwards branched out into the *Ureters*, render them extremely sensible; and those Nerves (by Consent of Parts) cause that Vomiting which usually accompanies Nephritick Pains. The Kidneys have two Eminent Blood Vessels, the *Emulgent Vein* and *Artery*; of which the later distributes the Blood from the

the *Aorta* into the Body of the Kidneys, and the former brings it back again.

RENES *Succenturiati*, are a Pair of Glandulous Bodies placed above the Reins or Kidneys: Their Use (by some) is supposed to be, to receive the Lympha into their Cavities, thereby to attenuate and render more fluid and capable of Circulation, the Blood returning from the Kidneys, where it hath parted with its *Serum*. But we are yet, saith Dr. *Gibson*, in the dark as to their true Use: They are called also *Glandula Renales*, and by *Bartholin* *Capsula Atrabilaria*: By Dr. *Wharton*, *Glandula ad Plexum Nervorum sita*. They are larger in Children than in Men; being in the former near as big as the Kidneys, but they do not increase proportionably as other Parts do.

RENITENCY, is that Resistance which there is in Solid Bodies when they press upon, or are impelled one against another, or that Resistance that any heavy Body makes on the Account of its Weight, to our Arm or Hand when we lift it up.

RENT, signifies a Sum of Money, or other Consideration issuing Yearly out of Lands or Tenements; of which Lawyers reckon three Sorts, *viz.* *Rent-service*, *Rent-charge*, and *Rent-seck*: *Rent-service*, is where a Man holds his Lands of his Lord by Fealty, and certain Rent, or by Fealty Service, and certain Rent, or that which a Man making a Lease to another for Term of Years, reserveth Yearly to be paid for them. *Rent-charge*, is where a Man makes over his Estate to another, by Deed indented, either in Fee, or Fee-tail, or for Term of Life, yet reserves to himself, by the same Indenture, a Sum of Money Yearly to be paid to him, with Cause of Distress for Non-payment. *Rent-seck*, or Dry Rent, is that which a Man making over his Estate by Deed indented, reserveth Yearly to be paid to him without Cause of Distress, mentioned in the Indenture.

REPARATIONE faciende, is a Writ which lies, in divers Cases, whereof one is, where three are Tenants in Common, or Joint-tenants, *pro indiviso*, of a Mill or House which is fallen to decay, and the one being willing to repair it, the other two will not; in this Case the Party willing shall have this Writ against the other two.

REPELLENT Medicines, are such Things as by stopping the Heat and Afflux of Humours, and by shutting up the Pores with their cold and binding Qualities, decrease the swelling of a Part, and drive the Humours another way.

REPETITION, (a Figure in Rhetorick) is when a Person thinking his first Expression not well understood, and is impatient to make his Hearers know what he means, repeats or explains it, another way.

REPLEADER, in Law, is to plead against that which was once pleaded before.

REPLEGIARE, signifies properly to redeem a Thing detained or taken by another, by putting in legal Sureties. See *Replevin*.

REPLEGIARE de averiis, is a Writ brought by one whose Cattle are distrained, or put in the Pound, upon any Cause by another, upon Surety, given to the Sheriff to prosecute or Answer the Action in Law.

REPLEVIN, is a Writ that lies where a Man is Distrained for Rent or other Thing, then he shall have this Writ to the Sheriff, to deliver to him the Distress, and shall find Surety to pursue his Action against the Distrainer; and if he pursue it not, or

if it be found or judged against him, then the Distrainer shall again have the Distress, and he shall have in such Case a Writ called, *Returbo habendo*. Goods may be replevied two Ways, *vizi* by Writ; and that is by the Common Law; or by Plaint, and that is by Statute Law for the more speedy having again of their Cattle and Goods.

REPLICATION, is an Exception of the second Degree, made by the Plaintiff, upon the first Answer of the Defendant: It is also, that which the Plaintiff replies to the Defendant's Answer in Chancery, which is either *General* or *Special*.

The Special is grounded upon Matter arising out of the Defendant's Answer, *et c.*

The General is so called from the general Words therein used.

REPORT, in Law, is a publick Relation of Cases Judicially argued, debated, resolved, or adjudged, in any of the King's Courts of Justice, with the Cause and Reasons of the same delivered by the Judges. Also when the Chancery, or other Court, refer the stating of some Case, or comparing an Account, *et c.* to a Master of Chancery, or other Officer, his Certificate therein is called; a Report.

REPRISALIA, the same with *Clarigatio*.

REPRISES, is commonly (in Law) taken for Deductions and Duties which are Yearly paid out of a Mannor and Lands, as *Rent-charge*, *Rent-seck*, *Pensions*, *Corrodies*, *Annuities*, *Fees of Stewards or Bailiffs*, &c. Wherefore when we speak of the clear Yearly Value of a Mannor, we say it is so much *per Annum ultra reprints*, besides all Reprises.

RFPRIEVE, in Law, is properly to take back, or suspend a Prisoner from the Execution and Proceeding of the Law for that time.

REPTILS, are all those *Creeping Animals* which rest upon one Part of their Body while they advance the other forward; as *Alders*, *Asps*, *Snakes*, *Earthworms*, &c.

RESCUIT, is an Admission, or receiving a third Person to plead his Right in a Cause formerly commenced between other two; as if a Tenant for Life or Years bring an Action, he in the Reversion comes in, and prays to be received to defend the Land, and to plead with the Demandant. The Civilians call this *Admissionem tertii pro suo interesse*.

Rescuit is also applied to an Admittance of Plea, tho' the Controversy be only between two.

RESCOUS, or *Rescus*, in Law, is a Resistance against lawful Authority; as if a Bailiff, or other Officer, upon a Writ do Arrest a Man, and others by Violence take him away, or procure his Escape, this is a *Rescus in Fact*: So, if one distrain Beasts for Damage feasant in his Ground, and as he drives them in the High-way towards the Pound, they enter into the Owner's House, and he withholds them there, and will not deliver them upon Demand, this Detainer is a *Rescus in Law*. It is also used for a Writ which lies for this Fact, called *Breve de Rescussu*. *Rescus*, in Matters relating to Treason, is Treason; and in Matters concerning Felony, is Felony.

RESCUSSOR, is he that commits such a *Rescus*.

RESERVATION, in Law, signifies a Keeping or Providing; as when a Man lets his Land, he reserves a Rent to be paid to himself for his Maintenance. Sometimes it signifies as much as an Exception; as when a Man lets a House, and re-

serves

serves to himself one Room, that Room is excepted out of the Demise.

RESIANCE, or *Residence*, signifies a Man's Abode or Continuance in one Place: And it is all one indeed with *Residence*; but that Custom ties this only to Persons Ecclesiastical.

RESIDENCE, is a Word peculiarly used both in the Common and Canon-Law, for the Continuance or Abode of a Parson or Vicar upon his Benefice.

RESIDUAL Figure, in Geometry, signifies the remaining Figure after Subtraction of a Lesser from a greater.

RESIDUAL Root, in Mathematicks, is one composed of two Parts or Members only connected together with the Sign —: Thus $a - b$, or $5 - 3$, is a *Residual Root*; and is so called, because its true Value is no more than its *residue* or difference between the Parts a and b .

RESIGNATION, is a Word used for the giving up of a Benefice into the Hands of the Ordinary, otherwise by the *Canonists* termed *Renunciation*: And though it signifies all one in Nature with the Word *Surrender*, yet it is by Custom restrained to the yielding up a Spiritual Living, and *Surrender* to the giving up of Temporal Lands into the Hands of the Lord.

RESINA, in *Pharmacy* and *Botany*, is a fat and oleaginous Liquor flowing either Spontaneously, or else let out by Incision from any Tree or Plant. It will not dissolve in Water, but in Oil only, and is easily inflammable.

RESINE, or *Rosine*, of Jalap, Benjamin, Scammony, Turbith, &c. or of any Vegetable which abounds with Resinous Particles, is thus made in Chymistry.

The Vegetable grossly Powdered, is put into a Matrafs, and then well rectified Spirit of Wine is poured on it to the Height of four Fingers above the Matter; then another Matrafs hath its Neck fitted and luted into the former to make a double Vessel; and thus the Matter is digested for 3 or 4 Days in a Sand Heat, or till it hath given a good Tincture to the Spirit of Wine: Then the Dissolution is filtrated; and two Thirds of the clear Liquor is evaporated off, the Remainder is poured into a large Vessel of Water, and it will turn into a Milk, and the *Resine* will in time precipitate to the Bottom in a white Powder. It must be wash'd and dry'd in the Sun, and it will grow hard like common *Rosine*.

RESISTENCE of the Medium, is the Opposition against, or Hindrance of the Motion of any Body moving in a Fluid; as in the Air, the Water, the Ether, &c. And *this*, together with the Gravity of Bodies, is the Cause of the Cessation of the Motion of Projectiles, &c. This *Resistance*, in Mediums which are very Dense and Rigorous, so that Bodies can there move but very slowly, is nearly as the Velocity of the moving Body: But in a Medium free from all such Rigor, as the Squares of the Velocities, *Newt. Princip.* P. 245. For by the Action of a swifter Body, there is communicated to the same Quantity of the Medium, a greater Motion, in Proportion to that greater Swiftness or Velocity; and therefore in an equal Time, (by reason of the greater Quantity of the Medium being moved) the Motion will be communicated in a duplicate Ratio: But the Resistance must always be as the Motion communicated, because Action and Re-action are equally contrary.

He found also the Thing to be true by Experiment, in a Pendulum of 10 Feet in Length; that the Resistance against a Globe or Ball moving swiftly in our Air, is nearly in a duplicate Ratio of its Velocity: But if it move Slower, a little greater than in that Proportion, P. 339.

He found also by making a Lead Bullet swing as a Pendulum in a Vessel of Water, that the Resistance of Water in Proportion to Air, is as $\frac{535}{178}$ to

Dr. Wallis hath an entire Discourse on this Subject in *Phil. Transf.* N^o. 186, where he premises as a *Lemma*, That supposing all other Things equal, the Resistance of Bodies is always proportionable to the Velocity; since in a double Degree of Velocity there is twice as much Air to be moved in the same time, &c.

As to the different Resistences which Bodies of different Figures will find in passing through any Medium, Sir *Is. Newton* proves, *Prop.* 34. *Theor.* 28.

That if a Globe and Cylinder with equal Diameters be moved according to the Direction of the Axis of the Cylinder, that the Globe's Resistance will be but half of the Cylinders.

And in the following Scholium, he shews what kind of Figure revolving round an Axis, will generate a Solid that shall move in any Medium, with the least Resistance; and gives a Hint of the Use that this may be of for *Building of Ships*.

After this, several Investigations of the Figure of a roundish Solid, which should move through a Medium with the least Resistance, were publish'd by the Marquis *Hospital*, *Bernoulli*; and very briefly and clearly by Mr. *John Craig* in the *Phil. Transact.* N. 268. Where he solves the Problem, to determine the Curve, by whose Rotation round an Axis, a round Solid shall be generated, which being moved according to the Direction of that Axis, shall have the least Resistance in any Medium.

RES Naturales: Natural Things are Three; Health, the Causes of Health, and its Effects. Others reckon Seven; as the Elements, Temperaments, Humours, Spirits, Parts, Faculties, Actions; but Elements and Temperaments belong to Natural Philosophy; Humours, Spirits and Parts, are reckon'd amongst the Causes of Health, which consist of a good Temperature, and a due Conformation; Faculties and Actions are comprehended under the Effects of Health. *Blanchard*.

RES Non-naturales: Things that are not Natural, are Six; Air, Meat and Drink, Motion and Rest, Sleeping and Waking, the Affections of the Mind, Things that are let out of, and Things retained in the Body. They are so called, because that if they exceed their due Bounds, they often occasion Diseases. *Blanchard*.

RESOLVEND, a Term in the Extraction of the Square and Cube Roots, &c. signifying that Number which arises from augmenting the Remainder after Subtraction, by drawing down the next Square Cube, &c. and writing it after the said Remainder.

RESOLUTION (in Mathematicks) is a Method of Invention, whereby the Truth or Falshood of a Proposition, or its Possibility or Impossibility is discover'd, in an Order contrary to that of *Synthesis*, or Composition: For in this Analytical Method, the Proposition is propos'd as already known, granted, or done; and then the Consequences thence deducible are Examined, till at last you come to

some known Truth or Falshood, or Impossibility, whereof that which was proposed is a necessary Consequence, and from thence justly conclude the Truth or Impossibility of the Proposition: Which if true, may then be demonstrated in a Synthetical Method. This Method of Resolution consists more in the Judgment, Penetration, and Readiness of the Enquirer or Artist, than in any Particular Rules: Tho' those of Algebra are of necessary Use, and a good Treasure of Geometry in his Head will be of great Advantage to him in all Manner of Investigations.

RESORT, or *Refort*, is a Law Word, properly used in a Writ of Tail of Coufenance, as *Descent* is in the Writ of Right.

RESPECTU computi vice-comitis habendo, is a Writ for the respiting of a Sheriff's Account, upon just Occasion directed to the Treasurer and Barons of the *Exchequer*.

RESPIRATION, *ῥαπνοῖς*, includes both In-and Expiration, and is an alternate Dilatation and Contraction of the Chest, whereby the Air is taken in by the Wind-pipe for the Accension of the Blood, and by and by is driven out again with other Vaporous Effluvioms. The Cause of Respiration does not seem to consist in the Dilatation and Contraction of the *Thorax*; as is commonly thought, but in the Contraction of the Tunic, which covers the upper Part of the *Oesophagus* and the Wind-pipe, as far as its closest Recesses. *Blanchard*.

There are many Opinions about the Uses of Respiration: Some think the chief, if not the sole Design of it, is to cool and temper the Heat of the Blood, and the Heart.

Others will have the Substance of the Air to get by Respiration into the Vessels of the Lungs to the left Ventricle of the Heart; not only thereby to cool the Blood, but also help to generate aerial Spirits. This was the Opinion of *Hippocrates*, *Aristotle* and *Galen*.

Others take, with more Probability, *Respiration* to serve for the *Ventilation* of the Blood in the Lungs, in its Passage through them, whereby 'tis disburthened of many Excrementitious Steams and Superfluous Serosities, which are carried off by the Breath in Expiration; so that the Blood may be advantageously depurated, by what is carried off by the Emunctory of the Lungs.

In the *Philos. Trans.* N^o 65, there is a very pretty Account of the Cause and Manner of Respiration, by the famous *Laur. Bellini*.

RESPIRE, a Word used in Law, for Delay, Forbearance, or Continuance of Time.

RESPIRE of Homage, is the Forbearing of *Homage*, which ought first of all to be performed by the Tenant that holdeth by *Homage*; and it had the most frequent Use in such as held by Knights-Service in *Capite*, who did pay into the *Exchequer* every fifth Term, some small Sum of Money, to be respited the doing of their *Homage*. See the *Stat. 12. Car. 2. cap. 24.* whereby this is taken away as a Charge incident or arising from *Knights-Service*.

RESPONSALIS, in Law, he who gives an Answer, is he that appears for another in Court at a Day assigned: As if *Essoigniator* came only to declare the Cause of the Parties Absence, whether Demandant or Tenant; and *Responsalis* came for the Tenant, not only to excuse his Absence, but also signify, what Trial he meant to undergo.

REST, in Musick. See *Pause*.

RESTITUTION, the returning of Elastic Bodies forcibly bent to their natural State, is called the *Motion of Restitution*.

RESTITUTION, in Law, signifies the yielding up again, or restoring of any Thing unlawfully taken from another: As also the setting him in Possessions of Lands or Tenements that hath been unlawfully disseised of them.

RESTITUTIONE extracti ab Ecclesia, is a Writ to restore a Man to the Church, which he had recovered for his Sanctuary, being suspected of Felony.

RESTITUTIONE Temporalium, is a Writ that lies where a Man being Elected and Confirmed *Bishop* of any Diocese, hath the King's Royal Assent thereto for the *Recovery* of the *Temporalities* or Barony of the said Bishoprick; and it is directed from the King to the *Escheator* of the County.

RESTRAINT, is when any Action is hindered or stopped contrary to Volition or Preference of the Mind.

RESUMMONS, in Law, signifies a *Second Summons*, and Calling of a Man to answer an Action, where the *First Summons* is defeated upon any Occasion, as the Death of the Party, or the like.

RESUMPTION, in a large Sense, signifies the taking again into the King's Hands such Lands or Tenements, as before, upon false Suggestion, or other Error, he had delivered to the Heir, or granted by Letters-Patent to any Man.

RETAINING Fee, is the first *Fee* given to any Serjeant or Counsellor at Law, whereby to make him sure that he shall not be on the contrary Part.

RETE Mirabile. In those Creatures, that have the *Glandula Pituitaria* large; (as in Calves for Instance) the two Carotid Arteries meeting about the *Sella* of the Wedge-like Bone, presently divide themselves into small Twigs, which being interwoven with (tho' not so numerous) Twigs from the internal Jugular Veins, and also with nervous Fibres from the larger Trunk of the fifth Pair of Nerves, make on each Side a notable *Plexus*, called *Rete Mirabile*. There enter into this *Rete* some Twigs also from the Cervical Arteries; and there pass out of it several Twigs into the *Glandula Pituitaria*. So that in these Creatures that Gland seems to be of the same Use to the *Rete Mirabile*, as the *Glandula Pinealis* is to the *Plexus Choroides*, viz. To separate a serous Matter from the arterial Blood. But in Man (according to most Anatomists) this *Rete* is wholly wanting; so that there passing only sometimes a Twig or two, and sometimes none, from the Trunk it self of the Carotid Artery, into the *Glandula Pituitaria*, that Gland is of less Use in him than in other Creatures that have the *Rete*. Yet Dr *Ridley* affirms, That he never found this *Rete* wanting, or with any Difficulty discoverable in Men, springing from, and lying on the Inside of each Carotid Artery: But confesses, that it is far smaller in them than in Brutes; for which Difference he thus accounts. Brutes by reason of their prone Position, would, but for this *Rete*, be in danger of having their Brains deluged as it were with an over-great Quantity of the influent Blood, and of a Rupture of the Vessels by its violent Ingress, and this Danger is so much the more threatened, by how much the same Cause which brings it into the Brain with that Force, is equally as great and effectual to hinder its proportionable

tionable return. For the Relief of which Inconvenience, Nature hath contrived a Means for its more easy and safe Descent into the Brain, by turning that one largest Stream of Blood (which through its being pent in one Channel, becomes so rapid) into many more, (by which means the Carotid Trunk above the *Dura Mater* in those Creatures, is very small to what it is beneath; whereas that Artery in Men, &c. hath the same Bigness on both Sides the Membrane) and they not only reticulated and contorted for the more flow and laborious Descent of the Blood; (which Contrivance the Ancients thought was only for a more exact Preparation of the Blood for Animal Spirits) but also many of them by their Insertion into the *Glandula Pituitaria*, attended with small Veins issuing thence, to take off some Part of the Burthen too. And that to the aforefaid Position of several Creatures ought chiefly to be ascribed the Variety of Magnitude of this *Rete* in several of them, its Size in *Dogs* seems highly to evince; in whom, by reason of their Horizontal Position, being neither so prone as several Brutes who feed on Grass, nor so erect as Man, this *Rete* is found smaller than in the first, and larger than in the last.

RETENTION, is a Faculty of the Mind, whereby it makes a farther Progress towards Knowledge.

RETICULARIS plexus, the same with *Choroides*.

RETICULUM, the same with *Omentum*.

RETIFORMIS plexus. See *Plexus Retiformis*.

RETIFORMIS tunica, is the principal Organ of Sight; being a certain Expansion of the inner Substance of the Optic Nerve in the Eye, which is to the Eye like a whited Wall in a dark Chamber, and receives and represents the visible Species that are let in by a Hole as it were into a darkened Room.

RETINA tunica, the same with *Retiformis*.

RETIRADE, in Fortification, is a kind of Retrenchment made in the Body of a Bastion or other Works, which is to be disputed Inch by Inch, after the first Defences are Dismantled. It usually consists of two Faces, which make a Re-entring Angle.

RETIRED Flank. See *Flank*.

RETORT, is an Instrument or Vessel in Chymistry, commonly of this Figure, used for Distillations of Oils and Volatile Salts, and also of Acid Spirits. 'Tis sometimes made of Glass, sometimes of Earth, and sometimes of Iron, according to the Nature of the Matter to be Distilled, and the Degree of Fire necessary to perform the Operation.

Earthen Retorts are best for the drawing of Acid Spirits, because they will bear the utmost Heat, and not Melt, as Glass ones sometimes do. Therefore when you are forced to use a Glass Retort in so strong a Fire, it must be coated or covered over with Lute. See that Word.

There is also another kind of Earthen Retorts, which are flat at the Bottom, and whose Nose or Beak turns upwards, which in great Furnaces are used for the Distillation of Acid Spirits; and they have Earthen Receivers Luted to them.

RETRACTORES Alarum Nasi, &c Elevatores Labii Superioris: These Muscles arise broad and fleshy from the fourth Bone of the Upper Jaw,

whence descending obliquely, they are soon inserted to the Upper Lip, and *Ala Nasi*. Their Name shews their Use is to lift up the Nose and Upper Lip.

RETRAHIENS Auriculam, is a Muscle by some called *Triceps Auris*, because it has sometimes 3 Beginnings. *M. du Verney* says it is composed of five or six fleshy Fibres, which have their Origination from the Superior and Forepart of the *Apophyse Mastoidea*, and descend obliquely to their Insertion in the Middle of the *Concha Auriculae*.

RETRENCHMENT, in Fortification, is a Ditch bordered with its Parapet, and secured with Gabions or Bivins laden with Earth. It is sometimes taken for a simple *Retirade* in Part of the *Rampart*, when the Enemy is so far advanced, that he is no longer to be Resisted, or beaten from the first Post.

RETROCESSION of the Equinoxes, is the Annual going backward of the Equinoctial Points about 50 Seconds. See *Equinoxes*.

RETROGRADE, in Astronomy, is usually appropriated to the Planets, when by their proper Motion in the Zodiac, they move backward or contrary to the Succession of the Signs: As from the second Degree of *Aries* to the first, &c. But this Retrogradation is only apparent, and occasioned by the Observer's Eye being placed on the Earth: For to an Eye at the Sun, the Planet will appear always Direct, and never either Stationary or Retrograde.

RETURN, in Law, hath two several Applications: The one is the *Return* of Writs by Sheriffs and Bayliffs, which is only a Certificate made to the Court, of that which he hath done touching the Execution of their Writ directed to him. And this among the *Civilians* is termed *Certificatorium*: Of *Returns* in this Signification speaks the Statute of *Westmin. 2 Cap. 39*. So is the *Return* of a Commission, a Certificate or Answer to the Court, of that which is done by the Commissioners, Sheriffs, or other, to whom such Writs, Commissions, Precepts or Mandates are directed. Also, certain Days in every Term are called *Return Days*, or Days in Bank; and so *Hilary* Term hath four *Returns*, viz. *Ostabis Hilarii, Quindena Hilarii, Crastino Purificationis &c Ostabis Purificationis*. *Easter* Term hath Five, viz. *Quindena Pasche, Tres Pasche, Mensis Pasche, Quinq. Pasche*, and *Crastino Ascensionis Domini*. *Trinity* Term hath Four, *Crastino Trinitatis, Ostabis Trinitatis, Quindena Trinitatis, Tres Trinitatis*; and *Michaelmas* Term Six, viz. *Tres Michaelis, Mensis Michaelis, Crastino Annæmarum, Crastino Martini, Ostabis Martini, Quindena Martini*. The other Application of this Word is in Case of *Replevin*; for if a Man Distrain Cattle for Rent, &c. and afterwards justify or avow his Act, so as it is found lawful, the Cattle before delivered unto him that was distrained, upon Security given to follow the Action, shall now be returned to him that distrained them.

RETURNO habendo, is a Writ that lies upon him that has avowed a Distress made of Cattle, and proved his Distress to be lawfully taken, for returning to him the Cattle distrained, which before were replevied by the Party distrained, upon Surety given to Prosecute the Action; or when the Plaintiff or Action is removed by *Recordari*, or *Accedas ad Curiam*, into the Court of *Common Pleas*, and he whose Cattle were distrained makes default, and doth not prosecute his Suit.

RETURNUM averiorum, is a Writ Judicial, granted to one Impleaded for the taking the Cattle of another, and unjust detaining them *contra Vadium* & *Plegios*, and appearing upon Summons, and is dismissed without Day, because the Plaintiff makes Default; and it lies for the return of the Cattle to the Defendant, whereby he was Summoned, or which were taken for Security of his Appearance upon the Summons.

RETURNUM irreplegiabile, is a Writ Judicial, sent out of the Common-Pleas to the Sheriff, for the final Restitution or return of Cattle to the Owner, unjustly taken by another, as *Damage-feasant*, and so found by the Jury before Justices of Assize in the Countrey, or otherwise by Default of Prosecution.

REVENUE, signifies properly the Rent that accrues to every Man from his Lands and Possessions.

REVERBERATE: The Word signifies properly to strike, reflect, or beat back again. The Chymists say, *Make the Flame reverberate on the Coppel*. That is, Let either the Flame of the Wood be so blown with the Bellows, as that it may be beaten back down on the Metal; or else make the Sides of the Furnace so close all about, that the Flame striking against its Sides, may be beat back again down on the Matter to be melted. For which latter Purpose they have a Particular Furnace called the

REVERBERATORY Furnace; which is a strong fix'd Furnace of two Bricks thickness, and must be large enough to hold a Retort, or more than one, for the Distillation of Acid Spirits, and other Things. The Mortar or Lute for such a Furnace is usually one Part Potters Earth, as much Horse-dung, and two Parts of common Sand kneaded in Water. The Ash-hole must be about a Foot high, and the Door contrived, if possible, so as that the Air may come freely to it, to light the Fire the more easily, or to increase the Flame. The Fire-place need not be quite so high: At the top of it are two Iron Bars placed cross-wise, to set the Retort on; and then the Furnace is rais'd about a Foot higher, to cover or close the Retort: Then is there fitted to this a *Dome* or Cover with its Chimney, which is set on the top of the Dome on a little Hole, which when the Chimney is not used, hath a Stopple to it: This Dome may be made of the same Paste that portable Furnaces are usually made of; which see under *Furnaces*.

And one may make according to his Fancy, Room, or Convenience, a Furnace of this Kind; and there is no need of keeping exactly to this Form, especially as to the Dome, which in a large Reverberatory may be made with Tiles or Bricks placed over the Retorts, and plaistered over with a Lute made of Ashes, melted with common Water.

Here follows the Figure of Mr. Lémery's Reverberatory, which will serve to give an Idea of the former Description.

- a The Ash-hole;
- b The Fire-Place;
- c The Dome or Cover;
- d The Chimney;
- e The Receiver;
- f The Retort.

Such a Furnace as this, will also serve for many Uses, as well as Distilling *per Reverberarium*; as to Distil with the Refrigeratory, in *Baineo*, &c. for the Copper Body may be placed on the Bars, and the Vessel holding the Water, Sand, Ashes, &c. as a little Practice will soon teach the Young Chymist.

REVERSED Talon. See *Talon*.

REVERSION, in Law, hath a double Acceptation, one is, *Jus revertendi cum status possessionis defecerit*, and this is but an Interest in the Land, when the Possession shall fall.

Secondly, When the Possession, and Estate which was parted with for a Time, ceaseth, and is determined in the Persons of the Alienees, Assignees, Grantees, or their Heirs, or effectually returns to the Donor, his Heirs or Assigns whence it was derived.

The Difference between a *Reversion*, and a *Remainder*, is, that a *Remainder* is general, and may remain to any Man, but to him that granteth or conveyeth the Land, &c. for Term of Life only, or otherwise. A *Reversion* is to himself, from whom the Conveyance of the Land, &c. proceeded, and is commonly perpetual, as to his Heirs also. And yet sometimes *Reversion* is confounded with *Remainder*.

REVIEW, A Bill of Review in Chancery, is where a Cause hath been heard, and the Decree signed and enrolled; and some Error in Law appears upon the Decree made, which Bill cannot be exhibited, but by License of the Court.

REVIVE, when any mix'd Body is restored again to its Natural Form and Condition, from out of the Disguises it was in, by being mixed with some other Body, they say it is *Revived*.

Thus when Mercury is distilled from Cinnabar, they call it Mercury revived from Cinnabar; because the Mercury was made into Cinnabar only for safety and convenience of its being carried from Place to Place. See *Mercury*.

BILL of REVIVER, is where a Bill hath been exhibited in *Chancery*, against one who answers, and before the Cause is heard, or if heard, before the Decree enrolled, either Party dies: In this case a *Bill of Reviver* must be brought, that the former Proceedings may stand revived, and the Cause be finally determined.

REVIVING, in Law, signifies a renewing of Reits and Actions after they be extinguished.

REVOLUTION, in Astronomy, is the Circulation of any Celestial Body, till it return to the same Point in which it was when it first began to move. But,

REVOLUTION, or as some call it, The *Restitution* of the *Animals*, is the Return of a Planet to any one Point of its Eccentrick, after it hath parted from it.

REVULSORIA, *V. S.* is whereby the Blood that gushes upon one part, is diverted a contrary way, by opening of a Vein in a remote and convenient place. This our Surgeons call frequently Bleeding for a *Revulsion*.

RHABDOLOGY, is the Art of computing or numbering by those Rods, commonly called *Neper's Bones*; which see.

RHACHITIS, is according to some, the Spinal Marrow; (which see in its proper place;) Also a Disease common amongst the *English*, which is an unequal Nourishment of the Body, accompanied with Looseness of Parts, Softness, Weakness, Faintness, Drowsiness, a great swelling Head, with Leanness below the Head; with Protuberances about the joints, crookedness of Bones, straitness of the Breast, swelling of the *Abdomen*, stretching of the *Hypochondres*, a Cough, &c. The *English* call it the *Rickets*: But because the occasion of it often lies in the Spinal Marrow, the Famous *Glysson* calls it appositely enough *Rhachitis*. *Blanchard*.

RHAGADES, the *Latins* say *Scissure*, *Fissura*, *Rima*, Chinks, Clefts, which as they happen in other parts of the Body, Hands, Feet, Lips, the entrance of the Womb; so they may happen in the Fundament, in the Extremity of the Gut *Rectum*, and in the *Sphincter*, or Muscle, which closes the Fundament. *Rhagades* in the Fundament are certain oblong little Ulcers, without swelling, like those which are sometimes occasioned in the Hands by great Cold. Some are superficial, others deep: Some are not hard nor callous, others are: Some are moist, and send forth Matter, others dry and cancrous. *Blanchard*.

RHEGMA, is a breaking forth or bursting of any part, as of a Bone, the inner Rind of the Belly, the Eye, &c.

RHEUMATISM, is a wandering Pain in the Body, often accompanied with a small Fever, Swelling, Inflammation, &c. *Blanchard*.

RHEXIS, the same with *Rhegma*.

RHINENCHYTES, is a little Syringe to inject Medicines into the Nostrils.

RHOMBE Solid, is two equal and right Cones joined together at their Bases.

RHOMBOIDES, so called from its Figure, is a pair of Muscles of the Scapula, proceeding from the two lowermost Vertebres of the Neck, and from the four upper Spinal Processes of the Vertebres of the Back: By and by they descend obliquely, and being fleshy at the beginning and end, go as far as the Basis of the Shoulder-blade, which they move backward and obliquely upward; It adheres strongly to its Subjacent Muscle the *Serratus Superior Posticus*.

RHOMBOIDES, a Figure in Geometry! See *Quadrilateral Figures*.

RHOMBUS. See *Quadrilateral Figures*.

RHUMBS. See *Rumbs*.

RHYOS, a Disease of the Eyes, caused by a consuming or diminishing of the Caruncle, or small piece of Flesh in the great corner of the Eye, so that it can no longer contain its Liquor. *Blanchard*.

RHYPTICA are Scouring Medicines which cleanse away Filth. *Blanchard*.

RHYTHMUS, is a certain Proportion of Pulses, Time, Life, Age, &c. *Blanchard*.

RIBBON, a Term in Heraldry, signifying the eighth part of a Bend; it is born a little cut off from the out-lines of the Escutcheon, thus.

He beareth On a Ribbon, Gules.

RIBBS of a Ship, are the Timbers of the Planks when the Planks are off; so called, because they are bending like the Ribs of a Carcase.

Those little long wooden Pieces also which belong to the Parrels of the Yards, and have holes in them like the Comb under the Beak-head, are called the Ribbs of the Parrels.

Ride, a Ship is said to Ride, when her Anchors hold her fast, so that she drives not away by the force of the Wind or Tide; and a Ship is said to Ride well, when she is built so that she doth not over-beat her self into a Head Sea, as that the Waves over-rake her, (that is over-walk her) from Stern to Stern. They say also a Ship

RIDES a-crofs, when the Rides with her Main yards and Fore-yards hoisted up to the Hounds; and both Yards and Arms topped alike. She is said to

Ride a Peek, when one end of the Yard is pecked up, and the other hangs down: And this is also said of a Ship, when in Weighing she is brought directly over her Anchor. She is said to

RIDE Atwart, when her Side is to the Tide. And to

RIDE betwixt Wind and Tide, when the Wind hath equal force over her one way, and the Tide another; but if the Wind hath more Power over her than the Tide, she is said to *Ride Wind Rode*. She is said to

RIDE Hawseful, when in a Stress of Weather she falls so deep into the Sea with her Head, that Water runs in at her *Hawser*. She is said to

RIDE Portise, when her Yards are struck upon the Deck, or when they are down *Aport-last*.

RIDEAU, in Fortification, is a Ditch, the Earth whereof is raised on its Side, or a small elevation of Earth, extending it self in length on a Plain, which serves to cover a Post, being also very convenient for those that would besiege a Place at a near distance; and to secure the Workmen in their Approaches to the Fort of a Fortress.

RIDERS in a Ship, are great Timbers both in the Hold and also Aloft, which are bolted on to other Timbers to strengthen them, when 'tis discovered a Ship is too weakly built.

RIENS Arreare, is a kind of Plea used to an Action of Debt upon *Arrearages* of Account, whereby the Defendant does alledge, There is nothing in *Arrear*.

RIENS passe par le fait, is the Form of an Election taken in some Cases to an Action.

RIENS

RIENS *per descent*, is a Form of Pleading when an Heir is sued for a Debt of his Ancestor, and he hath no Assets in his Hand, nor any Lands liable to be extended.

RIGGING of a Ship, is all her Ropes whatsoever belonging to her Masts or Yards, or any Part about her.

A Ship is well Rigged, when all her Ropes are of their fit size in proportion to her Burden. She is said to be over-rigged when her Ropes are too big for her; which wrongs her much in her Sailing, and is apt to make her *Heel*.

RIGHT, in Law, signifies not only a Right for which a *Writ of Right* lies; but also any Title or Claim, either by virtue of a Condition, Mortgage, or the like, for which no Action is given by Law, but only an Entry.

Thus is *Jus Proprietatis*, a Right of Propriety: *Jus Possessionis*, a Right of Possession: And *Jus Proprietatis & Possessionis*, a Right both of Property and Possession, and this was formerly called, *Jus duplicatum*: As if a Man be disseised of an Acre of Land, the Disseisee hath *Jus Proprietatis*; the Disseisor hath *Jus Possessionis*, and if the Disseisee release to the Disseisor, he hath *Jus Proprietatis & Possessionis*.

Right-angled, a Figure is said to be Right-angled, when its Sides are at Right-angles, or stand Perpendicularly one upon another: And this is sometimes in all Angles of the Figures, as in Squares and Rect-angles: Sometimes only in part, as in Right-angled Tri-angles.

Right-angled Tri-angle. See *Tri-angle*.

Right-Angles. See *Angles*.

RIGHT-ascension, of the Sun or Star, is that Degree of the *Equinoctial*, accounted from the beginning of *Aries*, which riseth with it in a *Right Sphere*.

Or, it's that Degree and Minute of the *Equinoctial* (counted as before) which cometh to the Meridian, with the Sun or Stars, or with any Point of the Heavens. The reason of which referring it to the Meridian, is because that is always at Right Angles to the *Equinoctial*; when the Horizon only is in a *Right* or *Direct Sphere*.

To find the Sun's or Star's *Right Ascension*, by the *Globe*.

Bring the Sun's or Star's Place to the Meridian, and the Number of Degrees intercepted between the beginning of *Aries*, and that Degree of the *Equinoctial* which comes to the Meridian, is the *Right Ascension*, if required in Time: Account every 15 Degrees to be an Hour, and every Degree to be 4 Minutes.

To find the Sun's *Right Ascension Trigonometrically*; having his greatest Declination and Distance from the next *Equinoctial* Point given; say,

As Radius is to the Co-sine of the Sun's greatest Declination :: So is the Tangent of his Distance from the next *Equinoctial* Point to the Tangent of the *Right Ascension*.

Example.

Let the Sun's Distance from the next *Equinoctial* Point be 30 Degrees 00 Minutes; his greatest Declination be 23 Degrees 30 Minutes.

Then to the Co-sine of 23° 30' ——— 9. 962398
Add the Tangent of 30° 00' ——— 9. 761439

Sum less Radius is the Tan. of 27° 53' 19. 723837

Which is the *Right Ascension* required.

The same may be also found, by having the present Declination, (suppose 11 Degrees 30 Minutes) and the greatest Declination 23 Degrees 30 Minutes given.

For, As the Tangent of the Sun's greatest Declination, is to the Tangent of his present Declination :: So is the Radius to the Sine of his *Right Ascension*.

The Operation stands thus:

To the Ar. co. of the Tan. of 23° 30' — 0. 361698
Add the Tangent of 11° 30' ——— 9. 38463

Sum adding the Radius = S. 27° 53' — 19. 670161

RIGHT or *Direct Sphere*, is that which has the Poles of the World in its Horizon, and the Equator in the Zenith: The Consequences of living under such a Position, (as those who live directly under the Line are in) is that they have no Latitude, nor Elevation of the Pole. They can see nearly both Poles of the World; all the Stars do Rise, Culminate, and set with them. And the Sun always rises and descends at Right Angles to their Horizon, and makes their Days and Nights even; because the Horizon bisects the Circle of his Diurnal Revolution.

To find the *Right Ascension* of a Planet, or Star that hath Latitude, use this Proportion.

As Co-sine of the Stars Declination is to the Co-sine of its Distance from the next *Equinoctial* Point :: So is the Co-sine of its Latitude, to the Co-sine of its *Right Ascension*.

RIGHT the Helm, a Sea Phrase, used by him that Commands to the Man at Helm, ordering him to keep the Helm even with the Middle of the Ship.

RIGHT Line, is the nearest Distance between any two Points. See *Line*.

RIGHT Muscles of the Head. See *Rectus Internus Major & Minor*.

RIGHT Sailing, is when a Voyage is performed on some one of the four *Cardinal Points*.

If a Ship sail under the Meridian; that is, on the North or South Points, she varieth not in Longitude at all; but only changeth the Latitude, and that just so much as the Number of Degrees she hath run.

If a Ship sail under the *Equinoctial*, upon the very East or West Points, she altereth not her Latitude at all, but only changeth the Longitude, and that just so much as the number of Degrees she hath run. If the Ship sail directly East or West under any Parallel, she there also altereth not her Latitude, but only the Longitude; yet not according to the Number of Degrees of a great Circle she hath sailed, as under the *Equinoctial*; but more

more than so many, according as the Parallel is remoter from the Equinoctial towards the Pole: For the less any Parallel is, the greater is the Difference of Longitude.

RIGHT *Sine*, the same with *Sine*; which see.

RIGOR, is a Vibration and Concussion of the Skin, and Muscles of the whole Body, accompanied with Chills.

RIGOROUS way of explicating Rarefaction is, as it is called by the Moderns, that which is made use of in the Peripatetic School; which see under *Rarefaction*.

RIM, in a Watch or Clock, is the Circular part of the Balance thereof.

RING *Dial*. See *Universal Equinoctial Dial*.

RING of *Saturn* is an Opaque Solid, Circular Arch and Plane, like the Horizon of a Globe, of Matter entirely encompassing round the Planet, and no where touching it; its Plane is at this Time nearly parallel to the Plane of our Earth's Equator: The Diameter of this Ring is $2\frac{1}{2}$ of *Saturn's* Diameters, and the Distance of the Ring from the Planet, is about the breadth of the Ring itself.

Galileus first discovered the Figure of *Saturn* not

to be round; but that the Inequality was thus in the Form of a Ring, Mr. *Hugens* first found out and published in his *Systema Saturniana*, 1659. 'Tis this Ring, and its various Positions in respect of the Sun, (whose Light it reflects like the Body of *Saturn* itself) and of the Eye of the Spectator, which occasions all the various Appearances of *Saturn* with his *Anse* (as they call them) or with none, with broad, or narrow ones, &c.

The following Figures which I borrowed from Dr. *Gregory's* Astronomy, will very well illustrate this Matter.

The first is a single Figure of the Planet, when his Ring is most visible: And the second explains the several Phenomena of the Ring in all its Positions, in respect of the Sun at S. during the Planet's entire Revolution round the Sun. When the Planet is at A or I, the Ring is scarce visible, because the Sun's Rays running almost parallel to it, can illuminate it but very sparingly. But when *Saturn* is at E. or N. then the Sun's Rays falling almost directly upon the Ring, do render it most of all conspicuous.

RIOT, in Law, signifies the forcible doing of an unlawful thing, by three or more Persons assembled together for that purpose.

RISING of the Sun or Star, is their appearing above the Horizon.

The *Rising of the Sun* may be found by the Globe; thus.

First rectify the Globe (which Word see;) then bring the Sun's Place to the East part of the Horizon; and the Hour Index will shew the Time either before or after Six.

The Time of the Sun's Rising doubled, gives the Length of the Day.

The *Rising of any Star*, may be thus found by the Globe.

Rectify your Globe and Hour Index; bring the Star to the East, and the Index will shew the Time of the Star's Rising.

Rising *Timbers* in a Ship, are the Hooks placed on her Keel; and are so called, because as these rise in Proportion, so her Rake and her Run rise on her flat Floor by degrees.

The **RISINGS** in a Ship, are those thick Planks which go fore and aft, on both Sides under the End of the Beams and Timbers of the Second Deck unto the third Deck, half Deck, and quarter Deck; and on them the Beams and Timbers of the Deck do bear at both ends, by the Ship's side.

RISUS Sardonius, is a Contraction of each Jaw, or a Convulsive kind of Grinning, caused by a Contraction of the Muscles on both sides of the Mouth. *Blanchard.*

RIVERS and *Springs*; whence they arise, see under the Word *Vapour*.

A **Road**, is in any place near the Land where the Ships may Ride at Anchor, and a Ship riding there is called a *Roader*.

ROB. See *Apothefima*.

ROBBINS in a Ship, are those small Lines which make the Sail fast to the Yards, being reeved into Eylet-holes in the Sail under the Head-rope; for that purpose. The Word is, *Make fast the Robbins*: For at Sea they don't say *tie*, but *make fast*.

ROD, a Measure of Length containing by Statute just 16 $\frac{1}{2}$ Feet *Englsh*. See *Pole*. This must carefully be distinguished from *Rood*, which is a Square Measure containing the fourth part of an Acre.

ROLL, in Law, signifies a Schedule of Paper or Parchment, which may be turned or wound up with the Hand to the Fashion of a Pipe; of which there are in the Exchequer several Kinds: As, *The great Wardrobe Roll*, *the Cofferer's Roll*, *the Subsidy Roll*, &c.

Roll of Court, the Court Roll in a Mannor, wherein the Names, Rents, and Services, of the Tenants were copied and enrolled.

RIDDER-roll; the Court *ex officio*, may award a *Certiorari ad informandum conscientiam*; and that which is certified shall be annexed to the Record, and is called a *Ridder-roll*.

Or a *Ridder-roll*, is a Schedule, or small piece of Parchment, added to some part of a Roll or Record.

ROLLS, or the Office of the Rolls in *Chancery-Lane*, formerly called *Domus Conventorum*, is the House that was built by King Henry the Third, for Jews converted to the Christian Faith; but Edward the Third expelled them for their Wickedness, and deputed the Place for the Custody of the Rolls and Records of the *Chancery*, the Master whereof is the Second in Chancery, and in the Absence of the Lord Chancellor or Lord Keeper, sits as Judge, being commonly called *the Master of the Rolls*.

ROLLS of Parliament, the Manuscript Registers or Rolls of the Proceedings of our old Parliaments. For before the use of Printing, and till the Reign of Henry the Seventh, our Statutes were all engross'd in Parchment, and (by virtue of the King's Writ to that purpose) proclaimed openly in every County.

In these Rolls we have a great many decisions of difficult Points in Law, which were frequently in former times referred to the Determination of this Supreme Court, by the Inferior ones of both Benches, &c.

ROMAN Indiction. See *Indiction*.

ROMAN Order of Architecture, is the same with the *Composite*. 'Twas invented by the Romans in the Time of Augustus, and set above all the others, to shew (say some) that the Romans were Lords

over all other Nations: 'Tis made up of the *Ionick*, and *Corinthian Orders*, and is more Ornamental than either.

ROMPEE, in Heraldry, they call a *Chevron* so; when it is born of this Figure.

He beareth a *Chevron Rompee*, between three Mulletts, Or, by the Name of *Sault*.

RONDEL, in Fortification, is a Round Tower sometimes erected at the Foot of the Bastions.

ROOD, a Square Measure containing just a Quarter of an Acre of Land: Some confound this Measure with a *Rod*, which is the Length of 16 $\frac{1}{2}$ Feet; and others with a Yard Land, or the *Quartona Terra*, but both very erroneously.

A *Rood* is sometimes called a *Fartbendele*.

ROOF-trees, or *Ruff-trees*, are the Timbers in a Ship, which go from the *Half-Deck* to the *Fore-Castle*: They serve to bear up the Gratings, and are supported by *Stanchions*. Also that Piece of Timber which on Occasion is laid over the *Half-Deck* to bear up Nettings, Sails, or Pieces of Canvass, is called a *Rlof-tree*.

ROOT, whatever Quantity being multiplied into its self Produces a Square, and that Square again being multiplied by that first Quantity Produces a Cube, &c. is called a *Root*, as either the Square, Cube, or Biquadrate *Root*, &c. according to the multiplication. See *Square*, *Cube*, &c. Also the Unknown Quantity in an Algebraick Equation is often called the Root. And what are the Determine number of Roots in any Cubick, or Biquadrate Equation, Mr. Halley shews in *Philos. Trans.* N. 100.

ROPES, of a Ship are in General all her Cordage; But Particularly they call by this Name only,

1. The *Entring-rope* which hangs at the Ladder to help People up the Side.
2. A *Top-rope*, so called, because belonging to the Top.
3. A *Bolt-rope*, into which the Sail is fowed.
4. A *Buoy-rope*, which is that to which the Buoy of the Anchor hangs.
5. The *Guest-rope*, which tows the Long-Boat.
6. The *Keel-rope*.
7. The *Bucket-rope*, which serves to heave the Bucket in drawing Water.
8. The *Rudder-rope*, which reaved into a Hole of the Rudder near the Head, and also through the Stern-post, both the Ends thereof are spliced together, serving to save the Rudder, if by any Accident it should be beaten off.

Also the *Preventer-rope*, which is a small Rope, seized cross over the Ties, close at the Ram-head; so that if any one part of the Tie should be broke, yet the Remainder should not run through the Ram-head, to endanger the Yard.

There is also a Rope called a *Breast-rope*, which Lashes the Parrels to the Masts.

And another called the *Guy-rope*, which is reeved through a Block, fastned by a Strop, to the Head of the Fore-mast, and having its end fastened to the Strop of the Winding Tackle, to bowle it forwards, that it may plumb directly over the Hatch Way.

And there is also a *Boat-rope*, by which the Boat hangs, or is fastened a Stern of the Ship.

ROPE yarn, is the Yarn of any Rope untwisted: 'Tis commonly made of Cable Ends which are Worn out, which are called Junks of the Cables: The Use of it is to serve small Ropes, to make Sinner Mats, &c. also to make Knetties, which are 2 of these Rope Yarns, untwisted, together: Also it helps to make Caburns, i. e. Lines to bind Cables withal; and to fasten the Sails to the Yard Arms, &c.

RORIFERUS Ductus, the same that *Ductus Chyliferus*.

ROS, in the Account of the Ancients, was the First Moisture that falls from the Extremities of the Vessels, and is dispersed upon the Substance of the Members. *Ros*, says *Galen*, is a Thin sort of Moisture whereby the Parts of our Body are nourished, and is contained in all the Parts of an Animal, like a certain Dew sprinkled upon them. *Blanchard*.

ROS Vitrioli, according to *Ang. Sala*, is the first Phlegm or Water that is distilled from Vitriol in *Bainco Marie*.

ROSA, the same that *Erysipelas*.

ROSIMES, of Vegetables how made. See *Refine*.

ROSTRIFORMIS Processus. See *Coracoides*.

ROSTRUM, in Chymistry, is the Nose of an Alembick.

ROTA Aristotelica, is the Consideration of a Wheel moving along a Plain, till it hath made one entire revolution: For then will its Centre have described a Line equal to that of the Circumference of the Wheel, and so will all lesser Concentric Circles. See an *Explication of this in Boyle* against *Linus*.

ROTATOR Femoris Exprossum. See *Obturator Externus*.

ROTATOR Major & Minor, are two *Apophyses* in the upper Part of the Thigh-Bone, called *Trichanteres*, in which the Tendons of many Muscles are terminated.

ROTULA, the same that *Mola genu*.

ROTULÆ. See *Tabellæ*.

ROTUNDUS, (See *Musculus*) is a Muscle of the Radius, serving to turn the Palm of the Hand downwards.

ROUND, is a Military Term, signifying a Walk or Turn, which an Officer attended with a Few Soldiers, takes in a Garrison or Fortified Place during the Night, to observe whether the Centries do their Duty, or not.

ROUND-house, is the uppermost Room or Cabin on the Stern of the Ship where the Master lies.

ROUND-in, or *Round-ast*, a Term at Sea belonging to the Main and Fore-sail: When the Wind largeth, they say, *Let rise the Main-tacks, or the Fore-tacks! Haul ast the Fore-sheet to the Cat-head; and the Main-sheet to the Cubbridge-head! And when these Sheets are thus haled down they keep them from flying up with the Passarado-rope*. This Work is called, *rounding in*, or *rounding ast the Sail*.

ROWLE in a Ship, is a round piece of Wood or Iron, wherein the Whip goes, being made to turn about, that it may carry over the Whip the easier from side to side.

ROWSE in the Cable, or *Rowse in the Hawser*, is a Word of Command at Sea, when a Cable or

Hawser lies too slack in the Water, and they would have it be made more *taught*; left on the turning of the Tide, the Cable should happen to be foul of the Anchor.

ROYAL Assent, is that *Assent* which the King gives to a thing formerly done by others, to the Election of a Bishop by Dean and Chapter; which given, then he sends a Special Writ for the taking of *Faalty*.

And also to a Bill passed in both Houses of Parliament; which *Assent*, in Parliament, being once given, the Bill is endorsed with these Words, *Le Roy le veult*, i. e. *It pleases the King*: But if he refuses to agree to it, then thus; *Le Roy S'avisera*, i. e. *The King will Advise*.

ROYAL Fort. See *Fort*.

ROYAL Parapet, or, *Parapet of the Rampire*, in Fortification, is a Bank about three Fathoms broad, and six Foot high, placed upon the Brink of the *Rampire*, towards the Country, to cover those who defend the *Rampire*.

RUBIGO, or *Mildew*, is a Disease happening to Plants, caused by a *Dewy Moisture* which falling upon them, and continuing there for want of sufficient Heat of the Sun to draw it up, doth by it's Sharpness, or Acrimony, corrupt the Inmost Substance of the Plant.

RUBRICA. See *Impetigo*.

RUCTATION, or Belching, is a depraved Motion of the Stomach, occasioned by an Effervescence there, whereby Vapours and Flatulent Matter are sent out at the Mouth. *Blanchard*.

RUDDER of a Ship, is a Piece of Timber hung on the Stern-posts by 4 or 5 Iron Hooks (called *Pivots*) and is as it were the Bridle of a Ship; because by it she is turned about at the Pleasure of him that stands at the Helm. A Narrow Rudder is best for a Ship's sailing, provided she can feel it; that is, be guided and turned by such a Rudder. For a Broad Rudder will hold much Water, when the Helm is put over to any side: But yet if a Ship have a *Fat Quarter*, so that the Water cannot come quick and strong to her Rudder, she will require a Broad Rudder. The aftermost Part of the Rudder is called, the *Rake of the Rudder*.

RUDDER-iron, are the Cheeks of that Iron, whereof the Pintle is part, which is fastened and nailed down about the Rake of the Rudder.

RUDDER-rope. *Vide Rope*.

RUGITUS, is an Effervescence of Chyle and Excrements in the Blood, whereby Wind and several other Motions are excited in the Guts, and rowl up and down the Excrements, when there's no easie Vent upwards or downwards. *Blanchard*.

RULE of Falshood. See *Position*.

RULE of Three, or the *Rule of Proportion*; or as it is called, from its excellent Use, *The Golden Rule*, is that which teaches to find a Fourth Number, which shall have the same Proportion to one of the three Numbers given, as the others have to one another.

This *Rule of Three* is, 1. *Direct*. 2. *Indirect*. 3. *Double-Rule Direct*. 4. *Double-Rule Indirect*.

Rule of Three Direct finds a fourth Number in such Proportion to the Third, as the second is to the first; or, as the first is to the second, so is the third to the fourth: Thus.

1 : 2 :: 3 : 6

This Rule requires (and is to be known thus : That if the second Term be greater or less than the first, the fourth Term shall be likewise greater or lesser than the third.

Or in the Question, if more require more, or less require less, then use this Rule *Direct*, and Multiply the second and third Terms together, and divide the Product by the first Term, the Quotient gives the fourth Term required.

Note, That the first and third Terms, and the second and fourth, are of the same Denomination : As if the first be of Money, Weights, or Measures, &c. so shall the third ; and so as the second, the fourth.

Example,

If 4 Yards cost 8 s. What will 6 Yards cost ?

Answer, 12.

y. s. y. s.
For 4 : 8 :: 6 : 12.

Here (according to the Rule $8 \times 6 = 48$, which divided by 4, gives 12 required.

Observe, That the Term which makes the Question, is to be set in the third place, and that which is of like Name with it, set in the first place, and the Numbers remaining set in the second, of whole Nature the Number sought must always be.

In this Rule, if you Multiply the second and third Terms together, the Product shall be equal to the Product of the first Term multiplied by the fourth ; which may very well serve for a Proof, if required.

RULE of Three Indirect, or the *Backward Rule*, is known by being contrary to the *Direct* ; for whereas the former required, that more shall have more, and less less ; as if 4 Yards cost 2 s. 8 Yards will cost more than 2 s. because it is double to 4 Yards, and so must the Answer be double to 2 s. that is 4 s.

But in this Rule, more will require less, and less more ; as, if 4 Horses in 6 Days eat 10 Bushels of Oats, 8 Horses will eat 10 Bushels in a fewer quantity of Days, viz. in 3. Here 10 Bushels being common is omitted, and the Question stands thus :

4 : 6 :: 8 : 3

Here the third Term contains the first, as often as the second doth the fourth : Therefore the Product of the first and second divided by the third, gives the fourth,

As $\frac{4 \times 6}{8} = 3$, that $\frac{24}{8} = 3$ the fourth Term required.

The *Double Rule of Three*, both *Direct* and *Indirect*, may be comprised in one Rule, with two Operations only.

1. Observing, That the given Terms are always five, whereof three are Conditional and Antecedents,

or Suppositions, the other two demand the Question, and are Consequents answering some of the former Antecedents ; inasmuch, that with the Answer there will be as many Consequents as Antecedents, which must match one another in the same Denomination exactly.

2. For the right placing of the Question and Terms, the three Terms of the Conditional part are duly to be regarded : Let that which is the Principal Cause of Loss or Gain, Increase or Decrease, Action or Passion be put in the first place ; and that which betokeneth the space of Time, Distance of Place, &c. be put in a second Place ; and the remaining part in the third. The Conditional part thus stated, the other two Terms wherein the Demand lies, must be placed so under the former Terms, that they may correspond one with another.

R U L E I.

Then, If the *Blank* or Place sought, fall under the third Term, Multiply the three last Terms for a Dividend, and the two first for a Divisor, and the Quotient gives the sixth Term required.

R U L E II.

But, If the *Blank* fall under the first or second Terms, Multiply the first, second, and fifth Terms for a Dividend, and the third and fourth for a Divisor, the Quotient gives the Answer.

Example 1.

If 12 Rods of Ditching be done by 2 Men in 6 Days, how many Rods shall be wrought by 8 Men in 24 Days ?

Answer, 194.

State your Numbers according to the former Direction, they'll stand thus ; the Blank under the third place.

Men.	Days.	Rods.
2	6	12
8	24	

Therefore (by the first Rule) $12 \times 8 \times 24 = 2304$ for the Dividend, and $2 \times 6 = 12$ for the Divisor ; the Quotient 194 gives the Answer.

Example 2.

If 2 Men work 12 Rods in 6 Days, how many Men will work 192 Rods in 24 Days ?

Answer, 8.

Your Terms being rightly placed, the Blank will fall under the first Term thus,

Men.	Days.	Rods.
2	6	12
	24	192

Here

Here $2 \times 6 \times 192 = 2304$ is the Dividend, and $12 \times 24 = 288$ is the Divisor, and the Quotient 8 is the Answer.

RUMB, or *Course of a Ship*, is the Angle which she makes in her Sailing with the Meridian of the Place where she is.

Complement of the Rumb, is the Angle made with any Parallel to the Equator by the Line of the Ship's run.

RUMB, in Navigation, is on Point of the Compaſs, or $11\frac{1}{4}$ Degrees, viz. the $\frac{3}{4}$ part of the Circumference of the *Horizon* or *Compaſs Card*, which is the Repreſentative of the *Horizon*.

RUMB-Line, is a Line deſcribed by the Ship's Motion on the Surface of the Sea, Steered by the Compaſs, making the ſame or equal Angles with every Meridian.

There *Rumbs* are *Helispherical* or *Spiral Lines*, proceeding from the Point where we ſtand, winding about the Globe of the Earth till they come to the Pole, where at laſt they loſe themſelves.

But in the *Plain* and *Mercator's Charts*, they are repreſented by ſtrait Lines. Their Uſe is to ſhew the bearing of any two Places one from another; that is, upon what Point of the Compaſs any Shore or Land lies from another.

RUMINANT Animals, are ſuch as chew the Cud.

RUMINATION, is the Action of chewing the Cud in ſome Adimals. *J. Con. Peyerus* hath Written a Tract, *De Ruminantibus & de Ruminatone*, Printed at *Baſil*, in 4to. In which he takes Notice, That ſome Animals do really and truly chew the Cud; ſuch as Oxen, Sheep, Deer, Goats of all Kinds, Camels, Hares, and Squirrels; which therefore generally have 3 Stomachs, the *Panuch*, the *Feck*, and the *Read*. But thoſe which ſeem only to imitate that Motion, he calls *Ruminantia Spuria*; ſuch as the Mole, Cricker, Bee, Beetle, Crab, Lobſter, Mullet, and ſeveral Birds. And theſe he affirms to have all of them their Stomachs composed of Muſcular Fibres, by means of which, they do as it were grind and work their Meat up and down ſomething like *Ruminating Creatures*. He defines.

Rumination to be a Natural Motion of the Stomach, Mouth, and other Parts, which relieve one a-

nother in this Action; by which means, the Meat eaten haſtily at firſt, is conveyed back to the Mouth again, there Chewed, and then Swallowed down a ſecond time, to the great Advantage of the Animal.

RUN of a Ship, is ſo much of her Hull as is always under Water, growing thinner and lankier by degrees from the *Floor Timbers* to the *Stern Poſt*. This is alſo called her *Way afterwar'd on*; and they ſay a Ship hath a good Run when 'tis long, and that the Water paſſes cleverly to her Rudder, her Tuck nor lying too low, which is of great Importance to her Sailing; for if the Water don't come ſtrongly to her Rudder, by reaſon of her being Built too broad below, ſhe can never Steer well; and a Ship that can't Steer well, can't keep a good Wind, and will have no freſh way through the Sea, but will be ſtill falling to Lee-ward; and therefore can never be a good Sailor. Nevertheless a Ship with a large and good Run, will loſe much Stowage, becauſe ſhe is narrow below.

RUNDLES, or *Roundels*, the ſame as Balls or Bullets, which ſee. 'Tis a Word uſed in Heraldry.

RUNG-Heads, which are made a little bending; to direct the Sweep or Mold of the *Futtocks* and *Naval Timbers*; for here the Lines which make the Compaſs and Bearing of a Ship, do begin.

RUNGS, the ſame with the *Floor* or *Ground-Timbers*, being the Timbers in a Ship which conſtitute her Floor, and are bolted to the Keel, whoſe ends are *Rung-heads*.

RUNNER, is a Rope belonging to the *Garnet*, and to the two Bolt-tackles, viz. That before which comes in the aftermoſt Shrouds of the Fore-Maſt, and that abaft which comes in the foremoſt Shrouds of the Main-Maſt.

This *Runner* is reeved in a ſingle Block which is ſeized to the end of a Pendant, and has at the one end a Hook to hitch into any thing, and at the other end a double Block, into which is reeved the fall of the Tackle or the *Garnet*, by which means it doth Purchase more than the Tackle or *Garnet* can do alone. The Word is *Overhale the Runner*; that is, bring down that end which has the Hook to it, that it may be hitched into the Sling, &c.

RAYS, is a too plentiful and preternatural falling of Tears.

SABLE; the Heralds Word for a Black Colour in the Arms of Gentlemen; but in those of the Nobility, they call it *Diamond*, and in the Coats of Sovereign Princes, 'tis called *Saturn*.

'Tis expressed in engraving by strokes drawn perpendicularly across each other.

SACCHARUM Saturni. See Salt of Saturn.

SACULI Medicinales, are when several Simples, according to the Nature of the Disease, are compounded and beaten together, and tied up in a little Bag, to be applied to the Part affected. This Bag is to be sewed or quilted down in several places, that the Ingredients run not altogether in a Lump. *Blanchard*.

SACCULUS Chyliferus or *Roriferus*, is what we usually call the *Receptaculum Chyli*, or the common Receptacle of the Chyle; and sometimes *Receptaculum Pecquetianum*, from *Pecquet*, who first found out both it and the *Ductus Thoracicus* (whose beginning it is) in the Year, 1651. I mean he was the first that assigned the true use unto them, but both were observed in Horses by *Bartholomæus Eustacius*, above 130 Years ago, as appears in a Book he writ, 1564. pag. 301. of the *Vena sine pari*, wherein he has these Words, (ascited by *Dr. Wharton*)

From this notable left Trunk of the Throat, (viz. the Subclavian Vein) there springs a great Branch, which besides that it has a Semi-circular Door, (or Valve) in its Origin, is moreover white, and full of watry Humour; and not far from its rise it is divided into two, that after a little space, unite again into one, which sending forth no Branches, descends by the left side of the Vertebrae; and having passed thro the Midriff, runs down the middle of the Loins: Where becoming larger, and folding about the great Artery, it has an obscure ending, which I have not as yet well discovered.

Here we have a clear Description of them, only that it is the beginning which he takes for the end: And contrarily, it is called the common Receptacle, because it receives both the *Chyle* and *Lympha* promiscuously, tho' some call it the Receptacle of the *Chyle*, in particular, but without reason; for it might as well be called, *Receptaculum Lymphae*, as *Chyli*; for that the *Lympha* passes not only with the *Chyle*, but after this is all distributed, the *Lympha* still continues to glide into it, and to ascend by the *Ductus Chyliferus Thoracicus*, which might as well be called *Lymphaticus* for the same reason.

It is seated under the Celiac Artery, and Emulgent Veins, about the middle Distance between the Kidneys and Capsule atrabilariae, upon the Vertebrae of the Loins, but for the most part, rather toward the left side.

Pecquet and *Casp. Bartholin* say, 'Tis seated betwixt the Tendon (or Appendices) of the *Diaphragma*; by the Motion whereof, it is pressed and milked, as it were, and its Contents propelled. It is of a Membranous, but thicker Substance

in Men than in Brutes, but not so capacious, seldom being so large as to admit one's Fingers end. Out of it there springs a Duct that presently ascends up into the *Thorax* (behind the descending Trunk of the *Arteria magna*) where it begins to be called, *Ductus Thoracicus*; but according to *Sylvius* it might more fitly be called *Spinalis*, seeing it runs along the inside of the *Spina Dorsi*.

This Duct having past the *Abdomen* and the *Midriff*, marches farther upward under the great Artery, till about the fifth or sixth Vertebra of the *Thorax*, where it turns a little aside from under it to the left Hand; and so underneath the Intercoastal Arteries and Veins, and the Gland *Thymus*, it ascends to the left Subclavian Vein, into whose lower side it opens, just there where the left Jugular Veins enters into it on the upper side, so that their Mouths face one another. But it opens not into this Vein with any large Orifice, but by six or seven little ones, which are all cover'd in the Cavity of the *Subclavia* with one broad Valve, looking towards the Cava from the Shoulder, whereby there is granted to the *Chyle* and *Lympha* a free Passage out of the *Ductus Chyliferus* into the *Subclavia*, but their return (or of Blood with them) out of the Vein into the Duct, is prevented.

This Duct ending thus in the Subclavian Vein, the *Chyle* that it conveys into it, passes with the Blood (returning by the Cava) into the right Ventricle of the Heart, where we will leave it to supply the Defect of the depauperated Blood; having only observed, that this Duct has many Semilunar Valves that hinder the ascending *Chyle* and *Lympha* from gliding back again; which Valves are manifest by this, that the *Chyle* contained in the Duct may easily by the Finger be pressed upwards, but by no means downwards; or if one make a hole in it, the Liquor tending from beneath upwards, will flow out at it; but that which is above it, is so stoppt by the Valves, that it cannot be made to descend by it.

SACCULUS Cordis. See *Pericardium*.

SACCUS, is with some Writers the Gut called *Rectum*.

SACER Ignis. See *Herpes Exedens*.

SACER Morbus. See *Epilepsia*.

SACER (Musculus) which may be also called *Transversalis Lumborum*. It lies under the Tenuous part of the *Longissimus Dorsi*; it is a fleshy not only from the *Os Sacrum*, but also from all the transverse Processes of all the Vertebrae of the Loins, and is inserted to their Superior Spines. We have sometimes observed, (saith *Mr. Cowper*) a *Spinalis Lumborum*, like the *Spinalis Colli*, which arising from the Superior Spines of the *Os Sacrum*, and marching with direct fleshy Fibres, is so inserted to the Superior Spines of the Vertebrae of the Loins: The *Transversalis Lumborum* lying under it, helps to move the whole Spine, or Vertebrae of the Neck, Back and Loins, obliquely backwards, as in looking behind us, &c.

SACCER. See *Saker*.

SACKS of Earth, used in Fortification; are made of coarse Cloath, the largest of them being about a Cubick-foot wide, and the lesser somewhat

what more than half a Foot. They are serviceable upon several occasions, more especially for making Retrenchments in haste, to place on Parapets, or the Head of the Breaches, &c. or to repair them when beaten down. They are of good use also when the Ground is rocky, and affords not Earth to carry on Approaches, because they can be easily brought on and carried off: The same Bags on occasion, are used to carry Powder in; of which they hold out about 50 Pound a piece.

SACRAMENTO *recipiendo, quod vidua Regis, non maritabit sine licentia Regis*, is a Writ or Commission to one, for taking of an Oath of the King's Widow, that she may not Marry without the King's Licence.

SACRE. See *Saker*.

SACRILEGIUM, Sacrilege, or an Alienation to Lay-men, and to profane or common purposes, of what was given to Religious Persons, and to Pious Uses. Our honest Fore-fathers were very tender of incurring the Guilt and Scandal of this Crime. And therefore when the Order of the Knights-Templars was dissolved, their Lands, &c. were all given to the Knights Hospitallers of Jerusalem, for this sacred Reason: *Ne in plus usus erogata contra donatorum voluntatem in alios usus distraberentur*.

SACROLUMBALIS, is a Muscle of the *Thorax*, which with the *Dorsi Longissimus*, have their Origin in Common: Externally they are Tendinous as they spring from the Posterior part of the Spine of the *Os Illium*, and Superior Spine of the *Sacrum*, and all the Spines of the *Vertebrae* of the Loins: Internally it arises fleshy, not only from those parts, but from the Transverse Processes of the last named *Vertebrae*; whence with direct Fibres ascending before it matches over the last Rib, it's divided into 2 fleshy Bodies; the outermost of which is called *Sacrolumbus*, whose Fibres ascend directly, and make so many thin Tendons as there are Ribs to whom they are inserted, which are joined with so many Accessory Muscles, arising from each Rib, and united with them, before their Insertions; as they pass over the Superior: And this Order or multiformed Disposition of it, is continued the whole length of the *Thorax*, to the third, fourth, fifth and sixth *Vertebrae* of the Neck; which superior part is by *Diemerbroeck* made a distinct Muscle, and called, *Cervicalis descendens*.

SACRUM *Os*: The *Os Sacrum* is the broadest of all the Bones of the Back, and doth sustain all the other *Vertebrae*: On the inside it is smooth and hollow, on the outside convex and uneven, being of something a triangular shape. In its upper part on each side it is knit firmly to the *Ossa Ilii*, by an inverting Cartilage. It consists of five or six Bones, plainly distinguishable in Infants, but more obscurely in grown Persons. These Bones have the Resemblance of (and are usually called) *Vertebrae*; for each of them have a Body and Processes, and a large hole to receive the *Spinalis Medulla*. The Bodies of these differ from those of the other *Vertebrae* in this respect; that whereas in those the lower part is always bigger, in these it is the less; by which means the uppermost is the biggest, and the lowest the least. Their smaller holes which serve for the ingress and egress of the Vessels, differ also from those of the other, in that they are not in their sides, but before and behind; of which those before are much the larger. As for their Processes, the Oblique can hardly be discerned, except in the

first. The Transverse are pretty long, but so united, that all seem but one. The hinder, or Spines, are like those of the Loins, but less, and still the lower the lesser; inasmuch that the lowest hath no Process, but only a round Protuberance.

SAFFRON of Gold. See *Aurum Fulminans*.

SAFFRON of Steel, or Mars, See *Crocus Martis*.

SAGITTA, a Constellation in the Northern Hemisphere, consisting of 8 Stars.

SAGITTA, in Botany, signifies the upper part of any small Twig, Cyon, or Graft of a Tree.

SAGITTA, in Mathematicks, is the same as the *Versed Sine* of any Ark, and is so called by some Writers, because 'tis like a Dart or Arrow standing on the Chord of the Ark. See *Versed Sine*.

SAGITTALIS Sutura, or *Veruculata*, is that Suture of the Skull, which begins at the *Coronal Suture*, and ends in the *Lambdoidal Suture*.

SAGITTARIUS, is the Ninth, in the Order of the 12 Signs of the *Zodiac*.

To **SAIGNER** a Moat, is to drain the Water by Subterraneous Conveyances, to the end that Hurdles laden with Earth, or a Bridge of Bulrushes, may be afterward laid upon the Mud that remains, and the Passage thereby consolidated.

SAIL: Every Yard in a Ship hath its proper Sail to it, and it takes its Name from the Yard: As the *Main-sail*, is that which belongs to the *Main-yard*: The *Fore-top Sail*, is that which belongs to the *Fore-top-mast Yard*, &c. *Head Sails*, are such as belong to the *Fore-mast* and *Bolesprit*: These are used to keep a Ship from the Wind, and to star her. *After Sails*, as the *Main-mast* and *Mission Sails* do keep a Ship to the Wind.

Few Ships can steer on a quarter Wind with one Sail, but require a *Head Sail* and an *After Sail* both, one to countermand the other: Tho' some Ships can steer with their *Main-top Sail* only.

The *Mission Sail* is cut by the Leech twice as deep as the Mast is long, from the Hounds to the Deck: And the *Sprit-Sail* is $\frac{2}{3}$ of the Depth of the *Fore-Sail*.

SAILING. See *Plain*, and *Mercator's Sailing*.

SAKER, a sort of Cannon, is either *Extraordinary*, *Ordinary*, or *least Size*.

SAKER Extraordinary, is 4 Inches Diameter at the Bore, 1800 Pound Weight, 10 Foot long, its Load 5 Pounds, Shot 3 Inches $\frac{1}{2}$ Diameter, and something more than 7 Pound $\frac{1}{4}$ Weight; its level Range is 163 Paces.

SAKER Ordinary, is a size lesser, 3 Inches and $\frac{1}{2}$ Bore, 9 Foot long, 1500 weight, its Charge 4 Pounds of Powder, Bullets Diameter 3 Inches $\frac{1}{2}$, Weight 6 Pounds; level Range 160 Paces.

SAKER the least Size, is 3 Inches $\frac{1}{2}$ Diameter at the Bore 1400 Pound weight; 8 Foot long, its Load near 3 Pound $\frac{1}{2}$, Shot 4 Pound $\frac{1}{2}$ weight, and 3 Inches $\frac{1}{4}$ Diameter.

SALAMANDERS Blood, is a foolish Term that the Chymists give to the red Vapours, which in Distillation of Spirit of Nitre, towards the latter end, do fill the Receiver with red Clouds; they are the most fix'd and strongest part of the Spirit; and nothing but Nitre yields a red Vapour in Distillation.

SAL Armoniack, is either *Natural*, which is found in some Parts of *Africa*, near the Line; or *Artificial*, which is made thus.

Five parts of Urine, one of Sea Salt, or *Sal Gemme*, and half an one of Chimney Soor are boiled together.

together into a Mafs, which Mats, being after this put into a fubliming Pots, over a gradual Fire, it fublimes into the Form of that Salt, which is the common *Sal Armoniack*. It is purified by Diffolution in Water, Evaporation, &c. As other Salts.

Equal Parts of this Salt, and common Salt decrepitated, are mingled, and then the Armoniack is fublimed from the Mafs, which is called, *Flowers of Sal Armoniack*. If inftead of Sea Salt, you fhould ufe Filings of Steel, the Flowers would be yellow, and they are a little more penetrating than the former.

SAL Circulatus Paracelfi, the fame with the Alkaleft.

SAL Polychrestum, is a Preparation of Salt-petre made by burning equal Parts of it with Sulphur in a Crucible, whereby 'tis deprived of its Volatile Parts.

They give it this Name from the *Greek πολύχρηστον*, as being good for many Ufes. Tho' 'tis indeed no very good Medicine, and unlefs it be very white, ought not to be ufed.

They give it as a Purge, from half a Dram to fix Drams; but there are to many other good Purgative Medicines, that there is no need of ufing this.

SAL Prunelle, is only purified Salt-petre, having fome of its moft Volatile Parts feparated from it, by burning upon it when melted in a Crucible over the Fire, about a 30th part of its weight of Flour of Brimftone. 'Tis given to cool and provoke Urine in Fevers and Quinfies; but Salt-petre purified three or four Times, is certainly a much better Medicine; for this burning of Sulphur upon it, carries off a good part of the fine and volatile Parts, and inftead of opening it, renders it more fix'd.

They often adulterate *Sal Prunelle* with Alum, but you may diftinguifh it by its over whitenefs, and glittering too much. This is fometimes called, *Lapis Prunelle* and *Chryftal Mineral*.

SAL Volatile Oleofum, or an *Aromatick Volatile Salt* is made, by putting to every Ounce of Volatile Salt of *Sal Armoniack* diffilled with Salt of Tartar, and dulcified with Spirit of Wine, about a Dram and an half of fome *Aromatick Oil* or *Eſſence*, drawn from one or more noble odoriferous Vegetables; as Cinnamon, Cloves, Roſemary, Balm, &c. and after the Spirit and Oil are well ftirred and incorporated together, the Volatile Salt and Spirit is drawn off in a Cucurbit.

Some mingle all together, viz. the *Sal Armoniack*, *Sal Tartari*, Spirit of Wine, and the Powder of Cinnamon, Cloves, &c. at firft, and then diftill off the Volatile Salt and Spirit all at once; but the former is the beft way.

The *Sal Volatile Oleofum*, is a well known and noble Medicine; 'twas firft invented by *Sibius de la Boe*; 'Tis a great Cephalick and Cordial, and is much beyond any of the Volatil Parts that are not Aromatized.

SALIENT Angle, a Term in Fortification. See *Angle*.

SALIENT, the Term in Heraldry for a Lion in a leaping Poſture, and ſtanding ſo that his right Fore-foot is in the Dexter chief Point, and his hinder left Foot in the Sinifter baſe Point of the Eſcutcheon, by which 'tis diftinguiſhed from *Rampant*.

SALIQUE Law, *De terra Salica nulla portio Hereditatis mulieri veniat, ſed ad virilem Sexum tota*

terra hereditas perveniat, &c. was an ancient Law made by *Pharamond* King of the *Franks*; part of which ſeems to have been borrowed by our *Henry the Firſt*, in compiling his Laws, as *cap. 89. Qui hoc fecerit ſecundum Legem Salicam moriatur*.

SALIVA, or Spittle, is a Liquor ſeparated by proper Ducts (which they call the *Ductus Salivales*) from the Glands of the Mouth, as the *Parotides*, the *Glandule Nuttiane*, the *Maxillares*, the *Sublinguales*.

'Tis probable that the Origin of the *Saliva*, is from the Arterious Blood; for as the Arteries pour Nutritious Blood into all other parts, ſo they do into the Glands alſo; part of which they convert into the own Nouriſhment, part is returned by the Veins in the circulation, and part (viz. of what is ſerous) they ſeparate, and beſtowing a ſubacid quality thereupon, make *Saliva* (or Spittle) of it.

To the Compoſition whereof (if not for the Separation of it) ſome think a Nervous Juice is contributed, the rather becauſe larger and more numerous Twigs of Nerves are communicated to the Glands, than to more other parts, which yet have a more exquisite ſenſe than theſe.

But in refutation of this Opinion, the above-mentioned *Dr. Nuck* alleges this Experiment.

That if the Nerve that runs to any Gland, be either hard tied or cut in ſunder, yet the Secretion of the *Saliva* will not thereupon ceaſe, but will onely proceed more ſlowly; which ſlowneſs may be attributed not to the want of any conſtitutive Principle of the *Saliva*, ſo much as to the want of that Motion in the Gland (that to be ſure depends as well upon the Nerves as upon the Pulſation of the Artery) which is neceſſary for the quicker diſpatch of the *Saliva*, through or out of the Gland.

The manner of the Secretion of the *Saliva*, is like that of the Liquor of all other Glands, and proceeds from the Conformity of the Particles of the Liquor to the Pores in the Gland, or the Mouths of the Excretory Veſſel.

After its Separation, its Motion into and along the Salival Ducts is much farthered by the Muſcular Motion of each part reſpectively.

Now the *Saliva* is not to be reputed a meer Excrement, for it is believed by all Modern Anatomiciſts, that it ſerves for the farthering of the Fermentation of Meats in the Stomach, if it be not the main Ferment of it.

That it has a fermentative Quality *Diemerbroeck* proves by this Experiment: That if a piece of white Bread be chewed and moiſten'd with much Spittle, and then be mixed with Wheat-paſte kneaded with warm Water, it will make it ferment.

Dr. Nuck thinks it an Univerſal Ferment for Meats and Drinks, partaking of Divers Qualities (or Particles) but of none in any exceſſive Degree. That it is Acid he demonſtrates by this familiar Obſervation.

" That if when Milk is a boiling, one take a Spoonful to taſte of, and then preſently whiſt it is moiſt with the *Saliva*, put it into the Milk again (ſtill a boiling) the Milk will break as if ſome Acid Liquor were mixed with it.

That it is endued with a Volatile Salt, he thinks is evident from its curing the Itch, Tetters, &c. That Oleous Particles are mixed with the acid, he ſuppoſes muſt be concluded from its killing Quickſilver: And whereas it uſually becomes frothy in the Mouth, upon its being agitated by the Motion

of the Muscles of the Tongue, and those which move the lower Jaw, and that he thinks proceeds from its being endued with a Lixivial Salt and Spirituous Oleous and acid Particles, (while the Volatile Spirit vanishes.)

SALIVATION, is an Evacuation of Spitte by Salivating Medicines, of which fort principally are Mercurial Preparations.

SALLY, in the Art of War, is the Term for the issuing out of the Besieged from their Works, and falling upon the Besiegers to cut them off, and to destroy their Works.

SALT, the first of the three Hypostatical, but the third of the five Chymical Principles: Its two Essential Properties seem to be, *Dissolubility in Water*, and a pretty *Pungent Sapor*, being an active incombustible Substance; they say it gives all Bodies their Consistence, and preserves them from Corruption, and occasions all the Variety of Tasts.

There are three Kinds of Salts: *Fix'd Volatile*, and *Essential*.

The *Fix'd Salt* is thus drawn: The Matter is first calcined, and then the Ashes are boiled in a good deal of Water, that the Salt may be the better dissolved: After this the Solution is filtrated, and all the Moisture evaporated, and then the Salt remains in a dry form at the bottom of the Vessel. This *Fix'd Salt* so drawn, is called a *Lixivious Salt*, because a kind of *Lixivium*, or Lye, was made of the Ashes of the Body calcined.

Volatile Salt, is that which is drawn from the Bodies or Parts (chiefly) of Animals, and from some fermented, or rather purified parts of Vegetables: It rises quick and easily, and is the most Volatile of any Bodies so called.

The *Essential Salt* is drawn from the Juice of Plants by ChrySTALLIZATION: How, see *Essential Salt*.

Mr. Boyle reckons three other Kinds of Salts, viz. *Acid*, *Urinous*, and *Lixiviate*: Seethose Words. And he discovers whether any Liquor contains an Acid Salt, or no, by dropping some of it on Syrup of Violets, for then it will turn it red; but if it turn it green, it is either of an *Urinous* or *Lixiviate* Nature: To distinguish which, he drops some of it into a Solution of Sublimate made in common Water; then if a white or milky colour be produced, he concludes it to belong to the Tribe of *Urinous Salts*; but if it produce a yellow or orange colour, he judges it to be of a *Lixiviate* Nature.

SALT Common, its Spirit how drawn, see *Spirit of Salt*.

Mr. Boyle proves this Principle producible by Art, as well as other. See *Sceptical Chymist*, Part ult. p. 1.

SALT of Saturn, *Saccharum Saturni*, or Sugar of Lead, is the Body of that Metal opened and reduced to the Form of a Salt by distilled Vinegar.

Thus any of the Calxes of Lead, as suppose *Ceruse*, is powdered, and distilled Vinegar is poured upon it to four Fingers height above the Matter, an Ebullition will follow, but without sensible heat it must be digested in a Sand-heat, two or three Days, and stirred often: Then pour off the Liquor by Inclination, and digest more distilled Vinegar with the *Ceruse*, and more after that till you have dissolved about half the Matter, mix all the Impregnations together in an Earthen or Glass Vessel; evaporate the Matter in a Sand-heat, till a small Skin or Pellicle, begin to arise upon the Surface, after which, place the Vessel in a cool place, there

will appear white Chrystals: Take them out, and evaporate again as before, and let the Vessel to cool to gain the rest of the Salt: Continue this till you have gotten all; then dry the Chrystals in the Sun; and keep them in a Glass. 'Tis chiefly used outwardly for Discales of the Skin; but sometimes 'tis given inwardly, from two to four Grains at a Dose in Quinies, &c.

SALT of Steel. See *Vitriol of Mars*.

SALT of Sulphur, a Preparation in Chymistry; improperly so called, since it is only a *Sal Polychrestum* impregnated with Spirit of Sulphur, and then reduced to an Acid Salt by Evaporation of all the Moisture. Some say this is a great Febrifuge.

SALT of Tartar, is made either by powdering what remains in the Retort after the Distillation of Tartar; or else by calcining bruised Tartar wrapped up in a Paper, till it turn white. Either of these must have a great deal of hot Water poured upon them to make a *Lixivium*, then the Liquor is filtrated and evaporated in a Sand-heat, till the *Fix'd Salt* remain at the bottom of the Vessel. This is the Alkali, or *Fix'd Salt* of Tartar. If it be exposed to the Air a few Days in an open Vessel in a Cellar, or some such moist place, it will melt or run into a Liquor; and this the Chymists call Oyl of Tartar *per Deliquium*.

SALTIER, the Name of one of the Ordinaries in Heraldry, of the Form of St. Andrew's Cross.

They tell you, that anciently 'twas the Figure of an Engine, which being stuck full of Pins, was used in the Scaling of the Walls of a Besieged Place.

Pearl a Saltier Ruby, the Coat of my Lord Macklesfield.

The *Saltier* is often counterchanged with the Field, and sometimes quarterly quartered, &c.

SALVA guardia, is a Security given by the King to a Stranger, fearing the Violence of some of his Subjects, for seeking his Right by Course of Law.

SALVATELLA, is that Vein which from the Veins of the Arm is terminated in the little Finger.

SANATIVE Waters, are the Mineral Waters of any kind, such as the *Chalibiate* ones of Tunbridge, the *Vitriolick* ones of Epsom, &c.

SANDARACHA, is by some Chymists the Term for red Arsenick; 'tis called also *Realgal*.

SANGUIFICATION, is the turning of the Chyle into Blood; which is performed in all the parts of the Body, and not as the Ancients imagined in some particular parts, as the Heart, Liver, &c.

SANGUINE, the Herald's term for the Colour usually called *Murvy*, being made of Lake, with a little *Spanish Brown*; 'tis represented in Engraving by Hatches like *Purple*: 'Tis mostly used in the Coats of Knights of the Bath. When 'tis born by Nobles, 'tis call'd *Sardonix*; and in the Coats of Sovereign Princes they call it *Dragon's Tail*.

SANIES, is a thick and bloody Pus or Matter, issuing out of a Wound or Sore.

SAPHÆNA, is the Vein of the Leg, or Crural Vein, it goes down under the Skin of the Thigh and Leg, accompanied with a Nerve which loes it self at the inner Ankle; it turns towards the upper part of the Foot, where it gives several Branches, of which some go to the great Toe.

SAPHA

SAPHATUM, is a dry Scurf in the Head. See *up Wounds with Flesh*, such as by their moderate Heats, and cleansing Qualities keep Wounds and Ulcers free from Filth, and preserve the Natural Temper of the Parts, so that the Aliment easily supplies the Solution of the Parts. *Blanchard.*

SAPONEA, is a Lambative made of Almonds. *Blanchard.*

SAPORIFICK Particles, are such as by their Action on the Tongue occasion that Sensation which we call Taste or Sapor. The manner of which, see in *Taste*.

SAPOROUS, are such Bodies as are capable of yielding some kind of Taste when touch'd with our Tongue; but those that afford no Taste, are called *Insipid*.

SAPPE, in Fortification, formerly signified the undermining, or deep digging with Pick-axe and Shovel at the Foot of a Work to overthrow it without Gun-powder: Now it is used to signify a deep Trench carried far into the Ground, and descending by Steps from top to bottom; so that it covers the Men sideways; and to save them from danger on the top, they use to lay a-crois it Madriers, that is, thick Planks; or Clugs, that is, Branches of Trees close bound together, and then they throw Earth over all, to secure them from Fire. When a Covert-way is well defended by Musketers, the Besiegers must make their way down into it by *Sappe*.

SARCOCELE, is a kind of Rupture, which consists in a fleshy Excrecence of the Testicles. *Blanchard.*

SARCOLIPLOCELE, a fleshy Rupture, or Protuberancy of the *Omentum*, either about the Navel, or in the Cods.

SARCOMA, is a fleshy Excrecence in the Nostrils, and chiefly in the lowest part of the Nose, where it is fleshy, without any shape, but like the proud Flesh of an Ulcer. *Blanchard.*

SARCOMPHALUM, is a fleshy Excrecence of the Navel. *Blanchard.*

SARCOTICKS, are those Medicines which fill

up Wounds with Flesh, such as by their moderate Heats, and cleansing Qualities keep Wounds and Ulcers free from Filth, and preserve the Natural Temper of the Parts, so that the Aliment easily supplies the Solution of the Parts. *Blanchard.*

SARDONIAN, or *Sardonick Laughter*, is an Involuntary Laughter, or rather a Convulsive Distortion of the Muscles of the Mouth, in which the Patient appears to Laugh.

SARPEDO. See *Lichen*.

SARRASIN, in Fortification, is a kind of Portulicace, otherwise called a *Hersa*, which is hung with a Cord over the Gate of a Town, or Fortrefs, and let fall in case of a Surprise.

SARTORIUS, a Muscle of the Leg, which receives this Denomination from the Use Taylors make of it, in bringing one Leg and Thigh over the other, to fit cross-leg'd. It is also called *Longissimus Femoris*, it exceeding the rest of the Muscles of that Part in length; and *Fascialis* from its passing over the Muscles of the Thigh and Leg like a Swathe. It ariseth sharp and fleshy from the fore-part of the Spine of the *O. Ilium*, clost by the *Membranosus*, and descending obliquely inwards above the *Musculus Rectus*, and *Vastus Internus*, and over part of the *Tibiceps*, of an equal breadth or Thickness, meets with the *Gracialis* below the middle of the Thigh internally, and descending with it becomes Tendinous in its Passage over the Internal and Inferior Head of the Thigh-bone, (under a strict Inclosure of the *Fascia Lata*) and is inserted four Fingers breadth below the superior part of the *Tibia* internally: Its Use is declared above.

SATELLITE Instrument of Mr. *Romer*, Mathematician to the French King, as its Description was sent in a Letter to Mr. *Flamsteed*, A. D. 1679. and since published in the *Artificial Clock-maker*, in the Figure annexed.

AB and *CD*, represent the Upper and Lower Plates of the Instrument.

KL, is an Axis or Spindle on which 4 Wheels are fixed, and which turn round with it, and with the Hand *L*: once in 7 Days.

EFGH, are Sockets or hollow Arbors of 4 Wheels running concentrically, or one within another.

The hollow Arbor *H*, carrieth round the *First Satellite p*, and belongeth to the Wheel or Pinion 22, which is driven by the fixed Wheel 87.

The hollow Arbor *G*, carrieth round the *Second Satellite s*, and belongeth to the Wheel 32, which is driven by the Wheel 63.

And the like of the Arbors *F* and *E*.

Within all these hollow Arbors is another fixed one included; on the top of which, is a Ball.

(*f*) representing the Planet *Jupiter*; round which the *Satellites* move, represented by the little Balls *p s t q*.

This

This *Satellite Instrument* may be added to a Watch, by causing the great Wheel, or Dial-Wheel, to drive round the Arbor *K L*, once in 7 Days.

And this Instrument may be of good use both at Sea and Land, to assist in finding the Longitude by *Jupiter's Satellites*; partly by giving notice when an approaching Eclipse is, that we may be ready with a Telescope to observe it; and partly when any Eclipse happeneth, to shew which *Satellite* it is that is Eclipsed, which is difficult to be seen in the Heavens; and partly to supply the place of Tables, or Calculations of the *Satellite Eclipses*, which it may do for a little while, tho' it must not be long trusted to.

SATELLITES, by Astronomers, are taken for those Planets who are continually, as it were, waiting upon, or revolving about other Planets; as the *Moon* may be called the *Satellite* of the *Earth*; and the rest of the Planets, *Satellites* of the *Sun*. But the Word is chiefly used for the new Discovered small Planets, which make their Revolution about *Saturn* and *Jupiter*.

SATELLITES of *Jupiter*, are four smaller Moons or Planets moving round about the Body of *Jupiter*, as the *Moon* doth round our *Earth*. They were first discovered by *Gallileus*, by the help of the Telescope.

The Distances of these Satellites, from the Body of Jupiter, are as follows; from the Observations of

	1	2	3	4	
<i>Cassini</i> —————	5.	8.	13.	23.

Third	7	3	59	$\frac{3}{5}$
Fourth	16	18	5	$\frac{1}{5}$

Vid. Newton's Princip. pag. 403.

Mr. *Flamsteed* in *Philosoph. Transact. N. 154.* says, That when *Jupiter* is in a Quartile of the *Sun*, the Distance of the first *Satellite* from his next Limb when it falls into his Shadow, and is Eclipsed, is one *Semi-diameter*, of *Jupiter*; of the second, two, or a whole *Diameter* nearly; of the third, three; of the fourth, five of his *Semi-diameters*, or something better, when the *Parrallax* of the Orb is greatest. But these Quantities diminish gradually as he approaches the Conjunction or Opposition of the *Sun* somewhat nearly, but not exactly in the Proportion of Sines.

SATELLITES of *Saturn*. Anno. 1684, in the Month of March, Mr. *Cassini*, by the help of excellent Object Glasses, of 70, 90, 100, 136, 155, and of 220 Feet, discovered the two innermost; (that is, the first and second) *Satellites* of *Saturn*.

The First *Satellite* he observed to be never distant from *Saturn's Ring*, above $\frac{2}{3}$ of the apparent length of the same Ring: And it was found to make one Revolution about *Saturn*, in 1 Day, 21 Hours, and 19 Minutes; making two Conjunctions with *Saturn*, in less than two Days; one in the upper part of his Orb, and the other in the lower part: It is distant from the Centre of *Saturn* $4\frac{1}{3}$ of *Saturn's Semi-diameters*.

The Second *Satellite* of *Saturn*, was observed but $\frac{1}{2}$ of the length of his Ring distant therefrom,

making his Revolution about him in two Days, 17 Hours, and 43 Minutes. This is distant from the Centre of *Saturn*, $5\frac{2}{3}$ *Semi-diameters* of that Planet.

From a great number of choice Observations be concluded, That the Proportion of the Digression of the Second to that of the First, counting both from the Centre of *Saturn*, is as 22 to 17.

And the time wherein the Second *Satellite* makes its Revolution, is to the time wherein the first makes its, as $24\frac{1}{4}$ to 17.

The Third is distant from *Saturn*, 8 of his *Semi-diameters*, and revolves round him in almost $4\frac{2}{3}$ Days.

The Fourth, or *Hugenian Satellite*, as 'tis called, because discovered first by Mr. *Hugens*, revolves round *Saturn*, in about 16 Days, and is distant from his Centre about 18 *Semi-diameters* of *Saturn*.

The Fifth *Satellite* of *Saturn*, is distant from his Centre 54 *Semi-diameters* of *Saturn*; and revolves round him in $79\frac{1}{2}$ Days. The greatest distance between this *Satellite*, and the precedent, made Mr. *Hugens* suspect there may be a Sixth between these two; or else that this Fifth may have other *Satellites* moving round him.

Mr. Halley, in *Philosoph. Transact.* N. 145. gives a Correction of the Theory of the Motion of the *Hugenian*, or *Fourth Satellite of Saturn*, and makes the *True Time of its Period* to be 15 Days, 22 Hours, 41 Minutes, 6 Seconds; its *Diurnal Motion*, to be 22 Degrees, 34 Minutes, 38 Seconds, 18 Thirds. And the Distance of this *Satellite* from the Centre of *Saturn*, to be about 4 *Diameters* of the Ring, or 9 of the *Globe*; and the place where it moves, to differ little or nothing from that of the Ring; that is to say, intersecting the Orb of *Saturn* with an Angle $23\frac{1}{2}$ Degrees, so as to be nearly Parallel to the *Earths Equator*.

The Periodical Times of the Satellites of Saturn, according to Mr. Cassini, are of the

	Days.	Hours.	Minutes.
First	1	21	19
Second	2	17	43
Third	4	12	27
Fourth	15	23	15
Fifth	79	22	00

SATURN: The Proportion of the Body of Saturn to our Earth is about 30 to 1.

The Periodical Time of Saturn's Revolution about the Sun, is in the space of 30 Years or 10950 Days.

The Semi-diameter of Saturn's Orbit, is almost ten times as big as that of the *Magnus Orbis*, and therefore is of English Miles 946969690.

According to Mr. Cassini, Saturn's greatest Distance from the Earth is 244330, his mean Distance 210000, and his least Distance 175670 Semi-diameters of the Earth.

Mr. Hugen found the Inclination of the Ring of Saturn to the Ecliptick, to be an Angle of 31 Degrees.

Mr. Azout asserts, That the remote Distance of Saturn from the Sun doth not hinder, but that there is Light enough to see clear there, and more than in our Earth in Cloudy Weather.

In an Observation which Cassini made June 19 1692, of a precise Conjunction between a Fixt Star, and one of Saturn's Satellites, he saith, That with his 39 Foot Glass, he could plainly see the Shadow of Saturn's Globe to be in part oval upon the hinder part of his Ring. The Diameter of Saturn at the time of this Observation, appeared to be 45 Seconds.

The Diameter of Saturn to that of his Ring is as 4 to 9.

And the Diameter of the Ring seen from the Sun, would be but 50". and therefore the Diameter of Saturn seen from thence would be but 11". as Mr. Flamsteed found by measuring it. But Mr. Newton thinks it ought rather to be accounted but as 10". or 9". because he supposes the Globe of Saturn to be a little dilated by the unequal Refrangibility of Light.

Capt. Halley, in his Preface to the Catalogue of the Southern Stars, says, He found Saturn to move slower than the Astronomical Tables represent him.

The Distance of Saturn from the Sun, is about 16 times as great as that of our Earth from him; and therefore that Planet will not have above the 100th part of the Influence of the Sun which we have; and consequently cannot be Habitable by such Creatures as live on our Globe, unless there

be some unknown way of communicating Heat to him.

Dr. Gregory, in his *Astronomy*, makes the Semi-diameter of the Ring of Saturn to that of the Planet, as 2 $\frac{1}{2}$ to 1. and the Interstice between the Planet and the Ring, is the Breadth of the Ring.

How the Ring of Saturn will appear in all parts of the Orbit of the Planet, to an Eye placed at the Sun, or at the Earth, the same Learned Astronomer shews in his *Astron. Phy. & Geometr. Lib. IV. Prop. 69, 70.*

If an Eye were placed in Saturn, the Diameter of the Sun would appear 10 times less than it doth to us almost; and consequently, his Disk, Light and Heat will be there 90 times less. Saturn's Year is almost 30 of ours, but the length of his Day is yet uncertain, because the time of his Revolution round his Axis is not yet known: But Mr. Hugen judges they are not longer than the Days in Jupiter. That great Astronomer supposeth the Axis of Saturn to be perpendicular to the Plane of his Ring, and of the Orbits of the Satellites: If so, then there will be the same Position of the Equator and Poles, (as to the Fixt Stars) as there is in our Earth: The same Pole Star and the Fixt Stars will appear to Rise and Set after the same manner, in the same Latitudes. There is a vast Inequality in the Length of the Day in several parts of this Planet; and as great a diversity of Summer and Winter; which depends on the Quantity of the Inclination of the Plane of the Equator, to the Plane of the Orbit of Saturn round the Sun; which Hugen makes to be 31 Degr. which is almost $\frac{1}{2}$ more than in our Earth; where yet the differences and variety of Seasons and Weather are very sensible. For in Saturn, in the Latitude of 50 Degr. the longest Day will have no Night at all, and the longest Night will have no Day. And the two Frigid Zones will be each of them 62 gr. broad, at least 10 times as large as the whole Surface of our Earth. The Eye thus placed, will be able to discern none of the Planets but Jupiter, which will appear always to accompany the Sun, and never to be from him above 37 gr. The Parallax of the Sun in Saturn, is but 9", and therefore Infensible; but the Parallaxes of all his Moons or Satellites, are very considerable, and therefore their Distances from him will be easily computable.

But what an Eye placed in Saturn would most admire, is the Ring of that Planet; the only thing of that nature that is discovered in any of the Planets. Tho. Kepler in his *Epitome Astron. Copernic. Lib. 4. p. 586*, and after him Capt. Halley in his Enquiry into the Causes of Variation of the Needles Variation, *Phil. Transf. N. 195*, do suppose our Earth may be composed of several Crufts or Shells one within another, and concentric to each other. And if so, then 'tis possible the Ring of Saturn may be the Fragment or remaining Ruins of his formerly exterior Shell, the rest of which is broken and fallen down upon the Body of the Planet. And if Saturn ever had such a Shell round it, its Diameter would then have appeared as big to an Eye at the Sun, as that of Jupiter doth now, when seen from thence.

Since the outward Margin of the Ring is distant from Saturn $2\frac{1}{2}$ of Saturn's Semi-diameter, this cannot be seen at the distance of 64 Degr. from Saturn's Equator (in whose Plane the Ring is placed.) Therefore a Spectator placed in a Latitude higher than that, can never see the Ring at all; so that there

there is a Zone of almost 53° broad towards either Pole, to whom this famous Ring can never appear. And as the Spectator shall move nearer the Pole, first one, then the second Satellite, next the third and fourth; and when he is come within one Degree of the Pole, even the fifth Satellite cannot be seen, unless by Refraction; and in the Winter-time, neither Sun, Moon, nor any Planet, will be there visible, unless perhaps a Comet.

If the Eye be supposed to be placed in the Equator of *Saturn*, or in the Zone nearly adjoining, it can never see those Stars that are in or very near the Equator, nor any one of the Satellites; because the Ring will always hide them; and then at the Equinoxes it cannot see the Sun; and if it were any where else placed, it could not then see the Ring; because neither of its Faces will then appear illuminated by the Sun.

The breadth of this Ring 'tis hard to determine from our Earth, because its Thickness is so small: But Mr. *Hugens* makes it to be about six hundred German Miles.

For one half of *Saturn's* Year, (*viz.* 15 Years of ours) only one Face of the Ring will be enlightened by the Sun: Whence the Inhabitants which may be supposed to live in that Hemisphere, to which this Face of the Ring is turned, or to whom it is Summer, will see that part of the Ring which is above their Horizon, shining faintly by Day, (as our Moon doth when the Sun is above our Horizon) but brighter and stronger by Night, as our Moon doth in the Sun's absence: And after Sun-set, the Eastern part of this enlightened Arch will fall within the Shadow of *Saturn*; which Shade will ascend as Night comes on, and at Midnight will be at the highest; and then will descend again towards the Western part of the Ring, according as the Sun comes more and more to the Eastward.

This enlightened Ark will always shew how to describe a Meridian Line; for a Plane perpendicular to the Horizon, and passing thorough the Vertex of the Ark, will be in the true Meridian.

To an Eye placed any where without, and at less than 52° distance from the Equator, this enlightened Ark of the Ring will appear Concave as well as Convex, like a kind of Furnace or Vault, rising above the Horizon: But to an Eye or more than 52° , and less than 64 Degrees distant from the Equator, the hollow or concave Part will not be visible; but there will appear a bright Body arising as it were out of the Ground, and contiguous to the Horizon.

For the other half of *Saturn's* Year, while the Sun declines towards the depressed Pole; or during the 15 Years Winter, the Ring will not be visible, as having not that Face illuminated which is observed to the Spectator's Eye; but however will render it self sensible, by covering from the Sight, such Stars and Parts of the Heavens as are opposite to it, or apparently behind it. The shade of the Ring also will be extended more and more towards the nearer Pole; so that to an Eye placed any where within the aforesaid space, the Sun, when he attains such a certain Declination, will appear to be covered or eclipsed just at Noon, and then strait to emerge out of the Shadow. The next Day, the like Phenomenon will happen, but the Eclipse will begin sooner, and will be over later: And these Meridian Eclipses will daily increase in their duration, until the middle of Win-

ter; and then they will decrease again gradually, till at last they will come to nothing again; *viz.* When the Sun returning from the Tropic, hath the same Declination as he had when these Meridional Eclipses began.

And this will happen, if any Eye be placed in any Latitude greater than 25 or 26 Degrees; but if in a Latitude less than this, when the Meridian Darknes is of the greatest duration, the Sun will suddenly appear just in the Meridian, and then straitway will be Eclipsed again. The next Day, there will appear the like sort of Light, but it will last longer; and this Meridian Light will grow still longer and longer in duration, till Midwinter, and then (like the Darknes above-mentioned) it will be continually decreasing, until it quite disappear.

And from hence 'tis plain, that there is the greatest difference between Summer and Winter in the Globe of *Saturn*, of all the other Planets; and this both on the account of the long duration of each, and the great declination of the Sun from the Equator; and also, by reason of these Meridional Darkneses in the Winter, arising from the Rings Eclipsing the Sun. *Gregor. Astr. Phy. & Geom. Lib. 6. Prop. 6. p. 480.*

SAUSAGE, is a long piece of Cloth, the sides whereof are sewed in form of a Gut, as large as to contain a Tennis Ball. It is dipt in Pitch or Tar, and filled with Powder, on purpose to serve as a Train to set Fire to Mines, Fougades, or Bomb-Chests. Two of these *Sausages* are commonly applied to every Mine, to the end that if one should fail, the other may take effect.

SAUCISSONS, are a sort of Faggots made of great Boughs of Trees bound together in the middle and at both ends. Their use is much the same with the Bavings or small Faggots, *viz.* to consolidate the Way for Carriages, to make Travellers or Parapets in Ditches full of Water, &c.

SAVER default, in Law, is Word for Word to excuse a *Default* in Court, comes afterwards and alleges a good Cause why he did it, as Imprisonment at the same time, or such like.

SCALADOE, is the mounting of the Wall of a Fortify'd Town or Castle, with Scaling Ladders.

SCALE, in Mathematicks, signifies any Measures or Numbers which are commonly used; or the degrees of any Ark of a Circle, or of such Right Lines as are divided from thence; such as *Sines*, *Tangents*, *Chords*, *Secants*, &c. drawn or plotted down upon a Ruler, for ready Use and Practice in Geometrical or other Mathematical Operations. The several kinds of which follow, as

1. *Scales of Equal Parts*; of which that commonly called, a *Plane Scale*, is made by drawing any Right Line, as *a z* on Paper, Pastboard, &c. Then with a Pair of Dividing Compasses run along 10 small Divisions from *a* to *b*; and then setting off the whole Division *a b*, as often as you please, toward the Right-hand, as you see

For then may each of these great Divisions represent 10 Miles, as in a Scale of Miles in a Map; and consequently each of the smaller Divisions one Mile: Or the distance *a b* may be an Inch, and

the lesser Divisions will be both parts of Inches: Or the larger Divisions may be Leagues at Sea, &c. Or, in a word, this Scale may well enough represent any Measures or Numbers whatsoever, whose Parts are equal one to another. But this is more accurately indeed done by a

Diagonal Scale, which the larger Divisions of are commonly of an *Inch*, or of *half an Inch*; and are made upon eleven Lines, so as to include ten equal Spaces (as in the Figure B) which are all cut at right Angles to the Transverse Lines P R. Then P K being divided into 20 equal Parts, as also R L; and from the Points of Division upon the Line P K, to those on the Line R L, are 10 Diagonals drawn; the 1st beginning at P, and ending at the 1st Division above R. The second beginning at the 1st Division above P, and ending at the 2d above R, &c. In short, they are all drawn from one Division less from P, to one Division more from R.

So that every *Diagonal*, by that time it hath passed from the first Line to the eleventh, is a whole 10th part of an Inch farther distant from the Line P R, than at the Point upon the first Line whence it was drawn. And every one of these *Diagonals* is divided into 10 equal Parts by the Parallel-line drawn along the Scale, and numbred on the Top from 1 to 9. Whereby 'tis evident, that the Intersection of any of these Parallel Lines numbred at the Top, with any *Diagonal*, is farther distant from the Line P R than the Intersection of the Line next before it, with the same *Diagonal*, by $\frac{1}{10}$ of $\frac{1}{10}$, that is, by $\frac{1}{100}$. Therefore you may by the *Diagonal Scale*, take the 100 part of an Inch, or of half an Inch, very exactly.

The Use of these Scales, viz. of *Equal Parts*, or the *Diagonal*, is chiefly, To lay down any Measure taken; or a Line being laid down, to find how much of the Measure that Line containeth.

The way to do both which, is to reckon the Unities from P towards R; the Tens, from P towards K; and the Hundreds, from 1, to 2, 3, 4, &c. of the great Divisions. Thus, for 432, count two of the Parallel Lines downward, and then run your Eye forward to the Right-hand, till you come to the 3d *Diagonal*, as at o; then the Compasses on the Line, extended from o to 4, will represent 432.

The Plain SCALE, (for Sea Uses) has also set thereon, the Scale of Chords, Natural Signs, Tangents, Semi-tangents, Seconds, Rhumbs, Hours, Leagues, and Longitudes; with the *Diagonal Scale* on the back-side, and some others, according as there is room. The way of deducing or graduating all which from the equal Divisions, or Degrees of the Circumference of a Circle, is, as in the following Scheme.

Having described the Circle AFE 90°, and quartered it with two Diameters AE, F 90 at Right Angles.

1. Divide the Ark E 90 into 9 equal Parts, and transfer the Divisions to the Right Line E 90, and that will be a Line of Chords.
2. Then Perpendicular to the Radius CE, erect the Tangent E 70; then a Ruler laid over C, and the equal Divisions of the Ark E 90, gives E 70, the Tangent Line truly divided.
3. If thro' the Divisions, 10, 20, 30, &c. on the Ark E 90, then you draw Parallels to C 90, it will divide CE, so as to make it a Line of Sines.

4. Setting one Foot of the Compass in C, extend the other to the several Divisions on the Tangent Line E 70, and describe the Arches 10, 10; 20, 20; 30, 30; &c. and the Line Z 90, will be a true *Line of Secants*.

5. A Ruler from A, to the several Divisions of the Ark E 90, divides the Line C 90, into a *Line of Semi-tangents*.

6. Divide the Ark E F, into eight equal Parts, and setting one Foot in E, transfer the Divisions of the Ark 1, 2, 3, &c. to the Right Line E F, and it shall be the *Line of Rhumbs*.

7. Divide F A, into six equal Parts, and setting one Foot in A, transfer them to the Strait Line FA, and that will be a *Line of Hours*.

8. Divide the Radius AC, into six equal Parts, and thro' each Division draw Lines Parallel to C 90; those Lines will Divide the Quadrant A 90, into six unequal Parts, and those transfer'd into the Chord A 90, makes the *Line of Longitudes*.

9. And the equal Divisions on the Radius A C, being subdivided, is the *Line of Leagues*, or *Line of equal Parts*.

SCALE of the Gamut, or Musical Scale, is a kind of *Diagram*, consisting of certain Lines and Spaces drawn to shew the several Degrees, whereby a Natural or Artificial Voice or sound may either ascend or descend.

The Name thereof is taken from the Greek Letter *Gamma*, which *Guido Aretinus*, who reduced the Greek Scale into this Form, plac'd at the bottom, to signify from whence it was derived; so that ever since, this Scale or *Gamut*, hath been taken for the Ground-work or first Foundation of all Musick, both Vocal and Instrumental.

But there were three different Scales in use among the Ancients, which had their Denominations from the three several sorts of Musick, viz. The *Diatonical*, *Chromatical*, and *Enharmonical*. Which see.

SCALENI, are three Muscles of the Thorax, so called from their Figure, having three unequal Sides.

1. *Scalenus Primus*, which arises fleshy from the Fore-part of the second, third, and fourth Transverse Processes of the *Vertebra* of the Neck; and descending obliquely forwards, becomes Tendinous at its Insertion to the first Rib: The Axillary Nerves pass between this and the following Muscles. Its Use is to draw the Superior Rib, together with the rest, upwards in Inspiration.

2. *Scalenus Secundus*, this springs fleshy from the second, third, fourth, and fifth Transverse Processes of the *Vertebra* of the Neck, laterally, (like the former) in its descent, it becomes thin and tendinous, marching over the first Rib to its Insertion in the second, and sometimes to the third.

3. *Scalenus Tertius*, this has its beginning near the former, from the same Transverse Processes of the *Vertebra* of the Neck; as also from the fifth and sixth of those Processes, and is soon Inserted to the first Rib.

SCALENOUS Triangles. See *Triangles*.

SCALPRUM, a Surgeon's Rasping and Scraping Iron, with which he scrapes rotten Bones.

SCAMILLI Impares, in Architecture, are certain Blocks or *Zocco's* which serve to elevate the rest of the Members of any Column or Statue, which was placed before the Horizon, (i. e.) beneath the Projectures of the *Stylabata Cornices*, and other *Saillies*; and will easily be conceived by considering the Pedestals of Statues, which do well represent them.

SCAMNUM Hippocrati, *Hippocrates's Bench*, is an Instrument of six Ells long: 'Tis used in setting of Bones.

SCANDALUM Magnatum, in Law, is the special Name of a Wrong done to any high Personage of the Land, as Prelates, Dukes, Earls, Barons, and other Nobles; as also of the Chancellor, Treasurer, Clerk of the Privy-Seal, Steward of the House, Justice of the Bench or other, and other great Officers of the Realm, by false News or Messages, whereby Debates and Discords betwixt them and the Commons, or any Scandal to their Persons might arise; and hath given Name to a Writ granted to recover Damage thereupon.

SCAPHA seu Linter, is the Inner Rim of the Ear.

SCAPHOIDES, is the third *Os Tarfi* in the Foot; 'tis joined to the Ankle-Bone, and the three hinder Bones. 'Tis called also *Os Naviculare*, from some resemblance it has to a Boat.

SCAPULA, the Shoulder-blade, a broad triangular Bone, with 3 Processes; 'tis very thin in the middle, but grows thicker about the Processes.

SCAPULARIS, *Externa* and *Interna*, are two little Veins so called, of which the former arises from the Muscles covering the *Scapula*; and the latter, from the Muscles which possess the cavity of the *Scapula*.

SCAPUS, is the term in Botany for the strait Stalk or *Shaft* of a Plant, standing upright like a Pillar or Column.

SCARFED, in the Sea-Carpenters Language, is the same as *Pieced*, or fastened or joined in: Thus they say the Stem of a Ship is *Scarfed* into her Keel; and they employ by it, That the two Pieces are shaped away flanting, so as to join with one another close and even; which they call *Wood and Wood*.

SCARIFICATION; 'tis an Incision of the Skin with a Pen-knife or Lancet. This is done either with or without Cupping-Glasses; without Cupping Glasses, if there be any Mortification or Gangrene, because the separation is by no means to be hastened; with Cupping Glasses, if there be a necessity to take away Blood.

SCARP, in Fortification, is the Foot of the Rampart-Wall, or the sloping of the Wall from the bottom of the Work, to the Cordon on the side of the Moat.

SCARPE, a term in Heraldry, probably derived from the French *Escharpe*, signifying the Scarfe which Military Commanders wear for Ornament. It is born something like a *Batton Sinister*, but is broader than it, and is continued out to the Edges of the Field; whereas the Bottom is cut off at each end.

He beareth Argent a Scarpe Azure.

SCELOTYRBE, is a wandering Pain in the Legs, proceeding chiefly from the Scurvy. Hence the Water proper for this Distemper, is called *Aqua Sceletyrbitis*. *Blanchard*.

SCENOGRAPHY, in *Perspectives*, the *Scenographick* appearance of any Figure, Body, or Building, is that Side that declines from, or makes Angles with that strait Line imagined to pass through the two outward convex Points of the Eyes, generally called by Workmen, the *Return* of a fore-right Side; and differs from the *Orthographick* Appearance in this, That the latter represents the Side of a Body or Building as it is seen, when the Plain of the Glass stands parallel to that Side: But *Scenography* represents it as it seems through a Glass, not parallel to that Side.

In Architecture and Fortification, *Scenography* is the manner of delineating the several parts of a Building or Fortrefs, as they are represented in Perspective.

SCEPTICK, is the term for a Person who maintains there is nothing Certain, and no real Knowledge at all to be had; but that a Man ought to Doubt of, and Disbelieve every thing.

SCHEME, is the Representation of any Geometrical or Astronomical Figure or Problem, by Lines sensibly to the Eye; and these are otherwise called *Diagrams*.

SCETICA febris, is opposed to the *Hectick* Fever, because it is seated mostly in the Blood, and is easily cured; but the *Hectick* Fever is fixed in the very Habit of the Body, and not to be remov'd without great difficulty. *Blanchard*.

SCHIRRUS, and *Schirrroma*, is a hard, livid Swelling, that resists the touch, and is without Pain. *Blanchard*.

SCHOLIUM, is a remark made leisurely, and as it were by the by, on that Proposition, Subject or Discourse before advanced, treated of, or delivered.

SCIATICA, the Gout in or about the Hip-Bone.

SCIENCE, is Knowledge founded upon, or acquired by clear, certain, and self-evident Principles.

SCIOGRAPHY, is the Art of *Shadows* or *Dyal-ing*: Also in Architecture, this Word is sometimes taken for the Draught of a Building cut in its Length or Breadth, to shew the Inside of it; as also the Thickness of the Walls, Vaults, Floors, Timber-works, &c.

SCIOPTICKS. See *Obscura Camera*.

SCIOPTHERICUM *Telecopium*, is an Horizontal Dyal, with a Telescope adapted for observing the true Time both by Day and Night, to regulate and adjust Pendulum Clocks, Watches, and other Time-keepers; Invented by the Ingenious Mr. *Molyneux*, who hath published a Book with this Title, which contains an Accurate Description of this Instrument, and all its Uses and Applications.

SCIRE facias, is a Writ Judicial, most commonly to call a Man to shew cause to the Court whence it Issues, why Execution of a Judgment passed, should not be made out. This Writ is not granted until a Year and a Day be elapsed after a Judgment given. *Scire facias*, upon a Fine, lies not but within the same time after the Fine levied, otherwise it is the same with the Writ of *Habere facias seisinam*.

SCLEROPHTHALMY, it is hard blearedness of the Eyes, accompanied with Pain; a slow motion of the Eyes, with redness and dryness. *Blanchard*.

SCLEROTICA, or hardening Medicines, are such as unite the Parts more firmly amongst themselves; and that either by dissipating the thin and soft Parts, or else sometimes by retaining them; the first by hardening the Matter into a *Schirrus* by too hot Medicines; the latter is done when the Part affected acquires a Hardness, by cooling and astringent Medicines, such are *Sengreen*, *Nightshade*, *Purslane*, and *Water-Lentils*. Therefore these *Sclerotic* Medicines are either Healing, or else Cooling and Astringent. *Blanchard*.

SCLEROTICA Tunica. See *Cornea*.

SCOLIASIS, is a distortion of the Back-Bone to one or t'other side.

SCLOPOMACHÆRION, is a Surgeon's Knife, with which Wounds of the *Thorax* are widened; 'tis used also in opening larger Swellings; as also in opening the *Abdomen*.

SCONCES, are small Forts built for Defence of some Pass, River, or other Place.

Sometimes they are made regular of four, five, or six Bastions; others of smaller Dimensions fit for Passes, or Rivers, and likewise for the Field, which are.

1. *Triangles with half Bastions*, which may be all of equal Sides, or they may be something unequal. However it be, divide the Sides of the Triangle into two equal Parts, one of these three Parts will set off the *Capitals*, and the *Gorges*, and the *Flanks* being at Right-Angles with the Sides, make half of the Gorge.

2. *Square with half Bastions*, whose Sides may be betwixt 100 and 200 Feet; and let one third of the Side set off the *Capital* and the *Gorges*; but the Flank (which raise at Right-Angles to the Side) must be but one half of the Gorge or *Capital*, that is on the sixth part of the side of the Square.

3. *Square with half Bastions and Tong*.

4. *Long Squares*.

5. *Star Redoubt of four Points*.

6. *Star Redoubt of five or six Points*.

7. *Plain Redoubts*, which are either small or great: The small are fit for Court of Guards in the Trenches, and may be a Square of 20 Foot to 30. The middle sorts of *Redoubts* may have their Sides from 30 to 50 Feet; the Great ones from 60 to 80 Feet square.

The Profile (that is, the Thickness and Height of the Brest-works) to be set on these several Works, and the Ditches, are alterable and uncertain; for sometimes they are used in Approaches, and then the Wideness of the Brest-work at the Bottom may be 7 or 8 Foot, Inward Height 6, and Outward 5 Foot; the Ditch may be 8 or 10 Feet, and sometimes 12; and for the Sloaps to be wrought according to the nature of the Earth; sometimes they may be made 14 or 20 Feet Wide at the Bottom, and the Height of 7, 8, or 9 Feet, and

and to have two or three Ascents to rise to the *Parapet*; the Ditch may be 16 or 24 Feet Wide, and 5 or 6 Deep; and sometimes they may come near the smallest sort of Ramparts, and have a Breft-work Cannon Proof, with a Ditch of 50 or 60 Feet Wide, and are thus made to set upon Passes or Rivers to endure.

SCOPER-Holes, in a Ship are Holes made through the Sides, close to the Deck, to carry off the Water that comes from the Pump, or any other way. These Holes in the lowest Deck, and in the *Manniger*, have round Leathers nail'd over them, to keep the Sea-water from coming up into the Ship, which are called *Scoper Leathers*; and the short Nails with broad Heads, which fasten these Leathers down, are called *Scoper-Nails*.

SCORBUTUS, the Scurvy, is a Disease that is Epidemical to the *Hollanders*. The symptoms of it are generally livid Spots on the Hands and Feet, weakness of the Legs, stinking Breath, looseness of the Teeth, bleeding of the Gums, Convulsions, Pains, running Gout, Cholick, &c. *Blanchard*.

SCORE, in Musick, is the Original Draught of the whole Composition, wherein the several Parts, *viz.* Treble, second Treble, Base, &c. are distinctly scored or marked.

SCORPIO, is the 8th Sign of the *Zodiack*, being usually marked thus (m).

SCOT, a Part or Portion, according to *Rastall*, is a certain Custom, or common Tallage made to the Use of the Sheriff, or his Bailiffs; but now signifies a customary Contribution laid upon all Subjects, according to their Ability; for whoever are Affected to any Contribution, are generally said to pay *Scot and Lot*.

SCOTIA, a term in Architecture, the same with *Trochile*; which see.

SCOTIA, is Architecture, in a certain Member hollowed in form of a Demi-channel, which is placed between the *Tours* and the *Astragal* in the Bases of Pillars; as also sometimes under the *Larmier* or *Drip*, in the Cornice of the *Dorick* Order.

SCOTOMY, Dizziness or Swimming of the Head, is when the Animal Spirits are so whirled about, that the external Objects seem to run round. *Blanchard*.

SCORBICULUS Cordis, or *Anticardium*, the *Heart Pit*, formerly called *Gardia*, the Pit of the Breast, or as 'tis usually called the *Stomach*.

SCROPHULA, art preternatural hard Glandules, or preternatural Swellings of the Glandules of the Neck and Ears; they are contained in a proper Tunick. *Blanchard*.

SCROTUM, is that Rag which contains the Testicles of the Male: It consists of a Skin, a fleshy Panniculus, and the two Tunics; of which, the outermost is called *Elyroids* or *Vaginalis*; the innermost Tunic is called *Albuginea*. In the middle of it is a Line extended in the length, which divides the right part from the left, which they call the *Septum*. For its more easie Distention or Contraction, 'tis generally supposed to be void of Fat. See more under the Word *Testes* and *Testiculi*.

SCROTUM Cordis, so some are pleased to call the *Pericardium*; which see.

SCROWLES, or *Volutes*, a term in Architecture. See *Valuta*.

SCURVY. See *Scorbutus*.

SCUTIFORME *Os*. See *Mola Genu*.

SCUTIFORMIS *Cartilago*. See *Ensisformis*.

SCUTTLES in a Ship, are square Holes, big enough to let in the Body of a Man cut in the Deck, to let People down on occasion into any Room below. They are generally before the Main-Mast, before the Knight in the Fore-Castle: In the Gun-Room to go down to the Stern Sheets: In the Round-House to go down into the Captain's Cabin, when forced by the Enemy in a Fight aloft. There are also some smaller Scuttles, which have Gratings over them; and all of them have covers to them, that Men may not tumble in at Night, when 'tis dark.

Also, those little Windows and long Holes which are cut out in Cabbins to let in Light, are called *Scuttles*.

SCUTUM. See *Mola Genu*.

SCYPHOS, is the *Infundibulum* in the Brain; likewise those Passages which convey the Spirit from the *Os Cribriforme* to the *Pallat*, are so called by some Writers. *Blanchard*.

SEA-Gate, when two Ships are aboard one another, by means of a Wave or Billow: The Seamen say, They lie aboard one another in a *Sea-Gate*.

SEA-Quadrant. See *Back-staff*.

SEA-York, when the Sea is so rough, that they cannot govern the Helm with their Hands, then the Seamen seize two Blocks to the end of the Helm; one on each side, and then reeving two small Ropes through them, which they call *Falls*, and which are fastned to the sides of the Ship, by having some Men at each Tackle, they govern the Helm according to Direction. This they call a *Yoke* to steer by. Sometimes they make a *Yoke*, by taking a double turn about the end of the Helm by a single Rope, the ends being laid to the Ship-sides; and by this means they guide the Helm; but this is not so good a *Yoke* as the other.

SEAMS of a Ship, are Places where her Planks meet and joyn together. There is also a kind of peculiar Seam in the fowing of Sails, which they call a *Monks Seam*; which see.

SECANT, is the Right Line drawn from the Centre of a Circle cutting it, and meeting with the Tangent without. See under *Trigonometry*.

SECOND, is the Sixtieth part of a *Minute*.

SECOND Deliverance, is a Writ that lies for him, who after a return of Cattle Replevied; Adjudged to him that distrained them, by reason of a default in the Party that Replevied, for the Replevying of the same Cattle again, upon Security put in for the re-delivery of them in case the Distress be Justified.

SECONDARY Circles, in reference to the *Ecliptick*, or *Circles of Longitude* of the Stars, are such as passing through the Poles of the *Ecliptick*, are at Right Angles to the *Ecliptick* (as the *Meridian* and *Hour Circles* are to the *Equinoctial*). By the help of these (Infinitely many Circles, all Points in the Heavens are referred) to the *Ecliptick*: That is, Any Star, Plane, or other *Phenomenon*, is understood to be in that Point of the *Ecliptick* which is cut by the *Secondary* Semicircle which passes through such Star or Phenomenon. And if two Stars, &c. are thus referred to the same Point of the *Ecliptick*, they are said to be in *Conjunction*; if in opposite Points, they are said to be in *Opposition*: If they are referred to two Points at a *Quadrants* distance, they are said to be in a *Quartile Aspect*;

Aspect; if the Points differ a *sixth part* of the Ecciptrick, the Stars are said to be in a *Sextile Aspect*, &c.

And in general, all Circles which Intersect one of the six greater Circles of the Sphere at Right Angles, may be called *Secondary Circles*; as the Azimuths or Vertical Circles in respect of the Horizon, &c.

SECONDARY Planets, are such as move round others, whom they respect as the Centre of their Motion; tho' they move also along with the Primary Planets in the Annual Orbit round the Sun. And these are otherwise called the *Satellites*: Such is the Moon to the Earth; and *Jupiter* hath four moving round him; as *Saturn*, according to *Cassini*, hath five; *Mars*, *Venus*, and *Mercury*, have no Secondary Planets moving round them, that have been yet discovered.

The Learned Dr. Gregory in his *Astronomia Geom. & Physica*, Lib. IV. shews and proves at large, That tho' the Motion of the Primary Planets be sufficiently simple and uniform, as being compounded only of a projectile Motion forward in a right Line, which is a Tangent to the Orbit, and a Gravitation towards the Sun at the Centre; and also being at such vast distances from each other, that the effects of their mutual Gravitation towards one another are insensible; yet is the matter far otherwise in reference to the Secondary Planets. For every one of these (altho' it chiefly gravitate toward its respective Primary one, as towards its Centre) at equal distances from the Sun, is attracted towards him with equal accelerated Gravity, as the Primary one is towards him; but at a greater distance with *less*, at a nearer distance with *greater*. From which double Tendency towards the Sun, and towards its own Primary Planet, the motion of the *Satellites* or Secondary Planets comes to be mightily compounded and affected with many Inequalities. As for Instance, he Proves,

1. That the Satellite shall be continually accelerated in its Motion from the time of its Quadrature with the Sun, to the next following Conjunction or Opposition, but that contrariwise, from the Syzygys to the Quadratures, it shall be retarded, and therefore will not always move Swifter in or near the Syzygys, and slower near the Quadratures. From whence will follow,

2. That the Orbits of these Secondary Planets will be of a Figure more circular in the Quadratures, than in the Syzygys, where the swiftness of the Motion will make the Figure of the Orbit more Rectilinear. And therefore the Satellite will run farther from its Primary Planet in the Quadratures, than at the Syzygys; so that the Orbit will be a little Elliptical, having the Primary Planet for its Centre; and the longer Diameter will coincide with the Line of the Quadratures, and the shorter with that of the Syzygys.

And these irregularities will arise, if the Sun's power of perturbing the motion of the Satellite be excluded; and the Orbit be concentrick with that of the Primary Planet. For, if the Orbit be eccentric, it may happen that the Satellite shall be farther off from the Primary one in the Syzygys, and so move slower, than it shall do at the Quadratures.

And when this is the case, that the Satellite's Orbit, is not a Circle concentrick to the Primary Orbit, but an Ellipsis in one of whose Focus's the Primary Planet is placed; then the motion of the

Satellite will be so disturbed by the Sun, that as it runs into its Orbit, the *Apes* of the Orbit shall be moved sometimes in *Consequentia*, and sometimes in *Antecedentia* (whereas he proves before, that the *Nodes* and *Apes* of the Primary Planets are at rest.)

3. When the Plane of the Satellite's Orbit, is inclined to the Plane of the Primary Orbit, the Line of the Nodes of the Secondary Orbit will be moved in *Antecedentia*, with an angular motion, and an unequal Velocity; for it will recede most swiftly when the Nodes are in Quadrature to the Sun; after which, it will move slower; and at the time of the Nodes being in the Syzygys, it will be perfectly at rest.

4. The Inclination also of the Plane of the Secondary Orbit to the Primary one, will be continually varying, and will be *greatest* when the Nodes are in the Syzygys with the Sun; and *less* (*ceteris paribus*) when they are in the Quadratures; and from the time of the Nodes being in the Syzygys to the Quadratures, it will be always decreasing; and from the time of their being in the Quadratures to the Syzygys, continually increasing.

And he proves, that all these Irregularities, whether in any excentrick or concentrick Orbit, will always be something greater when the Satellites is in *Conjunction* with the Sun, than when he is in *Opposition* to him.

After this, he proceeds to shew, what Errors or Irregularities in the motion of these Secondary Planets will be produced by the Sun, supposing the Primary Planet to move in an excentrick Orbit round the Sun. Of which, Sect. IV. of the said Book IV.

SECRETION, is the separation of one Fluid from another in the Body of an Animal or Vegetable, by the means of Glands or something analogous to them.

Dr. Havers in his *Osteologia*, explains *Glandular Secretion*, by observing, first, That all Motion in its proper Tendency is direct, (which is exactly, right) and that the Glands which are seated on the sides of the Arteries all over the Body, are so placed, as to favour the motion of any Particles that strike against them in a Right Line, more than the Veins; and having Pores adapted to the Figure of the Particles which they separate, the Particles endeavour in their motion to get into those Glandules; and being there received, are separated and distinguished from the rest of the mass of Blood, and so assume the form of that Liquor which we find separated by every Gland. And that the Glands are so situated as to favour the motion of a Particle in a Right Line more than the Veins, he saith, is apparent from Observation of the gradual construction of the Arterial Channel. See Vol. II.

SECTA ad Curiam, is a Writ that lies against him who refuses to perform Suit either to the County or Court-Baron.

SECTA facienda per illam que habet aniciam partem, is a Writ to compel the Heir that hath the Elder's part of the Co-heirs to perform Service for all the Co-parceners.

SECTA unica tantum facienda pro pluribus hereditatibus, is a Writ that lies for that Heir that is disinherited by the Lord to more Suits than one, in respect of the Land of divers Heirs descended unto him.

SECTIO Casaria. See *Hyſteratomotocia*.

SECTION Conick, is the Figure made by the ſolidity of a Cone's being ſuppoſed to be cut by a Plane.

If the *Section* be made by the *Axis*, or through the *Vertex*, the Figure ariſing is a *Triangle*. If by a Plane, Parallel to the *Base* of the Corner, or *ſubcontrarily* poſited, the Figure produced is a *Circle*.

If the *Section* be made Parallel to one ſide of the Cone, the Figure produced is a *Parabola*: If thro' both ſides of the Cone, 'tis an *Ellipſis*; and if thro' one ſide of the Cone, thro' the *Base*, and not Parallel to the other ſide of the Cone, 'tis an *Hyperbola*.

Archimedes, *Euclid* and other ancient Mathematicians, called that only a *Conick Section*, when the Plane cutting the Cone was at right Angles to the ſide of the Cone; and according as the Angle made by the ſides of the Cone meeting in the *Vertex*, as it was a *right*, *obtufe*, or *acute* one, they called it the *Section of Right-angled*, *Obtuſe-angled*, or *Acute-angled Cone*. By which Words they underſtood what we now call the *Parabola*, the *Hyperbola*, and the *Ellipſis*: Which three Sections, (as alſo the *Circle*) *Apolonius Pergeus* (juſtly called *Magnus Geometra*) found out to be producible in any Cone, according to the four ways of cutting it, as above-mentioned.

SECTION, in Mathematicks, ſignifies the cutting of one Plane by another, or a *Solid* by a Plane.

The common *Section* of two Planes is always a right Line, being the Line ſuppoſed to be drawn on one Plane by the *Section* of the other, or by its Entrance into it.

SECTION of a *Building*, in Architecture, is underſtood of the *Perſile* or *Delineation* of its Heights and Depths raiſed on the Plane; as if the *Fabrick* were cut aſunder to diſcover the Inſide.

SECTIS non faciendū, is a *Writ* that lies for a Woman, who, for her *Dower*, ought not to perform *Suit* of Court.

SECTOR, is an *Inſtrument* made of Wood, Ivory, Brals, &c. with a Joint, and ſometimes a piece to turn out to make a true Square, with Lines of Sines, Tangents, Secants, Equal Parts, Rumbs, Polygons, Hours, Latitudes, Metals, Sotids, &c. and is generally uſeful in all the Practical Parts of the Mathematicks, and, particularly contrived for *Navigation*, *Surveying*, *Aſtronomy*, *Dyaling*, *Projection of the Sphere*, &c. By *Gunter*, *Foſter*, *Collins*, and others. There are likewiſe *Sectors* for *Fortification* and *Gunnery*, by Sir *Jonas Moor*.

The great Advantage of the *Sector* above any other Rule or Plain-scale, is that all its Lines can be accommodated to any Radius; which is done by taking off all Diviſions Parallelwiſe, and not Lengthwiſe. The ground of which Practice is this, That *Parallels* to the *Base* of any Plain Triangle, bear the ſame Proportion to it :: as the Parts of the Legs above the Parallel do to the whole Legs.

SECTOR of a *Circle*, is a mixt Triangle comprehended between the Radius and an *Ark* of the Circle.

As here,

The Sector *abc*, made by the Legs *ab* and *ac*, and the Ark *bc*.

To find the ſuperficial Content of any Sector, ſee *Arch*, N. 9.

SECUNDA ſuperoneratione paſture, is a *Writ* that lies where *Admeaſurement of Paſture* hath been made; and he that firſt ſurcharged the Common, doth again ſurcharge it, notwithstanding the *Admeaſurement*.

SECUNDANS, in Mathematicks, is an infinite ſeries of Numbers, beginning from Nothing, proceeding as the ſquates of Numbers in Arithmetical Proportion.

As for Inſtance,

0, 2, 4, 9, 16, 25, 36, 49, 64, &c.

SECONDARY; that Officer who is the ſecond, or next to the chief Officer; as the *Secondaries* of the Fine Office; the *Secondaries* of the Compters, who is next to the Sheriff of London in each of the two Compters; *Secondary* of the Office of the Privy-Seal; *Secondaries* of the Pipe, two; *Secondary* to the Remembrancers, which are two Officers in the Exchequer.

SECUNDINE, the *Secunding* or *After-Birth*, are the three Membranes, *Chorion*, *Alantois*, and *Amnion*, which with the *Placenta*, are excluded after the Birth.

SECURITATE pacis, is a *Writ* that lies for one who is threatned Death or Danger, againſt him that ſo threatneth, and is taken out of the *Chancery*, and directed to the Sheriff.

SECURITATEM inveniendi quod ſe non diſvertat ad partes externas ſine licentia Regis, is a *Writ* that lies for the King againſt any of his Subjects, to ſtay them from going out of his Kingdom: The ground of which is, That every Man is bound to ſerve and defend the Common-wealth, as the King ſhall think meet.

SE defendendo, is a *Plea* for him that is charged with the Death of another, ſaying, he was neceſſitated to do that which he did in his own defence; the other ſo *Aſſaulting* him, That if he had not done as he did, he muſt have been in hazard of his own Life; But this Danger ought to be ſo great, that it ſeems inevitable; and tho' he juſtifie it to be done in his own Defence, yer he is driven

to procure his Pardon of course from the Lord-Chancellor, and forfeits his Goods to the King.

SEDIMENTUM Urinae, the Sediment of Urine, are parts of the nutritious Juice, which being separated from the Blood, with the Serum, because of their Gravity, sink to the bottom of the Urine.

SEEL, a Sea Word much of the same Sense with *Heel*; for as they call it, *heeling*, when a Ship lies down constantly or steadily on one side; so they call it *seeling*, when the rumbles on one side violently and suddenly, by reason of the Sea forsaking her, as they call it; i. e. the Waves leaving of her for a time in a rowling Sea: When a Ship thus rumbles to *Lee-ward*, they call it *Lee-seel*; and in this there is not much danger, even in a Storm, because the Sea will presently right her up again; but if she Rows or Seels to Windward, there is fear of her coming over too short or suddenly, and so by having the Sea break right into her, be either foundered, or else have some of her upper Works carried away.

SEGMENT of a Circle, is a Figure contain'd between a Chord and an Ark of the same Circle.

To find the Superficial Content of any Segment of a Circle, see *Area*, N. 10.

SEGMENT of a Sphere, is a part of it cut off by a Plane; and therefore the Base of such a Segment must always be a Circle, and its Superficies a part of the Surface of the Sphere.

Its solid Content is found by multiplying the Surface of the whole Sphere, by the Altitude of the Segment, and then dividing the Product by the Diameter of the Sphere, and to the Quotient, adding the *Area* of the Base of the Segment.

Or if it is less than an *Hemisphere* thus:

Take the Altitude of the Segment from the Radius of the Sphere, and by the Difference multiply the *Area* of the Base of the Segment; and Subtract this Product from that which will arise from multiplying the Semi-Axis of the Sphere into the Convex surface of the Segment; then divide the Remainder by 3, and the Quotient is the Solidity sought.

This latter Method supposes the Axis of the Sphere to be given; if not, it may be found thus.

Let the Altitude of the Segment be called *a*, and its Semi-diameter *s*.

Then will

$a \cdot s \cdot s \cdot \frac{s}{a}$; add $\frac{s}{a}$ to *a*, and that shall give the Axis sought. 13. b 6. Euclid.

SEGMOIDALES, or *Semilunaries*, are Valves of the *Arteria Pulmonaria*, and are so called, because they resemble a Half-moon, or Segment of a Circle; their substance is Membranous: When they separate, they give passage to the Blood, from the Ventricle into the Artery; but they shut the Passage, and are thrust together by the Blood, if it endeavours to return.

SEGREIANT, the Heralds Word for *Griffins*, when drawn in a leaping or saliant Posture.

SEJANT, (i. e. sitting) the Term is used in Heraldry for a Lion, or other Beast, when it is drawn

in an Escutcheon sitting like a Cat, with his Fore-feet strait.

SEISIN, from the French *Seisine*; *possession*: So *primer Seisin*, is the first possession; and *to Seise*, is to take possession.

Seisin, according to the common Law, is twofold; *Seisin in fact*; and *Seisin in Law*.

Seisin in fact, is when a Corporal Possession is taken.

Seisin in Law, when something is done which the Law accounteth a *Seisin*, as an Inrolment: And this *Seisin in Law*, is as much as a Right to Lands and Tenements, tho' the Owner be by Wrong disseised of them: And he who hath had an Hours Possession quietly taken, hath *Seisin de droit & de claime*, whereof no Man may disseise him by his own force or subtilty, but must be driven to his Action; and 'tis called by Coke, *Seisin in Law*, or *Actual Seisin*.

The *Civilians* call the one *Civilem Possessionem*, the other *Naturalem*.

SESINA habenda, *quia Rex habuit annum, diem & vastum*, is a Writ that lies for Delivery of *Seisin* to the Lord of his Lands or Tenements, after the King, in the Right of his Prerogative, hath had the Years, Day, and Waste.

SEIZING, or *Seasing*, in the Sea Language, is the same as *Fastening*, (viz.) of two Ropes together with some Rope-yarn, &c. Also the fastening of a Block at the end of a Pendant or Tackle, Garnet, &c. is called *Seizing*.

The *Boats seasing*, is a Rope by which a Ring, or little Chain is made fast in the Foreship of the Boat, whereby, in a Harbour, the Boat is fastened to the Ship's side.

SELLA Equina, seu *Turcica*, or *Sphenoides*, a part of the Brain, is compounded of four Processes of the Bone *Sphenoides*, or the Wedge-like Bone; it contains the *Pituitarian Glandule*; and in Brutes, the *Rete Mirabile*.

SEMEIOSIS. See *Diagnosis*.

SEMEIOTICA, is that part of Physick, or the Art of Medicine, which treats of the Signs of Health and Sickness; assisting the Physician to make probable Guesses and Conjectures of the Constitution and State of his Patient.

SEMETs, according to Dr. Grew, are the Apices of the Attire of a Plant. See *Apices*.

SEMI-BREVE, a Term in Musick. See *Notes and Time*.

SEMI-CIRCLE, is the Figure contained between the Diameter of a Circle, and half the Circumference.

Also an Instrument for Surveying, made of Brass, and divided into 180 Degrees, being half the *Theodolite*.

SEMI-COLON, is a Stop, or Point in a Sentence, between a *Comma* and a *Colon*, and mark'd thus (;) and expresses a Pause greater than the former, and less than the latter.

SEMI-CUBICAL Paraboloid, is a Curve whose Ordinates are in *Subtriplicate* of the *Duplicate* proportion of the Diameter: That is, the Cubes of the Ordinates are as the Squares of the Diameters.

In this *Paraboloid*, the Segments of the Curve, cut by Ordinates (at equal Distances) are as the Ordinates in a *Parabola*; and therefore their Squares increased by Equals in Arithmetical Progression; and consequently that Curve to a Right Line, as the Trunk of a *Parabola* to a *Parabola*.

SEMI-

SEMI-CUPIUM, is a Bath, in which the Patient is only up to the Navel in Water.

SEMI-DIAMETER, or *Radius*, is that Line that is drawn from the Center to the Circumference of a Circle.

SEMI-DIAMETER, in Fortification, is twofold, *viz.* the Greater and Lesser: The former being a Line composed of the Capital, and the Small Semi-diameter of the Polygon: And the other, a Line drawn to the Circumference from the Centre thro' the *Gorges*.

SEMI-DIAPASON, a Term in Musick, signifying a Defective or Imperfect *Octave*.

SEMI-DIAPENTE, a Term in Musick, signifying an Imperfect *Fifth*.

SEMI-DITONE, in Musick, is the Lesser Third having its Terms as six to five.

SEMI-LUNARES *Valvulae*. See *Segmoidales*.

SEMI-MEMBRANOSUS, is a Muscle of the Leg, so called from its being half Tendinous and Membrane-like, lying immediately under the *Seminervosus*: It ariseth broad and tendinous from the Protuberance of the *Os Ischium*, and in its descent becomes broader; and in less than half its Progress begins to grow fleshy, and is dilated into a large and fleshy Belly, lying under the long round Tendon of the *Semi-nervosus*, becoming a short thick Tendon, inserted to the superior part of the upper Appendix of the *Tibia* backwards. Its Use is to help to bend the *Tibia*.

SEMINAL Leaves: much the greatest part of all Seeds which are sown in the Earth, come up, or shoot forth at first with too little, plain, soft, and undivided Leaves; which because they are usually very different from the Leaves of the succeeding Plant in Magnitude, Figure, Surface, and Position, are called very properly by this Name *Seminal Leaves*: As the little embrionated Plant which lies in Miniature in every Seed, is called, the *Plantula Seminalis*.

SEMI-NERVOSUS, seu *Semi-tendinosus*, a Muscle of the Thigh, which is so called from its being half Tendinous, and Nerve-like. It ariseth partly Tendinous and partly Fleshy from the External part of the Protuberance of the *Os Ischium*, and presently being dilated to a large fleshy Belly, becomes a round Tendon in half its Progress, which descending over the fleshy Belly of the *Semi-membranosus*, marcheth close by the *Gastrocnemius*, on the posterior part of the Superior Appendix of the *Tibia*; from whence it passes forwards to its Insertion in the said Bone immediately below the termination of the *Gracilis*: This with the *Gracilis* acting, bend the *Tibia* directly backwards. Its Tendon, together with the *Sartorius*, *Gracilis*, *Semi-membranosus* and *Biceps*, make the inward Hamstrings, as they are commonly called.

SEMI-QUADRATE, the same with *Semi-quartile*.

SEMI-QUARTILE, an Aspect of the Planets when distant from each other 45 Degrees, or one Sign and a half.

SEMI-QUAVER, a Term in Musick. See *Notes and Time*.

SEMI-QUINTILE, an Aspect of the Planets, when at the Distance of 36 Degrees, from one another.

SEMI-SEXTILE, an Aspect of the Planets, when distant from one another 30 Degrees, or 1 Sign, and is noted thus, SS.

SEMI-SPINATUS, is a Muscle which seems to be a Continuation of the *Sacer*; and therefore may not improperly be called *Transversalis Dorsi*; it ariseth fleshy from all the Transverse Processes of the *Vertebrae* of the *Thorax*, and marching obliquely upwards, is inserted to the superior Spines of the said *Vertebrae*: These with the *Quadratus Lumborum Sacer*, and *Transversales Colli* acting, move the whole Spine, or *Vertebrae* of the Neck, Back, and Loins, obliquely backwards, as when we endeavour to look very much behind us: If they all act together on each side, they assist in erecting the Trunk of the Body.

SEMI-TENDINOSUS. *Vid. Semi-nervosus*.

SEMI-TONE, a Term in Musick; of which there are two sorts, *viz.* a Greater and a Lesser; the *Enharmonical* *Diesis*, being the Difference between them.

SEMITA Luminosa, is a Name given by Mr. Childrey in his *Britannia Baconica*, p. 183, 184. to a kind of Lucid Track in the Heavens, which a little before the Vernal Equinox, (he saith) may be seen about 6 a Clock at Night, extending from the Western edge of the Horizon up towards the *Pleiades*.

After this, the *Phaenomenon* was taken notice of by *Cassini* and *Fatio*, who both evince, That this Light comes diffused from each side of the Sun: Its brightness is much the same with that of the *Via Lactea*, or the Tail of a Comet. 'Tis seen plainest with us about the beginning of *October*, and towards the end of *February*.

S. *Fatio* conjectures, That the Bodies, or rather the Congeries or Aggregate of those Bodies which occasion the Light, doth conform to the Sun like a *Lens*; and takes it to have ever been the same: But *Cassini* thinks it arises from a vast Number of small Planets which encompass the Sun, and give this Light by Reflection, esteeming it also not to have existed long before he observed it: But this latter is overthrown by *Childrey's* Observations, whose Book was Printed in 1661; and he saith there he had taken notice of it for many Years.

SEND, when a Ship is either at an Anchor, or under Sail, falls with her Head or Stern deep into the Trough of the Sea (*i. e.* into a Hollow made between two Waves or Billows) they say the *sends* much that way, whether it be *A-head*, or *A-stern*.

SENESCALLO & *Marescallo quod non teneant placita de libero tenemento*, &c. is a Writ directed to the Steward, or Marshal of England, inhibiting them to take Cognisance of any Action in their Court that concerns either Freehold, Debt, or Covenant.

SENSATION is the perceiving of things by our Senses; and is the Original of most of the Ideas which we have, which by our Senses are derived to our Understanding.

The *Cartesians* assert Sensation to be only a simple Perception, whereby the Motions of external Objects affecting the Extremities of the Nerves in the Organs of the Body, are communicated all along those Nerves to the *Glandula Pinealis*, where the Soul residing receives her Informations, and accordingly makes Judgments upon them.

In which, (except as to that Whim of the Soul's residing in the *Glandula Pinealis*) they are certainly much in the right: For Sensation is properly and ultimately made in or by the Mind, or discerning Faculty, which probably, from the different Mo-

tions of the internal parts of the Brain, is excited and determined to differing Perceptions; and to these we give differing Names, as Heat, Cold, and other Qualities.

SENSIBLE Horizon. See *Horizon*.

SENSIBLE Point. See *Point Sensible*.

SENSITIVE Plants, are such whose Frame and Constitution is so nice and tender, that at the touch, or at the least pressure of ones Hand, they will contract their Leaves or Flowers, as if they really felt Pain by such a Contract.

Of these the Botanick Writers mention many Kinds, some of which contract with Heat, others with Cold.

SENSORIUM Commune, or the Seat of the common Sense, is that part of the Brain in which the Nerves, from the Organs of all the Senses, are terminated, which is the beginning of the *Medulla Oblongata*.

SENSORY, the Organ or Instrument of Sense, as the Eye of Seeing, the Ear of Hearing, &c.

SENSUS, Sense, is when the Motion impressed by the outward Objects upon the Fibres of the Nerves, is conveyed by the help of the Animal Spirits in the Nerves, to the common *Sensory*, or *Medulla Oblongata*.

SEPARATION, with some Writers of Navigation, is the same with what is more usually called, the *Departure*; that is, a Ship's difference of Longitude from any place, or from another Ship. Our Seamen commonly call it *Easting* or *Westing*; according as the Difference of Longitude is East or West.

SEPHYROS (in some Authors) is a hard Inflammation of the Womb.

SEPTAN Fevers, intermitting Fevers that return every seventh Day.

SEPTANGULAR, the same with *Heptangular*.

SECTENTARIUS, a Constellation in the Northern Hemisphere, consisting of 30 Stars.

SEPTENTRIONAL Signs, are the first 6 Signs of the *Zodiac*, so called, because they decline towards the North from the Equinoctial, and are the same with *Boreal Signs*.

SEPTICA, five Putrefacientia are those things, which by a Malignant sharpness, rot and corrupt the Flesh.

SEPTUM Cordis, the fleshy part that divides the Right Ventricle of the Heart from the left.

SEPTUM Lucidum, is a Partition, which is diaphanous, upon the account of its thinness, it distinguishes the Ventricles of the Brain.

SEPTUM Transversum. See *Diaphragma*.

SEQUATUR sub suo periculo, is a Writ that lies where a Summons ad *Warrantisandum* is awarded, and the Sheriff returns, That he hath nothing whereby he may be summoned; then goes out an *Alias* and *Pluries*; and if he come not at the *Pluries*, then goes out this Writ.

SEQUESTER, is a Term used in the Civil Law for renouncing, as when a Widow comes into Court, and disclaims to have any thing to do, or to intermeddle with her Husband's Estate, who is Deceased; she is said to *Sequester*.

SEQUESTRATION, is the separating of a thing in Controversie from the Possession of both those that contend for it: And it is of two sorts; *Voluntary*, or *Necessary*.

Voluntary, is that which is done by Consent of each Party.

Necessary, is that which the Judge doth of his Authority, whether the Parties will or not.

It is used also for the Act of the Ordinary, disposing of Goods and Chattels of one Deceased, whose Estate no Man will meddle with.

Also for the gathering of the Fruits of a Benefice void to the Use of the next Incumbent.

SEQUESTRO habendo, is a Writ Judicial, for the dissolving a Sequestration of the Fruits of a Benefice made by a Bishop at the King's Command, thereby to compel the Parson to appear to the Suit of another: For the Parson, upon his Appearance, may have this Writ for the Discharge of the Sequestration.

SERIES, properly speaking, is an orderly Progress or Continuation of things one after another. 'Tis commonly in *Algebra* connected with the Word *Infinite*, and there, by *Infinite Series*, is meant certain Progressions, or Ranks of Quantities orderly proceeding, which make continual Approaches to, and if infinitely continued, would become equal to what is inquired after.

This Method took its Rise from the Learned Dr. Wallis's *Arithmetick of Infinites*, and has been of late so pursued by several Worthy Persons of our own Nation, especially the Incomparable Sir Isaac Newton, that it is now one of the greatest Improvements of *Algebra*.

SEROSITIES, are serous Humours abounding in the Body.

SERPENTINE, so the Chymists (from its Figure) call that long winding Worm, which is placed in a Tub of Water in the Distillation of Spirits. See *Worm*.

SERPENTINE Line, the same with *Spiral*; which see.

SERPIGO. See *Lichen*.

SERRATUS Major Anticus, is a Muscle which arises fleshy from the whole *Basis Scapulae*, and passing under the *Subscapularis*, it becomes broader and thicker, still running somewhat forwards till it's inserted to the eight superior Ribs laterally, by so many distinct fleshy Portions, or *Digituli*, representing the Teeth of a Saw; the two, and sometimes three inferior of which, are indented with the *Musculus Obliquus Descendens* of the *Abdomen*. This like the *Serratus Minor Anticus*, dilates the *Thorax*, or moves the *Scapulae* forwards and downwards, when its Muscles are relax'd.

SERRATUS Minor Anticus, is a Muscle, by Anatomists generally reckoned a Muscle amongst those of the *Scapula*: But we are persuaded (says *Cowper*) from its Position that it may be equally serviceable to the *Thorax*, in elevating those Ribs it is inserted to; It arises fleshy from the *Processus Coracoideus Scapulae*, and descends obliquely forwards, becomes broader and thinner, and is inserted fleshy to the bony part of the second, third, fourth, and fifth Ribs. If the *Scapulae* are elevated by their proper Muscles, this with its Partner, are then capable of dilating the Breast in large Inspirations. But if they are depressed, it may be easily conceived with what Difficulty that Action must be performed.

SERRATUS inferior posticus, is a Muscle of the *Thorax*, much larger than Authors generally assign it: "In a Robust Man we observed its Continuation, (says *Cowper*) not only from the Spines of the *Vertebrae* of the Loins, but from all those of the *Thorax*, as well underneath as below the former Muscle; its superior and inferior Parts be-
"ing

ing entirely Tendinous, its Middle growing fleshy near its ferrated Termination at the Curvature of the ninth, tenth, eleventh, and Extremity of the twelfth Ribs. The *Ductus* of the Fibres of this passing transverse, and those of the precedent descending obliquely, do decussate each other in Acute Angles; which *Riolan* has well observed, and contrary to the Opinion of Authors, assigns it with its Partner, a different Use in depressing the *Thorax*; both performing the Office of a Bandage in binding together and constringing the Posterior Muscles of the Spine, not unlike the Constructive Inclosures of the Thigh and Cubit.

SERRATUS superior pecticus, is a Muscle of the *Thorax*; which lies immediately under the *Rhomboides*: It arises with a thin Tendon from two inferior Spines of the *Vertebrae* of the Neck, and three superior of the *Thorax*, from thence descending obliquely over the *Splenius Capitis*, and under parts of the *Sacrolumbalis*, and *Dorsi Longissimus*, it becomes fleshy, marching over the *Scapula*, to its Insertion at the Curvature of the second, third, and fourth Ribs, by so many distinct fleshy endings, representing the Teeth of a Saw, whence its Name. This assists in elevating the Ribs or *Thorax*.

SERVE, to serve a Rope (in the Sea Phrase) is to lay upon it Spun-yarn, Rope-yarn, Sinnet, a piece of Canvas, or the like, which is there rowled fast round about the Rope, to keep it from fretting or galling in any place.

SERVIENTIBUS, are certain Writs touching Servants and their Masters violating the Statutes made against their Abuses.

SERVITUS acquittandis, is a Writ Judicial, that lies for one distrained for Services to *F.* who owes and performs to *R.* for the Acquittal of such Services.

SERUM, is a watery, thin, yellowish, and saltish Humour, which consists chiefly of Water, with a moderate quantity of Salt, and a little Sulphur: The Use of it is to be a Vehicle to the Blood: And this is that watery part that separates from the Blood in the Vessel, after any Person is let Blood. A small Heat will Coagulate it.

SESAMOEIDEA *Osfa*, are 16, 19, 20, and sometimes more little ones, so called from the likeness they have to *Sesamum* Seeds, which are found in the Joints of the Hands and Feet.

SESQUIALTER, in Musick. See *Time*.

SESQUIALTERAL Proportion, is when any Number or Quantity contains another once and an half, and the Number so contain'd in the Greater, is said to be to it in *Subsesquialteral Proportion*.

SESQUIQUADRATE, an Aspect or Position of the Planets, when at the Distance of 4 Signs and an half, or 135 Degrees from each other.

SESQUIQUINTILE, an Aspect of the Planets, when 108 Degrees Distant from each other.

SESQUITERTIAL Proportion, is when any Number or Quantity contains another once and one third.

SESSIONS, is a sitting of Justices in Court upon Commission, as the *Sessions of Oyer and Terminer*, *Quarter-sessions*, otherwise called *General-sessions*, opposite whereto, are *Especial*, otherwise called *Privy-sessions*, which are procured upon some special occasion, for the more speedy dispatch of Justice.

Sessions of Parliament, is a *Sessions* which continues till it be prorogued or dissolved.

SETACEUM, is when the Skin of the Neck is taken up and run through with a Needle; and the Wound afterward kept open by Bristles, a Skean of Silk, &c. which is after moved to and fro, to give vent to the Humours that are ill disposed in that Part. 'Tis also called *Seton* and *Setum*.

SETON, or *Setum*. See *Setaceum*.

SETT, when the Seamen observe on what Point of the Compass, the *Sun*, *Land*, &c. bears, they call it, *Setting* the *Sun*, or *Land*, by their Compass.

SETTLE a Deck, is the Word at Sea for taking a Deck lower than it was at first, which they call *settling* a Deck.

SEVERAL title, is that whereby Land is given or entailed severally, to two Men and their Wives, and to the Heirs of their Bodies begotten; the Donees have joint Estate for their two Lives, and yet they have *several* Inheritance, because the Issue of the one shall have his Moiety, and the Issue of the other, the other Moiety.

SEVERAL Tenancy, is a Plea or Exception taken to a Writ that is laid against two as joint, which are *several*.

SEVERANCE, is the singling or severing of two, or more, that are joined in one Writ.

For Example; If two join in a Writ *de libertate probanda*, and the one afterward be Non-suit: Here *Severance* is permitted; so that notwithstanding the Non-suit of the one, the other may severally proceed.

There is also *Severance* of the Tenants in an Assize, when as one or two, or more Disseisors appear upon the Writ, and not the other.

As also *Severance* in *Attaints*, and *Severance* in *Debt*, where two or more Executors are named Plaintiffs, and the one refuses to prosecute.

Severance of Corn, is the cutting and carrying it off from the Ground; and sometimes the setting out the Tythe from the rest of the Corn, is called *Severance*.

SEW, when a Ship at Low-water comes to lie on the Ground, and to lie dry, they say *she is sewed*; and if she be not quite left dry, they say, *she sews* to such a part.

SEXAGENARY Tables, were Tables contrived (formerly) of Parts proportional, where by Inspection, you may find the Product of two *Sexagenaries* to be multiplied, or the Quotient of two that are to be divided, &c.

SEXAGESIMAL Fractions, or *Sexagenaries*, are such as have always 60 for their Denominator: There were antiently no others used in Astronomical Operations; and they are still retained in many Cases; tho' *Decimal Arithmetick* begins to grow in Use now in Astronomical Calculations.

In these Fractions, (which some call *Astronomical*) the Denominator is usually omitted, and the Numerator only written down: Thus.

$$4^{\circ}, 59', 32'', 50''', 16''''.$$

Is to be read, 4 Degrees, 59 Minutes, 32 Seconds of a Degree, or 60th parts of a Minute, 50 Thirds, 16 Fourths, &c.

The Ancients, before the introducing of Algorithm by the Numeral Figures now in use, (finding

it troublesome to exprefs and manage Fractions of divers Denominators, especially when they are to be expreffed by great Numbers; and troublesome alfo. to exprefs and manage Integers, when they happen to be great Numbers) though fit to divide an Integer into 60 Parts, which they call'd *Sexagesims*, which now we call Minutes, or Scruples; and each of these into 60 Parts, which they called Seconds, and (if there were yet need of greater Exactness) each of these into 60 Thirds; and each of these into as many Fourths; and so onward, as far as there was occasion, which they called *Sexagesims*, or *Sexagesimal parts*.

And (to avoid great Numbers) a Collection of sixty Integers they called a *Sexagene*; and sixty of such, a second *Sexagene*; and sixty of these a third; and so onward, as there was occasion.

Thus, for $\frac{1}{2}$, the fourth part of an Integer, (be it Hour, Day, Degree, or whatever else) they put 15' (that is, 15 Minutes); for $\frac{1}{3}$, they put 7' 30" (that is, 7 Minutes and 30 Seconds); which is exactly the same in Value: And for $\frac{1}{4}$, (because this cannot be exactly exprefs'd in a *Sexagesims*) they would put 8', (which is pretty near, but somewhat too little) or 9' (which is yet nearer, but somewhat too much) or (if these be not exact enough for the present purpose) 8' 34", or 8' 34" 17"; or yet more accurately, if need be, till they come to so much exactness, as that the small remaining difference might safely be neglected.

And such *Sexagesims* were used not only by *Ptolemy*, (by whom the seem to have been first introduced) and other *Greek* Writers, but by the *Arabs* also, (in imitation of *Ptolemy*) and are continued in Use with us to this Day.

So for 227015, (which is the Number of Days, whereby the *Arabic* Years of the *Hegira* begin later than our Account by the Years of our Lord) they put 1''' 3" 3' 35"; that is, 1 Third *Sexagene*, 3 seconds *Sexagene*s, 3 first *Sexagene*s, and 35 Days. And this Account we meet with in the *Alphonfine* Tables, and (of later Times) in those of *Lansbergius*.

And for the better expediting the Work of Multiplication and Division in these *Sexagesims* and *Sexagene*s, they had a Table for that purpose, in such form as this.

$$1 \text{ By } \left\{ \begin{array}{l} 1 \\ 2 \\ 3 \\ 4 \\ \&c. \end{array} \right\} \text{ makes } \left\{ \begin{array}{l} 0 \ 1 \\ 0 \ 2 \\ 0 \ 3 \\ 0 \ 4 \\ \&c. \end{array} \right\}$$

$$5 \text{ by } \left\{ \begin{array}{l} 5 \\ 6 \\ 7 \\ 8 \\ \&c. \end{array} \right\} \text{ makes } \left\{ \begin{array}{l} 0 \ 25 \\ 0 \ 30 \\ 0 \ 35 \\ 0 \ 40 \\ \&c. \end{array} \right\}$$

$$10 \text{ by } \left\{ \begin{array}{l} 10 \\ 11 \\ 12 \\ 13 \\ \&c. \end{array} \right\} \text{ makes } \left\{ \begin{array}{l} 1 \ 40 \\ 1 \ 50 \\ 2 \ 00 \\ 2 \ 10 \\ \&c. \end{array} \right\}$$

$$11 \text{ by } \left\{ \begin{array}{l} 11 \\ 12 \\ 13 \\ 14 \\ \&c. \end{array} \right\} \text{ makes } \left\{ \begin{array}{l} 2 \ 1 \\ 2 \ 12 \\ 2 \ 23 \\ 2 \ 34 \\ \&c. \end{array} \right\}$$

$$30 \text{ by } \left\{ \begin{array}{l} 30 \\ 31 \\ 32 \\ 33 \\ \&c. \end{array} \right\} \text{ makes } \left\{ \begin{array}{l} 15 \ 0 \\ 15 \ 30 \\ 16 \ 00 \\ 16 \ 30 \\ \&c. \end{array} \right\}$$

$$50 \text{ by } \left\{ \begin{array}{l} 50 \\ 51 \\ 52 \\ 53 \\ \&c. \end{array} \right\} \text{ makes } \left\{ \begin{array}{l} 41 \ 40 \\ 42 \ 30 \\ 43 \ 20 \\ 44 \ 10 \\ \&c. \end{array} \right\}$$

And so onward, as far as 60 by 60, makes 60 00.

Which Tables they contracted into a square or triangular Form, extending from 1 to 60; of like nature with what we call the *Pythagorical Table* for Multiplication, extending from 1 to 10.

Such a *Sexagenary Table* there is (or should be, if not torn out) in *Blundevill's Exercises*, with a Description, and Directions for the use of it; first published about the Year 1600, or sooner, (for it is mentioned in the Preface to his Theories, published in the Year 1602, as having been then received with good approbation) and Re-printed a seventh time in the Year 1636. And the like in other Writers of Astronomical or *Sexagesimal* Fractions.

And then they had other Tables or Rules to determine the Denomination of the Product; as thus, Multiplication of

$$\text{Integers into } \left\{ \begin{array}{l} \text{Primes} \\ \text{Seconds} \\ \text{Thirds} \\ \text{Fourths} \\ \&c. \end{array} \right\} \text{ makes } \left\{ \begin{array}{l} \text{Primes} \\ \text{Seconds} \\ \text{Thirds} \\ \text{Fourths} \\ \&c. \end{array} \right\}$$

$$\text{Primes into } \left\{ \begin{array}{l} \text{Primes} \\ \text{Seconds} \\ \text{Thirds} \\ \text{Fourths} \\ \&c. \end{array} \right\} \text{ makes } \left\{ \begin{array}{l} \text{Seconds} \\ \text{Thirds} \\ \text{Fourths} \\ \text{Fifths} \\ \&c. \end{array} \right\}$$

$$\text{Seconds into } \left\{ \begin{array}{l} \text{Seconds} \\ \text{Thirds} \\ \text{Fourths} \\ \text{Fifths} \\ \&c. \end{array} \right\} \text{ makes } \left\{ \begin{array}{l} \text{Fourths} \\ \text{Fifths} \\ \text{Sixths} \\ \text{Sevenths} \\ \&c. \end{array} \right\}$$

The sum of all which Particulars, are equivalent to this one General, the Exponent of the Product, (that is, of the last part thereof) is equal to the Exponent of both the Factors put together, as 10' by 11' makes 1". 50"; and 10' by 12' makes 2" 0", &c. So 10" by 10" makes 1". 40", &c.

My meaning is, That such Tables they had (expressed in Numeral Figures) of later times, since those Figures were in use; but before, they must be expresse in such a way as this, viz.

$$\begin{array}{l} \text{II}^{\circ} \text{ into III}^{\circ}, \text{ makes VI}^{\circ} \\ \text{III}^{\circ} \text{ into IV}^{\circ}, \text{ makes XII}^{\circ}. \\ \text{IV}^{\circ} \text{ into III}^{\circ}, \text{ makes XII}^{\circ}. \end{array}$$

That is, 4 *Sexagene*s into 3 Seconds of the *Sexagesims*, makes 12 of the first *Sexagesims*, because $+1-2=-1$.

XVI" into X'", makes CLX'; that is, II^v, XL^v,

(Which

SEX

(Which they find for Expedition, by consulting their Sexagesimal Table, as we do the Table of Multiplication; where finding XVI in the top, and X in the side, they have, in the square answering to both, II, XL.)

XLV into LIV", makes XL', XXX",

Concerning this Process, by Sexagesimal Multiplication, &c. and the Demonstration of it, we have a learned and accurate Treatise in the Greek, of Barlaam a Monk, (*Barlaamus Monachus*) under the Title of *Logistica*, (*λογιστική*) whom *Vossius* (cap. 18. *De Scientiâ Mathematicâ*) placeth about the Year 1350 (but mistakes of it for a Treatise of Algebra): It is published by *John Chambers*, (then a Fellow of *Eaton College*) with his Latin Translation, and Notes upon it, in the Year 1600, encouraged thereunto by Sir *Henry Savile*, who chanced to light on a Greek Manuscript thereof abroad, and did himself, from thence transcribe it.

But this way of Multiplication and Division in Sexagesimals, proves so perplex and troublesome, (notwithstanding such a Table at hand) that since the *Indian Figures* came in use, whereby we may with more convenience manage great numbers) it is thought less troublesome, (when there is occasion to Multiply or Divide) to reduce all to the lowest Denomination; and then, having performed that Work, (of Multiplication or Division, or both) to reduce it back again to the several Denominations.

As for Instance; supposing the Luner Month of Conjunction, (from New-Moon, to New-Moon) according to the Moon's middle Motion, to be 29 D. 12 H. 44' 3" 10", *Proximè*; and I would compute how much the Moon moves from the Sun in 6 D. 5 H. 14' 16" 35". I know well that there be many Astronomical Tables computed to expedite such Operations; (which here I do not meddle with) but without such Preparatory Tables, my Work must stand thus:

if 29 D. 12 H. 44' 3" 10" (that is, 11' 48 H. 44' 3" 10") give 360 Degrees, (that is 6' 10 D. Sexagenes of Degrees) then 6 D. 5 H. 14' 16" 35" (that is, 2' 29 H. 5' 14" 16" 35") will give, how much?

Now, if I were to Work it by the Sexagesimal Tables of Multiplication, the Work would be so perplex, that I will not here repeat it; and therefore it is thought better to reduce the first and third Numbers to the lowest Denomination, that is (here) to third Scruples.

SEX

D. H. ' " "	D. H. ' " "
29 12 44 3 10	6 5 14 16 35

	32235360
153086580	+ 33
+ 10	
	32235395"
153086590"	

And then the Work will stand thus.

If 153086590 Thirds give 360 Degrees; Then 32235395 Thirds, give how many Degrees?

Where Multiplying the third Number by the second, and dividing by the first, I shall have the Number of Degrees sought in Integers, with the common Fraction annexed; which being reduced to Sexagesimals, will give the answer in Degrees, Minutes, Seconds, &c. Or I might have reduced the 360 Degrees into Thirds also, (which must have been done, if to these Degrees there had been annexed first, second, and third Minutes) and then the Answer had been in third Minutes; and these to be reduced to Degrees, Minutes, &c.

Which Operation, tho' it be troublesome enough, is yet more expedite, than by the Sexagesimal Multiplication and Division, since the time that we have learned, (by help of the Numerical Figure) to manage great Numbers, which in *Prolemy's* time were not in use.

And in like manner, whatever other come to be so Multiplied.

According to this Sexagesimal Method, *Prolemy* divides the Radius or Semi-diameter of a Circle into 60 Parts, (and consequently, the whole Diameter into 120) and each of those Parts into 60 Minutes, and each of those into 60 Seconds, and so forward, as far as occasion requires. And accordingly, the Arch answering to such a Chord; (that is, the sixth part of the Circumference, whose Chord Equals the Radius) into 60 Degr. and consequently the whole Circumference into 360° and each of these Degrees into Minutes, Seconds &c. by a continual Sexagenary Division.

And consonant hereunto, he makes his Table of Chords of Subtenes (in such Parts, Minutes, and Seconds) answering the several Arches in a Circle.

Instead

Instead of which, the *Arabs* or *Saracens* have introduced (as more Expedient) their Table of Sines, (or half Chords of the double Arch) expressed in like manner by sexagesimal Parts.

Which they did in imitation of *Ptolemy*, than that they were necessitated so to do, having the use of Numeral Figures as we have, which *Ptolemy* and others of the Ancients had not.

But *Arzachel* therein differs thus far from *Ptolemy*, that he divides his Diameter into 300 Parts which *Ptolemy* divides but into 120, and hath therefore less need of Subdivisions.

The reason why the Ancients did thus reduce their ordinary Fractions all to one kind of Denomination, was, to avoid the trouble which would arise from the different Denomination of Fractions, which (when they had not the helps that now we have) would be very great; and therefore chose to admit of Approximations, many times, instead of accurate Equalities.

And why they chose the Number 60, rather than any other Number, was, because if they had made use of 12, or such other small Number, they would be put upon a necessity of the more Subdivisions, and a Number much greater than this they could not well manage; (there being, even in this, trouble enough) and of Numbers about this bigness, this was thought most convenient, as being most capable of exact Divisions, without being put to the necessity of Approximations or Subdivisions; admitting, for Divisors, the six first Numbers, 1, 2, 3, 4, 5, 6, (which none less than it can do) and as many more answering to them 10, 12, 15, 20, 30, 60, (that is Twelve in all there being no Number less than it, admitting of so many Divisors; nor can any, greater than it, admit of more, which is not at least twice as great; which cannot be said again of any greater Number, till we come to 360. And this is that which is made the Number of Degrees in the whole Circle.

And this Division of Integers into Sexagesims (Minutes, Seconds, Thirds, &c.) especially in the Parts of Arches, Angles, Time, and Motion; the *Arabs* have retained, in imitation of the *Greeks* (or *Egyptians*) and we from them, even to this Day. *Wallis's Algebra*, Chap. VII.

SEXANGLE, in Geometry, is a Figure consisting of six Angles.

SEXTANS, is the sixth part of any thing, thus: There is an Astronomical Instrument called a *Sextant*, as being the 6th part of a Circle. This hath a graduated Limb, and is used like a Quadrant.

SEXTILE, the Position or Aspect of the Planets, when at 60 Degrees distant, or at the distance of two Signs from one another; and is marked thus, *.

SHACKLES, aboard a Ship, are those oblong Iron Rings, and bigger at one end than at the other, with which the Ports are shut fast, by thrusting the Wooden *Bar* of the Port through them. There are also a sort of Shackles to lift the Hatches up with, of the former Figure, but smaller; they are fastened at the Corners of the Hatches.

SHALLOP, is a small light Vessel with only a small Main-Mast and Fore-Mast, and Lugg-Sails, to hale up and let down on occasion: They commonly are good Sailers; especially the French *Chaboups*; and are used often as Tenders upon a Man of War.

SHAME, is an uneasiness of the Mind, upon the thought of having done something which is Indecent, or will lessen the valued Esteem which others have of us.

SHANK, or *Shank Painter*, in a Ship, is a short Chain fastned under the Fore-Mast Shrouds, by a Bolt to the Ships-side; having at the other end a Rope fastned to it. On this Shank-Painter, the whole Weight of the Aft-part of the Anchor rests, when it lies by the Ship's-side. The Rope by which it is haled up, is made fast about a Timber-head.

SHAPOURNETT: The Heralds call a kind of Cap which is born in some Coats of Arms by this Name.

SHEER, or *Sheering*; the Sea Phrase for the going of a Ship when she is not steered steadily; then they say she *sheers* or goes *sheering*; as they do also when she goes in and out by means of the swift running of a Tide-Gate, &c. for then being at an Anchor, they say there is danger, lest she should *sheer home* her Anchor, or *sheer a-shore*.

SHEER-Hooks, aboard a Ship; are great Hooks of Iron sometimes used when a Ship designs to board another. They are like a Sickle, and are let into the Main-Yard-Arms and Fore-Yard-Arms in order to spoil, cut or tear the Enemy's Shrouds, Sails, or Rigging.

SHEER-Shanks, at Sea, is the term for a kind of Knot, by which they tie up or shorten a Runner when 'tis too long, so that they cannot hoise in the Goods by it over the Ship's-sides. This Knot can be let loose again when they please.

SHEERS, for the Seamen call two Masts Yards, or Poles set up and seized a-cross each other aloft, near the top. This Pair of *Sheers*, as they call it, is placed below on the *Chain-Wales* of the shrouds, and lashed fast to the Ship's-sides to keep them steady aloft. Their use is to set in or take out a Mast; for which end, there is fastned at the place where they cross one another, a strong double Block with a strap. They serve also to hoise in or out of Boats that have Masts, such Goods as are wanted to be taken in or out.

SHEATHING of a Ship, is casing that Part of her which is to be under Water, with something to keep the Worms from eating into her Planks. 'Tis usually done by laying Tar and Hair mixt together all over the old Plank, and then nailing on thin new Boards: But this hinders a Ship's Sailing; and therefore of late some have been sheathed with milled Lead.

'Tis very well worth trying what the New-stone Pitch will do in this case; if it will defend from the Worm, as perhaps it will, a Ship might be Paid with it cheaper than with the Crown-Pitch; and it will not crack nor scale off as that will do, but keep always soft and smooth. I have seen where it hath been on 13 Months, and yet it was very black and soft.

SHEATS in a Ship, are Ropes bent to the Clews of the Sails; serving in the Lower-fails to *Hale-aft* or *Round-off* the Clew of the Sail: But in Top-fails they serve to *Hale-home* as the Word is, or to hale the Clew of the Sail close to the Yard-Arm.

If the Main-fail Sheats are *haled-aft*, 'tis in order to make the Ship keep by a Wind; but when the Fore-sheats are *haled-aft*, 'tis that the Ship may fall off from the Wind: And if she will not do it readily, they then hale the Fore-fail (by the sheat) flat in, as near the Ship's-sides as they can; and this they call *Flattning in the Fore-fail*. When they say, *Ease the Sheat*, they mean *Peel it*, or let it go out gently; but when the Word is, *Let fly* the

the *Sheat*, they mean, let it go all at once, and run out as fast as it can; and then the Sail will hang loose, and hold no Wind. In a very great Gale or Gust of Wind, there is another Rope bent to the Clews of the *Main-sail* and *Fore-sail*, above the *sheat* Block, to succour and ease the *Sheat*, and then they call a *False-sheat*.

Sheats in a Ship, also, are those Planks under Water which come along her *Run*, and are closed into the *stern Post*: So also that Part within Board in the *Run* of the Ship, is called the *Stern-sheats*. The Seamen say when they would have the *sheats* of the Main or Fore-sail haled aft, *Tally the sheats*.

SHEWING, in Law, is to be quit of Attachments in any Court, and before whomsoever in Plaints shewed, and not avow'd.

SHIFTERS, certain Men aboard a Man of War, who are employed by the Cooks to shift or change the Water in which the Flesh or Fish is put and laid for some time, in order to fit it for the Kettle.

SHIVERS, so the Seamen call those little round Wheels in which the Rope of a Pulley or Block runs. They turn with the Rope, and have pieces of Brass in their Centres, (which they call the *Cocks*) with Holes in them, into which the Pin of the Block goes, and on which they turn. These *Shivers* are usually of Wood; but some are of Brass, as those in the *Heels* of the *Top-masts*.

SHOALE, in the Sea phrase, is the same as shallow: They say, 'tis good *Shoaling*, when as a Ship sails towards the shoar, she finds by her sounding, it grows shallow by degrees, and not too suddenly; for then a Ship may go in safety.

SHORT-Accent, in Grammar, shews that the time of Pronunciation ought to be short, and is marked thus (').

SHOT of a Cable, is the splicing of two Cables together, that a Ship may ride safe in deep Waters, and in great Roads: For a Ship, will Ride easier by one shot of a Cable, than by three short Cables out a-head.

SHOT, for Ordnance, are of several sorts, as *Round-shot*, which are round-Bullets fitted in proportion to the Bore of the Piece.

Cross-bar-shot, are round shot, with a long spike of Iron cast in it, as if it did go through the middle of it.

Trundle-shot, being only a Bolt of Iron 16 or 18 Inches long, sharp-pointed at both ends, and about a Hand's breadth from each end, having a round broad Bowl of Lead cast upon it, according to the Bore of the Piece.

Langrel-shot, which runs loose with a shackle to be shorned when it is put into the Piece; and when it flies out, it spreads it self. At each end of the Bar it has half a Bullet, either of Lead or Iron.

Chain-shot, is two Bullets with a Chain betwixt them, some being contrived round, yet so that they will spread in flying their full Length and Breadth.

Case-shot, is any thing of small Bullets, Nails, old Iron, and the like, to put into the *Case*, to shoot out of Ordnance.

SHOULDRING, in Fortification, is a Reinforcement opposed to the Enemies, or a Work cast up for a Defence on one side, whether it be made of heaps of Earth cast up, or of *Gabions* and *Facines*. A *Shouldring* also is a square *Orillon* sometimes made in the Bastions on the Flank near the shoulder, to

cover the Canon of a Casemate. Again, it is taken for a Demi-bastion or Work consisting of one Face, and one Flank, which ends in a Point at the head of a *Horn-work* or *Crown-work*: Neither is it to be understood only of a small Flank added to the sides of the *Horn-work*, to defend them when they are too long, but also of the Redents which are raised on a strait Line.

SHROWDS, are great Ropes in a Ship, which come from either side of all Masts. They are fastened below by Chains to the Ship's sides, and aloft over the Head of the Mast; their *Pendants*, *Fore-tackle*, and *Swifters* being first put under them: They are also served there, to prevent their galling the Mast. The *Top-mast-throwds* are fastned to the *Putrocks* by Plaits of Iron; and by Dead-mens Eyes and Lanniers also as the others are. The terms are *Ease the shrowds*; that is, slacken them: *Set Taught the Shrowds*; that is, set them stiffer. The Bolt-sprit hath no throwds.

SICUT *alias*, is a second Writ lent out, when the first was not executed.

SIDEMEN, or *Questmen*, be those that are Yearly Chosen, according to the Custom of every Parish, to Assist the Churchwardens in the Enquiry and representing such Offenders to the Ordinary, as are Punishable in the *Court Christian*.

SIDERAL Year. See *Solar Year*.

SIDERATIO. See *Spacelos*.

SIEF, *Album*. See *Collyrium*.

SIEGE, is the encamping or sitting down of an Army before a Place, in order to take it, either by Force or by Famine.

SIGMOIDE, are the *Apophyses* of the Bones, representing the Letter C of the ancient Greeks. Also the *Valves* of the great Artery that hinder the Blood from returning back to the Heart.

SIGNIFICABIT, is a Writ *de Excommunicato capiendo*, which issueth out of the Chancery upon a Certificate given by the Ordinary, of a Man that stands obstinately Excommunicate, by the space of forty Days, for the laying him up in Prison without Bail or Mainprize, until he submit himself to the Authority of the Church. And 'tis so called, because the Word *Significavit* is an Emphatical Word in the Writ. There is also another Writ in the *Register*, *Fol. 7.* directed to the Justices of the Bench, commanding them to stay any Suit depending between such and such, by reason of an Excommunication alledged against the Plaintiff; because the sentence of the Ordinary that did Excommunicate him, is appealed from, and the Appeal yet depends undecided.

SILICUA, in Botany, is the Seed-vessel, *Husk*, *Cold*, or *Pod*, of such Plants as are of the Leguminous kind.

SILLON, in Fortification, is an elevation of Earth, made in the middle of a Moat, to Fortifie it when too broad: It is otherwise called *Envelope*, which is the more common Name.

SIMILAR *Arks* of a Circle, are such as are like Parts of their whole Circumference.

SIMILAR *Bodies*, in Natural Philosophy, are called such as have their Particles of the same Kind and Nature one with another.

SIMILAR, or *simple Parts*, by Anatomists are called such as are throughout of the same nature and texture, as all the Parts of the Bone are Bony, &c.

SIMILAR *Plane Numbers*, are those *Numbers* which may be ranged into the form of *similar Rectangles*;

angles; that is, into Rectangles, whose sides are Proportional, such are 12 and 48; for the sides of 12 are 6 and 2 (as in Fig. B.) and the sides of 48 are 12 and 4 (as in Fig. C.) But $6.2::12.4$, and therefore those Numbers are *similar*.

SIMILAR Polygons, are such as have their Angles severally Equal, and the sides about those Angles Proportional.

Thus, if in the Polygon A, all the Angles abc , &c. are respectively equal to all those def , &c. in the Polygon B. And that also ab hath the same Proportion to $bc::ad$ hath to ef . Then those two Polygons are *similar*.

SIMILAR Rectangles, are those which have their sides about the equal Angles Proportional; that is, as $ab:eb::ad:ef$.

COROLLARY I.

All Squares must be *similar Rectangles*; for (since they have all their Sides equal, and all their Angles right) whatever Proportion the side am hath to the side bi of the other Rectangle, the same must also the other side ab have to the side eb ; because they are equal to am , and to bi .

COROLLARY II.

Hence all *similar Rectangles* are to each other as the *squares* of their *Homologous sides*.

For the Rectangle A, is to B :: as the Square bm is to the Square ei ; since as well Squares as Rectangles are in a duplicate Ratio to that of their sides.

SIMILAR Right-Lin'd Figures, are such as have equal Angles, and the sides about those equal Angles proportional.

SIMILAR Segments of a Circle are such as contain equal Angles.

SIMILAR solid Numbers, are those, whose little Cubes may be so ranged as to make *similar* and rectangular Parallelopipeds.

SIMILAR Triangles, are such as have all their three Angles respectively equal to one another.

As if the Angle a be equal to d , the Angle c equal to e , and the Angle b equal to f ; then is the Triangle abc similar or like to dfe : And then the sides about the Equal Angles are always proportional; that is, ab hath the same Proportion to ac as fd hath to de , and is thus written;

$$ab : ac :: fd : de.$$

PROPOSITION.

All Similar Triangles, have the sides about their Equal Angles Proportional.

Thus in the Figure.

I say, $AB : ab :: AC : ac :: CB : bc$, &c.

For set the lesser Triangle into the greater, by taking $Ab = ab$, and $Ac = ac$, then will the Base bc , be the same as in the lesser Triangle; and the whole Triangle Abc , will be equal to abc .

And therefore the Angle Abc , will be equal to the Angle B , and $Ac = C$.

Wherefore the Line bc , is Parallel to Bb : And therefore,

$$Ab : AB : Ac : AC :: bc : BC, \text{ \&c.}$$

Q. E. D.

Otherwise thus, according to *Euclid*.

Let the Triangle abc , be similar to dce . Then I say, That the sides about their Equal Angles are Proportional:

Set the Bases of the two Triangles ac and ec , together as that they may join and make one

Right Line ae ; and draw out the Lines ab and ed , till they meet together in the Point f .

DEMONSTRATION.

Because the Angle $a =$ Angle dce , af , is Parallel to cd also, because the Angle acb , is equal to the Angle ecf ; the Lines bc and fe are Parallel. Wherefore $bcdfe$, must be a Parallelogram, whose opposite sides are equal, that $bf = cd$, and $bc = fd$.

Therefore because cd is Parallel to the Base af , of the Triangle fea ; $de : fd$ (or bc) :: $ec : ac$.

That is, $de : bc :: ec : ac$. And therefore alternately, $de : ec :: bc : ad$. And so the sides about c and e are proved Proportionable.

Also because bc is Parallel to the Base fe , of the Triangle afe . Therefore $ec : ac :: fb$, (or cd) : ab : That is, $ec : ac :: cd : ab$. And therefore alternately, $ec : cd :: ac : ab$. And so the sides about the equal Angles a , and dce , are found Proportional. The same may be easily done by the Angles b and d .

Another Demonstration by *Pardie*.

Because the Angle A is $=$ to a , Angle C to c , &c. Therefore the Ark opposite to them must be equal: (That is, not in length, but must contain an equal Number of Degrees.) Wherefore Chords also subtending those Arks, must be Proportionable Chords of the same Number of Degrees; and consequently will be all Similar Parts of their own proper Radius.

That is, $ca : ab ::$ (in respect of its Radius) $CA : AB$. in respect of its Radius. Therefore

the Sides about the equal Angles will be proportional.

Or, $bc : ba :: BC : BA$, Q. E. D.

COROLLARY I.

From hence it follows, That all *Similar Triangles* are to one another, as the Squares of their Homologous Sides. For these *Triangles* are the Halves of *Similar Triangles* or *Parallelograms*, which are to one another in a *Duplicate Ratio* of their Homologous Sides; Therefore the Halves must be as the Wholes.

COROLLARY II.

All *Similar Polygons* are to one another as the Squares of their Homologous Sides. For being made up of *Similar Triangles*; the Aggregates or Sums will be to each other, as the Parts cut, of which they were made.

SIMONY, is an unlawful Contract made to have a Man presented to a Rectory or Vicarage: It was agreed by all the Justices, that if the Patron present any Person to a Benefice with Cure, for Money, that such Presentation, &c. is void, tho' the Presentee were not Privy to it, and the Statute gives Presentation to the King: But this is now repealed.

SIMPLE Flank. See *Flank*.

SIMPLE Place, a Term in Geometry. See *Place Simple*.

SIMPLE Problem. See *Linear Problem*.

SIMPLE Problem, in Mathematicks. See a *Linear One*.

SIMPLE Quantities, in Algebra, are such as have but one Sign, whether Positive or Negative: Thus.

$2a$, and $-3b$, are *Simple Quantities*.

But $a + b$, and $+d - c + b$ are compound ones.

SIMPLE Tenaille. See *Tenaille*.

SINAPISMUS, is a Medicine applied to the Head, and is prepared of Mustard, Wild Raddish, and Leven. *Blanchard*.

SINCIPUT, the Fore-part of the Head, reaching from the Fore-head to the Coronal Suture.

SINE, or *Right Sine*, is a right Line drawn from one end of an Arch, perpendicularly upon the Diameter drawn from the other end of that Arch; or it is half the Chord of twice the Arch. See more under the Word *Trigonometry*.

SINE assensu capitali, is a Writ against him that alienates Lands without consent of his Chapter or Covent.

SINE Complement. See *Complement*.

SINE die, in Law, when Judgment is given against the Plaintiff, he is said to be *in misericordia pro falso clamore suo*: But when for the Defendant, then 'tis said, *Eat inde sine die*.

SINGLE, or *Simple Excentricity*. See *Eccentricity*.

SINGULTUS, or the Hickoup, is a Convulsive Motion of the Midriff, caused by rough and irregular Particles, forcing it to this disordinate Motion. *Blanchard*.

SINICAL Quadrant, is made of Brass or Wood, with Sines drawn from each Side intersecting one another, with an Index divided by Sines also,

with ninety Degrees on the Limb, and two Sights to the Edge, to take the Altitude of the Sun. Sometimes instead of Sines, 'tis divided all into equal Parts: And is used by Seamen to solve by inspection any Problem of *Plain Sailing*.

SINESTER Side or Part of an Efcutcheon, is the left Side Part. *Vide Efcutcheon*.

SINNET, is a Line or String made of Rope-yarn, consisting generally of two, fix, or nine Strings, which are divided into three Parts, and are platted over one another, and then it is beaten smooth and flat, with a Wooden Mallet, its use is to *Serve* the Ropes, that is to keep them from gawling.

SI non omnes, is a Writ of Association, whereby, if all in Commission cannot meet at the Day assigned, it is allowed, That two, or more of them, may finish the Business.

SINUS, any Cavity in or between the Vessels of an *Animal Body*, the Anatomists call a *Sinus*, and some Philosophical Writers call these Fissures or Cavities which are between the several Strata or Layers of the Earth, in Mines, &c. by this Term *Sinus*, for *Sinus* in Mathematicks. See *Sine*.

SINUS Meningium, are those 3 Cavities which *Galen* calls the Ventricles of the Thick Membrane. The first and second, or the Lateral *Sinus*, are seated between the Brain and the *Cerebellum*, and end in the vertebral *Sinus's*. The third begins from the *Os Cribriforme*, and ends in the middle of the former *Sinus's*. The fourth arises from the *Pinealis* Glandule, and ends in the middle of the lateral *Sinus's*. The Inferion of these *Sinus's* is called *Trocular Herophili*. The *Sinus's*, after they have passed through the Scull, are partly continued with the Jugular Veins, and partly descend through the whole length of the Spinal Marrow down to the *Os Sacrum*. The use of them is to supply the place of Veins, for they convey the Blood from the Brain and *Cerebellum*, partly into the Jugular Veins, and partly into the Vertebral *Sinus's*. *Blanchard*. With us the Ventricles of the Brain are accounted only the three Partitions or Subdivisions of the Forinx; and they serve as a Sink to drain away the excrementitious Matter of the Brain.

SINUS Ossium, are those Cavities of the Bones which receive the Heads of other Bones.

SIPHON, a Glass or metalline crooked Pipe, Tube, or Cane. See *Syphon*.

SI Recognoscant, is a Writ that lies for a Creditor against his Debtor, for Money numbered, that hath before the Sheriff in the *County Court*, acknowledged himself to owe his Creditor such a Sum, received of him in *pecuniis numeratis*.

SIRIUS, the *Dog-star*, a bright Star of the first Magnitude, in the Constellation *Canis major*, its Longitude is 99 Degrees, 47 Minutes, Latitude 39 Degrees, 32 Minutes.

SIRONES, little Pusles in the Palm of the Hand, and Sole of the Foot, containing certain small Insects or Worms.

SCARFED, the Sea Term, when one Piece of Timber is let and fasten'd into another. See *Scarfed*.

SKELETON, of a Man or other Animal, is when the Bones are cleaned and dry, and put together according to Art in their natural Order and Position.

SKUPPERS, and *Skupper-holes*. See *Scoper-holes*.

SLATCH, when any Rope or Cable hangs slack, the Seamen call the middle Part which hangs

hangs down, the *Slatch* of the Cable or Rope, so also after long foul Weather, if there come a small Intervall of fair, they say, this is a *Slatch* of fair Weather.

SLEEPERS, Timbers lying before and aft in the bottom of a Ship as the Rung-heads do; the lowermost of them is bolted to the Rung-heads, and the uppermost to the *Futtocks*, in order to strengthen and fasten the *Futtocks* and *Rungs*.

SLIDING Rules, or Scales, are Instruments to be used without Compasses, in Gauging, Measuring, &c. having their Lines fitted so as to answer Proportions by Inspection; they are very Ingeniously contrived and applied by *Gunter*, *Partridge*, *Cogshall*, *Everard*, *Hunt*, and others, who have Written particular Treatises about their Use and Application.

SLING, a Word used variously at Sea; there are *Slings* to hoist up Casks or any other heavy things; which are made of Ropes, spliced into themselves at either end, with an Eye big enough to hold the thing to be *Slung*.

There are other *Slings* which are made longer and with a small Eye at each end, one of which is put over the Breech of a Piece of Ordnance, and the other Eye comes over the end of an Iron Crow, which is put into the Mouth of the Piece, to Weigh and Hoist the Gun as they please.

There are also *Slings* for the Yards, which is done by binding them fast to the *Cross-tree* aloft, and to the Head of the Mast with a strong Rope or Chain, that if the Tye should happen to break, or to be shot to pieces in a Fight, the Yard nevertheless may not fall down upon the Hatches.

SMELLING, is probably occasioned by the *Effluvia* of Odorous Bodies mingling themselves with the Air, and entering up the Nostrils, which are covered with a very Nervous and Sensible Coat, and there insinuating themselves into the Processes of the Olfactory Nerve, do move it variously according to their various and different Nature, and so communicate to the Brain, such corresponding Motions, as enables the Soul to judge differently of the Bodies emitting such *Effluvia*: And from hence when the *Effluvia* produces a grateful Sensation, we say its hath a sweet Smell, but when a disagreeable one, we say it stinks.

SMITEING-Line, in a Ship, is a small Rope fastened to the Mizen-yard Arm, below at the Deck, and is always furled up with the Mizen-sail, even to the upper end of the Yard, and from thence it comes down to the Poop. Its Use is to loose the Mizen-sail without striking down the Yard, which is easily done, because the Mizen-sail is furled up only with Rope-yarns; and therefore when this Rope is pulled hard, it breaks all the Rope-yarns, and so the Sail falls down of it self: The Word of Art is, *Smite the Mizen* (whence this Rope takes its Name;) that is, hale by this Rope that the Sail may fall down.

SNATCH Block, is a great Block in a Ship, with a Shiver in it, having a Notch cut thro' one of its Checks for the more ready receiving in of any Rope: For by this Notch, the middle part of a Rope may be reeved into this Block, without passing it in end-ways. This ready Block is commonly fastened with a Strap about the Main-mast, close to the Upper Deck, and is chiefly used for the Fall of the *Winding Tackle*, which is reeved into this Block, and then brought to the Captain.

SNOW. The Learned Dr. Grew, in *Philoso-*

phical Transactions, N. 92. gives the following Account of Snow, which seems very exact and just.

1. With Mr. *Des Cartes*, and Dr. *Hook*, he observes, That many parts hereof are of a Regular Figure; for the most part being as it were so many little Rowels, or Stars of 6 Points; being perfect and transparent Ice, as any one may see upon a Pool, or Vessel of Water; upon each of which 6 Points, are set other collateral Points, and those always at the same Angles, as are the main Points themselves.

2. Amongst these Regular Figures, tho' many of them are large and fair; yet from these taking our first *Item*, many others, alike Regular, but far less, may likewise be discovered.

3. Amongst these, not only Regular, but entire Parts of Snow, looking still more warily, we shall perceive, that there are divers others indeed irregular, which yet are chiefly the broken Points, Parcels, and Fragments of the Regular ones.

4. That besides the broken parts, there are some others which seem to have lost their Regularity, not so much in being broken, as by various Winds, first gently Thaw'd, and then Froze into little irregular Clumpers again.

From whence the true Notion, and external Nature of Snow, seemeth to appear, viz. That not only some few parts of Snow, but originally, the whole Body of it, or of a Snowy Cloud, is an infinite Mass of Icicles regularly figured; not one Particle thereof I say, originally, not one of so many Millions, being indetermined, or irregular; that is to say, a Cloud of Vapours being gathered into Drops, the said Drops forthwith descend; upon which Descent, meeting with a soft freezing Wind, or at least passing thro' a Colder Region of the Air, each drop is immediately froze into an Icicle, shooting it self forth into several Points or *Stiries*, on each Hand forward its Centre: But still continuing their descent, and meeting with some sprinkling and intermixing Gales of Warmer Air, or in their continual Motion and Waftage to and fro, touching upon each other; some are a little thaw'd, blunted, frosted, clump'd, others broken, but the most hanked and clung in several Parcels together, which we call Flanks of Snow.

It being known what Snow is, we understand; why, though it seem to be soft, yet 'tis truly hard: because true Ice, the inseparable property whereof is to be hard; seeming only to be soft, because upon the first touch of the Finger, upon any of its sharp Edges or Points, they instantly thaw; or otherwise they would pierce our Fingers as so many Lancets.

Why again, though Snow be true Ice, and so hard and dense a Body, yet very light; because of the extreme thinness of each Icicle in comparison of its breadth. For so Gold, which though of all Bodies it be the most ponderous, yet being beaten into Leaves, rides upon the least breath of Air; and so in all other Bodies, where there is but little Matter contained within large Dimensions, and possibly in no other Case.

Also, how it is *White*, not because hard; for there are many soft Bodies White; but because consisting of parts, all of them singly transparent, but being mixed together appear White; as the Parts of Froth, Glais, Ice, and other transparent Bodies, whether soft or hard.

Thus much for the *External* Nature of *Snow*; let us next enquire into its *Essential* Nature.

Now to make a Judgment of this, is by considering, what the general Figure of *Snow* is, and comparing the same with such Regular Figures as we see in divers other Bodies, in that where we see the like Configurations, we may believe there is the like Subject: wherein, or the like Efficient *whereby* but those and these are made.

As for the Figure of *Snow*, 'tis generally one, viz. that which is above described: Rarely of different ones, which may be reduced chiefly to two general Circulars and Hexagonals, either Simple or Compounded together, more rarely, either to be seen of more than 6 Points; but if so, then not of 8 or 10 but 12. Or in single Shoots, as so many short, slender Cylindeers, like those of *Nitre*. Or by one of those shoots, as the Axle-tree, and touching upon the Centre of a Pair of pointed Icicles, joynd together as the two Wheels. Or the same Hexagonal Figure, and of the same usual breadth; but continued in thickness and profundity. All these are rare, the first described being the general Figure.

As for the Configuration of other Bodies we shall find, that there are divers which have some a less, others a more near resemblance thereto. *Nitre* is formed as is commonly known in long Cylindrical shoots, as also all *Lixivial* Salts for the most part resembling, tho' not perfectly, the several Points of each Starry Icicle of *Snow*. *Salt of Harts-horn*, *Sal Armoniack*, and some other volatile Salts, besides their main and longer shoots have others shorter Branched out from them; resembling as those the main, so these the Collateral Points of the *Snow*, but the Icicles of *Urine* are still more near: For in *Salt of Harts-horn*, altho' the Collateral shoots stand at acute Angles with the main, yet not by pairs at equal height: And in *Sal Armoniack*, altho' they stand Diametrically opposite, or at equal height; yet withal at right, not acute Angles: Whereas in the Icicles of *Urine*, they stand at equal Heights, and at acute Angles both; in both, like those of *Snow*. And it is observable that the Configuration of *Feathers* is likewise the same. The reason whereof is, because Fowls having no Organs for Evacuation of Urine, the Urinous Parts of their Blood are evacuated by the Habit or Skin, where they produce and nourish Feathers.

From whence it should seem, That every Drop of Rain aforesaid, containing in it self some Spirituous Particles, (as from the height to which they are advanced, the prolifick Verue of Rain, and its easie tendency to Putrefaction, above other Water, is argued they do) and meeting with others in their Descent, of a Saline, and that partly Nitrous, but chiefly Urinous, or of an *acide-salinous* Nature; the said Spirituous Parts are apprehended by them, and with those the Watry; and so the whole Drop is fix'd, yet not into any indifferent and irregular shape, depriving their Spirituous parts of their Motion in an instant; but according to the Energy of the Spirituous, as the Pencil, and

the Specifick Nature, or determinate possibility of the Saline Parts, as the Ruler, 'tis thus figured into a little Star.

These things somewhat further considered and cleared, may add a little to that great deal of Light which the Honourable Mr. Boyle, hath given to the Nature of Gold, the Air, and the Bodies therein contained, in his Excellent Discourses thereof.

SOC, is a Word signifying a Power, or Liberty of Jurisdiction; whence comes the Law *Latine* Word *Soca*, for a Seigniorie enfranchised by the King, with liberty of holding a Court of his *Sockmen*, or *Socagars*; that is, his Tenants whose Tenure is hence called *Socage*.

SOCAGE, is a Tenure of Lands by, or for certain inferior Services of Husbandry to be performed to the Lord of the Fee, or is a Tenure of Lands, when a Man is infeoffed freely without any Service, Word, Relief, or Marriage, and pays to his Lord such Duty as is called, *Petie Sergeanty*, &c.

There is also *Free, or Common Socage*, and *Base Socage*, or *Villanage*.

Other Divisions thereof there are in Law Books: But by the Statute 12 *Car. 2. cap. 24.* all Tenures shall be adjudged, and taken to be turned into *free and common Socage*.

SOCMANS, or *Sokemans*, are such Tenants as hold their Lands and Tenements by *Socage* Tenure.

SOLEUS, is a Muscle that helps to extend the Foot.

SOLAR Comet. See *Discus*.

SOLAR Cycle. See *Cycle of the Sun*.

SOLAR Spots. See *Spots of the Sun*.

SOLAR Year, is either *Tropical*, or *Siderial*.

Tropical Year, is that space of Time, wherein the Sun returns again to the same Equinoctial, or Solstitial Point, which is always equal to 365 Days, 5 Hours, and about 55 Minutes.

The *Siderial* Year; is the space wherein the Sun comes back to any particular Fixed Star, which is about 365 Days, 8 Hours, and 9 Minutes.

SOLE Tenant, is he or she that holds only in his or her own Right, without any other joined: As, if a Man and his Wife hold Land for their Lives, the Remainder to their Son; here the Man dying, the Lord shall not have Heriot, because he dieth not *Sole-Tenant*.

SOLET & debet. See *Debet and Solet*.

SOLID, in Geometry, is the Third Species of Magnitude, having three Dimensions, Length, Breadth and Thickness; and is frequently used in the same sense with Body. It may be conceived to be formed by the direct Motion, or the Revolution of any Superficies, of what Nature, or Figure soever.

SOLID Angle, is an Angle made by the meeting of three or more Planes, and those joining in a Point, like the point of a Diamond well cut.

SOLID Bastion. See *Bastion*.

SOLID Numbers, are those which arise from the Multiplication of a Plain Number, by any other whatsoever; as 18 is a *solid Number* made of 6, (which is *Plane*) multiplied by 3; or of 9 multiplied by 2.

SOLID Place. See *Place solid*.

SOLID Problem, in Mathematicks, is one which can't be Geometrically solved, but by the Interfection of a Circle, and a Conick Section; or by the Interfection of two other Conick Sections besides the Circle.

As, *To describe an Isosceles Triangle on a given Right Line, whose Angle at the Base, shall be triple to that at the Vertex.*

This will help to Inscribe a Regular Heptagon, in a given Circle, and may be resolved by the Interfection of a Parabola and a Circle.

The following Problem also helps to Inscribe a Nonagon in a Circle; and may be solved by the Interfection of a Parabola, and an Hyperbola between its Asymptotes: *Viz.*

To describe an Isosceles Triangle, whose Angle at the Base, shall be Quadruple of that at the Vertex.

And such a Problem as this, hath 4 solutions, and no more; because 2 Conick Sections can cut one another but in 4 Points.

How all such Problems are constructed, Mr. Halley shews in *Philosoph. Transact. N. 188.*

SOLIDITY (see *Firmness*) is a Quality of a Natural Body contrary to Fluidity, and appears to consist in the Parts of Bodies being interwoven and intangled one with another, so that they cannot diffuse themselves several ways, as Fluid Bodies can.

SOLLICITOR, is a Man employ'd to take care of, and follow Suits depending in Courts of Law, or Equity; formerly allowed only to Nobility, whose Menial Servants they were; but now too frequently used by others, to the damage of the People, and the increase of Champerty and Maintenance.

SOLSTICE, is the Time when the Sun entering the Tropical Points, is got furthest from the Equator, and before he returns back towards it, seems to be for some time at a stand, being moved in the same Parallel, and scarce making any other Lines than perfect Circles, so small is its Progress. These *Solstices* are two:

Estival, or Summer *Solstice*, when the Sun enters *Cancer* the 11th of June, making the longest Day, and the shortest Night.

And the *Hyemal*, or Winter *Solstice*, on the 11th of December, when he enters *Capricorn*, the Nights being then at the longest, and Days at the shortest; that is, in Northern Regions, for under the Equator there is no Variation, but a continual Equinox; and in the Southern Parts, the Sun's Entrance into *Capricorn*, makes the longest Day; and into *Cancer*, the longest Night.

SOLSTITIAL Colure. See *Colure*.

SOLUBLE Tartar, is made by boiling in 3 Pints of Water, 8 Ounces of Cream of Tartar, and 4 Ounces of the Fix'd Salt of Tartar, for about half an Hour in an Earthen Pan unglazed; and then when 'tis cool, filtrating and evaporating it till 'tis dry: 11 Ounces and 6 Drams of Salt will remain at the Bottom. This is the *Soluble Tartar*. 'Tis accounted a very good Aperitive Medicine.

'Tis called also a *Vegetable Salt*. Sometimes the *Tincture of Mars* is added in this Preparation, and then 'tis called *Soluble Tartar Chalybeate*.

An *Emericck Tartar*, is also made of this Soluble Tartar, and Liver of Antimony, which works as the common one.

SOLVENDO esse, a Term in Law, signifying that a Man hath wherewith to pay, or is a Person solvent.

SOLVENT, the same with Dissolvent, being any Corrosive Liquor, or *Mensstruum*, that will dissolve Bodies.

SOLUTIO Chymica, is a resolving any Body into its Chymical Principles; which are, Spirit, Salt, Sulphur, Earth and Water.

SOLUTIO continui, is a Diffolution of the Unity and Continuity of the Parts: As in Wounds, Ulcers, Fractures, &c.

SOLUTION, in Mathematicks, is the answering of any Question, of the Resolution of any Problem.

SOLUTIONE feodi Militis Parliamenti, and *Solutione feodi Burgens Parliamenti*, are Writs whereby Knights of the Shire and Burgessees may recover their Allowance, if it be denied.

SOLUTE. See *Laxative*.

SOMMONS. See *Summons*.

SOMNIFEROUS, or Sleeping Medicines, are such which consisting of ferid Sulphureous Parts, dissipate and extinguish the Animal Spirits, and hinder their Increase, whence follows Sleep. *Blanchard*.

SOPHISTICATED, the same with counterfeited, debased, or adulterated; and is usually spoken of Wines, Chymical Preparations, &c. when they are not made good in their Kinds, thro' the Avarice of the Compozer.

SOPHORIFEROUS. See *Somniferous*.

SORITES, is a sort of Argument composed of several Propositions, of which the second depends upon the first, the third upon the second, and so forward.

SORROW, is uneasiness of the Mind, upon the thought of a Good lost, which might have been enjoy'd longer; or the sense of a present Evil.

SOUND, seems to be produced by the subtiler, and more Etherial Parts of the Air, being formed and modified into a great many small Masses of Contextures, exactly similar in Figure; which Contextures are made by the Collision and peculiar Motion of the Sonorous Body, and flying off from it, are diffused all around in the Medium, and there do affect the Organ of our Ear in one and the same manner.

Sound, also appears not to be produced in the Air, so much by the swiftness, as by the very frequent Repercussions, and reciprocal Shakings of the Sonorous Body.

Sir *Isaac Newton* demonstrates, (in *Prop. 43. Lib. 2.* of his *Principles*;) That sounds, because they arise from the Tremulous Motion of Bodies, are nothing else but the Propagation of the Pulse of the Air. And this he saith, is confirmed by those great Tremors that strong and grave Sound excite in Bodies round about, as the Ringing of Bells, noise of Canon, &c.

And in another place he concludes; That Sounds do not consist in the Motion of any *Ether*, or finer Air, but in the Agitation of the whole common Air; because he found by Experiments, That the Motion of Sound depended on the Density of the whole Air.

He found by good Experiments, That a Sound moves 968 Feet, English, in a Second of Time, pag. 270. Sup-

Supposing the Air by the Pulse which causes Sound, to be in a Motion, like that of the Water when its Waves roul; he calculates the Breadth of the Pulse, or the Distance between Wave and Wave, to be in the Sounds of all open Pipes, double the Length of those Pipes, which he grounds on an Experiment of Father Merfennus, in his *Harmonicks*, that an extended String made 104 Vibrations in a Second, when it was an Unifone with the *Cfaut* Pipe of an Organ, whose Length was 4 Foot open, and 2 Foot stop'd, pag. 372.

Why the Sound ceases always with the Motion of the Sonorous Body; and why they reach the Ear equally soon, when far off, or near: He shews in *Prop. 48, Cor.* where he proves, That the Number of the Pulses propagated, is always the very same with the Number of the Vibrations of the Tremulous Body, and that they are not by any means multiplied as they go from it.

The following Properties have been observed of Sound; in many of which, there is a near Relation between it and Light. For,

1. As Light acquaints the Eye with the different Qualities, Magnitudes, and Figures of Bodies, so Sound in like manner informs the Ear of many of the same Things, in the Sonorous Body.

2. As Light presently vanishes on the Removal, or Total Eclipse of the Radiating Body, so a Sound perishes as soon as the Undulation of the Air ceases, which Motion both produces and preserveth all Sounds.

3. The Diffusion of Sound from the Sonorous Body is *Spherical*, like the Radiation of Light from its Centre.

4. A great Sound drowns a less, as a greater Light eclipses a less.

5. Too Great, Loud, or Shrill a Sound is Offensive and Injurious to the Ear, as too great and bright a Light is to the Eye.

6. Sound also (like Light) moves sensibly from Place to Place, tho' nothing near so swift as Light. It is Reflected like Light from all hard Bodies; it is hindered and refracted, by passing thro' a Denfer Medium. But it differs from Light in this, that whereas Light is always propagated in Right Lines, the Motion of Sound is almost always *Curvilinear*.

7. Sound also differs much from Light in this, that it is very much weakened by Winds, and such like Motions of the Air, which yet have no Effect on Light. For *Merfennus* Computes, that the Diameter of the Sphere of a sound heard against the Wind is near a third Part less, than when coming with the Wind.

8. A very small quantity of Body, serves to reflect the Rays of Light: as we perceive manifestly in small pieces of Looking-glasses, &c. But there appears to be necessary a Body of much larger Dimensions to Return a Sound, or to make an Echo.

9. As to Reflection of Sounds: 'Tis observed,

that if one stand near the Reflecting Body, and the Sound be not very far off, tho' an Echo be produced, yet it cannot be heard; because the Direct and Reflex Sound, enter the Ear almost at the same time: But then the Sound appears to be stronger than ordinary, and lasts longer: Especially when the Reflexion is made from divers Bodies at once; as from Arches and Vaulted Rooms, from whence the confused Bomb of such like Places arises.

And from hence probably may be deduced, the Reason why Concave Bodies are (*ceteris paribus*) fittest to produce great and clear Sounds; such as Bells, &c. for in such Bodies the Sound is very swiftly and very often Reflected from side to side, and from one Part of the Cavity to another, and the Bell hanging at liberty, this produces great tremblings and shakings of the whole Concave Body, which occasions the Sound to continue till they cease and are quiet.

10. There is one Phenomenon of Sounds that is indeed very wonderful, That all Sounds great or small, with the Wind or against it, from the same Distance, come to the Ear at the same Time.

Dr. *Holder* in his Books of the Natural Grounds and Principles of Harmony; says, That if the tremulous Motion which causeth Sound, be Uniform, then it produces a Musical Note, or Sound: But if it be Difform, then it produces a Noise.

The *Florentine* Academicks found a Sound to move one of their Miles (*viz.* 3000 *Braccia*, or 5925 Feet) in Five Seconds of Time: Therefore according to them, it moves 1185 Foot in one Second.

But Sir *Isaac Newton* found it to move but 968 Foot, in a Second of Time.

Sound, in Geography, is any great Indraght of the Sea, between two Head-lands, where there is no Passage through.

Sounding, when the Seamen try the Depth of the Water with a Line and Plummert, they call it Sounding. But their *Sounding Line*, as they call it, is a Line different from the *Deep Sea Line*, as being bigger than it, and not much above 20 Fathom in length; and is marked at 2 Fathom, with a piece of Black Leather betwixt the Stranns; so also at 3 Fathom, and at 4; but at 5 'tis marked with a piece of White Leather, or Cloth.

This Line can be used when the Ship is under Sail; but the Deep Sea Line cannot be used well, except the Ship be brought upon the Back-stays, (See *Deep Sea Line*.)

To sound the deepest Sea without a Line.

Take a Globe of Fir or Maple, or other light Wood, as A; let it be well secured by Varnish, Pitch, or otherwise, from imbibing Water; take also a piece of Lead or Stone D, considerable heavier than will sink the Globe.

Let there be a long Wire-staple B, in the Ball A, and a springing Wire C, with a bended end F; and into the said Staple, press in with your Fingers, the springing Wire on the bended end: And on it hang the Weight D, by its Hook E; and so let Globe and all sink into the Water gently, in the posture represented in the said Figure, to the Bottom, where the Weight D, touching first, is thereby stop'd; but the Ball being by the *Impetus* it acquired in descending, carried downwards, a little after the Weight is stop'd, suffers the springing Wire to fly back, and thereby sets it self at liberty to re-ascend: And by observing the time of the Balls stay under Water, (which may be done by a Watch, having Minutes and Seconds; or by a good Minute-glass; or best of all by a Pendulum vibrating Seconds; which must be 3 Foot, 3 $\frac{1}{2}$ Inches long, *viz.* between the middle of the Bullet, and the upper end of the Thread, where it is fastened, or held when it Vibrates. By this way, with the help of some Tables, you may come to know any Depth of the Sea.

Note, That care must be had of proportioning the Weight, and Shape of the Lead, to the Bulk, Weight, and Figure of the Globe, after such a manner, as upon Experience shall be found most convenient.

In some of the Trials already made with this Instrument, the Globe being of Maple-wood, well covered with Pitch, to hinder soaking in, was 5 $\frac{1}{2}$

Inches in Diameter, and weighed 2 $\frac{1}{2}$ Pounds; the Lead of 4 $\frac{1}{2}$ Pounds Weight, was of a Conical Form, (but is now used of a Globous) 11 Inches long with the sharper end downwards, 1 $\frac{7}{8}$ at the Bottom, in Diameter: And in those Experiments made in the *Thames*, in the Depth of 19 Foot Water, there passed between the Immersion and Emerision of the Globe, 6 Seconds of an Hour; and in the Depth of 10 Foot Water, there passed 3 $\frac{1}{2}$ or thereabouts: From many of which kind of Experiments, it will likely not be hard to find out a Method to calculate what depth is to be included from any time of the like Globes stay under Water.

As for instance: If in the Depth of 20 Fathom, measured by the Line, the Globe stays under Water, 15 Seconds; then if the Ball stay 700 Seconds, the Depth of the Sea is 933 Fathom and 2 Foot, if the Ball be found to move equal Spaces in equal Times.

And now I'm mentioning the way of finding the Depth of the Sea, it may be of use to shew you how you may get Water from thence, which shall not communicate as it comes up with any of the Water above it.

To fetch up Water from any Depth of the Sea.

Let there be made a Square Wooden Bucket, as represented by the Figure C; whose Bottom E E, are to be so contrived, that the Weight A do sink the Iron B, to which the Bucket C, is fastned by the two Handles D D, (on the Ends of which are the moveable Bottoms or Valves E E) and whereby draws down the Bucket: The Resistance of the Water keeps up the Bucket in the Posture C; whereby the Water hath a clear thorough passage all the time it is descending; whereas, as soon as the Bucket is pulled upwards by the Line F, the Resistance of the Water to that Motion, beats the Bucket downwards, and keeps it in the Posture G; whereby the included Water is preserved from going out, and the Ambient Water kept from getting in.

By the Advantage of this, or the like Vessel, the several Degrees of Saltness of Sea-water, may be known, according to its nearness to the Top or Bottom; or rather the Constitution of the Sea-water in the several Depths of several Climates.

SOUTH Direct Dials. See *Prime Verticals*.

SOUTHERN Signs. See *Austral Signs*.

SOWNE, is a Term used in the *Exchequer*; where *Estreats that Sowne not*, are such as the Sheriff by his Industry cannot get, and *Estreats that Sowne*, are such as he may gather.

SPACE, if considered, barely in Length, between any two Beings, is the same Idea that we have of *Distance*; but if it be considered in Length, Breadth and Thickness, it is properly called *Capacity*: And when consider'd between the Extremities of Matter, which fills the Capacity of *Space*,

with something, Solid, Tangible, and Moveable, or with Body; it is then called *Extension*, so that *Extension* is an Idea belonging to Body only; but *Space* 'tis plain may be considered without it. So that *Space*, in the general signification, is the same thing with *Distance*, consider'd every way, whether there be any solid Matter in it or not.

Space therefore, is either *Absolute* or *Relative*.

Absolute Space, considered, in its own Nature, and without regard to any thing external, always remains the same, and is immoveable; but *Relative Space*, is that moveable Dimension or Measure of the former, which our Senses define by its Positions to Bodies within it; and this the vulgar use for immoveable *Space*.

Relative Space, in Magnitude and Figure, is always the same with *Absolute*, but 'tis not necessary it should be so Numerically. Thus if you suppose a Ship to be indeed in *absolute Rest*, then the Places of all things within her, will be the same *Absolutely* and *Relatively*, and nothing will change its Place. But then suppose the Ship under Sail, or in Motion, and she will continually pass thro' new Parts of *absolute Space*: But all things on Board consider'd *Relatively*, in respect to the Ship, may be notwithstanding in the same Places, or have the same Situation and Position, in regard to one another.

SPAGYRICA Medicina. See *Hermetic*.

SPAGYRICK, or *Spagyric* Art, the same with Chymistry; and a *Spagyrist*, is a Chymist. Chymistry is called the *Spagyric* Art, from *σπῆν* and *αἰσεν*, to extract, and to collect, or gather together. Because it teaches how to separate and extract the purer Parts or Substances, from mixt Bodies.

SPARADRAPUM, in a Piece of Linen ting'd on both sides, either with a thick Ointment, or Plaster, and is made this way. After you have melted your Ointment, or Plaster, dip your Linen in it, extend it, and keep it for use. *Blanchard*.

SPASMODICKS, are Medicines against Convulsions.

SPASMOLOGIA, is a Treatise of Convulsions.

SPASMUS, is any Convulsive Motion: *Cardan* makes two sorts of Convulsive Affections, viz. *Tetanus Spasmus*; and by the former he understands a constant Contraction, whereby the Member becomes rigid and inflexible; by the latter he understands sudden Concussions and Motions, which cease and return Alternately. *Blanchard*.

SPASMUS Cynicus, a sort of Convulsions, whereby the Mouth is distorted on one side thro' the Contraction of the Muscles.

SPECIALITY, in Law, is most commonly taken for a Bond, or Bill, or such like Instrument.

SPECIES, in Metaphysics, or Logick, is an Idea, that relates to another more general one, to which it is subservient, and has only under it *Individuals* and *Singulars*.

SPECIES in Algebra, are those Letters, Notes, Marks, or Symbols, which represent the Quantities in any Equation or Demonstration. This short and advantageous way of Notation, was first Introduced by *Vieta*, about the Year 1590, and by it he made many discoveries in the Process of *Algebra*, not before taken notice of.

The Reason why *Vieta* gave this Name of *Species*, to the Letters of the Alphabet subservient to *Algebra*, and why he calls it *Arithmetica Species*:

ofa: Seems to have been in Imitation of the *Civilians*, who call Cafes in Law, but abstractedly between *John a-Nokes* and *John a-Stiles*, or between *A, B* and *C*, supposing those Letters to stand for any Persons indefinitely; such Cafes, I say, they call *Species*. Wherefore since the Letters of the Alphabet will also as well represent Quantities, as Persons, and that too Indefinitely one Quantity as well as another, they may properly enough be called *Species*; that is Symbols, Marks, or Characters. From whence the *Litteral Algebra* is frequently now a-days called *Specious Arithmetick*, or *Algebra in Species*.

SPECIES, in Medicine, are properly the Simple Ingredients in the Druggists, or Apothecaries Shops, out of which compound Medicines are made: But the Writers of *Pharmacy*, do usually give this Name to some *Aromatick*, or *Cathartick Powders*, because probably they were formerly kept ready prepared in the Shops, to form Electuaries, Tablets, Pills, &c. as some are still.

SPECIES, *Visibles*, are those wonderfully fine superficial Images of the Bodies which the Light produces, and delineates in their due Proportion and Colours in the Bottom of our Eyes. These the *Aristotelians* would have to be Immaterial, but a recco Experiments prove, That tho' they are admirable subtilie, yet they are really corporeal.

SPECIFICK is in general, whatever is peculiar to any distinct Species of Things, and which distinguishes them from all others of different Species. Therefore the Logicians say, That in every good Definition of any thing, the Specifick Difference ought always to be inserted. Hence,

SPECIFICK Gravity, is the Appropriate and peculiar Gravity or Weight, which any Species of Natural Bodies have, and by which they are Plainly Distinguishable from all other Bodies of Different kinds. By some 'tis not improperly called *Relative Gravity*, to distinguish it from *Absolute Gravity*, which encreases in Proportion to the Bigness of the Body weighed. Thus, if any Body weigh a Pound, one as big again will weigh two Pounds: And let the Bodies be of what Nature or Degree of Specifick Gravity soever, a Pound of one will be as much as a Pound of the other, Absolutely considered: Thus as is commonly said, a Pound of Feathers, is as heavy as a Pound of Lead. But if you consider Lead and Feathers Relatively, the Specifick Gravity of the Former, will be much greater than that of the Latter. Or Lead, or Bulk, for Bulk will be much heavier than Feathers: And Gold heavier than Lead, &c.

'Tis of so great Advantage in many respects as will appear below to find truly the Specifick Gravities of Bodies, that many Curious Ways have been thought of, and experimented for this Purpose. As by forming exact Cubes of different substances, and taking their Weight accurately in Nice Scales; and by melting Metals of different Gravities, and then casting them in Moulds of the same Dimensions. But for Practice and Universal use, nothing is better than the following Method, which is to weigh any Body first in Air, and then in Water; which latter being considerably a Denfer Fluid than Air, will buoy up the Body immersed in it in part; and will consequently make it weigh less there than in the Air. And if after this you subtract the Weight found in the Water, from the former in the Air; a Remainder or Difference will be found, which is the Weight of

as much Water as is equal to the Bulk of the Body. As *Archimedes* hath demonstrated Mathematically, and *Mr. Boyle* Physically and Experimentally, in his *Hydrostatical Paradoxes*. So that by this means having two Bodies, one Firm, and the other Liquid, with the Weight of each part, 'tis very easie to find the Proportion that one hath to the other, Bulk for Bulk; by only dividing the greater by the lesser; for the Quotient will shew the Specifick Gravity of the heavier Body compared with as much Water as is equal to it in Bulk. As if the Quotient be 2, 3, 6, or 19; the Body will accordingly be twice, thrice, 6, or 19 times as heavy as Common Water.

The Application of which Rule, and the great Advantages which may be made of the use of it. You will find in the following Problems or Experiments.

I. To find the Specifick Gravity of such Bodies as will sink in Water, and not be dissolved by it.

Having ready a Pair of good small Scales which will turn with the $\frac{1}{4}$ of a Grain, (or $\frac{1}{8}$ Part may do well enough) drill a small Hole in the middle of one Scale, thro' which put a Horse-hair about a Foot in length with a Knot at the upper end of it, and a Loop at the other, put as much Horse-hair in the opposite Scale, as will serve to Equiponderate the other, and having well adjusted your Scales: Weigh first the Body in the Air, carefully turn the Weight into Grains, ('twill be best to use Troy Weight) and write down the Number on a piece of Paper. Then fasten the Body to the Horse-hair, and leisurely immerse it into a Vessel of Rain; or Spring Water, and putting Weights into the opposite Scale, find its Weight exactly in the Water, (where it must swim about freely, and not touch the Bottom or Sides, of the Vessel.) Turn also this Weight into Grains; and subtract it from the former Weight in Air, and note the Remainder; by which Remainder divide the first found Weight in Air; and the Quotient will be the Proportion that the Body bears to Water; that is, will shew the Sepcick Gravity in respect of Water, which is pitched on as a Standard to compare it by.

Exámple.

A Piece of white Marble weighed in Air 1169 Grains, and in Water 738 Grains; which subtracted from the former Weight left 431 Grains; by which Remainder dividing the Weight in Air, 1169, the Quotient was $2\frac{7}{11}$, which is the Specifick Gravity of Marble, in respect of as much Water as is equal to it in Bulk.

N. B. If you practice this much, 'twill be best to hang your Scales upon a Gibbet, or some other Rest, where they may hang freely; and so you will have both your Hands at liberty for more nicely adjusting the Balance, and your Arm will not be weary with holding the Scale; and be sure that the Scales play freely, and are no way tangled, and that you do not wet your Weights, nor Scales; for a little carelessness may produce great Errors in such Cases: Let also the Body hang a while in the Water before you weigh it, and move it up and down, and gently knock it against the Sides of the Vessel, to extricate it from all Bubbles of Air, that else sticking to it, may buoy it up a little, and consequently

frequently induce you to mistake its Weight. You should also have a small pair of Pliers, or Tongs, to take up your Grains withal, lest you let them fall; which with your Fingers you may be apt to do, and so occasion your self a needless trouble.

'Twill be convenient also to make a little Net of Horse-hair (of small Mathes) to hold round, or small Bodies, that cannot conveniently be fastened with one Hair only; be sure always to Equipoise your Scales, before you begin to weigh.

The Uses of this Experiment.

1. Since common Stone, Marble, and Rock-Chrystal, &c. (See the Table of *Specifick Gravity*) are to Water, but as $2\frac{1}{2}$ (or 5 to 2;) if you find a piece of strong Matter, whose *Specifick Gravity* exceeds that Proportion, you may conclude, That it hath in it something of a Mineral, or Metalline Nature, in proportion to its excess above the Weight of common Stone.

2. By this Method also, a Body may be examined, whether it be of a stony Nature, or not? So *Coral* and *Pearls*, will be discovered to approach rather to a Stony, than to a common Vegetable, or Animal Nature; and *Bezoar*, and the Stones found in the Bladders of Men, or other Animals, will by their great lightness shew themselves of a very different Constitution from ordinary Stones.

3. By this Method, you may make an Estimate of the Goodness of several Stones, or Bodies of the same Kind, or Denomination: For having found the Gravity of such as are Excellent, all others of lesser Goodness, may easily be distinguished, as they are any way diverse from that Standard.

4. And thus also Genuine Stones, or Minerals, may be easily distinguished from false ones; and counterfeit Money readily known from Sterling, tho' never so well wash'd over, or gilded; for having by your own Trials, or by the help of such a Table as is here annexed, gotten the *Specifick Gravity* of such Stones, Gems, or Corns, as are True and Genuine, let that be the Standard whereby to estimate others by; which last use, is of universal Advantage, and may assist the Physician, Apothecary, or Druggist in the Drugs, the Jeweller in Gems, and Precious Stones, and the African Merchant, in the Choice of the Sand or Dust Gold, which is often Counterfeit.

Had the Curious *Dampier* known this Method, he might perhaps have trucked and gotten some of the Indian yellow Rings at the *Bashee Island*: (*vid. Dampier's Travels*, Edit. 2. Chap. 15. p. 427.) which it appears he had no great Encouragement to do, not being able exactly to distinguish whether they were Gold or not.

II. To weigh Mercury, or such heavy Fluids that will sink into, and not mingle with Water; as also the Fragments of, or small Precious Stones, Pearls, &c. and all Powders that are heavier than Water, small Sands, Filings of Metals, Gold Grains, or Dust, and such like small things about which a Horse-hair cannot be fastened.

To provide a small Glass Jar, or a little Silver or Brass Cup (but Glass is best when it can be had) with two Handles or Ears to it, and that shall hold

about an Ounce and a Half, or two Ounces of Water; and weighing it carefully in the Air first, note exactly its Weight, (which lay by in some ready Place) then also find the Glass's Weight in Water, and lay the Weights carefully by, by themselves; and if you intend to make frequent use of this Practice, 'twill be better to get two pieces of Lead, one of the weight of the Glass in the Air, the other of its weight in Water, which will be always in readiness. This done, put the Mercury, Liquor, or Powder you intend to weigh into your Glass, (which may be called the *Hydrostatical Bucket*) and putting into the opposite Scale the before-found weight of the Bucket, find the weight of the Matter in Air, and write it down (as in *Experiment 1.*) then take the Bucket out of the Scale, and pour into it, by degrees (that it may mingle well with it, and exclude all Air) Water enough to cover the Matter, or wet it thoroughly; and then putting into the opposite Scale the weight that answers to the Bucket in Water, fasten your Bucket by a Horse-hair to your Scale, and let it down gently into a Vessel of Water, and so find its weight carefully in the Water; then (as in *Experiment 1.*) Subtract that from the weight in Air, and by the Remainder divide the weight in Air, and the Quotient will be the *specifick Gravity* of the Liquor, Powder, &c. to as much Water as is equal to it in Bulk.

III. To weigh such solid Bodies as will dissolve in, or be injured in Water.

Weigh them (as before) first in Air, and then instead of Water, use the clear Oil or Spirit of Turpentine, which is cheap enough, and may be had at any Druggists, in which no Salts, nor Vitriols, nor Acid Sublimates will dissolve; and proceed in all things, as if you weighed the Body in Water; and so you will obtain the *specifick Gravity* of the Body in respect of Oil of Turpentine; which may be the Rule for these sorts of Bodies, as common Water was for the others. And this way will have the same Use as the other: For having at any time weighed a piece of any Body (as suppose *Mercurius dulcis*) in the Oil, that you know is good; that may be your Standard to try more of the same Sublimate for the future; for if you find it hath not the same *specifick Gravity* that the former (which you weighed) had, but is lighter, you may conclude it hath not its due proportion of Mercury; and consequently, is adulterated, as indeed that which is Sold in the Druggists Shops often is; and therefore those that deal much in such things, may make a Table (from their own Experience) of the weights of Bodies in respect of Oil of Turpentine, which will be of ready Use to them: And then their *specifick Gravity* in respect of Water (by a little Calculation) may be easily enough found by the following Experiment.

IV. To find the *Specifick Gravity* of Liquids and Fluids.

1. These are of two sorts, and consequently 'twill be expedient to be furnished with a double Standard to examine them by. In order therefore to find the weight of Common Water, Beer, Ale, Burning Spirits, or any Vegetable or Animal Liquors; get either a piece of Amber or Red hard Seal-

ing Wax, or a Roll of common Brimstone, and weigh it first in the Air, and then in the Liquor you intend to examine; and (proceeding as in *Exper. 1.*) you will thence find the specifick Gravity of that Body in respect of the Fluid, and consequently of the Fluid in respect of that Body: And therefore pitching on that Body as your common Standard, 'tis easie to compare the Weight of all Liquids of the first kind in reference to it; for those in which the Body weighs less, will be the *Heavier Liquors*: And those in which it weighs more, lighter, in proportion to the decrease or increase of the weights of your Standard in the Fluid.

2. But to find the Weights of strong briny Seawater, saline Menstrua, and all acid Spirits and Stygian-waters, as the Oil of Vitriol, Aqua-fortis, &c. 'twill be necessary to employ a heavier Body for your Standard; and therefore in such, weigh either a piece of Rock-Crystal, or which will do as well, white Marble, or a piece of solid Glass; such as the Tobacco stoppers of that Metal, &c. which being more ponderous, will sink in these Liquors, in which Amber or Wax will not; and proceed as above in the former part of this Experiment.

U S E S.

1. By these Experiments, the goodness of all kinds of Liquors may be examined: For, as to the first kind of Liquors before-mentioned, 'tis probable, the more fine and spirituous they are, the lighter they will be, and the more your piece of Amber or Sealing-wax will weigh in them; which having once weighed in some Liquor of the kind, that you were assured was good, the weight of your Piece in that, may be the Standard to compare others by. But the latter sort of Liquors will require a contrary way of estimation; for the more ponderous they are, the better they may be judged to be; and consequently, the less your piece of Marble or Glass weighs in them, the greater degree of goodness you may conclude them to contain. By weighing also the Solid in a parcel of any kind of these that you have proved as good, its weight may be the Standard, to compute the goodness of those of the same sort of Liquors.

2. Hence also you may most accurately discover, whether you are imposed upon by the Merchant, Vintner, or Distiller, &c. in Quantities of Wine or Spirits which you have bought on the Credit of the Sample that was shewed you to examine; for if you find that the specifick Gravity of the whole Vessel sent you home, is different from that parcel which you tried, you may be assured, that 'tis some way mix'd and adulterated.

3. The Chymist also may by this means adjust his Menstrua for the dissolving of Mineral or Metallick Bodies to the best advantage; by so tempering them, (either by weakening their Strength, or increasing it) that they shall prove the most expedite Dissolvents: For many know very well, that a Menstruum may as well be too strong, as too weak: And therefore the specifick Gravity of an apt Menstruum may perhaps be the best guide to portion another for the same purpose.

V. To find the Solid Content of any small Body, tho' never so irregular, (if it be heavier than Water) by weighing it in Water.

Mr. Boyle, by many curious Trials, found that a Cubic Inch of Water is equal in weight to about 256 Grains, or half an Ounce, and 16 Grains Troy: Which Number of Grains is very happy for such Trials, because of its many aliquot Parts; and also, because every 32 Grains answers to just $\frac{1}{8}$ of an Inch.

Suppose therefore you weigh a Body first in Air, and then in Water, and shall find it in the latter Medium to lose of its weight in Air just 256 Grains or $\frac{1}{2}$ Ounce 16 Grains, you may conclude that the solid Content of that Body is just one Cubic Inch; and if it lose but $\frac{1}{2}$ or $\frac{2}{3}$, or $\frac{3}{4}$ of that number of Grains, the Content is $\frac{2}{3}$, $\frac{3}{4}$, $\frac{4}{5}$ of a Cubick Inch. So on the other side, if it lose more than 256 gr. as 2, 3, or 4 times that weight; its solid Content will be accordingly 2, 3, or 4 Cubic Inches. The like is true of all other proportional Decrements of the Bodies weight, in comparison of 256, the Standard for one Cubick Inch.

The reason of this Process is clear enough, if we consider that every Body weighed in Water, loses there so much of its weight as the Water amounts to, which is equal to that Body in Bulk; or in other words, That it weighs less in Water, than in Air, by the weight of as much Water as is equal to the Body in bulk, which is the Fundamental Theorem of all Hydrostaticks, and is Mathematically demonstrated by Archimedes, and Physically by Mr. Boyle, in his *Hydrostatical Paradoxes*.

And since also, as is before declared, a Cubick Inch of Water weighs exactly 256 Grains, what every Body loses in Water just that Sum (of its former weight in Air) must needs be in Solid Content equal to a Cubick Inch; for the Decrement of its weight is equal to the weight of as much Water as its bulk takes up, (by the universal Theorem) and that is found to be in weight 256 Gr. which is exactly equal to one Cubick Inch; therefore the Content of that Body is just so much.

U S E S.

This is more exact than any Mensuration can be for small Bodies; 'tis very expeditious, and may be of good use (besides its Curiosity) in a great many Cases, as is obvious to any thinking Person.

VI. To find the Solid Content of a Body lighter than Water, by its weight in that Medium.

This Experiment will have two Cases.

1. When the Body to be measured will not be injured by the Contract of the Water, Weigh the Body in Air; and then take a piece of Lead, or some such heavy Metal, and of a known and even weight, (as suppose a Penny-weight or Half a Penny-weight, &c. to avoid Fractions) and capable of sinking your Body in Water. Weigh your Lead in Water, and Subtract that weight from its weight in Air, and keep the Remainder as the Specifick weight of your piece of Lead in Water. This done, fasten your Lead with Horse-hair to the

the Body you intend to measure; and weighing the Aggregate also in Water, Subtract this last weight from that just now found in Air, and the difference will be the Specifick weight of the said Aggregate in Water; and lastly Subtract from it the Specifick weight of the Lead alone in Water, and the remainder is the weight of the light Body you intend to measure, or to find the solid Content of; which is easily done by the Process in the close of the 5th Experiment: For this last found weight being divided by 256, or by its Half, &c. will accordingly give you the Body's Solid Content in entire, half, or quarters of Cubick Inches.

Example.

Because this last Process hath something of difficulty in it, (especially to a young Hydrostatician) I will subjoin the following Example, which will serve not only to enlighten this, but many other Rules of this nature:

- | | |
|--|-------------------|
| | Gr. |
| 1. A Cube of Oak which was made with great Exactness by a good Workman, | 192 $\frac{1}{2}$ |
| 2. A piece of Lead just $\frac{1}{2}$ an Ounce (to make it sink) weighed, | 240 |
| 3. The Lead in Water weighed | 220 |
| Which Subtracted from 240, the Lead's weight in Air, left for its Specifick weight in Water. | 20 |
| 4. The Aggregate of the Wood and Lead's weight in Air was | 433 $\frac{1}{2}$ |
| 5. The weight of the Aggregate in Water was | 162 |
| 6. Which Subtracted from the weight of the Aggregate in Air 433 $\frac{1}{2}$ left | 271 $\frac{1}{2}$ |
| 7. The Specifick weight of the Lead in Water (<i>viz.</i> 20) being Subtracted from which last remainder I left for the weight of the Cube in Water | 251 |
- Which last Number wants but 4 Gr. and a $\frac{1}{2}$ of 256, the Standard before mentioned, *viz.* Of the weight in Grains of a solid Inch of Water.

C A S E 2.

When there is danger of injuring the Body by its either being dissolved by Water, or else admitting it too much into its Pores, you may use Oil of Turpentine instead of Water; only instead of the Standard 256 Grains for a Cubick Inch, you must use 221, for that Mr. Boyle found a Cubick Inch of that Oil to weigh; and therefore proceed altogether as in the last Case, only use Oil instead of Water, and divide the weight of your Solid in Oil of Turpentine, by 221, and the Quotient will give the Contents of it in Cubick Inches or parts of an Inch.

You may also in some cases, having first found the weight of the Body you would examine in Air, over-lay it carefully with a Coat of Bees-wax, to keep it from being injur'd by the Water, and having then found the weight of the Bees-wax used to cover it, (which is easily done by weighing the Body again when covered, and then from that weight Subtracting the weight of the naked Body

before found) sink it in Water with a piece of Lead as before taught; and observing the weight of the Aggregate, then proceed with the remaining part of the Experiment, as is Case 1.

VII. To find the weight of any Floating Body, tho' never so great, by knowing what part of it is under Water.

Suppose a Ship should have under Water a part of its Hull equal to 100000 Cubick Feet, I chuse such a round Number to avoid Fractions, (how to find the Content of the Part of a Ship, that is under Water doth not belong to this Place, but it may be easily enough done by one versed in solid Mensuration). 'Tis found by Experience, that a Cubick Foot of Water weighs 76 Pound Troy, and Archimedes hath demonstrated, That as much Water as is equal in bulk to the part of the floating Body that is under Water, is in weight equal to the whole floating Body. Therefore 'tis plain, That to solve this Problem, you need only Multiply 100000 by 76, (which is 7600000) and the Product is the weight of the whole Ship in Pounds Troy.

A Table of Specifick Gravity of Bodies in Proportion to Water, from Mr. Boyle and my own Experiments.

	Proportion.
Amber	as 1, 04 to 1
Agate	as 2, 64 to 1
Allom Stone	as 2, 18 to 1
Antimony (Hungarian)	as 4, 07 to 1
Antimony Crude, which seem'd to be very good	as 4, $\frac{1}{2}$ to 1
Regulus, made of that above, and the common way	as 6 $\frac{1}{2}$ to 1
Cinnabar of Antimony	as 7 $\frac{1}{2}$ to 1
Bezoar Stone	as 1, 48 to 1
— Another	as 1, 64 to 1
A fine Oriental one	as 1, 53 to 1
— Another	as 1, 34 to 1
A piece of cast Brass	as 7 $\frac{3}{4}$ to 1
An old Brass Gold Weight (mark'd XXXIII.)	as 8, 83 to 1
A piece of hammer'd Brass	as 8, 66 to 1
Coral red	as 2, 63 to 1
Chrystal	as 2, 21 to 1
Cornelian	as 3, 29 to 1
Calculus humanus	as 1, 72 to 1
— Another	as 1, 47 to 1
— Another	as 1, 57 to 1
Coco-shell	as 1, 34 to 1
Native Crabs-Eyes	as 1, 89 to 1
Artificial Crabs-Eyes	as 2, 48 to 1
Calx of Lead	as 8, 94 to 1
Copper Stone	as 4, 09 to 1
Copper Ore	as 4, 15 to 1
Copper Ore Rich	as 4, 17 to 1
An old Copper Half-penny, (Charles 2d's Coin)	as 9, to 1
Common Cinnabar	as 8, $\frac{1}{2}$ to 1
Cinnabar of Antimony	as 7, 03 to 1
— Another Piece	as 7, 06 to 1
Coral white	as 2, 54 to 1
Chalk, found by Dr. Slare to be	as 1, $\frac{3}{4}$ to 1
Gold Ore not Rich from India	as 2, 63 to 1
— Another	— An-

—Another lump of the same	as 2, 55	to 1
An old Jacobus	as 18	$\frac{1}{2}$ to 1
A piece of Gold Common-wealth Coin	as 17	$\frac{1}{2}$ to 1
The Gold of a Seal	as 16	1 to 1
Granatiminera	as 3, 1	to 1
Granate Bohemian	as 4, 36	to 1
A piece of common Glafs Coffe- Dish of a brown colour	as 1, 76	to 1
Hematites English	as 3, 76	to 1
A Hone to Set Razors on	as 2, 96	to 1
An Icicle broken from a Grotto, found by Dr. Slare to be	as 1, 19	to 1
Ivory	as 1, 91	to 1
A piece of burnt or roasted Iron Ore	as 3	$\frac{1}{2}$ to 1
A piece of hammer'd Iron (per-haps part Steel)	as 7	$\frac{3}{4}$ to 1
Lapis manati	as 2, 86	to 1
Lapis Lazuli	as 2, 98	to 1
Lapis Calaminaris	as 4, 92	to 1
Lapis Judaicus	as 2, 69	to 1
Lead Ore	as 7, 14	to 1
Lead (an ordinary piece)	as 11	$\frac{1}{2}$ to 1
—Another	as 11, 42	to 1
Lead Ore from Cumberland Rich	as 7, 54	to 1
A good Load-stone	as 4, 75	to 1
—Another	as 4, 93	to 1
Marcafites	as 4, 45	to 1
—Another from Stalbridge	as 4, 50	to 1
Mercury revived from the Ore	as 14	to 1
Manganefe	as 3, 57	to 1
Mineral (Cornish) shining like a Marcafite	as 9, 06	to 1
Marble white	as 2, 7	to 1
Ofteocolla	as 2, 24	to 1
Pearl (a large one)	as 2, 51	to 1
Fine Orient Seed Pearl	as 2, 75	to 1
Rhinoceros-horn	as 1, 99	to 1
Sulphur vive	as 2,	to 1
—Another very fine from Germany	as 1, 98	to 1
Slate (Irish)	as 2, 49	to 1
A Silver Half-crown (K.W's Coin)	as 10, 75	to 1
Silver Ore, choice from Saxony	as 4, 97	to 1
—Another piece	as 7	to 1
A Whetstone, not fine, such as Cutlers use	as 2, 74	to 1
A round Pebble-stone (within of Flint)	as 2, 61	to 1
Talc, a piece like Lapis Amianthus	as 2, 28	to 1
Talc (Venetian)	as 2, 73	to 1
Talc (Jamaican)	as 3,	to 1
New English Tin Ore, Mr. Huberts	as 4, 8	to 1
Tin Ore, black, rich	as 4, 18	to 1
Another choice Piece	as 5,	to 1
Tutty	as 5,	to 1
Tin Glafs	as 9, 55	to 1
Vitrum Antimonii per see	as 4, 76	to 1
Vitriol Engl. a very fine Piece	as 1, 88	to 1
Unicorns-horn, a Piece	as 1, 91	to 1
Human Blood, Mr. Boyle found	as 1, 33	to 1
Serum of the Blood to Water, he found to be	as :: 302	to 253
Asphaltum, Mr. Boyle,	as 1, 14	to 1
Scotch Coal	as 1, 13	to 1

A Table of Specifick Gravity, from Phil. Trans. N. 169.

Pump water	1000
Dried Firr	546
Dried Elm	600
Dried Cedar	613
Dried Walnut Tree	631
Crab-tree (meanly dry)	705
Ash, meanly dry, and fappy	734
Heart Ash, pretty well dry'd	845
Maple dry	755
Yew of Knot or Root 16 Years old	760
Beach meanly dry	854
Oak, very dry, and almost Worm-eaten	753

SPECIFICK Medicines, are ſuch as have a Peculiar Vertue againſt ſome Diſeaſe; as the *Quinquina*, or *Cortex Peruviana*, hath to cure Intermitting Fevers: And Phyſicians mention in their Books three kinds of Specifick Medicines.

1. Such as are Eminently, and Peculiarly Friendly to this or that Part of the Body, as to the Heart, the Brain, the Stomach, &c.

2. Such as do ſeem to Attract, Expel, or Evacuate ſome determinate Humour by a kind of Specifick Power, that they are endowed with. Thus Jalap Purges, Watry Humors, Rhubarb Bile, &c. And;

3. Such as have a Virtue to cure by ſome hidden Property, this or that Particular Diſeaſe.

That there are ſuch Medicines as theſe, in the latter and moſt proper Senſe of the Word, Mr. Boyle makes very probable, by theſe Reaſons.

1. The Concurrent Teſtimony of Experience both Ancient and Modern. *Galen* promiſed a Book on this Subject, but it is loſt if he ever Wrote it.

2. 'Tis manifeſt that Inconſiderable Quantities of Poiſon can do very great miſchief, and produce great and diſmal Effects without any manifeſt Quality appearing to be in them: And therefore by Parity of Reaſon, one would conclude, Medicines may be found which ſhall heal and do good the ſame way.

3. The Teſtimony of Phyſicians themſelves who in their Writings, do always mention ſome one Specifick or other, which they believed was really ſuch.

And certainly it would be well worth while to keep an account of the Operations of as many pretended Specificks, as can come to any Phyſicians knowledge, and by no means to reject all things of that Nature, becauſe a Reaſon cannot preſently be given for the Cure; for if we ſhould always do ſo, we muſt reject almoſt every thing.

SPECILLUM, is a Surgeons Inſtrument called uſually a *Probe*, by which he ſearches the Depths, Windings, &c. of Wounds and Ulcers.

SPECULUM Lucidum. See *Septum Lucidum*.
SPECULUM Oculi, the Apple, or Pupil of the Eye. See *Aranea Tunica Oculi*.

SPECULUM Oris. See *Dilatatorium*.

SPELL, a Sea Word ſignifying to let go the Shears and Bowlings of a Sail, (chiefly the Miſſen) and Bracing the Weather Brace in the Wind, that the Sail may lie looſe in the Wind: This is done, when a Sail hath too much Wind in it, and there is Danger of Wronging the Maſt. This Word is moſtly uſed about the *Miſſen-sail*. For there inſtead of ſaying take in the *Miſſen* and *Peek it up*; they ſay in one Word *Spell the Miſſen*.

To do a *Spell* alſo with them, ſignifies doing any Work for a ſhort time, and then leaving it: Therefore a *Freſh Spell* is when Freſh Men come to Work; and to give a *Spell*, is all one as to ſay, Work in ſuch an ones Room.

SPENT, The Seamen ſay a Ship hath *Spent* any Maſt, or Yard, when it is broken down by foul Weather, or any ſuch accident: But if it be done by an Enemies Shot in Fight, they ſay ſuch a *Yard or Maſt was ſhot by the Board*.

SPERMATICK Veſſels, and *Parts*, are thoſe Arteries and Veins, which bring the Blood to, and convey it from the Teſticles: Likewiſe thoſe Veſſels through which the Seed paſſes: Likewiſe

all whitish Parts of the Body, which because of their Colour, were anciently thought to be made of the Seed: Of this sort are the Nerves, Bones, Membranes, Gristles, &c.

SPERMATOCELE, a Rupture caused by the Contraction of the Vessels which eject the Seed, and its falling down into the *Scrotum*.

SPHACELUS, is a sudden Extinction of Life and Sense in every Part.

SPHÆNOIDALIS Sutura, is a Suture that surrounds the *Os Sphenoides*, separates it from the *Os Occipitis*, from the *Os Petrosus*, and from the *Os Frontis*.

SPHÆNOIDES, is a Bone of the *Cranium*, common both to the Skull and upper Jaw; it is of a very irregular Figure; and is situated in the middle of the Basis of the Skull, and is joined to all the Bones of the *Cranium*, by the *Sutura Sphenoidalis*, except in the middle of its Sides, where it is continued to the *Ossa Petrosa* as if they were one Bone. This Bone has a small Protuberance in the middle thereof, from which the Muscles of the *Uvula* arise: On its Inside it has 4 Processes called *Clinoides*. Betwixt the two Tables of this Bone, under the *Cella Turica*, there is a *Sinus* divided in two in the middle, which opens by two Holes into the Cavity of the Nostrils. In this Bone some say, there are also 12 Holes; by the first and second pass the Optic Nerves; by the rest pass other Nerves for the Motion of other Parts, as also of Veins and Arteries.

SPHENOPALATINUS, is a Muscle of the *Gargaveon*, which descends from a round fleshy Origination at a Process of the *Os Sphenoides*, which is in a direct Line between the *Ala Vespertilionis*, and *Processus Styloides*, thence it becomes a round fleshy Belly in half its Progress, grows less again near its lateral Insertion to the Posterior Part of the *Gargaveon*.

This with its Partner acting, draw the *Gargaveon* with the *Uvula* upwards and backwards; which hinders the masticated Aliment from Regurgitating through the *Foramina Narium* in *Deglutition*.

SPHÆNOPHARINGÆUS, is a pair of Muscles arising from the *Sinus* of the inner Wing of the *Os Cuneiforme*, and going Obliquely downward, is extended into the Sides of the Gullet; it dilates the Gullet.

SPHÆNOIS. See *Os Cuneiforme*.

SPHÆNOPOTERIGOPALATINUS, See *Pterigopalatinus*.

SPHAGITIDES, according to some, are the Jugular Veins in the Neck.

SPHERE, is a Solid Body, made by the Rotation of a *Semicircle* about its Diameter.

i. All Spheres are to one another as the Cubes of their Diameters. For under the Word *Cylinder*, you will find it proved, That *Cylinders* whose Altitudes are equal to the Diameters of their Bases, are in Proportion to each other as the Cubes of their Diameters; which is thus expressed $\frac{1}{2} r d d d : r D D D :: d d d. D D D.$ wherefore, be the Ratio of a Sphere to a Cylinder of the same Diameter and Height to it, what it will, (and what it is, is shewn in another place) call it r : Therefore $\frac{1}{2} r d d d. \frac{1}{2} r D D D :: \frac{1}{2} r y d d d. \frac{1}{2} r Y D D D.$ But $\frac{1}{2} r y d d d. r Y D D D :: d d d. D D D.$ That is, Spheres are to each other as the Cubes of their Diameters. Q. E. D.

2. The solidity of a Sphere is equal to the Surface multiplied into $\frac{2}{3}$ of the Radius; as is proved from Cor. 1. of Prop. 4. in the word *Cylinder*.

3. A Sphere is equal to $\frac{2}{3}$ of a Cylinder having the Diameter of its Base and its Axis equal to that of the Sphere, i. e. a Sphere is $\frac{2}{3}$ of the Cylinder circumscribed: And the Surface of the Sphere and the curved one of the Cylinder circumscribing it, is the same in Quantity; as is proved in *Cylinder*, Prop. 4. and *Corollaries*; as also very briefly under the word *Indivisibles*.

4. The Surface of the Sphere is equal to four times the Area of a great Circle. See *Cylinder*, Prop. 4. Coroll. Wherefore add to the Curve and Surface of the Cylinder its two circular Bases, and that will make six great Circles of the Sphere: So that the Surface of the Sphere is but $\frac{2}{3}$ of the whole Surface of the Cylinder. See also *Cylinder*.

An entire Sphere of Glass will unite the Parallel Rays of any Object at the Distance of near its Semidiameter behind it. *Molyneux Dioptr.* p. 93.

SPHERE of Activity, of any Body, is that determinate Space or Extent all round about it, to which, and no farther, the *Effluvia* continually emitted from that Body do reach, and where they operate according to their Nature. Thus we see the *Magnetical Effluvia* have certain Bounds and Limits, beyond which they will have no Influence to turn or to attract the Needle: But where-ever a Needle be placed, so as that it can be moved by a Load-stone, it may be said to be within the Sphere of Activity of the Stone.

SPHERICK Geometry, or *Projection*, is the Art of Describing on a Plane the Circles of the Sphere, or any Parts of them in their just Position and Proportion, and of Measuring their Arks and Angles when Projected.

As an Introduction to which, you must understand.

PROPOSITIONS.

- I. If a Cone, as *A B C*, be cut by a Plane, either by the Axis, or through the Vertex, the Section will be a Triangle.

For the Point A is the Vertex of the Cone, and will be so of the Triangle, and B C is a Right Line, because 'tis the Diameter of the Circle of the Base, and A B and A C must be Right Lines, because the Surface of the Cone will be described by either of them; wherefore the Section A B C is a Triangle. Q. E. D.

II. If a Cone as ABC be cut by a Plane Parallel to its Base, the Section efg will be a Circle.

For let F be the Centre of the circular Base; then will AF be the Axis; and if the Cone be cut by the Axis, the Section ABC will be a Triangle. Let eg , the Diameter of the Section, be drawn, cutting the Axis in i , wherefore eg the Diameter of the Section will be parallel to BC , the Diameter of the Base.

And consequently,

$$AF:FB::Ai:ie \text{ and} \\ \text{as } AF:FC::Ai:ig.$$

Wherefore, by *Inverse Proportion*, and *ex aequo*, as $FC:FB::ig:ie$.

But $BF = FC$, therefore $ie = ig$.

And the same consequence will arise if you take o and K , any two other Points in the Base and in the Section; for Ki being parallel to oF , and AoF being a Triangle. $AF:oF::Ai:Ki$, but as $AF:FB::Ai:ie$. Wherefore *ex aequo* $oF:FB::Ki:ie$. And therefore Ki , and ie are equal also, and consequently the Section is a Circle. For i is a Point from whence more than two Right Lines drawn to the Curve efg are equal; wherefore that Curve must be a Circle. *Q. E. D.*

III. If a Scalenous Cone ABC be cut by a Plane in a Subcontrary Position to its Base, the Section DEH will be a Circle.

1. The Section ABC made through the Axis, is a Triangle.

2. The Triangle AED is Similar to ABC ; tho' placed a contrary way, (by the Supposition) (which is called Subcontrary Position.)

3. ED being the mutual Intersection of two Planes will be a Right Line, on which take any Point, as (i) and through it draw $F-i-G$ parallel to BC , and there let the Cone be cut also, then the Plane that cuts it being parallel to the Base of the Section, FHG must be a Circle, and FG a Diameter.

Now, because both these Intersecting Planes are Right to the Plane of the Triangle ABC their common Intersection IH , will also be a Right Line, and perpendicular to the Plane of the Triangle, and to the two Lines ED and FG . And then, because the Triangles ABC , AED and AFG are all Similar, the Angles at G and E must be equal; and the Vertical ones at i being so too, the Triangle FEI must be Similar to IDG . Wherefore $DI:IG::FI:IE$, therefore $UDIE = \cap FIG$; but because FG is the Diameter of a Circle, and IH perpendicular to it, and terminated at the Circumference, 'twill be a middle Proportional between the Segments of the Diameter, and have its Square equal to the Rectangle FIG , (as also to its Equal EID) wherefore the Point H is in the Circumference of a Circle, whose Diameter is DE . *Q. E. D.*

DEFINITION I.

A Circle of the Sphere, as to its Projection on any Plane, is of four kinds.

1. The Primitive Circle, or Limb which bounds the Projection, and within which 'tis always made.

2. A Direct Circle, whose Plane is directly opposite to the Eye, or when the Eye is in the Axis of the Plane.

3. A *Right Circle*, whose Plane is coincident with the Axis of the Eye; or with the visual Rays.

4. An *Oblique Circle*, whose Plane lies oblique to the Axis of the Eye, so that it makes unequal Angles with it.

To *Project* the Sphere truly in *Plano*, is a Part of *Perspective*; whereof there are several kinds; but the most usual is what is properly called the *Stereographick*, or *solid Projection of the Sphere*; and the *Orthographick*, or the *Analemma*: The latter of which, see in *Analemma*.

In the former, the Circles of the Globe are drawn or represented on a Plane, which passes through its Center, and hath the Eye, supposed to be in the Pole or 90° distant from it; *Projecting* the several Circles or Arks of Circles on that Plane, or on any one parallel to it.

In this *Projection*, if a Line pass through the Eye, or be coincident or parallel to the Axis; it will be represented by a Point.

IV. If a Line be direct to the Eye, it will be projected into a *Right Line*, whose Parts will be in the same Proportion to one another, as those of the *Primitive Line*, of which it is the Representation.

For, since the Line BC (which may be the Diameter of a Parallel Circle) is supposed to lie Parallel to DF, and is projected into it from the Eye at A, if you draw the Lines AD, AE, and AF, the Triangles ABG and AEF will be Similar; as also will AGC and AEF; wherefore as AB:AD::BC:DF. and as AB:AD::AG:AE. also as AG:AE::BG:DE::GC:EF. Wherefore as the whole BC to the whole DF:: the Part BG: to the Part DE:: GC: EF.

PROP. 5.

But if a Line lie oblique to the Eye, the Parts of it in the Projection will not be in the same Proportion, as they are in the Line it self, but those Parts of it which lie nearest to the Eye, will in the Projection appear longer than those which lie more remote from it.

Thus, if the Eye be at A, I say the Line BC lying oblique to it, will be projected into the Line DE; and its half BF, which lies nearer to the Eye, shall be represented by the Line DF, which is longer than FE, the Representation of the other half which lies remote from the Eye; as is in a manner self evident.

If a Circle be right to the Eye, or hath its Plane coincident with, or parallel to its Axis, it will be Projected into an infinite right Line.

PROBLEM I.

Prop. 6. To represent on the Plane of the Projection a Right Circle, and to distinguish there such Parts and Divisions as shall truly correspond to those of the Right Circle given.

Let the Circle given be ABCD; and let it be divided into eight equal Parts, as in the Figure; and let the Eye be at A. Draw FG at right Angles to AC, the Axis of the Eye, to represent the Plane of the Projection; and draw also from A, AF, AB, AI, AC, AK, AD, AG, through the several Divisions of the given Circle; Then will FB, BO, OE, EP, PD, and DG, be the proper Representations of the Parts of the given Circle.

And if on A as a Center with the Distance AE, another Circle be described, 'tis plain, that OE, EB and EF, &c. will be Tangents of the Angles OAE, BAE, FAE, &c. at the Circumference,

ference, which are severally the halves of the Angles IEC , BEC , HEC , &c. at the Centre: Of which latter Angles, the Arks of the Circle given CI , CB , and CH , are the proper measures; wherefore the Right Lines OE , BE , FE , &c. are the Tangents of half those Arks; which shews us that every Diameter of a great Circle, or its Parts within or without the Primitive, is to be measured on the Scale of Half Tangents; and that the Divisions of it begin at the Centre of the Primitive Circle.

P R O P. 7.

A Circle placed oblique to the Eye at A, will be a true Circle in the Projection; but its true Centre is different from its apparent one.

Let BC be the Diameter of an oblique Circle, which is to be Projected from the Eye at A , on a Plane Represented by the Line FR , which Mr. Oughtred calls the Line of Measures.

1. 'Tis plain the Diameter BC will be represented by the Line FE . 'Tis also plain, that if right Lines were drawn from A to all the Parts of the oblique Circle, of which BC is the Diameter, they would make an oblique Cone of Rays, as ABC .

2. But I say that the Scalenoconic Cone of Rays ABC is cut by the Plane FR , *subcontrarily* to its Base, and consequently the Section will be a Circle (by the 3d) wherefore the giving oblique Circle will always be represented by a Circle on the Plane of the Projection.

That the Scalenoconic Cone ABC is cut Subcontrarily to its Base, may be thus proved.

Draw AD through the Centre of the Sphere K , and join BD and CD .

The Angle ACD is a right one, (being in a Semicircle) and the Angle AKB is right, by Supposition and Construction; and the Angle DAC is common to the two Triangles AKE and ADC ; wherefore they are Similar, and consequently the Angle ADC is equal to the Angle AEK .

But the Angle ADC is equal to the Angle ABC , as being in the same Segment; and the Angle ADC was before proved $=$ to the Angle AEK ; wherefore the Angle $ABC =$ Angle AEK ; and since the Angle ABC is common to both, therefore the Angle F must be equal to the Angle C , and consequently the Cone ABC is cut *subcontrarily*, and therefore FE is the Diameter of a true Circle, whose real Centre will be in P the middle Point; but the apparent Centre of the Circle will be at L ,

where the Point O (which is the middle Point of BC) is projected.

There are several other ways of finding P the Centre of the Projected Circle; but this is as expeditious as any.

To Project the Poles of the oblique Circle BC , draw through K the Centre of the Sphere, a right Line as QS , perpendicular to BC , which therefore will be the Axis of the oblique Circle: Then a Ruler laid from A through Q and S , the Pole of that Axis shall Project the Polar Points in N and Z .

P R O P. VIII.

The Center (P) of every great Circle (BG) which lies oblique to the Primitive (in the Projection) is so far distant from C, the Centre of the Primitive, as is the Tangent of the Ark of Elevation of its Plane, above the Plane of the Primitive.

Make the Ark $Bu = GT$, the Complement of the Angle of Elevation, and draw uA , which will find the Point P , the Centre of the Projected Circle.

D E M O N S T R A T I O N.

Because the Angle $BAu =$ Angle CAG as being on equal Arches) and the Angles ABG equal to the Angles Ade , (by the Subcontrary Position) therefore the Triangles BAu and Ade are Similar, and consequently the Angle BSA (which is equal to the Angle $A'cd$) is a right one.

Draw BL perpendicular to BC , wherefore, the Triangles BLC and APC are Similar; for Angle $BLC =$ Angle PCA , as being both right ones; and the Angle $APC = BLC$, because BL and AP , are Parallels; wherefore the Angle $BCL =$ Angle PAC .

But PC is the Tangent of the Angle PAC , and therefore of its equal the Angle BCL , or of the Ark BK , which is equal to the oblique Circle's Elevation above the Plane of ed ; wherefore P the Centre of the oblique Circle is distant from C by the Tangent of its Elevation above the Plane ed . $Q.E.D.$

C O R O L.

Also, because the Triangles ePA and ACG are Similar, (as having Angle $e =$ Angle G , by Subcontrary Position) and the Angle $BAP =$ Angle CAG (as being on equal Arks) therefore will $eP : P$

$e P : P A :: A C : C G$, that is, $e P = P A$. But $P A$ is the Secant of the Angle $P A C$, or of the Ark $B K$; wherefore the Secant of the Elevation $e P$ fet from e , shall find P the Centre as before; $P e$, $P A$, or $P d$ being its Radius.

PROP. IX.

Problem. 2.

To project a Lesser, or Parallel Circle PL , whose Poles are in the Line of Measures Q, r ; representing the Plane of the Projection.

First, *Project* the Diameter of the Lesser Circle PL, into that of the *Projection* in the Points *d* and *r*, and draw a Line from P to N; to which erect PC at Right Angles; so shall C be the true Centre of the projected Circle.

DEMONSTRATION.

The Angle NAP , is equal to the Angle $\text{OP}\tau$, because A N is parallel to P O : Also the Angle e A P , is equal to the alternate Angle e P L : But the Angle e A P , added to the Angle e , is equal to a Right one. Wherefore the Angle $\text{OP}\tau + \text{P}\tau\text{O}$, = a Right Angle: That is, The Angle $\text{d P}\tau$, is a Right Angle. Wherefore $\text{d}\tau$, is the Diameter of a Circle.

Now NPC , being right by Construction, take from those two right Angles, the common one dPC , and the Angle $NPd (= \angle e)$ must remain equal to the Angle CPr , and the Angle r , is = to the Angle e , because the Triangles Nde , and Pdr , are similar: Wherefore the Triangles PCr , and NPe , are similar; and consequently, $eN : NP :: PC : Cr$ but $eN = NP$; therefore $PC = Cr$. Therefore both are Radii of a Circle. $Q. E. D.$

And to prove $P C \doteq d C$, and consequently that they also are Radii.

I say, The Triangle $d P C$, is an Iſoſceles, be-
 cause the Angle $P d C$, is equal to the Angle $d P C$;
 which I thus prove.

The Angle $P d o + \angle d P o = \text{Right Angle}$,
 $= \angle d P C + \angle C P r$, but $C P r = \angle e = d P o$:
 Therefore taking away the common Angle $d P o$,
 (or its equal $C P r$) $d P C$ must remain equal to
 $P d C$: wherefore $P C (= C r) = C d$. Where-
 fore c is the true Centre of the projected Circle.

COROLLARY I.

1. Hence 'tis plain, That making NP the Radius of a Circle, whose Centre is N , the projected Circles Centre C , is distant from N , the Centre of the Primitive, by NC ; the Secant of the Ark Pb , or of that lesser Circle's Distance from its Pole b .

2. The Semi-diameter of this projected Circle (C d) is equal to (C P) which is the Tangent of the laid Ark P b, or of that Circle's Distance from its Pole.

PROP. X.

The Angle of the Intersection of any two Circles on a Plain, is equal to the Angle made by their Radii drawn from their Centres to the Point of Intersection.

I say, The Rectilineal Angle $\sigma T n$, made by the two Radii σT , and $T n$, is equal to the Curvilineal Angle $\sigma T c$, made by the Arks σT , and σT ; which is equal also to the Curvilineal Angle $n T a$, made by the Arks $n T$, and $T a$.

Draw oT , and Ta , Tangents to the Intersecting Circles.

Then the Angles of Contact $\angle T \hat{c}$, and $\angle n \hat{t} a$, which are made by the Tangents and the Curves, being less than any acute ones, and indeed no Quantity; the Tangent $\angle t \hat{e}$, and $\angle d \hat{t} a$ will fall in with the Circles, and make the same Angles with one another, as the Arks of those Circles do: Wherefore the Curvilinear Angle $\angle o \hat{t} c$, is equal to the Rectilinear one $\angle o \hat{t} d$; and on the other side, the Curvilinear Angle $\angle n \hat{t} a$, is equal to the Rectilinear one $\angle a \hat{t} e$.

Wherefore since the Right-lin'd Angles $d T c$, and $o T n$, are both Right Angles, and equal: If you take away the common Angle $o T c$, the Angle $d T o$, must be equal to the Angle $c T n$; and consequently the Angle $e T n$, is equal to the Angle of Intersection $o T c$. Q. E. D.

PROP. XI.

PROP. XI.

All Angles made by Circles on the Superficies of the Sphere, are equal to those made by their Representatives on the Plane of the Projection.

Let there be two Circles, Q and T, intersecting each other at d.

I say, the Angle Q d T, made by the Planes of these Circles, is equal to the Angle o g h, made by their Tangents o d, and d h, when projected.

Let the Eye be at A, and the point of Intersection d; then draw d h, a Tangent to the outer Circle d T, and d o, a Tangent to the Inner Circle d Q.

Thence since the Plane of the Projection e g, as also that made by the Tangents d h, and d o, (which are in the same Plane) are both perpendicular to the Plane of the Circle e T d A; their common Intersection o h, must be a Right Line, and also perpendicular to e g.

Draw all the Lines, as in the Figure; then will the Angle A d m, (made by the Tangent and Secant) be equal to the Angle g, (in the opposite Segment) which is equal to q d A, because the Triangle q A d, is an *Isosceles*; but the Angle q d A = \angle h g d, because q d is parallel to e g: Therefore the Angle h g d = \angle A d m = Vertical Angle b g d: Wherefore the Triangle b d g, is an *Isosceles*, and consequently d b = b g.

Hence the Triangle o d h, hath two Sides, o h, and h d, and the Right Angle o b d, equal to two Sides, and one Angle, in the Triangle o h g: Wherefore all things are equal, and consequently the Angle o g h, is equal to the Angle o d h, equal to the Curvilinear Angle Q d T. Q. E. D.

PROP. XII.

To Project a lesser Circle, when its Poles are not in the Plane of the Projection.

Let O L be the Diameter of such a Circle, a Ruler from the Point d, where the Eye is supposed to be placed, to O, will Project the Point a; and from d to L, will project the Point b: Therefore a b is the projected Diameter, and consequently its middle Point e, will be the Centre of that Circle in the Projection.

The Demonstration you have universally in Prop. 4.

Or, since by (Prob. 1.) C a, and C b, will be the half Tangents of the Arks A O, and A L, (for the Primitive Circle is right to the Eye at d:) Therefore to project such a lesser Oblique Circle, you need only take the half Tangents of the Distance of each end of the Diameter of such a lesser Circle from the Point A, opposite to the Eye supposed at d; and set them from the Centre C, and they will find the Points a and b, the ends of the projected Diameter; and a b bisected, will give the Centre e.

P R O P. XIII.

All Great Circles of the Sphere, passing through any Point *a*, in the Diameter of the Projection, shall have their Centres in the Line *g f*, which is perpendicular to the Diameter *g b*, and their Centers will be distant from the Point *g*, the Centre of the Circle *A a D*, by the Tangent of the Angle of their Intersection with the said Circle *A a d*.

It is plain from what hath been proved in Proposition 10, that the Angle of the Radii of any two Circles is equal to the Angle of the Intersection of their Peripheries: And therefore if it were required to draw a great Circle thro' the Point *a*, which shall make any given Angle with the Circle *A a d*.

Set the Tangent of that Angle, from *g* the Center of the Circle *A a D*, found by the making a Circle pass thro' the three Points *A*, *a*, and *D*, and that shall find the Point *f*, the Centre of the Circle required

C O R O L L A R Y.

Hence if *a* be supposed to be the Polar Point of the World projected, and it were required thro' it, to project all the Hour Circles; *A a D*, will be the Hour Circle of six, whose Center is in *g*; and by setting the Tangents of 15, 30, 45, 60, &c. both ways from *g* towards *f* and *b*, (agreeable to the Radius *ag*) all the other Hour Circles may be described on the Plane of the Projection; from their Centers in the Line *f h*.

Which is the Foundation of all Dyalling, or the True Projection of the Hour Circles of the Sphere on any given Plane:

P R O P. XIV.

Problem 3. To find the Pole of any Great Circle.

If the Pole of the Primitive Circle be required 'tis its Centre,

If the Pole of a Right or Perpendicular Circle be sought, 'tis 90 Degrees distant, reckoned upon the Limb from the Points, where this Circle (which is a Diameter) cuts it.

As *P* is Pole of the Perpendicular Circle *a b*.

If the Pole of an Oblique Circle be described, which in the Projection will be an Ark of a great Circle.

1. Consider that this Circle must cut the Primitive in two Points, that will be distant from each other just a Diameter, as is the Case of the Intersection of all great Circles.

2. The Pole of this Circle must be in a Line Perpendicular to its Plane. And,

3. This Circle Poles cannot but lie between the Centre of the Primitive one, and its own,

For Instance.

Let the Poles of the Oblique Circle *A B C*, be required.

T. Draw

1. Draw the Diameter A C, and then another as D E, Perpendicular to it.
2. Lay a Ruler from A to B, it will cut the Limb in F; then take the Cord of 90 Degrees, and set it from F to h.

3. Lay a Ruler from h to A, it will cut D E in g; which Point g is the Pole required.

N. B. The finding the Points f and h, is called reducing B to the *Primitive Circle*, and to the *Diameter*.

PROP. XV.

Problem 4. To describe a Spherical Angle of any Number of Degrees given.

1. If the Angular Point be at the Center of the *Primitive Circle*, then 'tis made at any Plane Angle, numbring the Degrees in the Limb, from the Line of Cords: For all Circles passing thro' the Centre, and which are at Right Angles with the Limb, must be projected into Right Lines.

2. If the Angular Point be at the Periphery of the *Primitive Circle*; draw a Diameter as A C; (see the last Figure :) Then take the secant of the Angle given in your compasses, (as suppose 65 Degrees) and setting one Foot in A, cross the Diameter in e, or if no Diameter be drawn, placing one Foot in C, and crossing the former Ark, you will find the same Point e, which is the Center of the Circle A a C, which with the *Primitive* makes an Angle D A a of 65 Degrees.

N. B. If the Angle given be obtuse, take the secant of its Supplement to 180 Degrees.

3. If a Point as a were assigned, thro' which the Ark of the Circle constituting the Angle must pass; draw the Diameter A C (as before :) Then take the secant of the given Angle, and setting one Foot in A or C, strike an Ark as at e, and then with the secant of the given Angle, setting one Foot in a, cross the other Ark in e, which will be the Centre of the *Oblique Circle* required.

PROP. XVI.

Problem 5. To draw a great Circle thro' any two Points given, as a and b within the *Primitive* one.

Draw a Diameter thro' that Point which is furthest from the Center, as D R, producing it beyond the Limb if there be occasion; set 90 Degrees from D or R to O, and draw O a.

Then erect O H, Perpendicularly to a O, and produce it till it cuts the Diameter prolonged in H; that Intersection H is a third Point, thro' which as also this a and b, if a Circle be drawn, it will be a great Circle, as e a b g.

Which is easily proved, by drawing the Line e C g; for that Line is a Diameter: Because its Parts multiplied into one another, are equal to $a c + c H = O C g$, by 35. d 3, and Cor. 8 d 6, Euclid.

PROP. XVII.

Problem 6. To draw a great Circle Perpendicular to, or at Right Angles with another.

Let it pass thro' its Poles, and 'tis done.

Of which there will be four Cases.

1. To draw a Circle Perpendicular to the *Primitive*; which is done by any straight Line passing thro' the Centre.

2. To draw a Circle Perpendicular to a Right Circle; is only to draw a Circle at Right Angles with that Right Circle.

3. To draw an Oblique Circle Perpendicular to a Right one; only draw a Circle which shall pass thro' both the Poles of such a Right Circle, and 'tis done.

Thus the Oblique Circle D z R, is Perpendicular to the Right one O Q, because it passes thro' its Poles D and R. See the last Figure.

4. To draw one Oblique Circle Perpendicular to another.

Find First P the Pole of the given Oblique Circle C e B, and then draw any how the Diameter D R, so a Circle drawn thro' the Three Points; D P and R shall be the Circle required; for passing thro' the Poles of the Oblique Circle C e B, it must be Perpendicular to it.

PROP. XVIII.

P R O P. XVIII.

Problem 7. *To measure the Quantity of the Degrees of any Arch of a great Circle.*

1. If the Arch be part of the Primitive, 'tis measured on the Line of Chords.

2. If the Arch be any Part of a Right Circle, the Degrees of it are measured on the Scale of half Tangents, supposing the Centre of the Primitive Circle to be in the beginning of the Scale, so that if the Degrees are to be reckoned from the Center, you must account according to the order of the Scale of half Tangents.

But if the Degrees are to be accounted from the Periphery of the Primitive, as will often happen, then you must begin to account from the end of the Scale of half Tangents calling 80, 10, 70, 20, &c.

3. To measure any Part of an Oblique Circle; first find its Pole, and there laying the Ruler, Reduce the two Extremities of the Ark required to the Primitive Circle, and then measure the Distance between those Points on the Chords.

Thus in the last Figure, if the Quantity of $e B$ an Arch of the Oblique Circle $C e B$ were required; lay a Ruler to P the Pole, and reduce the Points e and B , to the Primitive Circle, so shall the Distance between e and B , measured on the Chords, be the Quantity of Degrees in the Ark $e B$.

P R O P. XIX.

Problem 8. *To measure any Spherical Angle.*

1. If the Angular Point be at the Centre of the Primitive, then the Distance between the Legs taken from the Limb, and measured on the Chords, is the Quantity of the Angle.

2. If the Angular Point be at the Periphery of the Primitive Circle, as suppose the Angle $A C B$ were required.

Here the Poles of both Circles being in the same Diameter; find the Pole of the Oblique Circle $C B O$, which let be $B P$. Then the Distance $R P$,

measured on the Scale of half Tangents, is the measure of the Angle $A C B$.

For the Poles of all Circles, must be as far distant from each other, as is the Angle of the Inclination of their Planes.

But if the two Poles are not in the same Diameter, being both found in their proper Diameters, reduce those Points to the Primitive Circle, and then the Distance between them there, accounted on the Chords, is the Quantity of the Angle sought.

Thus, if the Angle $B C R$ be sought.

A Ruler laid to the Angular Point C , and P the Pole of the Oblique Circle $C B O$, will find on the Limb of the Point F , and being laid from the same Angular Point thro' n , the Pole of the Right Circle $C R O$, will give the Point n in the Limb, wherefore the Ark $F n$ measured on the Chords, is the measure of the Angle $B C R$.

3. When the Angular Point is some where within the Primitive Circle, and yet not at the Center, proceed thus.

Suppose the Angle $a b c$ be sought.

Find the Pole P of the Circle $a b d$, and then the Pole of the Circle $c b c$: After which lay a Ruler to the Angular Point; and the two Poles P and Q , and reduce them to the Primitive Circle, by the Points x and z ; so is the Ark $x z$ measured on the Chords, the Measure of the Angle $a b c$ required, and $C b d$ is its Complement to 180 Degrees.

P R O P. XX.

Problem 9. To draw a Parallel Circle.

1. If it be to be drawn Parallel to the Primitive Circle at any given Distance, draw it from the Centre of the Primitive, with the Complement of that Distance taken from the Scale of the half Tangents.

2. If it be to be drawn Parallel to a Right Circle, as suppose ab Parallel to AB , were to be drawn at 23 Degrees 30 Minutes distant from it; From the Chords take 23 Degrees 30 Minutes, and set it both ways on the Limb from A to a , and B to b (or set its Complement 66 Degrees, 30 Minutes both ways from P the Pole of AB) to the Points a and b .

Then take the Tangents of the Parallels Distance from the Pole of the Right Circle AB , which is here 66 Degrees, 30 Minutes, and setting one Foot in a and b , with the other strike two little Arches to Intersect each other some where above P , which will give C the Centre of the Parallel Circle abd required.

3. If it be to be drawn Parallel to an Oblique Circle, and at the Distance suppose of 40 Degrees.

First, find P the Pole of the Oblique Circle ABC , and then measure on the Scale of half Tangents the Distance gP , which suppose to be 34 Degrees.

grees, then add to it 50 Degrees the Complement of the Circles Distance, it will make 84 Degrees, and also subtracting 50 from it, or it from 50, it will make 16 Degrees: Then this Sum and Difference taken from the half Tangents, and set each way from P the Pole of the Oblique Circle, will give the Diameters two extremes a and b , or the Points of the Intersection of the Parallel, and then the middle Distance between a and b , is the Centre of the true Parallel Circle Pab , which is Parallel to the given Oblique Circle ABC , and at the given Distance of 40 Degrees; or the half Tangent of 84 set from g , will give b , and the half Tangent of 16 Degrees set also from g , will give the Point a , the two ends of the Parallel Circles Diameter.

P R O P. XXI.

Problem 10. To measure any Projected Arch of a Parallel Circle.

Here will be three Varieties.

1. If it be Parallel to the Primitive, then a Ruler laid thro' the Centre and the Division of the Limb, will divide the Parallel into the same Degrees, or determine in the Limb the Quantity of any Ark Parallel to it.

2. If the Circle be Parallel to a Right one, as abd is, in Case the second of the last Proposition, and it were required to measure that Ark ab , or to divide it into proper Degrees: Since that Parallel Circle is 66 Degrees, 30 Minutes distant from P , the nearer Pole of the Right Circle AB , and consequently 113 Degrees, 30 Minutes distant from its other Pole, take the half Tangent of 113 Degrees, 30 Minutes, or the Tangent of its half 56 Degrees, 45 Minutes, and with that Distance, and on the Centre of the Primitive, draw a Circle Parallel to the Limb; and divide that half of it, which lies towards the opposite Pole of AB into its Degrees, which is easily done by a Sector: Then a Ruler laid from P , and the equal Divisions of that Semicircle, shall divide ab , or measure any Part of it.

3. To measure or divide the Ark of a Circle which is projected Parallel to an Oblique one.

As suppose the Circle abd which is Parallel to the Oblique one ABC , in Case the third (Fig. 2.) of the preceding Proposition: And at the Distance of 40 Degrees; this Parallel Circle being 40 Degrees distant from the Plain of the Circle ABC must be 50 Degrees distant from its Pole, and consequently 130 Degrees from the opposite Pole. Take therefore the half Tangent of 130 Degrees, or the Tangent of its half 65 Degrees, and with that as a Radius, draw a Circle Parallel to the Limb of the Primitive; which Circle divide it into proper Degrees: Then shall a Ruler be laid thro' P , and the equal Division of that Circle, cut the little Circle abd into its proper Degrees; or truly give the Measure of any part of it.

SPHERICK Triangle, is a Space included within the Arks of three great Circles of the Sphere, intersecting each other on the Surface of the Globe, and every such Triangle is either *Quadrantal*, which hath on one Side (at least a Quadrant and one Angle Right); or *Ordinary Quadrantal*, which hath all

its Sides more or less than 90 Degrees; and all its Angles bigger or lesser than Right ones.

The Application of Spherick Geometry, to the Construction and Mensuration of all the Parts of Spherick Triangles.

In the Right-angled Spherick Triangle ∇ R ∇ .

H = 54 Degrees, 15 Minutes, the Sun's Longitude from the next Equinoctial Point, or 24 Degrees, 15 Minutes of φ .

B = 51 Degrees, 52 Minutes, the Sun's Right Ascension.

P = 18 Degrees, 15 Minutes, the Sun's Declination.

φ = the Angle of the Sun's Position.

∇ , \simeq , the Angle of the Sun's greatest Declination.

To make the Triangle.

With 60 Degrees of a Line of Chords, describe the Circle Z C K Q, which is the Limb, or Primitive Circle, and here represents the foliocal Colure. Draw the Diameter E Q, which will be the Equator g here represented by a Right Line, because the Eye is at ∇ or \simeq , in its Plane. Take 23 Degrees, 30 Minutes from the same Chord, and set it from E to C, so shall CK be the Ecliptick, which will be a Right Line, also for the same Reason. Then either the Sun's Place set from ∇ on the Ecliptick, or his Right Ascension set from thence on the Equator, will give the Point φ , or R, accordingly. Then draw Z N at Right Angles to the Equator, and so you will have three Points Z φ N, or Z R N, thro' which the Circle of Declination Z φ R N, may be easily drawn.

To measure the Sides and Angles.

The Sides H and B being straight Lines, are measured on the Scale of half Tangents, by Prop. 6. of Spherick Geometry; and the Side P is measured by finding l , the Pole of the Oblique Circle Z φ H; and from thence laying a Ruler to the two Extremities of the Side P, (*i. e.*) thro' φ and R, in or-

der to reduce them to the Limb in E and e ; the Ark E e , measured on the same Line of Chords, will give the Quantity of the Side φ R = 18 Degrees, 15 Minutes.

And this is the general Rule to measure the Arks of all Oblique Circles, Prop. 18. Case 3.

For the Angles.

That at R, is a Right one, and so known.

That at ∇ , is the Angle of the Sun's greatest Declination = 23 Degrees, 30 Minutes, and its Measure is the Ark B C of the Limb, by Prop. 19. Numb. 1.

The Angle of the Sun's Position φ , is measured by laying a Ruler thro' φ , the Angular Point, and thro' a and l , the Poles of the Circles C ∇ K, and N ∇ Z, which will find the Points a and l in the Limb, and the Ark a L = 72 Degrees, is the Measure of the Angle φ required, by Prop. 19. Numb. 3.

You may consider also, the Triangle Z C φ , where one Angle is at the Periphery of the Primitive Circle, and this will help to shew the Varieties of Right-angled Spherick Triangles.

Here the Angle C is a Right one, being made by an Hour Circle, or the Meridians cutting the Equator; for here C K may represent the Equator, and let Z be the Zenith of any Place, then will C φ be the Hour from Noon; C Z will be the Latitude of the Place, and φ Z, the Complement of the Sun's Height, being now supposed to be in the Equator. The Angle Z will be the Sun's Azimuth from the South, the Oblique Circle Z φ R N, being a Vertical one; and the Angle φ , will be the Angle of the Sun's Position. Which Triangle C φ Z may be formed, and all its Sides and Angles measured by the Propositions and Rules above delivered.

Again,

In the Right-angled Spherick Triangle N C R. R = Right Angle made between the Horizon H R and the Meridian n R.

B = Complement of the \odot 's Amplitude = 50 Degrees 8 Minutes.

H = to the Sun's Distance from the Pole above the Horizon h R; or the Complement of his Declination.

P = to the Elevation of the Pole, or Latitude of the Place.

⊙ = the Angle of the Sun's Position.

⊙ n R = the Hour from Midnight.

To describe this Triangle.

First, Draw the Circle $b n R$, representing the Meridian, and then the Diameter $b R$, for the Horizon of London: Set the Poles height 51 Degrees, 30 Minutes from R to n the North Pole, and draw the Oblique Axis, $n \gamma S$. Then if the Sun's Amplitude be given, set that, Suppose 39 Degrees 52 Minutes, from γ to \odot , which will limit the Base B , and give a Point thro' which and the two other given Points n and S , a great Circle may be drawn, which will form the Triangle. But if instead of that, the Angle $\odot n R$, or the Time from Midnight had been given, then you must turn that Time into Degrees, and by *Prop. 15. Case 2.* make a Spherick Angle with the Limb, of that Number of Degrees, at the Point n , and that will determine the Point \odot .

The Angle $\odot n R$, is measured by *Prop. 19. Case 2.*

Thus also in Oblique angled Spherick Triangles, all the Sides and Angles may (by this Method) be measured, and the Triangles constructed.

In the following Obtuse-angled Spherick Triangle $\odot Z N$.

$Z N$ = to the Complement of the Poles Elevation, = 38 Degrees, 30 Minutes.

⊙ N = the Complement of the Sun's Declination from the Equator $E Q$.

⊙ Z = 46 Degrees, 49 Minutes = the Complement of the Sun's Altitude above the Horizon $b R$.

⊙ $N Z$ = 30 Degrees, is the Hour from Noon or Ten a Clock in the Morning.

⊙ $Z N$ = 137 Degrees, 47 Minutes is the Sun's Azimuth from $Z R n$, the North part of the Meridian.

To Construct the Triangle.

1. With 60 Degrees of a Line of Chords, draw the Primitive Circle $Z R n b$; which crosses in the Centre with two Diameters, $b R$ representing the Horizon of London, and $Z N$, the Prime Vertical Circle.

2. Set the Elevation of the Pole = 51 Degrees, 30 Minutes, from R to N ; so is N the North Pole of the World: And drawing $N S$ thro' the Centre, it will be the Axis, and S the South Pole.

3. Cross $N S$ with another Diameter at Right Angles, and that will be $E Q$, the Equinoctial.

4. Then because the Time from Noon is 2 Hours, or 30 Degrees, and that all Hour Circles pass thro' the Poles, and make Angles with the Meridian; make an Angle at N , of 30 Degrees, by *Prop. 15. Case 2.* which will be the Spherick Angle $E N \odot$.

5. And since the Azimuth is 137 Degrees 47 Minutes, from the North, subtract that out of 180, and there will remain 42 Degrees, 13 Minutes, the Sun's Azimuth from the South; and because all Azimuths, or Vertical Circles, pass thro' Z the Zenith; make an Angle with the Primitive at Z , of 42 Degrees, 13 Minutes, (by *Prop. 19. Case 2.*) and so will your Triangle be Stereographically projected, and the Reason of the Thing made plain and easie.

I don't give Instances of the *Analemma*, or of the several Stereographick Projections on the Plains of the Horizon, Equator, Meridian, &c. because you will find them in their proper Places under those Words.

SPHERICAL Numbers. See *Circular Numbers*.

SPHEROID, is a solid Figure made by the Rotation of a *Semi-Ellipsis* about its Axis; and is always equal to $\frac{2}{3}$ of its circumscribing Cylinder, *Archim. de Conoid. & Spheroid. 18. & 25. 2.*

SPHINCTER, is a Muscle that contracts the Gullet, *Anus*, Bladder, &c.

SPHINCTER Ani, is a large, thick, fleshy Muscle encompassing the *Anus*: Its Figure and Series of Fibres externally, immediately under the Skin, incline to an oblong Oval: It is connected forward, to the *Accelerator Urine*; backwards, to the *Os Coccygis*; its Fibres are Circular for near two Inches in breadth; it is much larger in Men than in other Animals, in whom by reason of the erect Position of the Body, there is greater Force required to retain the *Feces*, which is the Office of this Muscle.

SPHINCTER Gulae. See *Oesophagus Gulae*.

SPHINCTER Vaginae, is a Muscle lying immediately under the *Clitoris*, encompassing the *Vagina* with Circular Fibres 3 Fingers in Breadth: In some Subjects (saith Mr. Cowper) it scarce appeareth fleshy. When this Muscle acts, it not only straitens the *Vagina*, but thereby it also hinders the Blood in its return from the *Plexus retiformis* of the *Pudendum*, by compressing some of its Veins that pass underneath, by which means the *Labia* become distended, and the *Vagina* contracted.

SPHINCTER Vesicae, is a Muscle seated in the upper part of the Neck of the Bladder, immediately

ately above the *Glandula Prostate*; whose Contraction hinders the Involuntary Egrels of the Urine.

SPHYGMICA, is that Part of Physick which treats of Pulses. *Blanchard*.

SPIKES, or as the Seamen call them *Speeks*, are large long Iron Nails with flat Heads; they are of divers Lengths, some a Foot or two long, and some are jagged, so that they cannot be drawn out again. They are used to fasten the Planks and Timbers. They call also a kind of small *Fidd*, which serves them to open and splice small Ropes, a *Marling Spike*.

SPIKING up the Ordnance, is fastning a *Coin*, or *Quoin* with Spikes to the Deck, close to the Breech of the Carriages of the Great Guns, that they may keep close and firm to the Ship-sides and not break loose when the Ship *Rolls*, and by that means endanger the breaking out of the *Butt-head* of a Plank.

SPINA Dorsi, are the hinder Prominences of the *Vertebrae*.

SPINA Ventosa, is an Ulceration, in which the Bones are eaten by a malignant Humour without any Pain of the *Periosteum*, or Membrane that covers the Bone: After that, a Swelling being risen without any Pain, the Part affected is quite eaten out with the Ulcer, from whence frequently follows a Necessity of Amputation.

SPINALIS Colli, is a Muscle so called, because it accompanies the Spines of the Neck; it arises from the five superior Transverse Processes of the *Vertebrae* of the *Thorax*, and inferior of the Neck, and in its Ascent becomes more fleshy, and is so inserted largely into the inferior Part of the *Vertebrae* of the Neck laterally, &c. These draw the *Vertebrae* of the Neck directly backwards.

SPINALIS Medulla. See *Medulla Spinalis*.

SPINDLE, is the smallest Part of a Ship's Capstan which is betwixt the two Decks. The *Spindle* of the *Jeer Capstan* hath *Whelps* to heave the *Viol*. Also the Axis of the Wheel of a Watch or Clock is called the *Spindle*, and its Ends the *Peavets*.

SPINE, the Back-Bone, or long jointed Chinese Bone that goes down the Back.

SPINSTER, a Term in Law, being an Addition usually given to all unmarried Women, from the Viscount's Daughter downward.

SPIRAL-Line, in Geometry, is according to *Archimedes* thus generated.

If a Right Line as A B, having one end fix'd at B, be equally moved round, so as with the other end B, to describe the Periphery of a Circle; and at the same time a Point be conceived to move forward equally from B towards A in the right Line B A, so as that the Point describes that Line, while the Line generates the Circle. Then will the Point with its two Motions describe the curve Line B, 1, 2, 3, 4, 5, &c.

which is called a *Helix* or *Spiral Line*; and the plane Space contained between the Spiral Line and the Right Line B A, is called the *Spiral Space*.

If also you conceive the Point B to move twice as slow as the Line A B, so as that it shall get but half way along B A when that Line shall have formed the Circle; and if then you imagine a new Revolution to be made of the Line carrying the Point, so that they shall end their Motion at last together; there will be formed a *Double Spiral Line*; and two Spiral Spaces as you see in the Figure. From the Genesis of which may easily be drawn these Corollaries.

1. That the Lines B 12, B 11, B 10, &c. making equal Angles with the first and second Spiral, (as also B 12, B 10, B 8, &c.) are in Arithmetical Proportion.

2. The Lines B 7, B 10, &c. drawn any how to the first Spiral, are to one another as the Arks of the Circle intercepted betwixt B A and those Lines. Because whatever Parts of the Circumference the Point A describes; as suppose 7, the Point B will also have run over 7 Parts of the Line A B.

3. Any Lines drawn from B to the second Spiral, as B 18, B 22, &c. are to each other, as the aforesaid Arks, together with the whole Periphery added on both sides: For at the same time that the Point A runs over 12, or the whole Periphery, and perhaps 7 Parts more, shall that Point B have run over 12 and 7 Parts of the Line A B, which is now supposed to be divided into 24 equal Parts.

PROPOSITIONS.

I. The first Spiral Space A D C B is to the first Circle :: as 1 to 3.

Divide the Circumference of the Circle into 3 = Parts by Lines drawn from the Center B, beginning from the first Line B A; then will (by Cor. 1.) B c be = 1, B D = 2, and B A = 3; and the Sectors circumscribed about the Spiral will be as the Squares of the Radii, viz. C B c = 1, D B d = 4,

$DBd = 4$, and $ABa = 9$; and so it will be always, if you make never so many Bisections of the 3 first Divisions of the Circle. That is, the Lines drawn from B to the *Spiral*, will be as 1, 2, 3, 4, 5, 6, &c. and the Sectors circumscribed, as 1, 4, 25, 36, &c. always going on in the order of Squares, or in a duplicate Ratio. But a Rank of such Terms, are to a Rank of as many, equal to the greatest, as 1 to 3 (by N. 7. of *Arithm. Progression*.) Wherefore the whole *Spiral Space* (which is composed of such Sectors) is to the whole Circle :: as 1 to 3. Q. E. D.

(Or,)

If another Circle be drawn with a Radius double to the former, its Area will be (as the Square of its Diameter) 4 times as great as that of the former. Therefore the first Circle to the second will be as 1 to 4, or as 3 to 12. And since the *Spiral Space* is to the first Circle as 1 to 3, that Space to the second Circle will be as 1 to 12; and to a 3d Circle so described, as 1 to 27; to a 4th, as 1 to 48, &c.

II. The first *Spiral Line* is equal to half the Periphery of the first Circle; for the Radii of the Sectors, and consequently the Arches are in simple Arithmetick Progression, while the Periphery of the Circle contains as many Arches equal to the greatest; wherefore the Periphery to all those Arches, is to the *Spiral-line* as 2 to 1 (by N. 6. of *Arithm. Progression*.)

I thought one Proposition, with a Corollary or two, enough on this Subject, to give the Reader a Specimen of the *Genesis, Nature and Properties*, and way of Demonstration used about *Spiral Lines*: Those that will see more, may consult *Archimedes*, *Dr. Wallis's Arithmetick of Infinites*, or *Sturmius's Matth. Enucleat.* lib. 2. Chap. 4.

Proportional Spirals, are such *Spiral Lines* as the Rhumb Lines on the Terrestrial Globe, which because they make equal Angles with every Meridian, must also (as we shew in *Prop. 7.* of *Spherick Geometry*, which see) make equal Angles with the Meridians in the Stereographic Projection on the Plane of the Equator; and therefore will be, as the Learned Capt. *Halley* observes, *Proportional Spirals* about the Polar Point. From whence that excellent Mathematician demonstrates, That the Meridian Line is a Scale of Log. Tangents of the $\frac{1}{2}$ Meridian-complements of the Latitudes. See *Meridian Line*.

In *Proportional Spirals*; the Angles BPD, BPD, &c. or the Arches B D, B d, &c. are Exponents of the Ratios of B' P to P C. For if the Arch B D be divided into innumerable equal Parts, right Lines drawn from them to the Center P, shall divide the Curve B c c C into an Infinity of Proportionals; and all the Lines P c, P c, &c. shall be an Infinity of Proportionals between P B and B C, whose Number is equal to all the Points d d, in the Arch B D: But an infinite Number of Proportionals between the two Terms of the Ratio, is to that infinite Number of equal Parts between any other two Terms: as the Logarithm of the one Ratio is to the Logarithm of the other; therefore, as B D to B d, or as the Angle B P D to the Angle B B c; so is the Logarithm of the Ratio of P B to P C, to the Logarithm of the Ratio of P B to P c. Q. E. D.

SPIRIT, which the Chymists call Mercury, is one of the 5 Principles separable from a mixt, by Fire; 'tis subtil, light, penetrating, and active, and hath its Particles in a very quick Motion. This is probably that which causes the Growth and Encrease of all Bodies; but where it abounds most, those Bodies do soonest corrupt, because of its rapid Motion. This appears in Vegetable and Animal Bodies, which yield the greatest Quantity of Spirit; whereas most Minerals, as having but a small Proportion of Spirit in them, are almost incorruptible.

This Principle is never drawn pure, any more than the others; and when it comes over involved in a little Oil, 'tis called an Ardent Spirit, such as Spirit of Wine, which therefore should rather be called an exalted Oil; and when it hath in it a little Volatile Salt dissolved, 'tis called a Volatile Spirit, as the Spirit of Hartshorn, Urine, &c. If it be impregnated with Acid Salts, its Volatility is then check'd, and 'tis called an Acid or Fixt Spirit, as Spirit of Salt, Vitriol, Allum, &c. which truly are only an Acid Salt dissolved and put into Fusion by a strong Fire.

SPIRIT of Niter is thus drawn: Mix one part of Salt-peter with three times as much Potters-earth dried; put this Mixture into a large earthen Retort, and set it in a close Reverberatory Fire; distill off the Phlegm with a small Fire in about 4 or 5 Hours, and when no more Drops will come, lute on a very large Receiver, and encrease the Fire gradually to the 2d Degree, some more volatile Spirits will come out in white Clouds: Keep the Fire thus about two Hours, and then encrease it to the greatest Violence you can give it, the Vapours will come red; continue the Fire till no more red Fumes come; in 14 Hours the Operation will be over. If you used 2 Pounds of Nitre, you will draw 1 Pound 14 Ounces of Phlegm and Spirit together. The Vessels had need be large, and $\frac{2}{3}$ of the Retort left empty, else there will be danger of breaking all to pieces, the Spirits come forth with that Violence.

This Spirit is the best *Aqua-fortis*, and is chiefly used for Solution of Metals. But when dulcified, is a good Medicine inwardly in many Cases.

SPIRIT of Salt, is made by drying and powdering the Salt, and then mixing of it with thrice its Weight of Potters-earth powdered: A Paste is made of these two with a little Rain-water, and then the Paste is made into little Balls or Pellets about as big as Nuts. A large earthen Retort or glass one coated, hath one third of it filled with these,

these, and being placed in a Reverberatory Fire, hath a large Receiver fitted to it. The Junctures must not be luted at first, but a very moderate Fire used for a time, to distil out all the Water: But as soon as you see some little white Clouds appear, throw out the incipid Liquor in the Receiver, and Lute it well to the Retort: Then encrease the Fire by degrees to the highest, and so let it continue 12 or 15 Hours, or till no more Clouds appear; when the Operation is ended, you will find the Spirit of Salt in the Receiver. Some rectifie this Spirit afterwards in a Cucurbit, by drawing off some of the weaker Spirit in a gentle Sand-heat, and then what remains is very strong of a yellow Colour, and very weighty.

If equal Parts of this acid Spirit and Spirit of Wine are mixed together, and digested for about 3 or 4 days, 'tis called *Spirit of Salt dulcified*.

Spirit of Salt will dissolve Leaf Gold, and will precipitate what *Aqua Fortis* hath dissolved. Which shews how very differently formed and figured the Point and Pores of *Acid Menstruums* may be, and frequently are.

SPIRIT of Sulphur, commonly call'd Oil of Sulphur, *per Campanam*, (from the Vessels form being like a Glass Bell, in which it is usually drawn) is only the acid Part of Sulphur turned into a Liquor by the means of *Fire*. *Lemery* uses a great Glass Tunnel for this Operation; which seems to be the best way of drawing this Spirit, *vid.* p. 445. *last Edition*. Some make use of Salt-petre in the drawing of Spirit of Sulphur, but that is not a good Practice, because the Nitre alters something of the mixture of the Spirit.

SPIRITS in an Animal Body, were reckoned of three sorts; the Animal Spirits in the Brain, the Vital in the Heart, the Natural in the Liver: But late Authors distinguish 'em only into two kinds; the Animal in the Brain, the Vital and Natural (which are accounted the same) in the mass of Blood. The Animal Spirits are a very thin Liquor, which distilling from the Blood in the outward or Cortical Substance of the Brain, are by the proper Ferment of the Brain exalted into Spirit, and thence through the Medullar Substance of the Brain, the *Corpus Callosum*, and *Medulla Oblongata*, are deriv'd into the Nerves and Spinal Marrow, and in them perform all the Actions of Sense and Motion.

The Vital or Natural Spirits are the subtillest Parts of the Blood which actuate and ferment it, and make it fit for Nourishment.

SPLANCHNICA, are Medicines proper against Diseases of the Intestines.

SPLEN, *five Lien*, the Spleen, is a Receptacle for the salt and earthy Excrements of the Blood, that there, by the Assistance of the Animal Spirits, it may be volataliz'd, and returning again into the Blood, may concur to its farther Fermentation. The Spleen consists of a great number of little Bladders, between which the Glandules are scattered up and down, and supply the place of Veins. The Spleen has likewise an Artery, Nerves, and Lymphatick Vessels, first discover'd by *Fr. Ruisch*, says *Blanchard*. But you will find a much better Account of it in *Gibson's Anatomy*, p. 105. See Vol. 2.

SPLENA, are Bolsters made of Linen, three, four, or five times doubled, even to the thickness of the Spleen: They are used upon Wounds, Ulcers, and Fractures. The Figure is threefold, according to the manner of Application, *viz.* at length obliquely, or transversely: They are called also *Plumaceoli*, and *Plagulae*. *Blanchard*.

SPLENETICK Artery, is said by some to be the greatest Branch of the *Celiaca*, whence it goes to the *Spleen*, and therein ends.

SPLENII Musculi, arise partly from the five lower *Vertebrae* of the Neck; and partly from the points of five of the upper *Vertebrae* of the Thorax: The Fibres of these Muscles tend obliquely, and are fastened to the hinder part of the Head. The use of 'em is to draw the Head backward. It hath its Name from its Figure, being something like to an Ox's Spleen.

SPLICE. At Sea they say a Cable or Rope is *spliced*, when the ends of two pieces being untwisted, the several Strands are wrought into one another by a Fidd. Also when an Eye is to be made at the end of a Rope, the ends of the Strands are by a Fidd drawn into the ends of the other Ropes Strands; and this is called a *Splice*.

SPLIT; the Seamen say when a Sail is blown to pieces, it's Spilt.

SPOLIATION, is a Writ that lies for one Incumbent against another, in any case where the Right of the Patronage cometh not in Debate: As if a Parson be made a Bishop, and hath Dispensation to keep his Rectory, and afterwards the Patron present another to the Church, which is Instituted and Inducted; the Bishop shall have against this Incumbent, a Writ of *Spoliation* in Court *Christian*.

SPONDÆUS, is the Foot of a Latin Verse, consisting of two Syllables, and both of 'em long, as *Ingens*.

SPONGOEIDEA ossa. See *Cribriiformia*.

SPOONING, when a Ship being under Sail in a Storm at Sea, cannot bear it, but is forced to put right before the Wind; then the Seamen say, *she spoons*; and when in such a case there is Danger lest she should bring her Masts by the Board with her rowling about, or Seal under Water, and so Founder, they usually set up the Fore-sail to make her go the steadier, especially if there be Sea-room enough; and this they call *Spooning with the Fore-sail*.

SPORADICI Morbi, are those Diseases which (tho' different in Nature) seize several People at the same time, and in the same Country.

SPOTS in the Sun. 'Tis certain those opake Masses which sometimes appear at the Sun, are not Planets revolving at any, even the least distance from him, but *Spots* or *Maculae* adhering to him; for whereas they revolve but once in about 26 Days; on Calculation it will appear, that a Planet near the Sun's Surface, as these must be, cannot have above 3 Hours allowed for its periodical Revolution, which being so different from the foremention'd space of 26 Days, quite decides that Controversie, and demonstrates those Masses to be real *Maculae* adhering to the Body of the Sun, as is here asserted.

Anno 1666, April 27th, 8 H. A. M. the Honourable Mr. Boyle observed a Spot in the lower Limb of the Sun, a little towards the South of its Equator, which was entred about $\frac{1}{10}$ of the Sun's Diameter, it self being about $\frac{1}{10}$ in its shortest Diameter of that of the Sun, its longest about $\frac{1}{4}$ of the same.

May the 8th, about 10 in the Morning, it appeared near about the same distance from the Westward Limb, a little South of its Equator; tho' at first it appear'd to be from the Eastward Limb, a little South also of its Equator. May the 9th, it disap-

disappeared. This *Spot* was very dark, and almost of a Quadrangular Form, and was enclosed round with a kind of duskyish Cloud.

May the 25th, the same *Spot* appear'd again, and seem'd to be in a part of the same Line it had formerly trac'd, and was entred about $\frac{3}{4}$ of its Diameter, about 7 h. P. M. At which time there appear'd another *Spot*, which upon its entrance was not above $\frac{1}{12}$ part of the Sun's Diameter: It appear'd to be longest towards the North and South, and shortest towards the East and West: and there seem'd to be dispers'd about it divers small Clouds here and there.

Anno 1671, August the 11th, 6 h. P. M. Mr. Cassini, by the help of a Three-foot Glas, observ'd in the Sun's Disk two *Spots* very dark, and distant from his apparent Center about $\frac{1}{3}$ of his Semidiameter.

But, that he might the more exactly note their Situation, in respect of the several Parts of the World, he made use of two very fine Threads, cutting one another at Right Angles in the common Focus of the two Glasses, and in the Axis of the Telescope; so that he might see the Sun's Center, and according as one of these Threads advanced Westward, it mark'd in the Sun a Circle parallel to the Equator; and the other Thread mark'd the Circle of Declination, or the Horary Circle. Then he observ'd that the *Spots* were in the Southern part of the Sun; that their Elongation from this Parallel, passing thro' his Center, could be no more than about $\frac{1}{8}$ of his Diameter; and that they were situat on the Eastern-side in respect of the said Center of the Sun. He also measur'd several times, from 6 a Clock at Night, to 7, the time which lap'd between the passage of the Sun's Center, and that of the first of these *Spots*, thro' the said Horary Circle, which sometimes he found to be 23, sometimes 22 Seconds, the Semidiameter of the Sun then passing in 66 Seconds.

August the 12th, he observ'd them from the time of Sun-rising, and perceiv'd that now they were nearer his Center. The time between the passage of the Sun's Center, and that of the interior edge of the Coronet which encompass'd them both, was then of 16 Seconds. At 7 a Clock it was but of 15, and the Southern Limb of the Coronet touch'd the Parallel passing through the Sun's Center.

From 6 at Night unto 7, the time between the passage of the Sun's Center and that of the Coronet's Limb, was found to be one time of 8 Seconds, at another time of 7", and another of 7" $\frac{1}{2}$. The distance of the *Spot* unto the Parallel, passing thro' the Sun's Center, was near the same on the North-side, with what it had been observ'd to be in the Morning on the South side.

August the 13th, about 6 in the Morning, the edge of the Coronet was distant from the Equator, on the North-side, 39 Seconds; and there was but one Second of Time from the passage of the Sun's Center into the passage of the same anterior edge of the Coronet.

At 8 h. 30', the Fore-edge was in the same Horary Circle with the Sun's Center; so that in one Day and an half, these *Spots* have run thro' very near the third part of the Sun's apparent Semidiameter, which giveth an Arch of 19 Degr. 30 Min. of the Circumference of the Sun's Body; and consequently their Diurnal Motion about the Sun's Axis hath been of 13 Degr. and the time of

their Periodical Revolution as far as could be conjectured in so little Time, must be about 27 Days and a half; which was confirm'd afterwards by farther Observations. *Phil. Trans.*

August the 30th, 1671, Dr. Hook observ'd a large *Spot* in the Center of the Sun's Face about Noon.

Sept. the 1st, he saw the same *Spot* again, and observ'd it to be mov'd about $\frac{1}{2}$ of the Sun's Diameter Westward.

April the 25th 1683, Mr. Flamsteed saw a large *Spot*, having 3' 40" more North Declination than the Sun's Center, and at 3 h. 35' after Noon he measur'd its Distance from the next Limb, 0', 40".

April the 26th, he saw it more remote from the Limb, and at 8 a Clock determin'd its Longitude from the Sun's Axis 66 $\frac{1}{2}$ Degr. and its Declination from the Solar Equator 8 $\frac{1}{2}$ Degr. South.

The Revolution of this *Spot*, Mr. Flamsteed found to confirm his former Theory of the Sun's Motion round his Axis in 25 d. 6 h. and that the Angle of his Equator and our Ecliptick is 7 Deg. and the Longitude of his Northern Pole was in 16°.

SPRING of the Air, or its Elastical Force, see more in Air.

That there is such a Spring or Elasticity in the Air, is clear from the following Experiments.

1. That Bladders but half blown up, and having their Necks well tied, did swell in their exhausted Receiver as if blown to their full Dimensions; and that full blown Bladders, and even thin square glass Viols well stop'd, will break to pieces when once the Air is well pump'd out of the Receiver.

2. A glass Syphon whose recurved Leg was turn'd up parallel to the upper and longer, and was seal'd Hermetically at the end of the lesser or shorter Leg, had a Quantity of Quicksilver pour'd into it, and by its being mov'd often up and down, the Air in the sealed and shorter Leg, was brought to the same Temperament of the External. After this more Mercury was pour'd in, till the Air in the sealed Leg was compress'd into about half its usual Dimensions; and then the Mercury in the longer Leg was 29 Inches higher than that in the shorter: By which it appears plainly, That the Spring of the Air in the sealed Leg was so great, as to equiperponderate a Column of Mercury of 29 Inches in Length. Boyle against Linus.

3. A Viol fill'd to but a 4th part with Quicksilver, had a long and slender glass Pipe fasten'd into its Neck, with Sealing-Wax or Cement, whose lower Orifice was a good way under the Quicksilver in the Viol; then having blown in a little Air, to try whether the Viol were well stopp'd, it was convey'd into a long and slender Receiver; and after the Air was drawn off by the Pump, the Spring of the included Air within the Bottle, impell'd the Mercury up to the Height of 27 Inches in the Pipe, and there kept it suspend'd; till upon the Re-admission of the Air, the Quicksilver fell down to its first Station in the Pipe. This Experiment Mr. Boyle often tried, and with desir'd Success.

And when it was tried with a Bottle that held a Quarr, the Spring of such a Quantity of Air was able to raise the Mercury up to 29 Inches $\frac{7}{8}$. But nothing could make it raise above the common Height of the Quicksilver in the Baroscope.

4. Into a Copper Vessel of a Cylindrical shape, was put almost Water enough to fill it, and then was immersed into it and kept under Water by a Weight, a square glass Viol that would hold 9 or 10 Ounces of Water, and was well stopp'd: After this, Mr. Boyle placed the Copper Vessel in his *Pneumatical Engine*, and pumping up the Air, he found, That the Spring of the Air included in the Viol broke it all to Pieces, tho' under Water, with a great Noise, and made a kind of Smoak or Mist appear above the Surface of the Water.

Which Experiment proves both the great Force of the Natural Spring of the Air, when the Weight of the Atmosphere is removed; and also that the Weight of the Atmosphere acts upon Bodies under Water; for that could by its universal pressure keep the Spring of the Air in the Bottle bent while it was under the Surface of the Water; but when once *that*, by plying the Pump, was taken off, the Elastic Particles unbent themselves violently, and broke the Viol. See the Experiments about the Pressure of the Airs Spring on Bodies under Water.

The Spring of the Air, is equal every where in a natural State to the Weight of the incumbent Atmosphere; just as if a Person should squeeze or compress together either by the force of his Hand, or by a Weight, any parcel of Wool, or such Elastic Bodies, the Wool would by its Spring equally press against the Hand or Weight. According to the third Axiom of Sir Isaac Newton's Principia, *Actioi contrariam semper & aequalm esse Reactionem.*

The Accurate Dr. Hook on Experiments well made, thinks we may conclude the Spring of the Air to be Reciprocal to its Extension. *Micrograph. p. 227.*

And the Resistance of the Spring of the Air, is found to be nearly equal to the Weight or Force that compresses it; and the Spaces that the same Air occupies under differing Pressures, are Reciprocally as those Pressures.

The Quantity of the Dilatation and Expansion of Air only by the Operation of its Spring, without any additional Heat, Mr. Boyle found to be so great, that a Bubble of Air included in a proper glass Pipe almost filled with Water, was extended to above 150 times its former Dimensions; and he believes would have taken up 200 times its former Room, had the Tube been long enough to have tried the Experiment. *New Exper. Phys. Mech. Edit. 3. p. 32, 33.*

He found also, that a Cylinder of Air of an Inch in Diameter, and less than two Inches in Length, would, when included in a Bladder, and the Weight of the Atmosphere taken off by pumping, by its bare Spring only, raise a Weight of above 10 Pounds *Averdupos*.

He found also, that the Spring of a Cylinder of Air of 2 Inches Diameter, and of the former length, was in the same Engine able to raise up 42 Pound Weight.

Whence it appears, that the Force of the Spring of different Cylinders of Air is in a duplicate Ratio, to the Diameters of those Cylinders.

The Spring of the Air, may be explicated either by supposing the Air near the Earth to consist of an heap of such little Springy or Elastic Bodies lying one upon another resembling those of a Fleece of Wool.

Or else according to D. Cartes his way by supposing, That the Air is nothing but a Congeries of flexible Particles of several kinds of Figures and Sizes, which are raised by Heat into the fluid and subtile *Ethereal Matter* that furrounds the Earth, and by the continual Agitation of that Matter, wherein those Particles swim, are so whirled about, that each Corpuscule endeavours to beat off all others from coming within the little Sphere requisite to its Motion about its own Center, and (in case any, by intruding into that Sphere shall oppose its free Rotation) to drive it away.

SPRING a Mast; so the Seamen call it, when a Mast is only crack'd, but not quite broken, in any part of her; as in the *Partners*, the *Hounds*, &c. then they say, *The Mast is Sprung.*

SPRING-Arbor, in a Watch, is that part in the middle of the Spring Box which the Spring is wound or turned about, and to which it is hooked at one end.

SPRING-Box, is that Cylindrical Case or Frame that contains within it the Spring of a Watch or other Movement.

SPRING-Tide, is the increasing higher of a Tide after a dead Neipe; this is about 3 Days before the Full or Change of the Moon; but the top or highest of the Spring-Tide is 3 Days after the Full or Change; then the Water runs highest with the Flood, and lowest with the Ebb, and the Tides run more strong and swift than in the Neipes.

SPRINGS and Fountains. Concerning the Origin of these, there is much Dispute, especially of such as are found on the tops of high Mountains.

Some, as Dr. Hook, Dr. Plot, and many others, think that they arise from the Sea-water percolated through the Bowels of the Earth, which by that means being deprived of its Salt, is rendered much Lighter than before, and so is capable of rising up to the height we commonly find Springs at, as Water rises in a Filtre, or in very small Tubes, &c.

And Dr. Hook hath a pretty Experiment about this, in his *Microgr. p. 25.*

But I cannot see how by this Hypothesis, supposing the Gravity of the whole Atmosphere could be taken off, Water can arise above 34 or 35 Foot above the level of the Ocean.

The Learned Capt. Halley supposes them to be caused from the Vapours exhaled by the Sun out of the Sea, &c. Of which see an Account under the Word Vapour.

The Ingenious Dr. Woodward, in his Natural History of the Earth supposes, That the great Abyss of Waters placed in the Bowels of the Earth, is the standing Fund and promptuary which supplies Water to the Surface of the Earth, and furnishes as well Springs and Rivers, as Vapours and Rain.

For he asserts, That there is a nearly uniform, and constant Fire or Heat, disseminated thro'out the Body of the Earth, and especially in the inferior Parts of it: The Bottoms of the deeper Mines being very sultry; and the Stone and Ores there being very sensibly hot even in Winter. That 'tis

this subterraneous Heat which evaporates and elevates the Waters of the Abyfs, buoing it up indifferently on all Sides, and towards all Parts of the Surface of the Globe.

That this rising Vapour, or Water, pervades not only the Fissures and Intervals of the *Strata*; but the very Bodies of the *Strata* themselves; permeating the Interstices of the Sand, Earth, or other Matter, whereof they consist; yea, even the most firm and dense Marble and Sand-stone; for these give Admission to it, tho' in lesser Quantity, and are always found saturated with it; which is the reason that they are softer, and can be cut much more easily when they are first taken out of the Earth, than they can afterwards, when they have lain some time exposed to the Air, and when that Humidity is evaporated.

This Vapour he asserts to proceed directly up towards the Surface of the Globe, on all sides, unless when impeded and diverted by the Interposition of *Strata* of Marble, the denser sorts of Stone, or other like Matter, which is so close and compact, that it can admit it only in a smaller Quantity, and this very slowly too.

And when it is thus intercepted in its Passage, the Vapour which cannot penetrate the *Stratum* directly, will some of it glide along the lower Surface of the *Stratum*, permeating the Horizontal Interval, which is betwixt that and the next *Stratum* lying underneath it; the rest will pass the Interstices of the Mass of the subjacent *Strata*, whether they be of laxer Stone, of Sand, Marble, or the like, with a Direction parallel to the site of those *Strata*, till it arrives at their perpendicular Intervals.

And when the Water is once come to these Intervals, in case the *Strata*, whereby the ascending Vapour was collected and condensed into Water, (as we usually speak) in like manner as by an Alembick, happen to be raised above the Level of the Earth's Surface; as those *Strata* always are, whereof Mountains do consist; then the Water being likewise got above the said Level, flows forth of those Intervals or Apertures; and if there be no Obstacle without, forms *Brooks* and *Rivers*. But where the *Strata*, which so condense it, are not higher than the mean Surface of the Earth, it stagnates at the Apertures, and only forms *standing Springs*.

He adds, That tho' this Supply of Water from the Abyfs, be continual, and nearly the same at all Seasons and alike to all Parts of the Globe, yet when it arrives at or near the Surface of the Earth, where the Heat (the Agent which evaporates and bears it up) is not so constant and uniform, as is that resident within the Globe, but is subject to Vicissitudes and Alterations, being at certain Seasons greater than at others; being also greater in some Climates and Parts of the Earth than in others: It thence happens that the Quantity of Water at the Surface of the Earth, tho' sent up from the Abyfs with an almost constant equality, is various and uncertain, as is the Heat there at some Seasons, and in some Countries, the Surface abounding, and being even drown'd with the Plenty of it, the Springs full, and the Rivers high: At other Seasons and in other Countries, both Springs and Rivers may be exceeding low, and sometimes totally fail.

When the Heat in the exterior Parts of the Earth, and in the Ambient Air, is as intense as that in the interior Parts of it, then all that Water which

passes the *Strata* directly, mounting up in separate Parcels, or in form of Vapour, does not stop at the Surface, because the Heat there, is equal both in Quantity and Power to that underneath, which brought it out of the Abyfs.

This Heat therefore takes it here, and bears it up; part of it immediately out of the Surface of the Earth; the rest thro' the Tubes and Vessels of the Vegetables which grow thereon, Herbs, Shrubs, and Trees, and along with it a sort of Vegetative Terrestrial Matter, which it detaches from out the uppermost *Stratum* wherein these are placed; this it deposits in them for their Nourishment as it passes thro' them, and issuing out at their Tops and Extremities, it marches still on; and is elevated up into the Atmosphere, to such an height, that the Heat there being less, it becomes condensed, unites and combines into small Masses, or Drops, and at length falls down again in Rain, Dew, Hail, or Snow.

And for the other part of the Water, which was condensed at the Surface of the Earth, and sent forth collectively into *standing Springs* and *Rivers*; this also sustains a Diminution from the Heat above, being evaporated more or less in Proportion to the greater or lesser Intensity of the Heat, and the greater or lesser Extent of the Surface of the Water so sent forth.

And as these Evaporations are at sometimes greater, according to the greater Heat of the Sun, so where ever they alight again in Rain, 'tis so much superior in Quantity to the Rain of colder Seasons, as the Sun's Power is then superior to its Power in those Seasons: This is apparent in our Northern Climate, where the Sun's Power is never very great, but yet our Rains in June, July, and August, are much greater than those of the colder Months, the Drops larger, and consequently heavier, and falling much thicker and faster than at other times.

But much more apparent is this in the Regions of the Earth, nearer to, or under the Equator, where the Sun having a much greater Force, their Rains (which are Periodical, happening usually about the same time, and lasting several Months) fall in such Quantities as to be more like descending Rivers than Showers; and by these are caused the mighty Inundations of the Nile, and other Rivers in those Regions.

But when the Heat in the exterior parts of the Earth, and in the Ambient Air, is less than that in the interior; the Evaporations are likewise less; and the Springs and Rivers do not only cease to be diminished, proportionably to the Relaxation of the Heat, but are much augmented, a great part of the Water which ascends to the Surface of the Earth, stopping there for want of Heat to amount it thence up into the Atmosphere, and saturating the superficial, or uppermost *Strata* with Water; which by degrees drains down into Wells, Springs, and Rivers, and so makes an Addition to them; and is the reason that these abound with Water in the Colder Seasons, so much more than they do in the Hotter.

And the Water which is thus dispensed to the Earth and Atmosphere from the great Abyfs, being carried down by Rains and by Rivers, into the Ocean, which communicates with the Abyfs, is by that means restored back again to it; and from thence it returns again in a continual Circulation,

to

to the Surface of the Earth, in Vapours and Springs.

SPRINGY, or *Elastick Bodies*, are such as having had their Figure changed by the Stroak or Percussion of another Body, can recover again their former Figure; which Bodies which are not Elastical will not do. Thus, If a piece of Steel be bent any way, it will recover again its former straitness, but a piece of Lead will stand bent in any form.

SPUNGING of a great Gun, is clearing of her Inside, after she hath been discharged, with a Wad of Sheep-skins, or the like, rolled about one end of the Rammer: Its design is to prevent any parts of Fire from remaining in her; which would endanger the Life of him who should load, or charge her again.

SPUN-YARN, or Rope-yarn, whose Ends are beaten or scraped thin, in order to fasten one piece to another, that so it may be as long as is necessary: It is of use to make *Caburns*, and for many other Purposes aboard a Ship.

SPURLE. See *Nothe cofke*.

SPURKETS, are the Spaces in a Ship's Side, betwixt the upper and lower Futtocks, or betwixt the Rungs fore and aft.

SQUAMMOSA *Sutura*, is one of the Sutures of the Bones of the Skull; so called, because the Parts of the Bones united by the Suture, do lie very slope, and like Scales.

SQUARE, is an Instrument of Brass, or Wood, having one side perpendicular, or at Right Angles to the other; sometimes made with a Joint to fold (for the Pocket) and sometimes has a Back to use on a drawing Board, to guide the *Square*.

SQUARE Figure, in Geometry, is one whose Right-lined Sides are all equal, and its Angles all right. See *Quadrilateral*: For its *Area*, see *Area*.

SQUARE Number, is one multiplied into itself; as 4, which arises from the Multiplication of 2 by 2; and 9, the Product of 3 by 3; also 16 made by 4, multiplied by 4, &c.

And a *Square Number* may be ranged into the Form of a Square, but that which cannot be so ranged, cannot be a *Square Number*.

The Square of any Number, or Line, as $5 + 3$, or $a + b$, divided into two Parts, is equal to the Sum of the Squares of those Parts, and also to the double Rectangle, or Product of those Parts, as is plain from only multiplying $a + b$ by it self, Algebraically. See *Euclid. Lib. 2. Prop. 4*.

Thus the Square of $5 + 3$, or 8, which is 64, is equal to

$$\begin{array}{r} aa \quad 25 \\ bb \quad 9 \\ 2ab \quad 15 \\ \hline \end{array}$$

$$Qa + b = aa + 2ab + bb = 64$$

To Compose any Square Number according to this Proposition.

$$\begin{array}{r} 2 \quad 5 \\ \hline 4 \quad . \quad . \quad aa \\ 2 \quad 0 \quad . \quad 2ab \\ . \quad 2 \quad 5 \quad bb \\ \hline 6 \quad 2 \quad 5 = \square 25 \end{array}$$

1. Write the Number down with the Distance of one Place between each Figure.

2. Find the Square of 2, the first Figure to the left Hand, writing it down under 2.

3. Then write the double Rectangle of 2 multiplied by 5, i. e. 20, under 4, as in the Margin.

4. Then Square 5, and write its Square down in that Order, as you see; and adding all together into one Sum, you will have $625 = \square 25$.

When a Number consists of more than two Places, proceed thus.

1. Find the first Square as before.

2. Multiply the two first Figures (towards the left Hand) and write down the Product twice, one under another.

3. Then find the Square of the second Figure, which write in its proper Order as before; add all these into one Sum for a new Square of a .

4. Then multiply the third Figure into the second, which taken together make a ; and write its Product down twice as before (in Step. 2.)

5. Square the third Figure, and subscribe its Square as before (in Step. 3.) then add all into one Sum, and repeat this Process as often as there is Occasion; the last Sum of all is the true Square required.

Thus,

$$\begin{array}{r}
 3 \ 6 \ 5 \\
 9 \dots \quad a \ a \\

 \end{array}$$

$$133225 = \text{Square of } 365.$$

From which Method of composing a Square, 'twill be easie to understand the way to extract the Square Root of any Number given,

As suppose 133225 . For,

1. Beginning at the right Hand, make a Point over the first Figure (5); and after that over every other Place alternately: Which Points shew you the Number of Places in the Root.

2. Find the nearest Square Root to the first part 13, which is 3, write it in the Quotient, and then place its Square (9) under, and subtract it from 13. This Root is a , and the Square $a \ a$.

3. To the Remainder (4) bring down the next Square 32, which will make 432, and will be equal to $2 \ a \ b + b \ b$, in the last Step of all, else always bigger, and is called the *Resolvend*. Then double the Figure (3) in the Quotient, and make it a Divisor to all the *Resolvend*, except the last Figure towards the right Hand, enquiring how often you can have 6 in 42, and place the Answer 6 (for tho' you can have it 7 times, yet 7 must not be taken, because 'tis too large) in the Quotient, and also after 6 in the Divisor. Then multiply the thus augmented Divisor by 6, and write the Product under, and subtract it from the *Resolvend*: To the Remainder 36, bring down the next Square 25, and then you have 3625 for a new *Resolvend*: Then, as before, double the Quotient 36, which makes 72 = $2 \ a$, for a new Divisor, and enquire how often you can have 72 in 362, write the Answer 5 = a in the Quotient, and also after the Divisor; and multiplying the augmented Divisor by it, you will have a Product 3625, = $2 \ a \ b + b \ b$, which subtracted from the *Resolvend*, leaves nothing, and so the Work is over, and the true Root found to be 365. If there had been more Points, the Work in this third Step must have been repeated till all was done.

The Example follows.

$$\begin{array}{r}
 133225 \quad (365 \\
 a \ a = 9 \\
 \hline
 2 \ a + b = 66) \quad 432 = \text{Resolvend.} \\
 \quad \quad \quad 396 = 2 \ a \ b + b \ b \\
 \hline
 2 \ a + b = 725) \quad 3625 = \text{Resolvend.} \\
 \quad \quad \quad 3625 = 2 \ a \ b + b \ b \\
 \hline
 0000
 \end{array}$$

But when a whole Number hath not a Square Root exactly expressible by any rational Number, then to approach infinitely near the exact Root, proceed thus.

Place as many Pairs of Cyphers on the right Hand of the Remainder, as you would have Decimal Places in the Root, and work as before, distinguishing them from the Integers by a Comma, thus: If the Square Root of 12 be desired to three Places in Decimals; annex 6 Cyphers to 12, and 'twill stand thus:

$$12, 000000$$

Whose Square Root being extracted, is found to be 3, 464, or $\frac{464}{1000}$, but because of the Remainder, it must be that 3, 464 is less than the true Root, and 3, 465 greater than it; yet not wanting the $\frac{1}{1000}$ of an Unite of the true Root.

The Square Root of a Vulgar Fraction, is thus found.

First, if the Fraction be not in its least Terms, let it be reduced to the least Terms; then extract the Square Root of the Denominator for a new Denominator, and of the Numerator for a new Numerator; this new Fraction shall be the Square Root of the Fraction proposed. Thus the Square Root of $\frac{1}{16}$ is $\frac{1}{4}$, of $\frac{1}{9}$ is $\frac{1}{3}$.

If the vulgar Fraction given, be incommensurable to its Square Root, both in the given Terms, and also in any other Terms that it is reducible to; then reduce the said Vulgar Fraction into Decimals, consisting of an even Number of Places; and then extract the Square Root thereof by Approximation, according to the Precepts already delivered.

Thus: If the Square Root of $\frac{1}{4}$ be required, its equivalent Decimal is 75, whose Square Root, 86602, &c. Therefore the Square Root of $\frac{1}{4}$ is, 86602 *ferè*.

If a mix'd Number were given for Extraction, whose Fractional Part is express'd in Terms of a Vulgar Fraction; reduce it into an improper Fraction, and (if commensurable, extract the Square Root of the Numerator and Denominator, (as before;) observing to reduce the Fractional Part of the mix'd Number, (or the improper Fraction equivalent to the mix'd Number) into its least Terms.

Thus: The Square Root of $5\frac{1}{4}$ is $2\frac{1}{2}$, for the improper Fraction equivalent to $5\frac{1}{4}$ is $\frac{21}{4}$, and the Square Root of $\frac{21}{4}$ is $\frac{3}{2}$, or $2\frac{1}{2}$.

S Q U

To extract the Square Root, according to the Method of Converging Series.

Suppose $aa = c = 2$.

For a take any Binomial, as suppose $r + S$; 'tis best to make $r = 1$, (i. e.) to the first Root, or Side of the given Square, because then S will converge the sooner.

Then will $rr + 2rS + SS = aa = c$.

Reject the Power of S , as being of small Value.

Then will $rr + 2rS = c$, or $2rS = c - rr$

Divide all by $2r$; and then $S = \frac{c - rr}{2r}$

which is the standing Theorem.

Suppose therefore $r = 1$; then $\frac{c - rr}{2r} = \frac{2 - 1}{2} = \frac{1}{2}$

Make $2r$ the Divisor $1, 0, 5 = S$
To the first $r = 1$, add $5 = S$, for a second r , in order for a new Operation.

Then $1, 5$ is the new r , the Square of which, is $2, 25 = rr$; from which subtract $2 = c$, because 2 is less than $2, 25$, and 'twill stand thus.

$$\begin{array}{r} rr = 2, 25 \\ - c = 2 \\ \hline 2r = 3) 0, 25 \end{array}$$

Which must be divided by $2r = 3$, and the Quotient will be $0, 83 = S$; which having a defective Sign, must be subtracted from the last.

$$\begin{array}{r} r = 1, 5 \quad 1, 5 \\ - , 083 \\ \hline 1, 417 \end{array}$$

Which will be a new r , for a third Operation; and its Square being $2, 007889 = rr$, (as before greater than $2 = c$.) Take $2 = c$ from it, thus.

$$\begin{array}{r} rr = 2, 007889 \\ - c = 2 \\ \hline \end{array}$$

Leaves $0, 007889 = S$.

Which being divided by twice the last $r = 2, 834$, gives in the Quotient $0, 002783 = S$; and this S subtracted from the last.

$$\begin{array}{r} r = 1, 417 \\ , 002783 \\ \hline 1, 414217 = a \end{array}$$

Which gives the Root at 7 Places at three Operations.

But if more exactness be necessary, call it a new r , for a fourth Operation, and proceed just as before.

N. B. This Method, which is Mr. Raphson's, is very pretty, but it labours under two Inconveniences, viz. The greatness of the Divisors, and the high Involutions; especially in extracting Roots out

S Q U

of higher Powers, as the Cube, Biquadrate, Fifth, Power, &c.

To obviate which, 'tis much better to use the following way, which is Mr. Ward's.

Let as before $aa = c = 2$, and $r + S = a$.

Then $rr + 2rS + SS = aa = c$.

Divide all by 2 ; then 'tis $\frac{1}{2}rr + rS + \frac{1}{2}SS$

$= \frac{C}{2}$ the Refolvend; and $rS + \frac{1}{2}SS = \frac{1}{2}C$

$-\frac{1}{2}rr = D$, the Dividend.

Whence arises this Theorem, $\frac{D}{r + \frac{1}{2}S} = S$, by dividing all by $r + \frac{1}{2}S$.

Let then (as before) the Square Root of $2 = C = aa$, be required.

First, Take $r = 1$: Then halve the Refolvend

$= \frac{C}{2} = 1$: And from it take $\frac{1}{2}rr = .5$, there remains $5 = D$. Make

$r = 1$, the Divis. $.50$ ($4 = S$, subcri. $\frac{1}{2}SS = 8$ under $48 = rS + \frac{1}{2}SS$ [the Cypher.

Di. $= r + S = 1, 4$ 20 (20 ($1 = S$ $145 = rS + \frac{1}{2}SS$

Di. $= r + S = 1, 41$ $.5500$ ($3 = S$ $4234, 5 = rS + \frac{1}{2}SS$

$r + S = 1, 413$ 126550 ($8 = S$ $113072 = rS + \frac{1}{2}SS$

$r = S = 1, 4138$ 1347800 ($9 = S$ $127246, 5 = rS + \frac{1}{2}SS$

$1, 41389$ 7533500 ($5 = S$ $7069462, 5 = rS + \frac{1}{2}SS$

$\therefore a = 1, 413895. 464037, 5$.

This Root $a = 1, 413895$ differs from the former Root found, but by $0, 000022$ (a little more than $\frac{1}{4545454}$) for no exact Root can be found by either way.

Here also, if more exactness had been required, the Remainder encreased by Cyphers, might have been made a new Dividend, and $1, 413895$ a new Divisor; and so you may proceed on as far as you think fit.

The vast Advantage of this Method above the former, any one will soon find that will try both.

An Example of this way, in a true Square Number.

The Square Root of 133225, is required.

$$\begin{array}{r}
 r = 3 \quad 66612.2 = \frac{1}{2} C. \\
 -4, 5 = \frac{1}{2} r r S S \\
 \hline
 \text{Divisor} = r = 3) 216 (6 = S. \\
 198 = r S + \frac{1}{2} \\
 \hline
 r = 36) 1812, 5 (5 = S \\
 1812, 5 = r S + \frac{1}{2} S S \\
 \hline
 0000,0
 \end{array}$$

Therefore $a = 365$.

SQUARING. By the Word *Squaring*, Mathematicians understand the making of a Square equal to any Figure given. Thus the *Quadrature* or *Squaring* of the Circle, is the finding a Square equal to the Area of a Circle, which hath not yet been done Geometrically.

SQUINANCY, or *Quinsy*, a Swelling and Inflammation in the Throat. See *Angina*.

STAGMA, are Juices of Plants mix'd together in order to Diffillation.

STALACTITÆ, are a sort of stony, sparry Icefiles which hang down from the Top or Arches of Grotto's, Caves, or Subterranean Caverns, and from the Roofs of the Buildings and Capitals of the Pillars of such Places as are built over the *Therma*, or Hot Springs. Of this kind are the *Sal Alumen* and *Vitriolum Stalacticum*, the *Minera Ferri-stalactica*, the *Vitriolum Capillare*, and the *Alumen Capillare*, &c. These Stalacticæ Dr. Woodward faith, should rather be called *Stagonitæ*.

STAMINA, in Botany, are those little fine Threads or Capillaments which grow up within the Flowers of Plants encompassing round the *Style*, and on which the *Apices* grow, at their Extremities. Whence the Botanists call that a

STAMINEOUS Flower, which is so far imperfect, as to want those coloured Leaves which are called *Petale*, and consists only of the *Stylus* and the *Stamina*.

And such Plants as do bear these *Stamineous Flowers* Mr. Ray, makes to constitute a large Genus of Plants, which he calls *Herbe flore Imperfecto five apetalo Stamineove*.

And these he divides into such as,

1. Have their Fruit or Seed totally divided from the Flower; and these are such Plants as are said to be of *different Sexes*: The reason of which is, that from the same Seed some Plant shall arise with Flowers and no Fruit, and others with Fruit and no Flowers: As *Hops*, *Hemp*, *stinging Nettles*, *Spinach*, *Cynorumbe*, *Mercariale*, and *Phyllon*.

2. Such as have their Fruit only a little disjoin'd from their Flowers; as the *Ambrosia*, *Bardana minor*, *Ricinus*, and the *Heliotropium Tricoccon*.

3. Such as have their Fruit immediately contiguous, or adhering to their Flower: And the Seed of these is either,

1. *Triangular*: And of this sort, some are lucid and shining, as the *Lapathum*, *Rhabarbarum*, and *Bistorta*, to which also may be reckoned the *Persicaria*.

Others are rough and not shining; as the *Hel-leberus Albus*, *Fegopryum*, *Convolvulus niger*, and the *Polygonum*.

2. Such as have a roundish Seed a little flattened or compressed, or of any other Figure but the former *Triquetrous* or *Triangular* one. And these have their Flower, or the Calyx of the Flower adhering to the *Bottom* or *Basis* of the Seed or Fruit; as the *Potamogeton*, *Blitum Silvestre*, *Poriataria*, *Atriplex*, *Blitum Sativum*, *Amuranthes Hoclocerieus*, and the *Saxifraga Aurea*.

3. Such whose Flowers adhere to the top or uppermost of the Seed; as the *Beta*, *Asarum*, *Archimilla*.

And to these kind of Plants, Mr. Ray reduces also the *Kaligenicatarum Sedum fruticosum*, the *Scoparia*, or *Belvidere* of the Italians.

STANCHIONS in a Ship, are those Timbers which being set up Pillarwise, do support and strengthen the waft Trees.

STANDING Part of the *Sheat*, is that part which is made fast to a Ring at the Ship's Quarter. When they say, *Over-hale the Sheat*, they mean, *Hale upon the standing Part*; But when they say, *Hale the Sheat* barely, they intend it only of the *Running Part*.

STANDING Ropes, are those Ropes which do not run in any Blocks, but are set taught, or let slack, as occasion serves, as the *Sheat-stays*, *Back-stays*, and the like.

STANDING Part of a Tackle aboard a Ship, is the end of the Rope where the Block is seized or fasten'd; as the other which is haled, is called *Fall*.

STAPES, or the *Stirrop*, because of its resemblance to a Stirrop, is a little Bone in the Ear, of a Triangular Figure, and is made of two Branches set upon a flat Basis, which stands upon the *Foramen Ovale*; the Union of the two Branches is called the Head of the *Stapes*, in which there is a small Cavity, wherein lies another little Bone.

STAPHYLOMA, is a Disease of the Eye, in which the two Tunicks of the Eye, *Cornea* and *Uvea*, being broken, fall outward in the shape of a Grape.

STAR, in Fortification, is a Work with several Faces generally composed of from 5 to 8 Points with Salient, and Re-entrant Angles flanking one another; every one of its Sides containing from 12 to 25 Fathoms.

STARBOARD, the right Hand side of a Ship, as Larboard is the left: Thus they say, *Starboard the Helm*, or Helm a Starboard; when he that Commands would have the Man at the Helm put the Helm to the right side of the Ship.

STAR-Fort. See *Fort*.

STARS. See *Fix'd Stars*.

STATICAL Baroscope, an Instrument invented by the Honourable Mr. R. Boyle, whose Description see in *Baroscope*.

STATICAL Hygroscope. See *Hygroscope*.

STATICKS, is a Science purely Speculative, being a Species of *Mechanicks*, conversant about Weights, and shewing the Properties of the *Heaviness* and *Lightness*, or *Æquilibria* of Bodies. When it is restrained to the Specifick Weights and

Æqui-

Æquilibria of Liquors, it is called Hydrostaticks; which see.

STATION, in Astronomy, signifies certain Places of the *Zodiack*, where a Planet being arriv'd, seems to stand still for some time in the same Degree, either in ascending to its *Apogee*, or descending to its *Perigee*.

STATION, is a place where a Man fixes himself and his Instrument, to take (as in Surveying) any Angles or Distances.

STATION-Line. See *Line of Station*.

STATION-Staff, is an Instrument consisting of two Rulers that slide to ten Foot, divided into Feet and Inches, with a moving Vane or Sight; two of which are used with a Level; and on the Edges, there are the Links of the Gunter's Chain divided. It is used in Surveying for the more easie taking Off-sets.

STATIONARY; a Planet is said to be *Stationary*, when to any Eye placed on the Earth, it appears for some time to stand still, and to have no progressive Motion forward in its Orbit round the Sun.

STATUS Morbis. See *Acme*.

STATUTE, is a Word that hath divers Significations; as first, it signifies an Act of Parliament made by the King and the Three Estates of the Realm; in which Sense it is either General or Special. In another Signification, *Statute* is a Short Writing, called a *Statute-Merchant*, or a *Statute Staple*; which see. *Statutes* are also vulgarly taken for the *Petit-Sessions*, by 5 *Eliz. cap. 4.*

STATUTE-Merchant, is a Bond acknowledged before one of the Clerks of the *Statutes-Merchant* and Mayor, or Chief-Warden of the City of London, or two Merchants of the said City for that purpose assigned, or before the Mayor, Chief-Warden, or Master of other Cities or good Towns, or other sufficient Men for that purpose appointed, Sealed with the Seal of the Debtor and of the King, which is of two pieces; the greater is kept by the Mayor Chief-Warden, &c. and the lesser by the said Clerks.

STATUTE-Staple, is so called either properly or improperly. A *Statute-Staple*, properly so called, is a Bond of Record, acknowledged before the Mayor of the *Staple*, in the Presence of one of the two Constables of the same *Staple*; for which Seal, the Fee is of every Pound, if the Sum exceed not 100 *l.* an Half-penny; and if it exceed 100 *l.* a Farthing; and by Virtue of such *Statute-Staple*, the Creditor may forthwith have Execution of the Body, Lands, and Goods of the Debtor. *Statute-Staple* improperly, is a Bond of Record, founded upon the Stat. 23 *H. 8. cap. 6.* Of the Nature of a proper *Statute-Staple*, as to the Force and Execution of it; and acknowledged before one of the Chief Justices; and in their Absence, before the Mayor of the *Staple*, and Recorder of London.

STATUTUM de Laboratoris, is a Writ Judicial, for the apprehending of such *Labourers* as refuse to work according to the Statute, Reg. Judic. Fol. 27.

STATUTO Mercatorio, is a Writ for the Imprisoning of him that has forfeited a Bond called *Statute-Merchant*, until the Debt be satisfied. Of these, there is one against Lay-persons, and another against Ecclesiastical.

STATUTO Stapule, is a Writ that lies to take his Body to Prison, to seize upon his Lands and

Goods, that hath forfeited a Bond called *Statute-Staple*.

STAYS in a Ship, are Ropes whose use is to keep the Mast from falling aft: All Masts, Top-Masts, and Flag-Staves have Stays, except the Sprit-sail Top-Mast; the Stay of the Main-mast, which is called the *Main-stay*, is by a Lannier fasten'd to a Collar, which comes about a Knee belonging to the Head; the *Main-top-mast Stay* is fasten'd to the Head of the Fore-mast, by a Strap and a dead Man's Eye, and so is the *Main-top-gallant-mast* stay'd to the Head of the Fore-top-mast; the Fore-mast and Masts belonging to it, are in the same manner stay'd to the Bolt-sprit and Sprit-sail Top-sail Mast, which Stays do likewise stay the Bolt-sprit itself. The *Misfen-stay* comes to the Main-mast by the Half-deck, and the Top-mast Stays come to the Shrouds with Crows-feet. The length of the Stay is the same with that of the Mast it belongs to.

The Main-mast, Fore-mast, with the Masts belonging to them, have also *Back-stays*; which help to keep the Mast from pitching forward, or overboard, because they go on either side of the Ship; To bring a Ship upon the

STAYES, or to *stay her*, is in order to her Tacking, which is thus done: At the same time bear up the Helm, let fly the Fore-sail Shear, let go the Fore-bowling, Brace the Weather-brace of the Fore-sail; the same is also done to the Top-sail and Top-gallant-sail, only their Shears must be kept fast. If the Sprit-sail be out, then at the same time let go the Sprit-sail Shear also, with the Fore-theet, and brace the Weather-brace: But the Tacks, Shears, Bracings, and Bowlings, of the Main-sail, Main-top-sail, and Misfen are not altered. And when the Wind comes in at the Bow, which before was the Lee-bow, it drives all the Sails backward against the Shrouds and Masts, so that the Ship makes no way forward, but drives with her Broad-side. Those are reckoned the best Ships which will stay with the fewest Sails.

STEADY, a Word of Command at Sea, from him that Comms to the Man at Helm, to keep the Ship steady in her Course, and not to make Angles or Yaws (as they call them) in or out.

STATOCELE, is a Rupure or Tumor in the Scrotum of a fatty or Suet-like Consistence. *Blanchard.*

STEATOMA is a preternatural Swelling which consists of a Matter almost like Suet of the same Colour throughout, soft; and tho' not easily yielding to the Touch, yet suddenly returns, the Fingers being removed, to its proper Shape and Bigness.

STEEL, is made, according to Mr. Lemery, p. 154, by stratifying of Plates of Iron in a large Furnace, with the Horns or Nails, of Animals, under which is made a very great Fire: Thus is the Iron calcined; but when red Hot, and near Melting, they take the Plates out and dip them suddenly in cold Water, and so they become Steel.

Steel is not so good as Iron for Medicinal Operation, because the volatile Parts are mostly purged away in the Calcination, and what remains is hardly dissolvable by the Juice in the Body.

STEER: To steer a Ship, is to guide or govern her by the Helm. He is the best Steersman that uses the least Motion in putting the Helm over to and again, and that keeps the Ship best from making

making Yaws; that is, from running in and out. There are three ways to Steer by.

1. By any Mark on the Land, so as to keep the Ship even by it.

2. By the Compass, which is to keep the Ship's Head upon such a Rhumb or Point of the Compass, as best leads to her desired Port.

3. To Steer as one is bidden or conned, which is the Duty (in a great Ship) of him that is taking his Turn at Helm.

STEERAGE, a Part of a Ship where he standeth that *Steereth*; that is, guides the *Helm* or *Rudder* of the Ship; and this in a Man of War is always before the Bulk-head of the great Cabin; and where-ever the *Steersman* be placed, he must stand so, as that he can see the *Leach* of the Sails, whether they be in the Wind or not.

STEEVE; the Seamen say that the *Bow-sprit* or the *Beak-head* of the Ship doth *Steeve*, when either stands too upright, and not straight enough forwards.

STEGANOGRAPHY, is the Art of secret Writing, which is known only to the Persons corresponding with one another; and which if the Letters should be opened, no one is supposed to be able to discover, or *Decypher*, as 'tis called. Thow now-a-days hardly any thing, can be written by this Art, but what may be decyphered, and the Sense and Meaning of it discovered. And in this Art of *Decyphering*, that Excellent Mathematician *Dr. Wallis*, is admirably ready.

STEGNOSIS, is a Constriction or stopping up of the Pores.

STEGNOTICA. See *Astringentia*.

STELLATE Plants, are by the Botanists call'd such Plants as have their Leaves growing on the Stalks at certain Intervals or Distances, in the form of a Radiant Star; and according to *Mr. Ray*, this is the Tenth Genus of English Plants: Of this kind is *Cruciata* or Cross-wort, *Mollugo*, *Wild-madder*, *Asterula* or *Woodruff*, *Galium* or *Ladies Bed-straw*, *Aparine* or *Cleavers*, *Rubia Tinctorum* or *Dyers Madder*. To which he adds, as a-kin to this Genus, the *Nasturtium Indicum*, Indian Cress, or yellow Lark-spur.

STEM of a Ship, is that main piece of Timber which comes bowing or bending from the Keel below where it is *scarfed*, (as they call it) that is, pieced in, right before the Fore-castle; this Stem it is which guides the Rake of the Ship; and all the But-ends of the Planks (forwards) are fix'd into it. This in the Section of a First-Rate Ship, is called the *Main-stem*.

STENTOROPHONICK-Tube, or Instrument, is the Speaking-Trumpet, invented by *Sir Samuel Moreland*.

STEP, that piece of Timber in a Ship whereon the Masts or Captains do stand at bottom, is called the Step of the Mast or Captain.

STERCOROSUS Fluxus, is that in which much liquid Excrement is often voided, proceeding from excrementitious Meats corrupted in the Stomach, or a great Quantity of Excrements heaped up in the Intestines. *Blanchard*.

STEREOBATA, in Architecture, is the Greek Word for the first beginning of the Wall of any Building, and immediately standing on the Foun-

dation: This is wrongly confounded with *Seyfobata*, which is the beginning of a Column, or its *Podestal*.

STEREOGRAPHY, is the Art of drawing the Forms of Solids upon a Plane.

STEREOGRAPHICK Projection. See *Projection of the Sphere in Plano*.

STEREOMETRY, is the Art of measuring all sorts of solid Bodies, which how to do, you will find under the proper Names of each Body.

STERN of a Ship, is all the hindmost or aftermost Part of her, generally speaking: But properly, 'tis only the outmost Part of her, Aft.

STERNFAST, is some fastnings of Ropes, &c. behind the Stern of a Ship, to which a Cable or Hawser may be brought or fixed, in order to hold her Stern to a Wharf, &c.

STERNPOST, is a great Timber let into the Keel at the Stern of a Ship, somewhat sloping, into which are fastned the After-Planks; and on this Post, by its Pintle and Gudgeons hangs the Rudder.

STERNOHYOIDES, is that Pair of Muscles which is commonly by Anatomists said to arise from the uppermost part of the Breast-Bone: But this is since proved a Mistake, for they arise from the internal Part of the *Clavicula*, next where its Origination is broad and fleshy, and ascends directly over the *Sternothyroides* and *Larynx*, of an equal Breadth and Thickness, to its Insertion at the Basis of the Fore-Bone of the *Os Hyoides*. This with its Partner acting, pulls the *Os Hyoides*, together with the Tongue and *Larynx*, directly downwards.

STERNOTHYROIDES, is a pair of Muscles which do arise broad and fleshy from the upper and internal Part of the *Sternum*, whence ascending on the sides of the Wind-pipe, over the *Glandula Thyroidea*, its inserted to the inferior Part of the Thyroidal or Scutiform Cartilage.

This, with its Partner, pulls the *Larynx* downward, and lengthens the *Canalis* or distance between the *Rimula* and Tip of the Tongue, (which latter seems to be the true *Plethrum Vochi*) whereby the Tone of the Voice is rendered grave.

STERNUM Os, the Breast-Bone is joyned to the Ribs in the foremost part of the Breast, consisting of 3 or 4 Bones, and frequently in those that are come to ripeness of Age, grows into one Bone; to this is joyned in the lower part of it, the *Cartilago Ensiformis*.

STERNUTATION, Sneezing, is a forcible driving out of the Head some sharp Matter which vellicates and disturbs the Nerves and Fibres: Or, as some say, 'tis an involuntary Motion of the Brain, which contracts the Muscles of the Thorax and Abdomen, to the intent that the Matter which vellicates the Nostrils and Brain may be driven out.

STERNUTATORIUM, *sive Sternutamentum*, a sneezing Medicine or Snuff.

STEWARD of a Ship, is he that receives all the Victuals from the Purser; and he is to see in well stowed in the Hold; in his Custody are all things of that Nature belonging to the Ship's use. He is to look after the Bread, and to distribute out the several Messes of Victuals in the Ship. He hath an Apartment for himself in the Hold, which is called the Steward's Room, where he sleeps and eats.

STILE, in Dialling, is the Gnomon or Cock of a *Dial*, that casts the Shadow upon the Hour-Lines; and is always parallel to the Axis of the Earth, in all kinds of Dials.

STILLATITIOUS Oils, in Chymistry, are such as are Extracted out of Mixts, by the Force of Fire; and hereby are distinguished from such as are made by *Expression*, or by pressing.

STILLICIDIUM Urine. See *Stranguria*.

STIRRUP of a Ship, is a piece of Timber put upon a Ship's *Keel*, when some of her *Keel* happens to be beaten off, and they can't come conveniently to put or fit in a new piece; then they patch in a piece of Timber, and bind it on with an Iron which goes under the Ship's *Keel*, and comes up on each side of the Ship, where 'tis nailed strongly with Spikes; and this they call a *Stirrup*.

STROAKED, when in a Ship the Water in the Bottom can't come to the Well of the Pump, they say, *The Ship is a-stroak*, or *stroaked*: So they say also, *The Limber-holes are stroaked*, when the Water cannot pass through them; and that the Pump is *stroaked*, when something is got into it which chokes it up, so that it will not work.

STOCKS; so the Ship-Carpenters call a Frame of Timber, and great Posts made a-shore to build Pinnaces, Ketches, Boats, and such small Craft, and sometimes small Frigats: Hence we say, a Ship is on the *Stocks*, when she is a building.

STOLONES, are the *Suckers* which spring up from the Root of any Tree or Plant; and which, if not cut off, will hinder the Thriving of the Tree.

STOMACHUS, in Anatomy, is not the Stomach of an Animal, for that is called *Ventriculus*; but is properly the left or upper Orifice of the Ventricle, or Stomach, by which Meats are received into it. To this part descend Nerves from the eighth Pair and intercostal Nerves, and are mixed and interwoven with one another. The Greeks call it *xaphia*, the Heart: Whence it is that a Pain which is sometimes felt in this part, is corruptly called the *Heart-burn*; and the Region of the Stomach hereabout is called also *Scrobiculus Cordis*, or the *Heart-Pit*. It hath its Fibres Orbicular, that its Orifice may exactly shut or close upon the Meat and Drink received into the Stomach, to prevent Fumes coming up from thence to affect the Head, and to hinder Concoction.

STONES, are such kind of Minerals as are hard and friable: To which also Bishop *Wilkins* annexes

Earthly Concretions, as being of a middle Nature between Stones and Metals, but are more soft usually and brittle than the former. And that Great Man distinguishes Stones into

1. *Vulgar*, and of no Price.
2. *Middle-priced*.
3. *Precious*: And these are of two kinds, either more or less Transparent.

1. *Vulgar Stones*, or such as are, of little or no price are distinguishable from their different Magnitudes, Uses, Consistences, into the

Greater Magnitudes of Stone; used either about

- { *Buildings*; whether of
 - { *Walls*; chiefly being of a
 - { *Softer Consistence*, whether Natural, or Factitious.
 - 1 { *Free-stone*,
 - { *Brick*.
 - { *Harder Consistence*; not easily yielding to the Tool of the Workman, growing either in
 - { *Greater Masses*.
 - 2 *Ragg*.
 - { *Lesser Masses*; whether such as are for their Figure
 - { *More Knobbed and Unequal*, used for the striking of Fire; either the more common, which is less heavy; or the less common, which is more heavy, as having something in it of a Metaline Mixture.
 - 3 { *Flint*.
 - { *Marchasite*, *Firestone*.
 - { *More Round and Even*.
 - 4 *Pebble*.
 - { *Roof or Pavement*, being of a laminated Figure, either natural or Factitious.
 - 5 { *Slate*.
 - { *Tile*.
- { *Metals*, either for the

Sharpening or trying of them

- 6 { *Whet-stone*.
 - { *Touch-stone*.
- Polishing or cutting of 'em*; being either of a more spongy and soft, or of a more hard Consistence.
- 7 { *Pumice*.
 - { *Emery*.
- Lesser Magnitudes*, either more or less minute.
- 8 { *Sand*.
 - { *Gravel*.

2. *Middle-priced Stones*, are either of a

- { *Shining Politur'd*, or capable of it; whether of a
 - { *Simple white Colour*, and more soft consistence
 - 1 *Alabaster*;
 - { Sometimes *White*, sometimes *Black*, or *Green*, and sometimes *Variegated* with Veins, growing in greater or lesser Masses.
 - 2 { *Marble*, *Porphyrie*,
 - { *Agai*.
 - { *Spotted with Red upon a Greenish Colour*, or with Spots of Gold-colour upon Blue.
 - 3 { *Jaspis*, *Heliotrope*.
 - { *Lazul*, *Azure-stone*.
 - { *Transparency*, either
 - { *Brittle*; whether Natural or Factitious.
 - { *Chrystal-ine*.
 - 4 { *Glass*.
 - { *Fissil*, into Flakes, either greater or lesser.
 - { *Selenite*, *Muscovia-glass*, *Ising-glass*,
 - 5 { *Talk*. (Spar.)
 - { *Relation to Metals*, attracting Iron, or making of Bras.
 - 6 { *Lead-stone*.
 - { *Cadmia*, *Calaminaris*.
- Incombustible Nature*.

7 *Amiantus.*

Strange Original; not being properly Minerals, tho' usually reckoned amongst them; but either a *Sub-marine Plant*, or supposed to proceed from a *Liquid Bitumen*.

8 { *Coral-ine.*
Amber.

There are several other stony Consistences mentioned in the Authors who Write *de Lapidibus*. Some that are found in the Bodies of Animals, their Stomachs, Guts, Bladders, Kidneys, &c. several of which are *Denominated* from the *Animals* in which they are found; as *Alektorius*, *Chelidonius*, *Bezoar*, &c. Others have peculiar Names from their *Shapes*; as *Astroides*, *Glossopetra*, &c. Others made of *Animals*, or Parts of *Animals* petrefy'd, which may be sufficiently express'd, without being particularly provided for in the *Tables*.

3. *Precious Stones, Gems, Jewels*, are such as for their Variety and Beauty are every where more esteem'd. Amongst which, some are *less Transparent*, which are distinguishable chiefly by their Colours, either,

Representing Variety of Colours, with Dimness less or more.

1 *OPAL.*

1 *CATS-EYES.*

Of Particular Colours.

Whitish and shining; tho' this be not properly a Mineral, but a part of a testaceous Fish.

2 *Pearl.*

Red.

3 *Sardius*, Cornelian, Blood-stone.

Pale, Fleisly Colour, like that of a Man's Nail.

4 *Onyx.*

Bluish.

5 *Turcois.*

Pale Purple.

6 *Chalcedony.*

As for that which is commonly stil'd a *Toad-stone*, that is properly a Tooth of the Fish called *Lupus Marinus*, as hath been made evident to the Royal Society, by that Learned and Inquisitive Person, Dr. *Merrit*.

4. *More Transparent Gems*, may be distinguish'd into such as are either,

Colourless; either most hard and bright, or that which is very like to this in other respects, but only less hard and bright.

1 { *Diamond*, Adamant.

1 { *Sapphire white.*

Coloured; to be rang'd according to the Colours in the Rainbow.

Red; of a Lustre greater or less.

2 { *Ruby*, Carbuncle.

2 { *Garnet.*

Yellow; whether paler or deeper.

3 { *Chrysolite.*

3 { *Topaz.*

Green; either most bright and pleasant, or of a darker kind of Sea-green.

4 { *Emerald*, Smaragd.

4 { *Beryl.*

Bluish.

5 *Sapphire.*

Purple, or *Violaceous*; more inclining to Blue, or to Yellow.

6 { *Amethyst.*

6 { *Hyacinth.*

3. Such *Earthy Concretions* as commonly grow in Mines, together with such other factitious Substances as have some Analogy to these, and are *dissolvable* by Fire or Water, may be distinguish'd by their being

Not Inflammable;

More Simple; being several kinds of Salts, whether of the

Sea-water, the most necessary Condiment for Meat; or of the Air, used as a chief Ingredient in the making of Gun-powder.

1 { *Salt.*

1 { *Nitre*, Salt-petre.

Earth; of a Styptick Quality, and Absterfiv, proper for the drying of Wounds, commonly boild up in a Consistence from a *Mineral Water*; or that other kind of Earthy Salt dug up in great Lumps.

2 { *Alume.*

2 { *Sal Gemme.*

Metals of all kinds; sometimes call'd Sugars and Crystals, but agreeing in the common Nature with that which is stil'd

3 *Vitriol*, Chalcantus, Copperas.

Vegetables, made either by Fermentation, or by Burning.

4 { *Tartar.*

4 { *Alcali.*

Animal Substances, made by Distillation, call'd,

5 *Urinous Salt.*

More mix'd of other Salts; more Volatile, or Fixed.

6 { *Sal-Armoniac.*

6 { *Chrysocolia*, Borax.

Inflammable; of a more

Dry Consistence, and yellowish Colour.

7 *Sulphur*, Brimstone.

Clammy and tenacious Consistence.

Not sweet-scented; more Solid, or more Liquid.

8 { *Bitumen.*

8 { *Naphtha.*

Sweet-scented.

9 *Ambergris.*

6. *Earthy Concretions not Dissolvable*, may be distinguish'd by their various Colours; being either

White and soft, according to degrees, more or less.

1 { *Chalk.*

1 { *Marle.*

Yellowish Red, whether more Yellow, or more Red.

2 { *Oker*, Yellow Oker.

2 { *Red Oker*, Ruddle.

Black; of a finer or coarser Grain.

3 { *Fett.*

3 { *Pit-coal*, Sea-coal.

Gold-colour, of a poisonous Nature, either as it is dug out of the Earth, or as it is sublim'd.

4 { *Orpiment*, Auripigmentum.

4 { *Arsenick*, Rats-bane.

Reddish; often found in the same Mines with Orpiment.

5 *Sandarach.*

STOPPER,

STOPPER, is a piece of Rope (in a Ship) having a *Wale-knot* at one end, with a *Lannier* spliced into it, and at the other end 'tis made fast in the place where 'tis to be used. Its use is to stop the main Halliards, or the Cable. The Stopper for the Halliards is fastened at the Main-Knight, and it serves when they are Hoisting the Main-yard to stop it, while the Men that hale may stay and rest a little. But 'tis chiefly used for the Cable, to stop it, that it don't run out too fast: They bind the *Wale-knot* about the Cable with the *Lanniers*, and that stops it, so that it cannot slip away. This Stopper is fastened to the Bottom of the Bitts by the Deck. The Word is, *Lay on the Stoppers*. And a Ship is said to *Ride by the Stoppers*, when the Cable is fastened or stayed only by them, and not *Bited*; but this is not safe Riding in a stress of Weather.

STRABISMUS, Squinting, is occasioned by the Relaxation, Contraction, Distortion, too great Length, or too great Shortness of the Muscles which move the Eye. *Blanchard*.

STRAIT, or *Streight*, in Hydrography, is a narrow Sea shut up between Lands on either side, affording a Passage from one great Sea into another; as the *Strait of Magellan*, the *Strait of Gibraltar*, &c.

STRAKE, in the Sea-Phrase, is a Seam between two Planks; as the *Garboard-strike* is the first Seam next the Keel. They say also a Ship heels *a-strike*, that is, hangs or inclines to one side, the Quantity of an whole Plank's breadth.

STRANGURY, is a difficulty of Urine, when the Urine comes away by Drops only, accompany'd with a constant Inclination of making Water.

STRAP, in a Ship, is the Rope which is spliced about any Block, and made with an Eye to fasten it any where on occasion.

STRATA. Dr. Woodward, in his Natural History of the Earth, observes (and that very truly) That the far greatest part of the Terrestrial Globe consists from its Surface downwards to the greatest Depth we ever Dig or Mine, of several *Layers* or *Strata* of different kinds of Earthy Matter lying one over another, without any regular Order. This Disposition of the Earth into these *Strata*, had been before observed by *Steno*; but the Observations and Deductions that Dr. Woodward made from them, are wholly New, very Numerous, and of great Importance.

STRATARITHMETRY, is the Art of Drawing up an Army or Battallion of Men, according to any Geometrical Figure assigned: And also of expressing the just Number of Men contained in such a Figure, as they stand in Array, either near at hand, or at a Distance.

STRATIFICATION, or *Stratum super Stratum*, as the Chymists call it, is putting different Matters *Bed upon Bed*, or one Layer upon another, in a Crucible in order to calcine a Metal or Mineral. Thus in *Cementation* (which see) there is first laid a Bed of Cement, then a Plate of Gold; then another Layer of Cement, and then another Plate of Gold; and this is done alternately, till the Crucible is full; which the Chymists would express by saying, *Stratify Gold and Cement in a Crucible*.

STREAM-Anchor, is only a small one made fast to a *Stream-Cable* for a Ship to ride by in gentle Streams, and in fair Weather, when they would only stop a Tide.

STRETCH; when at Sea they are going to

Hoise the Tard, or Hale the Sheet, they say, *Stretch forwards the Hale-Yards or Sheets*; meaning that the part which the Men are to Hale by, should be put into their Hands, in order to their Hoisting or Haling.

STRIE, with the Writers of Natural History, are the small *Hollows*, *Channels* or *Chamferings*, which are found in the Shells of Cockles, Escallops, and other Shell-Fishes.

STRIKE, a Sea-word variously used: When a Ship in a Fight, or on meeting with a Man of War, lets down or lowers her Top-sails, at least half Mast high, which they call *Striking the Top-sails* upon the Bunt, they say, *She Strikes*, meaning, the Yields or Submits, or pays her Devoir to that Man of War as she passes by. When a Ship touches Ground in shoal Water, they say also, *she Strikes*. When any Top-mast is to be taken down, the Word is, *Strike the Top-mast*: And when any thing is Let or Lowered, as they call it, down into the Hold, they call it *Striking down into the Hold*.

STRIKING-Wheel, in a Clock, is that which by some is called the *Pin-wheel*; because of the *Pins* which are placed upon the Round or Rim (which in Number are the *Quotient* of the *Pinion* divided by the *Pinion* of the *Detent-wheel*.) In 16 Days Clocks, the *first* or *great Wheel* is usually the *Pin-wheel*; but in Pieces that go 8 Days, the *second Wheel* is the *Pin-wheel* or *Striking-wheel*.

STRUCTURE, is the Combination or Result of all those Qualities or Modifications of Matter in any Natural Body, which distinguish it from others, and are what in other Words, is called the peculiar *Form* or *Texture* of it.

STRUMA. See *Scrophula*.

STUPEA, seu *Stupa*, is a piece of Linen dipt in a Liquor, and applied to the part affected.

STYLE, so the Botanists call that middle prominent part of the Flower of the Plant, which adheres to the Fruit or Seed: 'Tis usually long and slender, whence its Name of *Stylus*.

STYLE, in Dialling, is that Line whose Shadow on the Plane of the Dial, shews the true Hour-Line. This is always supposed to be a part of the Axis of the Earth, and therefore must always be so placed, as that with its two extreme Points it shall respect the two Poles of the World, and with its Upper-end, the elevated Pole. This Line is the upper Edge of the Cock, Gnomon, or Index.

STYLOBATA, in Architecture, is the Pedestal of a Column or Pillar.

STYLOBATON, or *Stylobata*, in Architecture, is the same with the Pedestal of a Column. This is sometimes taken for the Trunk of the Pedestal, between the Cornice and the Base; and then called *Truncus*, as it is also by the Name of *Abacus*.

STYLOCERATOHYOIDES, are Muscles of the *Os Hyoides*, which draws upwards the Tongue and Larynx, as also the Jaws in Deglutition, whereby the Masticated Aliment is not only compressed into the latter, (the Fauces being then dilated) but the Epiglottis is also depressed, and adequately covers the *Rimula* of the Larynx, by its Application to it; by which means the descent of the least part of the Aliment into the *Aspera Arteria* is hindred; which is a most wonderful Mechanism.

They arise from the outward Appendix of the *Os Styloforme*, and are extended to the Horns or Points of the *Os Hyoides*. The middle Tendon of the *Digastricus* of the Lower-Jaw is transmitted through it. 'Tis called also *Stylohyoidæus*.

STYLOEIDES, are Processes of Bone fashion'd backward like a Pencil fastned into the Basis of the Skull it self.

STYLOGLOSSUM, is that pair of Muscles which lift up the Tongue. They arise from the Appendix of the *Os Styloforme*, and are inserted about the middle of the Tongue.

STYLOHYOIDÆUS. See *Styloceratohyoides*.

STYLOPHARYNGÆUS, is a pair of Muscles placed at the Foot of the *Processus Styloides*, that dilate the Gullet, and draw the *Fauces* upwards. They descend from an Appendix of a Bone in fashion of a Pencil, and which reaches the Sides of the Gullet.

STYMMA, is that thick Mass which remains after the steeping of Flowers, Herbs, &c. and pressing out their Oil. *Blanchard*.

STYPTICK (Blood-stopping) the same with Astringents in the general; which see.

STYPTICK-Water of Mr. *Lemery*, is made of Colcothar, Burnt-Allum, Sugar-candy, of each half a Dram; the Urine of a Young Man and Rose-water, of each half an Ounce; Plantane-water, 2 Ounces: Mix all in a Mortar, and let it stand on the Sediment in a Viol; and when you would use it, pour off the clear Water by Inclination: 'Tis of very good Use to stop Bleeding.

SUBALTERN Propositions, as such as differ only in Quantity, and agree in Quality; as every Triangle is Right-Angled; some Triangles are Right-Angled.

SUBCARTILAGINEUM. See *Hypocondrium*.

SUBCLAVIAN-Vessels, are the Veins and Arteries that pass under the *Clavicles*.

SUBCLAVIS, is a Muscle of the *Thorax*, which arises from the inferior part of half the *Clavicula*, next its connexion with the *Spina Scapula*; hence its Fibres descend obliquely forwards to its Insertion at the superior part of the first Rib near the *Sternum*. Its use, according to *Spigelius*, who has written a Chapter expressly about this Muscle, is to depress the *Clavicula*.

SUBCONTRARY Position, (in Geometry) is when two similar Triangles are so placed as to have one common Angle *V* at the Vertex, and yet their Bases not parallel.

And therefore if the Scalene Cone *BVD* be so cut by the Plane *CA*, as that the Angle at *C* = *D*. The Cone is then said to be cut *Subcontrarily* to

its Base *B A*. See *Spherick Geometry*, where such a Section of a Cone is demonstrated to be a Circle.

SUBCONTRARY Propositions, are such as particularly differ in Quality, and agree in Quantity; as, *some Man is a Creature, some Man is not a Creature*.

SUBCUTANEUS, a Branch of the *Basilica*, running towards the inner Condyle of the Arm. It divides into *Ramus Anterior*, and *Posterior*, which see.

SUBDUCTION, the same with *Substraction*; which see.

SUBDUPLÉ Proportion, is when any Number or Quantity is contained in another twice: Thus 3 is said to be *Subduple* of 6, as 6 is double of 3.

SUBETH Avicenna. See *Coma*.

SUBJUNCTIVE Mood (in Grammar) so called, because it has always some Condition annexed to what we affirm, and so is subjoined to, or conjoined with some other *Verb*.

SUBLUXATION, a Dislocation, or putting out of Joint.

SUBLIMATE Corrosive, is a Preparation in Chymistry, whereby Mercury is impregnated with Acids, and then sublimed up to the top of the Vessel: Thus performed.

Pour on a Pound of good running Mercury, 18 Ounces of Spirit of Nitre, set the Matrafs in Sand a little warmed, till the Mercury be all dissolved, evaporate the Dissolution in a Glass, or Earthen Pan, till all the Moisture be carried off; and then powder the remaining white Mass in a Glass-Mortar, and then mix with it a pound of Vitriol calcined white, and so much Salt decrepitated. Put this Mixture into a Matrafs, whose 2 Thirds at least remain unfilled; set the Vessel in Sand, and begin with a small Fire for three Hours, after which, that Fire must be encreased to a good strength: The Sublimate will adhere to the top of the Matrafs, and there will be a pound and three Ounces of it. The Red *Scories* at the Bottom are uselets. 'Tis a more violent Escharotick than the *Lapis Infernalis*, and inwardly taken, is one of the strongest Poisons in the World. Of this is made *Mercurius Dulcis*. The Druggists sometimes sell a sort of it that is made of *Arsenic*; but you may easily discover it by rubbing it with a little Salt of Tartar, for then it will turn Black, but if it turn Yellow, 'tis good.

SUBLIMATION, an Operation in Chymistry, whereby the finer and more *subtile* Parts of a mixt Body are separated from the rest, and carried up in the Form of a very fine Powder to the Top of the Vessel. These Powders they call *Flowers*, as *Flowers of Brimstone*, of *Benjamin*, &c. the Vessels that serve for these Uses, are called,

SUBLIMING Pots, or *Aludels*; (which Word see.)

SUBLIMIS, one of the Muscles that bend the Fingers.

SUBLINGUALES, are Glands, one on each side of the Tongue, they have two excretory Ducts (as the *Maxillares*) form'd by the Union of that of each small Gland; they run on each side of the Tongue, near its Tip, where they open into the Mouth at a little Distance from the Gums; when the *Mylohyoidæus* acteth, it compresses them.

SUBLIN-

SUBLINGUINUS, is the same with the *Epi-glottis* or *Pion*; which see.

SUBLUNARY, all things that are in the Earth, or in the Atmosphere thereof, below the Moon.

SUBMULTIPLY Number, or Quantity, is that which is contained in another Number, a certain Number of Times exactly: Thus, 3 is Submultiply of 21, as being contained in it 7 Times exactly.

SUBMULTIPLY Proportion, the Reverse of Multiply; which see.

SUBORNATION, is a secret or under-hand preparing, instructing, or bringing in a false Witness, or corrupting or alluring to do such a false Act. Hence the *Subornation of Perjury*, mention'd in the Act of General Pardon, 12 Car. 2. cap. 8. is the Alluring to Perjury.

SUBPOENA, is a Writ whereby all Persons, under the Degree of Peerage, are called into Chancery, in such Case only where the Common Law fails, and hath made no provision; so as the Party who in Equity hath Wrong, can have no ordinary Remedy by the Rules and Course of the Common Law: But Peers of the Realm, in such Cases, are called by the Lord Chancellor's, or Lork Keeper's Letters, giving notice of the Suit intended against them, and requiring them to appear.

There is also a *Subpœna ad testificandum*, for the summoning of Witnesses, as well in Chancery, as other Courts.

There is also a *Subpœna* in the Exchequer, as well in the Court of Equity there, as in the Office of Pleas.

And these Names proceed from the Words in the Writ, which charge the Party summoned, to appear at the Day and Place assign'd; *sub Pœna centum Librarum*.

SUBSCAPULARIS, or *Immerfus*, is a Muscle of the Arm, so named from its situation; by some called *Immerfus*. It is a large fleshy Muscle filling the Internal Concave, part of the *Scapula*; arising fleshy from its whole *Basis*, and *Superior* and *Inferior Costa* Internally, and marcheth forward, lessening it self according to the Dimensions of the Bone, and passing over the Junction, is inserted in a Semicircular manner to the Neck of the *Os Humeri*: When this acteth, the *Os Humeri* is pulled near the Trunk of the Body. The Tendon of this Muscle, together with the *Supra* and *Infra Spinatus*, and *Teres Minor*, unite near their Insertions, and environ the Articulation of the *Os Humeri* with the *Scapula* not unlike the *Ligamentum Catum* of the *Coxa*, to prevent frequent Luxations: And by their successive alternate acting, the Arm is moved circularly.

SUBSIDY, in Law, signifies an Aid, Tax, or Tribute granted by Parliament to the King, for the urgent Occasions of the Kingdom, to be levied of every Subject, according to the Rate of his Lands or Goods, as the Parliament shall think fit.

SUBSTANCE, is whatever subsists by it self independently from any created Being; and which is the Subject of Accidents and Qualities.

SUBSTANTIA Corticalis Cerebri. See *Corticalis Cerebri*.

SUBSTANTIVES (in Grammar) are such Words as describe the Absolute Being of a Thing, and which joined with a Verb, do make a perfect Sentence.

SUBSTYLAR Line, in Dialling, is that Line drawn on the Plane of the Dial, over which the Style stands at Right Angles with the Plane. This is always the Representation of the Meridian of that place where the Plane of the Dial is Horizontal. The Angle between the Line, and the true Meridian, is the Plane's Difference of Longitude, and is measured on the Equinoctial.

SUB-SUPER particular Proportion, is contrary to *Super-particular* Proportion; which see.

SUBTENSE, or Chord of an Arch, is a Right Line extended from one End of that Arch to the other End thereof.

SUBTERRANEOUS, or *Subterranean*, is whatever is within the Surface, Bowels, or Caverns of the Earth. Thus those Trees, which being left there at the Universal Deluge, are so plentifully found buried in the Earth, in many Countries, are called *Subterraneous Trees*, and by some, *Fossil-wood*.

SUBTRACTION, in the general, is taking a lesser Quantity from a greater, to find the Difference between them, which is commonly called the *Remainder*; as the lesser Quantity to be subtracted is called the *Subtrahend*. The General Sign or Mark of Subtraction is —

SUBTRACTION, in Algebra, or in Species, conjoins the Magnitudes propos'd, changing all the Signs of the *Subtrahend*.

Thus: If from 4 *a*, you subtract *a*, by changing the Sign of the *Subtrahend*, it will stand thus:

$$\begin{array}{r} 4a \\ -a \\ \hline X = 3a \end{array}$$

Or thus,

$$4a - a = 3a$$

And in Algebra, the Remainder, or Difference is usually noted by the Letter X, or *d*.

N. B. To subtract +, is the same as to add — and to subtract —, is all one as to add +; as is plain from the Reasons given in Addition in Algebra; which see.

Algebraick Subtraction, in Compound Quantities, will easily be performed by only observing the General Rule of changing the Signs of the Quantity to be subtracted, and then comparing the several Members together, and contracting them.

As suppose from $36b + 5mm - 7df$, you would subtract $20b + 2df + 5mm$. Write them down one under another, changing all the Signs of the *Subtrahend*; and it will stand thus.

$$\begin{array}{r} 36b + 5mm - 7df \\ -20b - 5mm - 2df \\ \hline 16b - 9df = X \end{array}$$

Which compared and contracted, will give the Difference or Remainder.

SUBTRACTION of *Indices*, is done as Algebraical Quantities are, by changing the Sign of the *Subtrahend*: Thus,

From

From 3 take $\frac{2}{1} = 5$, from 3 take $\frac{2}{1} = 5$
from 3 take $\frac{2}{1} = 1$, from 3 take $\frac{2}{1} = 1$.

SUBTRACTION of *Integers*, in *Common Arithmetick*, is performed by subcribing the lesser Number under the greater, orderly; so that Units stand under Units, Tens under Tens, &c. and then beginning at the place of Units at the Right Hand: Take the lesser from the greater, writing down the Remainder under the Line: If nothing remain, write down a Cypher, or 0. If the upper Number be in any part (for it cannot be so in the whole) lesser than the Lower, add Ten to it, or call it Ten more than it is, writing down orderly the Excess above Ten; and then be sure to carry that Ten so borrowed, to the next Figure, calling it One more than it is, and so on, as the following Examples.

	18	756	8254	567438
	15	431	6332	358784
Rent.	3	325	1922	208654

In *Subtraction*, the Number to be subtracted, together with the Difference or Remainder, are equal to the Number from which the Subtraction was made, which is a good Proof for Subtraction; as in the third Example, 6332, and the Remainder 1922, makes 8254, the first Number.

But if the Numbers be of different Denominations, then 'tis but taking the lower Denomination from that above it, and setting down the Remainder: But if any of the upper Denominations be lesser than their respective lower ones, then you must borrow one of the former Denominations next to the Left Hand, and subtract, remembering to add 1 to the next Denomination below. As in the following Examples.

l.	s.	d.	l.	s.	d.
375	11	05	1754	11	02
132	09	04	982	13	05
243	02	01	771	17	09

Here the first Example has nothing of Difficulty in it; for the Lower is in each Denomination lesser than its Upper.

In the second Example, since 5 d. cannot be taken out of 2 d. I borrow 12 d. and 'twill be 14 d. Then I say, 5 from 14 leaves 9, which I set below: Now the 12 d. I borrowed, must be added to the 13 s. on the left Hand, then 'twill be 14 s. which I subtract from 31, (borrowing 20) refts 17: Then, as in whole Numbers, 3 from 4 leaves 1, &c.

SUBTRACTION of *Logarithms*. See *Logarithms*, N. 4.

SUBTRACTION of *Vulgar Fractions*. See *Vulgar Fractions*.

SUBTRACTION of *Decimal Fractions*. See in *Decimal Fractions*.

SUBTRIPLE Proportion, is when one Number or Quantity is contained in another three times: Thus 2 is said to be *Subtriple* of 6, as 6 is *Triple* of 2.

SUCCENTURIATI *Renes*. See *Capsula attribiliaria*.

SUCCESSION of the *Signs*, is that Order in which they are usually reckoned: As first *Aries*, next *Taurus*, then *Gemini*, &c. This is otherwise called Consequence.

SUCCOTRINE Aloes, is the finest sort that comes from the Island *Succotrya*, on the Coast of *Arabia*, and from its Colour is called, *Aloes Hepatica*, or Liver-colour'd Aloes.

SUCCUS Pancreaticus. See *Ductus Pancreaticus*.

SUCULA or *Succula*, is a Term in Mechanicks for a bare Axis or Cylinder, with Staves in it to move it round, but without any Tympanum, or *Peritrochium*.

SUDAMINA, are little Pimples in the Skin, like Miller Grains; this is frequent in Children and Youths, especially those that are of a hot Temper, and use much Exercise: They break out in the Neck, Shoulders, Breast, Arms and Thighs, &c. *Blanchard*.

SUDOR, Sweat, is a watry Humour which consists of Water chiefly, with a moderate Quantity of Salt and Sulphur; this is driven through the Pores of the Skin by the Heat and Fermentation of the Blood, and sometimes by its Weakness and Colligation. *Blanchard*.

SUDORIFICKS. See *Hydroticks*.

SUFFITUS, is a thickish Powder prepared of Odoriferous Plants, Gums, &c. which thrown upon Coals produces a pleasant Smell. *Blanchard*.

SUFFOCATIO Uterina. See *Histerica passio*.

SUFFRUTEX, is a Name by the Botanists, given to a low woody Perennial Plant, sending out no Leaves from its Root, and beginning to be branched from the very Bottom of the Stalk; such as *Lavender*, *Rue*, *Sage*, &c.

SUFFUSION. See *Hypochyma* & *Cataract*.

SUGAR of Lead. See *Salt of Saturn*.

SUIT, signifies a following another, but in divers Senses.

The first, is a Suit in Law, and is divided into *Real* and *Personal*, and is all one with *Action Real* and *Personal*.

Secondly, *Suit of Court*, or *Suit-service*, is an Attend that Tenants owe to the Court of their Lord.

Thirdly, *Suit-Covenant*, is when your Ancestor hath covenanted with mine to Sue to his Court.

Fourthly, *Suit-custom*, when I and my Ancestors have been seized of their own and their Ancestors *Suit*, time out of Mind.

Fifthly, *Suit Real* or *Regal*, when Men come to the Sheriffs Turn or Leet.

Sixthly, *Suit* signifies the following one in Chace, as *Fresh-suit*.

Lastly, it signifies a Petition made to the King, or any great Person.

SUIT of the King's Peace, is pursuing a Man for Breach of the King's Peace by Treasons, Insurrections or Trespasses.

SULPHUR, the second Hypostatical Principle of the Chymists, which we call Oil. See *Oil*. The

The Constituent Character of Sulphur seems to be *Inflammability*: And there are three Kinds of Inflammable Bodies obtainable by Chymistry.

First, *An Oil*.

Secondly, *An Ardent Spirit*.

Thirdly, *A Consistent Body*, like to common Brimstone: All which are properly Sulphur.

SULPHUREOUS Spirit of Vitriol. After the Spirit and Oil of Vitriol are in Distillation of that Mineral, driven out by a most violent Fire (for 3 or 4 Days together) into the Receiver, they commonly Rectifie the Matter in a Glass-Body; and the first Spirit that rises then with a very gentle degree of Fire, is called the *Sulphureous Spirit of Vitriol*.

SULPHUR of Antimony. See *Golden Sulphur of Antimony*.

SUM, in Mathematicks, signifies the Quantity that arises or results from the Addition of two or more Magnitudes, Numbers or Quantities together; this is sometimes call'd the *Aggregate*: And in Algebra, 'tis usually denoted by the Letter *Z*, which stands for *Zuma* or *Suma*; and sometimes by the Initial Letter *S*.

SUM of an Equation, is when the absolute Number being brought over to the other side with a contrary Sign, the whole becomes equal to *O*. And this *Des Cartes* calls the *Sum of the Equation proposed*.

SUMMER Solstice. See *Solstice*.

SUMMONEAS, is a Writ Judicial of great diversity, according to the divers Cases wherein it is used, which see in the Table of the *Register Judicial*.

SUMMONS, in Common Law, is as much as *Vocatio in ius*, or *Citatio* among the *Civilians*: But how *Summons* is divided, and what Circumstances it has to be observed. See *Fleta lib. 6. Cap. 6, 7*.

SUMMONS, in *Terra perita*, is that *Summons* which is made upon the Land, which the Party (at whose Suit the *Summons* is sent forth) seeks to have.

SUMMONS ab Warrantizand, in Law, is the Process whereby the *Vouchee* is called.

SUMPTUARY Laws, were Laws made to restrain Excess in Apparel, and to prohibit costly Cloaths, of which we had formerly many in *England*, but now are all repealed.

SUN, Our Excellent Sir *Isaac Newton* saith in his *Principia*, That the Density of the Sun's Light (which is Proportional to Heat) is seven times as great in *Mercury*, as with us; and therefore our Water there would be all carried off, and boil away: For he found by Experiments of the *Thermometer*, That an Heat but 7 times as great as that of the Sun-Beams in Summer, will serve to make Water boil.

He proves also, That the Matter of the Sun to that of *Jupiter*, is nearly as 1100 to 1; and that the Distance of that Planet from the Sun, is in the same Ratio to the Sun's Semidiameter.

That the Matter of the Sun to that of *Saturn*, is as 2360 to 1; and the Distance of *Saturn* from the Sun, is in a Ratio, but a little less than that to the Sun's Semidiameter.

And consequently that the common Center of Gravity, of the Sun and *Jupiter*, is nearly in the Superficies of the Sun; of *Saturn*, and the Sun a little within it. And by the same manner of Calculation it will be found that the common Center of Gravity of all the Planets, cannot be more than

the Length of the Solar Diameter distant from the Centre of the Sun: This common Centre of Gravity he proves to be at rest; and therefore tho' the Sun by reason of the various Position of the Planets may be moved every way, yet it cannot recede far from the common Centre of Gravity. And this he thinks ought to be accounted the Centre of our World. *Book 3. Prop. 12.*

By Means of the *Solar Spots* it hath been discovered that the Sun revolves round his own Axis, without moving (considerably) out of his Place, in about 25 Days. And that the Axis of this Motion is inclined to the Ecliptick, in an Angle of 87 Degrees, 30 Minutes nearly. *Gregor. Astronom.*

The Sun's apparent Diameter being sensibly ~~shorter~~ in December than in June, as is plain and agreed from Observation, the Sun must be proportionably nearer to the Earth in Winter than in Summer; in the former of which Seasons will be the *Perihelion*, in the latter the *Aphelion*: And this is also confirmed by the Earth's moving swifter in December, than it doth in June; as it doth about $\frac{1}{4}$.

For since, as Sir *Isaac Newton* hath demonstrated by a Line drawn to the Sun, the Earth always describes equal Area's in equal Times, when ever it moves swifter, it must needs be nearer to the Sun. And for this Reason there are about 8 Days more from the Sun's Vernal Equinox to the Autumnal, than from the Autumnal to the Vernal.

According to Mr. *Cassini*, the Sun's greatest distance from the Earth is 22374, his mean Distance 2200, and his least Distance 8022, Semidiameters of the Earth.

And that the Sun's Diameter is equal to 100 Diameters of the Earth, and therefore the Body of the Sun must be 1000000 times greater than that of the Earth.

Mr. *Argon* assures us, that he observ'd by a very exact Method the Sun's Diameter to be not less than 31 Minutes, 45 Seconds in his *Apogee*, and not greater than 32 Minutes, 45 Seconds in his *Perigee*.

The mean Apparent Diameter of the Sun according to Sir *Isaac Newton*, is 32 Minutes 12 Seconds, in his *Theory of the Moon*, 32' 15".

If you divide 360 Degrees (i. e. the whole Ecliptick) by the Quantity of the Solar Year, it will Quote 59 Minutes 8 Seconds, &c. which therefore is the Quantity of the Sun's Diurnal Motion. And if this 59 Minutes, 8 Seconds be divided by 24, you have the Sun's Horary Motion, which is 2 Minutes, 28 Seconds; and if you will divide this last by 60, you will have this Motion in a Minute, &c. And this way are the Tables of the Sun's mean Motion, which you have in the Books of Astronomical Calculation, constructed.

The Sun's Horizontal Parallax, Dr. *Gregory* and Sir *Isaac Newton* makes but 10 Seconds.

The same learned Mathematician, at the end of his *Astronomiae Phys. & Geometr. Elem.* hath a Comparative Astronomy, where among the rest he considers what Phenomina would appear in the Planetary System, &c. to an Eye placed at the Sun, which are such as these:

1. That the Fixt Stars would appear in a Concave Sphere, the apparent Centre of which, is the Eye of the Spectator.

2. He would distinguish the Planets from the Fixt Stars (tho' they would appear to him to be placed among them) by their Periodical Revolutions

ons, and by the Time of those, one Planet from another: And he would judge that Planet to be farthest off, whose Periodical Revolution was the longest; and so on in order for the rest, &c.

3. To this Solar Observer's Eye, the Planets would appear always *direct*, and never *Stationary*, nor *Retrograde*, as they do to an Eye at the Earth: And they would be found to return to the same Fixt Stars again as Periods of very different lengths; and the Inferior Planets would sometimes cover the superior ones.

4. If you suppose the Eye to be moved from the Centre of the Sun to its Surface, then by the Parallax of the Planets some better guess will be had of their Distances, than by the Observation of the different Velocity and Tardity of their Motion, could before be obtained: For to the Eye thus placed the Earth's Horizontal Parallax will be 16 Minutes, equal to the Sun's Semidiameter, and consequently sensible enough. That of *Saturn* will be something above one Minute and an half, (that Planet being 10 times the Distance of the Earth from the Sun; and the Horizontal Parallax of *Mercury* will be almost 50 Minutes: And since these Parallaxes are sufficiently sensible, the Distances of the Planets may be compared with the Sun's Diameter, and with one another.

5. To an Eye thus placed all the Fixt Stars and Planets will seem to revolve from East to West, in the space of 25 of our Natural Days: The North Pole of which Revolution, will be in that part of the Heaven, which we (Inhabitants of the Earth) call the 10th Degree of *Pisces*, with 83 or 84 Degrees of North Latitude: Wherefore the Arctick Pole-Star will be at the 2d Flexure of *Draco*, and which will not be above 3 Degrees from the Pole. The South-Pole will be in 10 Degrees of *Virgo*, with 83 or 84 Degrees South Latitude, near a Star of the fourth Magnitude, which in *Cap. Halley's* Catalogue is in the first Oar of the *Argo Navis*.

6. The Planets thus seen from the Sun will appear of different Magnitudes: For the Diameter of *Saturn*, will subtend there but an Angle of 18 Seconds: That of *Jupiter* near 40 Seconds: That of *Mars* but 8 Seconds: That of *Venus* 28 Seconds: And the Diameter of *Mercury* 20 Seconds.

But Mr. *Hugens* supposes the Diameters of the superior Planets will be much larger; as making that of *Jupiter*, to subtend an Angle of almost 54 Seconds; and that of the Body of *Saturn* without his Ring 27 Seconds.

7. Of these six Planets thus moving round the Sun, three will appear attended with their Satellites: Of which the Earth will have but one, which is the Moon; and who will appear at the greatest distance, not to be from the Earth above 10 Minutes.

Jupiter will appear with his four Moons, or Satellites; of which the outermost will never appear above nine Minutes distant from the Primary Planet.

Saturn will appear with his 5 Satellites (if so many there be) and the furthestmost of them will never be above 9 Minutes distant from his Body: His Ring also will appear compassing round the Planet.

The Paths, or Orbits of these Satellites being seen from the Sun sometimes more, sometimes less Oblique, will appear accordingly now broader, now narrower Ellipses; sometimes the Planes of

these Orbits being produced, will pass thro' the Sun: In which Case, the former narrow Ellipses will pass into Right Lines; which will happen twice in every Revolution of the Orbit round the Sun, if its Plane remain always parallel to its self: Whence the Satellite will now appear to be covered by the primary Planet; and then the Planet by it; and sometimes will appear round the Planet, without its Disk, in an Ellipsis.

8. The primary Planets, as also their Satellites, have not only rough and unpolished Surfaces, but also are so disform, that they have their Spots, which are places more or less obscure, (and sometimes more bright) than the rest of their Disk: And these Spots, by the Rotation of the Planet, or Satellite, round its Axis, do describe Circles; and therefore these Ways, or Paths of the Spots, being seen from the Sun in the Plane of the Planetary Disk, will now appear Elliptical, and now straight Lines, (as before the Paths of the Satellites Disk) according as the Sun is elevated on either side, above the Plane of those Circles, or is found in it, as it is when it is in the Equinoctial of that Planet. And if there be a Series or Row, of these Spots, (as in the Belts of *Mars* and *Jupiter*): these will appear in the Form of Semi-Ellipses (the one half being behind, or on the other side the planes) or will pass into straight Lines, which will also be the Case of the outward Edge of the Ring of *Saturn*. But some of these Spots will now and then be hid, and sometimes be visible for a long time, according as they are near to the Planets Pole, which is turned from or towards the Sun.

And this will be most observable in *Saturn*, and in the Earth, in the others scarcely at all, because in them the Illustration of the Sun reaches to both their Poles.

9. Besides these six primary Planets, and their 10 Satellites, which to our Solar Observer, will all appear to move within the Bounds of a Zodiac scarce 16 Degrees broad, and not much inclined to the Circle of the first Motion, all the same way, and in Orbits nearly Concentrical to the Sun: There are also another kind of Bodies, whose Number is uncertain, which move round the Sun in very Eccentric Orbits, and which are called Comets; and which sometimes come very near the Sun, and sometimes are vastly remote from him.

These Comets do not move all in the same Track (altho' each one always keeps his own) but some one Way, and some another, and mostly in Orbits very much inclin'd to the Ecliptick, and always in great Circles of the Sphere. Their Coma or Tail (to an Eye at the Sun) will not appear oblong, or stretch'd out in length, as it doth to us, but every way diffused round the Head.

SUNARTHROSIS, is the jointing of Bones, as that of the Ribs with the *Vertebra*, &c.

SUNDAY Letter, the same with Dominical Letter.

SUPERBUS Musculus. See *Attollens Oculorum*.

SUPERCILIUM. See *Cilium*.

SUPERFICIAL Content. See *Area*.

SUPERFICIAL Numbers; the same with Plain Numbers.

SUPERFICIES, the same with Surface; (which see) is Length and Breadth only, without Thickness.

SUPER-

SUPERFOETATION, is when after one Conception another succeeds, so that both are in the Womb together: *Sennertus* makes mention of frequent Cases of this Nature.

SUPER-INSTITUTION, one Institution upon another; as where *A.* is admitted and instituted to a Benefice upon one Title, and *B.* is admitted, instituted, &c. by the Presentment of another.

SUPERONERATIONE Pasture, is a *Writ Judicial*, that lies against him who is impleaded in the County, for the over-burdening of a Common with his Cattle, in case where he was formerly impleaded for it in the County, and the Cause is removed into the King's Court at *Westminster*.

SUPERPARTICULAR Proportion, is when one Number or Quantity, contains another once, and one such Part whose Numerator is 1; then the Number so contained in the Greater, is said to be to it in *Superparticular Proportion*.

SUPERPARTIENT Proportion, is when one Number or Quantity, contains another once, and some Number of *Aliquot Parts* remaining; as, $1\frac{1}{2}$, $1\frac{1}{3}$, $1\frac{1}{4}$, &c.

SUPER Prerogativa Regis, is a Writ which lay against the King's Widow, for marrying without his Licence.

SUPER Statuto, is a Writ that lay against the King's Tenant holding in Chief, which alieneth the King's Land without his Licence.

SUPER Statuto de Articulo Cleri, is a Writ against the Sheriff, or other Officer, that distrains in the King's High-way, or in the Glebe-Lands, anciently given to Rectories.

SUPER Statuto facto pour Seneschal & Marshal de Roy, &c. is a Writ lying against the Steward, or Marshal, for holding Plea in the Court of Freehold, or for Trespas, or Contract not made within the King's Household.

SUPERLATIVE Degree, in Grammar, is when an Adjective hath joyned to its Natural and Ordinary Signification, the Word *most* or *very*, as *most Wife*, *very Good*.

SUPERPURATION. See *Hypercatarrhis*.

SUPERSCAPULARIS Superior. See *Supra-spinatus*.

SUPERSEDEAS, is a Writ in divers Cases, and signifies in general, a Command to stay, or forbear the doing of that which ought not to be done, or in appearance of Law were to be done, were it not for that whereon the Writ is granted.

Thus: A Man regularly, is to have Surety of Peace against him of whom he will swear he is afraid; and the Justice required hereunto cannot deny it him: Yet if the Party be formerly bound to the Peace, either in *Chancery*, or elsewhere, this Writ lies to stay the Justice from doing that which otherwise he ought not to deny.

SUPER Statutum Edw. 3. versus Servants & Labourers, is a Writ lying against him who keeps my Servants, departed out of any Service against Law.

SUPER Statuto de York, quo nul fera Viteller, &c. is a Writ that lies against him that uses Victualling either in Gros, or by Retail in a City, or Borough-Town, during the time he is Mayor, &c.

SUPERVISOR, signifies a Surveyor, or Overseer: It was formerly, and is still among some a Custom, especially of the better sort, to make a *Supervisor* of a Will, but it is to little purpose: However the first might be good, that he should Super-

vise the Executor, and see the Will truly performed.

SUPINATOR Radii Brevis, is a Muscle of the *Radius*, which ariseth partly Tendinous and fleshy from the Superior and external Part of the *Ulna*, next the *Radius*, and passing obliquely transverse over that Bone, is so inserted to its superior Part below the Prominence of the *Radius*, where the round Tendon of the *Biceps* endeth: It helps with the *Supinator Longus*, to move the *Radius* outwards.

SUPPEDANEA. See *Supplantalia*.

SUPINATOR Radii Longus, is a Muscle of the *Radius*, which ariseth broad and fleshy from the superior and external Part of the *Os Humeri*, three Fingers breadth below the Termination of the *Deltoides*, and descending obliquely inwards, it gradually lessens it self, and becomes a flat, broad Tendon, which likewise grows narrower till it is inserted to the external and inferior Part of the *Radius* near the *Carpus*, it helps with *Supinator Brevis*, to move the *Radius* outwards.

SUPPLANTALIA, are Plaisters applied to the Feet; these for the most part are made of Leven, Mustard, wild Radish, Salt, Soap, Gunpowder, Euphorbium, &c. they are called also *Suppedanea*.

SUPPLEMENT of an Ark, in *Geometry* or *Trigonometry*, is the Number of Degrees that it wants of being an entire Semi-circle; as Complement signifies what an Ark wants of being a Quadrant.

SUPPLICAVIT, is a Writ issuing out of the *Chancery*, for taking the Surety of Peace against a Man: It is directed to the Justices of Peace of the County, and the Sheriff, and is grounded upon the Statute, Anno 1 E. 3. Cap. 16. which ordains, That certain Persons in *Chancery* shall be assigned to take care of the Peace. This Writ was formerly called *Breve de minis*.

SUPPORTERS, in *Heraldry*, are some kind of Beasts, Birds, &c. which in an Achievement, are drawn standing on each side of, and supporting the Shield, or Escutcheon. No one under the Degree of a *Knight Banneret*, can have his Arms drawn with *Supporters*.

SUPPOSITORY, is an oblong piece of a kind of Paste, of about a Finger's length, which in some Cases is put up into the Fundament, to purge the Patient; 'tis usually compounded of Honey, Salt, purging Powders, &c. *Blanchard*.

SUPURATION. See *Abcessus*.

SUPRA Spinatus, or *Supra Scapularis*, is a Muscle so called, because it is placed above the Spine of the Shoulder-blade: It ariseth fleshy from the superior part of the *Basis Scapulae*, that is above its Spine; as also from the said Spine and *Costa superior* of the *Scapula*; from thence passing between the *Processus Coracoidei*, and *Anchoreformis*, it grows less, and becoming Tendinous, marches over the Articulations of the *Humerus*, joining its Tendons with the *Infra-spinatus*, is inserted to the Head of the *Os Humeri*. The proper Use of this Muscle, is to lift the Arm upwards towards the Occiput.

SURA, the same with *Os Fibulae*.

SURALIS, is a Branch of the *Vena Cruialis*, it divides into two Branches, the one External, and the other Internal, which is the biggest; and each of those Branches divide again into two more: This Vein distributes its Branches upon the *Far* of

the Leg, and makes with the Branches of the *Paplitea*, all those *Plexus* of Veins which are conspicuous on the upper Part of the Foot.

SURAL Vein, is a Vein which runs down on the Calf of the Leg,

SUR cui in Vita, is a Writ that lies for the Heir of that Woman, whose Husband has alienated her Land in Fee, and she brings not the Writ *Cui in Vita*, for the Recovery of her own Land: In this Case her Heir may have this Writ against the Tenant after her Decease.

SURD Roots, or Numbers.

When any Number or Quantity, hath its Root proposed to be Extracted, and yet is not a *true Figure Number of that kind*: That is, if its Square Root being demanded, it is not a *true Square*: If its Cube Root being required, it self be not a *true Cube*, &c. Then 'tis impossible to assign, either in whole Numbers or Fractions, any exact Root of such Number proposed. And whenever this happens, 'tis usual in Mathematicks to mark the required Root of such Numbers or Quantities, by prefixing before it the proper Mark of Radicality, which is $\sqrt{\quad}$: Thus $\sqrt{\quad}$: 2 signifies the Square Root

of 2, and $\sqrt[3]{\quad}$: 16. or $\sqrt{\quad}$: (3) 16. signifies, the Cubick Root of 16: Which Roots, because they are impossible to be expressed in Numbers exactly (for no effable Number, either Integer or Fraction multiplied into it self can ever produce 2; or being multiplied Cubically can ever produce 16) are very properly call'd *Surd Roots*.

There is also another way of *Notation* now much in Use, whereby Roots are expressed, without the Radical Sign, by their *Indexes*: Thus, as x^2 . x^3 . &c. signify the Square, Cube, and 5th Power of x ; so $x^{\frac{1}{2}}$. $x^{\frac{1}{3}}$. &c. signify the Square Root, Cube Root, &c. of x . The Reason of which is plain enough, for since $\sqrt{\quad}$: x is a Geometrical mean Proportional between 1. and x . So $\frac{1}{2}$ is an Arithmetical mean Proportional between 0 and 1. and therefore as 2 is the Index of the Square of x , $\frac{1}{2}$ will be the proper Index of its Square Root, &c.

Observe also, that for Convenience or Brevity-sake, Quantities or Numbers which are not *Surds*, are often expressed in the Form of *Surd Roots*,

Thus $\sqrt{\quad}$: 4 $\sqrt{\quad}$: 27, &c. signifie, 2, $\frac{3}{2}$ 3,

&c.

But altho' these *Surd Roots* (when truly such) are inexpressible in Numbers, they are yet capable of Arithmetical Operations (such as Addition, Subtraction, Multiplication, Division, &c. which how readily to perform the Algebraist ought not to be Ignorant.

Surds are either *Simple*, which are expressed by one single Term; or else *Compound*, which are formed by the Addition or Subtraction of simple *Surds*: As $\sqrt{\quad}$: 5 + $\sqrt{\quad}$: 2: $\sqrt{\quad}$: 5 - $\sqrt{\quad}$: 2. or $\sqrt{\quad}$: 7 + $\sqrt{\quad}$: 2: Which last is called, an *Universal Root*: And signifies the Cubick Root of that Number, which is the Result of adding 7 to the Square Root of 2.

The Arithmetick of Surds consists of these principal Parts.

I. To reduce Rational Quantities to the Form of any Surd Roots assigned:

Which is perform'd by Involving the Rational Quantity according to the Index of the Power of the Surd, and then prefixing before it the Radical Sign of the Surd proposed.

Thus to reduce $a = 10$ to the Form of $\sqrt{\quad}$: 15. = $\sqrt{\quad}$: b . you must square $a = 10$; and prefixing the Sign, it will stand thus, $\sqrt{\quad}$: $a a = \sqrt{\quad}$: 100. which is in the Form of the Surd desired. So al-

so if 3. were to be brought to the Form of $\sqrt[4]{\quad}$: 12, you must raise 3 up to its fourth Power, and then prefixing the Note of Radicality to it, it will be $\sqrt[4]{\quad}$: 81. or $81^{\frac{1}{4}}$, which is in the same Form with $\sqrt[4]{\quad}$: 12.

And this way may a simple Surd Fraction, whose Radical Sign refers only to one of its Terms, be changed into another, which shall respect both Numerator and Denominator. Thus, $\frac{\sqrt{\quad} : 2}{5}$ is re-

duced to $\sqrt{\quad}$: $\frac{2}{25}$ and $\frac{5}{3}$ to $\sqrt[3]{\quad}$: $\frac{125}{4}$: Where the Radical Sign affects both Numerator and Denominator alike.

II. To reduce Simple Surds, having different Radical Signs, (which are called Heterogeneous Surds, to others that may have one common Radical Sign, or which are Homogeneous.

Divide the Indexes of the Powers of the Surds by their greatest common Divisor, and set the Quotients under the Dividends; then multiply those Indexes cross-ways by each others Quotients, and before the Products, set the common Radical Sign $\sqrt{\quad}$: with its proper Index: Then Involve the Powers of the given Roots Alternately, according to the Index of each others Quotient, and before those Products, prefix the common Radical Sign before found.

To Reduce $\sqrt{\quad}$: $a a$ and $\sqrt[4]{\quad}$: $b b$

2) $\sqrt{\quad}$: $a a$ 2) $\sqrt[4]{\quad}$: $b b$

X

$\sqrt{\quad}$: $b b$ $\sqrt[4]{\quad}$: $a a a a$

To Reduce $\sqrt{\quad}$: 5 and $\sqrt[4]{\quad}$: 7

$\sqrt{\quad}$: 5 $\sqrt[4]{\quad}$: 7

X

$\sqrt{\quad}$: 25 $\sqrt[4]{\quad}$: 2401

III. To reduce Surds to the lowest Terms possible.

Divide the Surd by the greatest Square, Cube, Biquadrate, &c. or any other higher Power, which you can discover is contained in it, and will measure it without any Remainder, and then prefix the Root of that Power before the Quotient, or Surd so divided, and this will produce a new Surd of the same Value with the former, but in more simple Terms. Thus, $\sqrt{16 a a b}$, by dividing by $16 a a$ and prefixing the Root $4 a$, will be reduced to this $4 a \sqrt{b}$ and $\sqrt{12}$, will be depressed to $2 \sqrt{3}$. Also $\sqrt[3]{c b^2 r}$, will be brought down to $b \sqrt[3]{c r}$. And this Reduction is of great Use whenever it can be performed: But if no such Square, Cube, Biquadrate, &c. can be found for a Divisor, then you must find out all the Divisors of the Power of the Surd propos'd; and then see whether any of them be a Square, Cube, &c. or such a Power as the Radical Sign denotes; and if any such can be found, let that be used in the same manner as is above said, to free the Surd Quantity in part from the Radical Sign. Thus, if $\sqrt{288}$ be propos'd; among its Divisors will be found the Squares 4. 9. 16. 36. and 144. by which if 288 be divided, there will arise the Quotients 72. 32. 18. 8. and 2. wherefore instead of $\sqrt{288}$, you may put $2 \sqrt{72}$, or $3 \sqrt{32}$, or $4 \sqrt{18}$, or $6 \sqrt{8}$, or lastly $12 \sqrt{2}$, and the same may be done in Species.

IV. To find whether two Surd Roots given, are Commensurable or not.

Those are called *Commensurable Surds*, which are to one another as Number to Number, as one Rational Quantity to another; or which are, when reduced to their least Terms, true Figure Quantities of their own kind.

To discover therefore, whether they are such or not: If the Surds are of different kinds, (or *Heterogeneous Surds* as some call them) they must first be reduced to one kind, and then divided severally by their greatest common Measure, for if then there will come out Rational Quotients, the first Surds are *Commensurable*; but if the Quotients are Irrational, or Surd Numbers or Quantities, then the proposed Surds are *Incommensurable*.

V. gr. To Examine whether $\sqrt{12}$ and $\sqrt{3}$ are Commensurable Surds, they being Homogeneous, I divide them severally by their greatest common Divisor, which is $\sqrt{3}$; and the Quotients are $\sqrt{4}$ and $\sqrt{1}$, that is 2 and 1. Wherefore, since 2 and 1. are Rational Numbers, I say that $\sqrt{12}$ and $\sqrt{3}$ are Commensurable Surds; or are to one another as 2 to 1. which is very plain; for no doubt $12 : 3 :: 4 : 1$. and 'tis plain that as Squares are to one another, so are their Roots; wherefore $12 : 3 :: \sqrt{12} : \sqrt{3}$. that is, as $\sqrt{12} : \sqrt{3} :: 4 : 1$. or as 2 to 1.

Whenever two Surds are divided by one common Divisor, (tho' not the greatest, if their Quotients come out Rational, or are to one another as Number to Number, those Surds are certainly Commensurable.

If Fractional Surds were given, not having a common Denominator, they must first be reduced to their smallest common Denominator, and then

if their Numerators are Commensurable, you may conclude the first Surd Fractions were so.

But if either the Numerators or Denominators of two Surds, proper Fractions, or mixt Numbers in the Form of Fractions (neglecting the Radical Sign) be Powers of that kind which the Radical Sign expresses, then they will need no Reduction; For if their Numerators or Denominators are Commensurable, the whole Surd Fractions proposed are certainly so. Thus, if it were enquired whe-

ther $\sqrt{\frac{50}{16}}$ and $\sqrt{\frac{72}{25}}$ are Commensurable Surds;

because 16 and 25 are Squares, or such Powers as the Radical Sign expresses or denotes, omitting the Sign $\sqrt{}$: you need only compare the Numerators $\sqrt{50}$ and $\sqrt{72}$; which being divided by their greatest common Divisor, $\sqrt{2}$; the Quotients will be 5 and 6 (i. e. $\sqrt{25} : \sqrt{36}$) Wherefore the given Surds are Commensurable, and are

to one another, as $\frac{5}{4} \sqrt{2}$ to $\frac{6}{5} \sqrt{2}$ and consequently, by

the precedent Rule may be expressed thus, $\frac{5}{4} \sqrt{2}$:

2 and $\frac{6}{5} \sqrt{2}$:

For an Instance in Species; suppose that it were enquired whether $\sqrt{27 a a}$ and $\sqrt{12 a a}$ were Commensurable Surds; Divide each by the greatest common Divisor $\sqrt{3 a a}$: And the Quotients $\sqrt{9}$ and $\sqrt{4}$, that is, 3 and 2. are Rational Numbers; and consequently, the proposed Surds are Commensurable.

Multiplication of simple Surd Roots.

If the Surds proposed be of the same kind, Multiply them one by another, and prefix the common Radical Sign to the Product; but if the Surds are Heterogeneous, or of different kinds, they must be reduced first (according to Rule 2.) to Surds, having the same radical Sign.

Thus to multiply $\sqrt{7}$ by $\sqrt{8}$, the Product will be $\sqrt{56}$.

For since in all Multiplication, as 1. is to one Factor, so is the other to the Product; therefore here $\sqrt{7} : 1 :: \sqrt{8} : \sqrt{56}$. But if 4 Terms are Proportionable, their Squares will be so too; wherefore $1. 7. :: 8. 56$. that is, 56 is the true Square of $\sqrt{56}$ and $\sqrt{56}$ the true Root of $7 \times 8 = 56$.

Other Examples.

I. If $\sqrt{8}$ were to be multiplied into $\sqrt[3]{4}$, because they are not Homogeneous Surds, they must be reduced to such by Rule 2. and then they will stand thus, $\sqrt[6]{512} \sqrt[6]{16}$, which being multiplied into each other, and the common Radical Sign prefix'd, will make $\sqrt[6]{8193}$; and thus the $\sqrt[3]{27}$ multiplied by $\sqrt[6]{9}$ when reduced, and rightly multiplied, produces $\sqrt[6]{531441}$.

II. When a Surd is to be multiplied by a Rational Quantity, that Rational Quantity ought first to be reduced to a Surd of like Nature with the true Surd. But 'tis oftentimes convenient only to connect them together, by prefixing the Rational Quantity to the Left-hand of the Surd. As suppose $\sqrt[4]{27}$ were to be multiplied by 6, the Product may commodiously be expressed thus, $6\sqrt[4]{27}$; and so if $\sqrt[4]{9}$ were to be multiplied by 10, it will stand thus, $10\sqrt[4]{9}$.

III. And when two Rational Quantities are thus prefix'd to two Surds of the same kind, you may find the Product of them, by multiplying the Rational Part by the Rational, and the Surd Part by the Surd, then those joyned together, will be the Product required. Thus, $6\sqrt[3]{7}$ multiplied by $5\sqrt[3]{3}$ produces $30\sqrt[3]{21}$.

IV. If any Surd Root be to be multiplied into it self, or *Involved*, according to the Index of its proper Power, you need only cast away the Radical Sign, and then the Quantity, or Number remaining, is always the Square, Cube, or other Power required; and will always be Rational.

Thus the Square of $\sqrt{11}$, is 11.

The Cube of $\sqrt[3]{30}$, is 30.

Also $2\sqrt{3}$ multiplied by $8\sqrt{3}$ = 48. and $3\sqrt{5}$ multiplied by $2\sqrt{5}$ = 30.

V. And if the Index of the Power be any even compound Number greater than two, and 'tis required to square such a Surd: There need only a Radical Sign, whose Index is half the former, be prefix'd to the Quantity, instead of the former Compound one, and it is done.

V. gr. Suppose you would Square this Surd, $\sqrt[4]{12}$; because the Index 4, is compounded of 2 and 2; $\sqrt{12}$, is the true Product, or the true Square of the Surd Root $\sqrt[4]{12}$. so also the Square of $\sqrt[4]{10}$, is $\sqrt{10}$.

The Reason of which, is plain: For suppose the $\sqrt[4]{16} = 2$ were to be squared; its Square in Surds will be expressed thus, $\sqrt{16} = 4$.

But when a simple Surd Quantity, whose Radical Sign hath for its Index some Ternary Number greater than 3, as 6, 9, &c. And 'tis required to Involve this Surd Cubically. Then only prefix before the Quantity a Radical Sign, with an Index, which is one third of the former, and 'tis done.

Thus, if $\sqrt[6]{64}$, were to be Cubed, it will be $\sqrt[2]{64}$, and the Cube of $\sqrt[3]{512}$, is $\sqrt[3]{512}$, &c. also the Biquadrate of $\sqrt{5}$, is 25 (as being the Square of the Square of $\sqrt{5}$.) and the Cube of $\sqrt[6]{81}$, will be $\sqrt{81}$ or 9.

In the general, to Square, Cube, &c. any Surd Root, is only to Square or Cube the Power, retaining the same Note of Radicality; but 'tis better where it can be done, to take one half, $\frac{1}{2}$ Part, &c. of the Exponent of the Root, as is above shewn in the last particular Rules.

On the contrary, if you would extract the Square,

Cube, or other Root of any Surd, you must double or triple, &c. the Exponent of the Radicality. Thus the Square Root of $\sqrt[4]{16}$ is $\sqrt{16}$, the Square Root of $\sqrt[3]{27}$ is $\sqrt{27}$, &c.

Division of simple Surd Roots.

I. If the Surds are Similar, Homogeneous, or of the same kind, divide one Number, or Quantity, by another, and prefix the common Radical Sign to the Quotient: But if they are Heterogeneous, or not of the same kind, they must be reduced before they can be divided.

Thus, $\sqrt{9}$ $\sqrt{576}$ ($\sqrt{64} = 8$. And $\sqrt[4]{5}$ ($\sqrt[4]{35}$ ($\sqrt[4]{7}$.

The Demonstration of which General Rule, is the same as that in Multiplication; for from the Nature of Division, the Divisor is to Unity :: as the Dividend to the Quotient. Therefore in our first Instance, $\sqrt{9} : 1 :: \sqrt{576} : 24$, but as these Roots are, so will their Squares be: That is, $9 : 1 :: 576 : 64$, and that these Numbers are truly Proportional, is apparent; because the Rectangles of the Extremes and Means are equal: Wherefore, $\sqrt{9} : \sqrt{576} :: 1 : 24$, and consequently 24 is the true Quotient.

II. If any Rational Quantity to be divided by its Square Root, the Square Root will be the Quotient: For if $a b$ be divided by $\sqrt{a b}$, the Quotient must be $\sqrt{a b}$: And if 50 be divided by $\sqrt{50}$, the Quotient will also be $\sqrt{50}$. Also if any Rational Quantity be to be divided by a Surd, that Rational Quantity must first be reduced to the Form of a Surd, by Rule 1.

III. When a Surd Root having a Rational Quantity prefix'd before it, is to be divided by the Surd Part of it, the Quotient will be the Rational Quantity. Thus, if $5\sqrt{9}$, be to be divided by $\sqrt{9}$, the Quotient must be 5: As if $5\sqrt[3]{9}$ had been divided by $\sqrt[3]{9}$, the Quotient would be $\sqrt[3]{9}$.

IV. When the Dividend and Divisor are the Products of two Rational Quantities multiplied severally into one common Surd; or when they are Rational Quantities prefix'd before one common Surd; then divide the Rational Part of the Dividend, by the Rational Part of the Divisor, and what results, is the true Quotient.

Thus, if $8\sqrt{5}$ be divided by $2\sqrt{5}$, the Quotient will be 4, and if $8\sqrt[3]{7}$, be divided by $4\sqrt[3]{7}$, the Quotient will be only 2.

V. But when the Dividend and Divisor are two Rational Quantities, or Numbers prefix'd to two unequal Surds; then you must divide, not only as before, the Rational Part of the Dividend by that of the Divisor, but also the Surd Part; and those two Quotients connected together, so as the Rational Part stand on the Left-hand, are the true Quotient sought.

Thus, if $4\sqrt{15}$ were to be divided by $3\sqrt{5}$, the Quotient will be $2\sqrt{3}$ ($= \sqrt{12}$.) and if $4\sqrt[3]{12}$, were to be divided by $3\sqrt[3]{2}$, the Quotient will be $\frac{4}{3}\sqrt[3]{6}$.

Addition and Subtraction of Surd Roots.

I. When two or more Simple and Equal Surds are to be added, multiply one of them by the Number of them all, and the Product is the Sum required.

Thus, The Sum of $\sqrt{5}$, and $\sqrt{5}$, is the $\sqrt{20}$; because $\sqrt{5}$ multiplied by 2, the Number of the Surds, that is by $\sqrt{4}$, gives $\sqrt{20}$ their Sum. Also the Sum of $\sqrt[3]{7} + \sqrt[3]{7}$, $+ \sqrt[3]{7}$; because the Surds are 3 in Number, is $\sqrt[3]{189}$; because $\sqrt[3]{7}$ multiplied by 3 (i. e.) the $\sqrt[3]{27}$ of 27 makes $\sqrt{189}$.

II. But if Unequal Simple Surds of the same kind are to be added together, or if one is to be subtracted from the other, you must first try whether they are Commensurable; and if they be, that is, if when they have been divided by their greatest common Divisor, their Quotients are Rational Quantities, then you must multiply the Sum of those Rational Quantities by the said Common Divisor, and the Product will be the Sum of the Surds proposed: Or if the Difference of those Rational Quotients be multiplied by the Common Divisor, then the Product will be the Difference of the given Surds, when the less is taken from the greater.

Thus, if the Sum or Difference of these two Surds, $\sqrt{50}$, and $\sqrt{8}$, were required; because they are unequal, I try first, Whether they are Commensurable or not, by dividing each by the greatest common Divisor $\sqrt{2}$. And the Quotients are $\sqrt{25}$ and $\sqrt{4}$; that is 5 and 2, which are Rational Numbers; and therefore the Surds are Commensurable: Then their Sum 7, or their Difference 3, multiplied by the common Divisor $\sqrt{2}$, produces $7\sqrt{2}$ for the Sum, and $3\sqrt{2}$ for the Difference of the Surds required.

III. If the Commensurable Surds proposed, had been Fractions, or Mixt Numbers, reduced to the Form of Fractions; they must (if they have not one) be reduced to a common Denominator in the least Terms; and then to find out the Rational Quotients, you need only divide the two New Numerators, by their greatest common Divisor; and then you must go on as above, in *Integral Surds*.

Thus, If the Sum and Difference of $\sqrt{\frac{24}{25}}$ and

$\sqrt{\frac{2}{3}}$ were required: When reduced to a com-

mon Denominator, they will be $\sqrt{\frac{72}{75}}$ and $\sqrt{\frac{50}{75}}$ and these divided by their greatest common Divi-

for: $\sqrt{\frac{2}{75}}$ the Quotes are $\sqrt{\frac{36}{75}}$ and $\sqrt{\frac{25}{75}}$ or

$6\sqrt{\frac{2}{75}}$, and $5\sqrt{\frac{2}{75}}$, whose Sum is $\sqrt{11\frac{2}{75}}$

and their Difference $\sqrt{\frac{2}{75}}$.

IV. if the Simple Surds given to be added, or subtracted, are *Incommensurable*, then they can only (generally speaking) be added or subtracted by the Signs $+$ and $-$: For neither Sum nor Difference can be expressed by any single Root. And from this Addition or Subtraction of simple Surds only by the Signs, arises what they call a *Surd Binomial*, or *Residual Root*.

Thus, $\sqrt{6} + \sqrt{7}$, is a *Binomial Surd*, and $\sqrt{7} - \sqrt{6}$ is a *Residual Surd*.

But from Prop. 4. and 7 of Euclid's second Book; there arises a Rule which helps us to find the Sum or Difference of *Incommensurable Square Roots*: Which is this.

To or from the Sum of the Squares of the given Surd Roots, add, or subtract, their double Rect-angle, and the Square Root of the Sum, or Remainder, is the Sum or Difference sought, (e. gr.)

To find the Sum and Difference of $\sqrt{14}$, and $\sqrt{12}$, their Squares being 14 and 12, their Sum will be 26, and the Double Rectangle of $\sqrt{14}$, into $\sqrt{12}$, is $2\sqrt{168}$. Wherefore

$\sqrt{26 + 2\sqrt{168}}$ is the { Sum } re-
quired. { Difference }

Of Compound Surds.

The Arithmetick of *Compound Surds*, depends on the Rules above given about *Simple Surds*, and on the true Knowledge of the Signs $+$ and $-$ in Algebraick Addition, Subtraction, Multiplication, and Division; only some particular Directions may be given as to *Binomials* and *Residuals*: As,

I. If any *Binomial* be to be multiplied by its corresponding *Residual*, the Difference of their Squares is the true Product; and therefore will come out a Rational Quantity, as if $\sqrt{a + e}$ be multiplied by $\sqrt{a - e}$, the Product will be a Rational Quantity, viz. $aa - ee$.

II. Involution in *Binomials* and *Residuals*, is best and most easily performed by a Table of Powers: As because we see that $aa + 2ae + ee = (a + e)^2$. We may conclude, That to square any *Binomial* whatsoever, you need only add the double Rectangle of the Parts, to the Sum of the Squares of those Parts; or take the double Rectangle from that Sum, if it be a *Residual*.

III. For Division in *Compound Surds*, 'tis convenient, if not necessary, to reduce them first to some better, and when it can be done, to a Rational Form. And,

(1.) If a *Binomial*, consisting of two simple Square Roots, or of one Square Root, and a Rational Quantity, be multiplied by its corresponding *Residual*, the Product will always be a Rational Quantity.

(2.) If a *Binomial*, consisting of two Biquadratic Simple Roots, or of one such, and a Rational Quantity; if this be multiplied by its corresponding *Residual*, the Product will be a *Residual* consisting of either two Square Roots, or else of one Square

Square Root a Rational Quantity; which Residual being multiplied, as is before said, by its Binomial, it produces a Rational Quantity.

(3.) If a Trinomial, having three simple Square Roots, be multiplied by it self, with one of the Signs changed; the Product will be either a Binomial, or Residual, which being multiplied by its correspondent Residual, or Binomial, will give in the Product, a Quantity entirely Rational.

IV. If a Binomial or Residual, consisting of two Simple Cubick or Biquadratick Roots, &c. or of one Cubick or Biquadratick Root, &c. and a Rational Quantity is proposed for a Divisor; find so many continual Proportionals in the Proportion of the Parts of the Binomial or Residual proposed, as there be Unites in the Index of the Radical Sign, and such whose Radical Sign may be the same with that of the Parts of the Binomial or Residual; but conjoined in the Binomial by +, and in the Proportionals by + and - alternately; or contrarily, in the Proportionals by +, and in the Residual by + and -; the Product of the said Proportionals so connexed, multiplied into the Binomial or Residual, will be a Quantity entirely Rational. After the same manner may a Binomial or Residual, having 5 or 6, &c. for the Index of a common Radical Sign of the Roots, be reduced to a Quantity entirely Rational.

And Note, That when the Roots are of Different Kinds, they must first be reduced to a common Radical Sign.

V. If the Divisor be a Simple Quantity; divide each Part of the Dividend by the Divisor, and connect those particular Products together by their Signs; but if the Divisor be a Binomial, Trinomial, or Quadrinomial, &c. of such Kind as before is specified, reduce that given Divisor to a new Divisor that may be a Simple Rational Quantity. Reduce also the given Dividend to a new Dividend, by multiplying the former by the Quantities that were Multipliers, in reducing the given Divisor to a Rational Quantity; then divide the new Dividend by the new Divisor: But when the Divisor cannot be reduced to a Simple Rational Quantity, set the Dividend as a Numerator, over the Divisor as a Denominator.

Thus, $12 + \sqrt{7} : 63$ divided by 3, the Quotient is $4 + \sqrt{7} : 7$; and $8 - \sqrt{12}$ divided by 2, the Quotient is $4 - \sqrt{3} : 3$; $\sqrt{21} + \sqrt{15}$ divided by $\sqrt{3}$, the Quotient is $\sqrt{7} + \sqrt{5} : 3$; $\sqrt{56} + \sqrt{24}$ divided by $\sqrt{6}$, the Quotient is $\sqrt{9 \frac{2}{3}} + 2 : 3$; and $\sqrt{28} - \sqrt{14}$ divided by $\sqrt{7}$, the Quotient is $\sqrt{4} : 2$.

SURETY of the Peace, (so called, because the Party that was in fear, is thereby secured) is an acknowledging of a Bond to the Prince taken by a competent Judge of Record, for the Keeping of the Peace. This Peace may a Justice of the Peace command, either as a Minister, when he is commanded thereto by a higher Authority; or as a Judge, when he doth it of his own Power, derived from his Commission. Surety of the good adhering, differs from this, That whereas the Peace is not broken without an Affray, or such like; the Surety

de bono gestu may be broken by the Number of a Man's Company, or by his or their Weapon and Hardness.

SURFACE, (the same with *Superficies*) is the bare outside of any Body; and considered by it self, is Quantity extended in Length and Breadth only, without Thickness.

There are *Plane Surfaces*, and there are *Crooked* or *Curved* ones.

A *Plane Surface* or *Superficies*, is made by the Motion of a *Right Line* always keeping in the same Plane.

Thus, if the Line AB be conceived to move (with a Motion parallel to it self in its first situation) in the same Plane downward, and at last to stop in the Position EF, it will describe the Plane Figure or Surface ABFE, which is called a *Parallelogram*: As also the Two Plane Figures or Surfaces ABF and AEF, which are called *Triangles*.

Also, if the Right Line CA having one end as A fix'd as on a Center, be moved quite round in the same Plane, till the Point C come to C again; this Line will by its Motion describe a *Plane Figure* or *Surface*, which is called a *Circle*, as CEBA.

Curved Surfaces, are *Convex* above or without, and *Concave* below or within; You may conceive them like the *Tilt of a Boat* or *Waggon*; And such Surfaces may be generated either by the Motion of a Right Line on a Curve, or a Curve Line on a Right one, v. gr. In the Figure.

Let the Curve Line *AaaC* represent the Hoop keeping up the Cloth of a Waggon or Boat; and let the Line *AB* represent the Gunnel or the upper Edge of the Boat's-side, or the upper Rail of the Waggon. 'Tis plain that if you conceive either the Right Line *AB* to move up along the Hoop *AaaC* till it come to the Top, and then down again on the other side till it come to the Bottom, it will by its Motion describe the Figure of the Tilt or curved Surface *ABbCaaA*. And the very same Figure would be produced by the Motion of one of the Hoops or crooked Line *AaaC*, carried (in a Position parallel to it self) along the Edges of the Boat or Waggon.

SURGE, the Sailors call a Wave or Billow of the Sea a *Surge*; also when they are Heaving at the Capstan, if the Cable happen to slip back a little they say the *Cable Surges*.

SURMOUNTED. The Herald's term for Bearing of one Ordinary upon another. A *Pile* surmounted of a *Chevron*.

SURPLUSAGE, in common Law, signifies a Superfluity or Addition more than needeth, which sometimes is the cause that a Writ abateth. It is sometimes also applied to matter of Account, and denotes a greater Disbursement than the Charge of the Accountant amounteth unto.

SURREJOYNDER, is a second Defence of the Plaintiff's Action, opposite to the Defendant's *Rejoinder*.

SURRE-BUTTER, is a second *Rebutter*, or a *Rebutting* more than once.

SURRENDER, is an Instrument in Writing, testifying with apt Words, That the particular Tenant of Lands or Tenements for Life or Years, doth sufficiently consent and agree, That he which has the next or immediate Remainder or Reversion thereof, shall also have the present Estate of the same in Possession, and that he yields and gives up the same unto him; for every *Surrender* ought forthwith to give Possession of the things *surrendered*. There may be also a *Surrender* without Writing; and therefore there is said to be a *Surrender in Deed*, and a *Surrender in Law*: \odot *Surrender in Deed*, is that which is really and sensibly performed: A *Surrender in Law*, is Intendment of Law by way of Consequent, and not Actual. As if a Man have a Lease of a Farm, and during the Term he accept of a new Lease; this Act is in Law a *Surrender* of the former: There is also a

Customary Surrender of the Copyhold Land, as may be seen in *Cooke sup. Littleton*, Sect. 74.

SURROGATE, signifies one that is substituted or appointed in the room of another, most commonly of a Bishop, or of a Bishop's Chancellor.

SURSOLID-Place. See *Place-solid*.

SURSOLID-Problem, in Mathematicks, is that which cannot be resolved, but by Curves of a higher Nature than a Conick-Section, *v. gr.* In order to describe a *Regular Endecagon*, or Figure of eleven Sides in a Circle, 'tis required to describe an Isosceles Triangle on a Right Line given, whose Angles at the Base shall be Quintuple to that at the Vertex, which may easily be done by the Intersection of a Quadratrix, or any other Curve of the second Gender, as they are called by some.

SURVEYING of Land, or *Planometria*, is the Art of Measuring all manner of Plain Figures, in order to know their superficial Content; which how to do Geometrically, I have shewed all along under the particular Name of each Plane Figure. But how to bring this to Practice, so as to Measure the Area's of Real Lands, Fields, Grounds, &c. by the help of proper Instruments, is what we usually call *Surveying*; and this is what is design'd to be taught under this Word. The Surveyor being furnished with a good Instrument to take Angles, as a well made Theodolite, or entire Brass Circle, with a well graduated Limb, and Telescope Sights, as also with a well divided Pole-Chain, an Off-set Rod, Station-Staves, &c. He may proceed after these or such like Methods, which a little Practice will familiarize to him.

1. To take the Plot of a Field at one Station in any Place thereof, from whence you may see all the Angles.

Suppose *ABCDEF* to be a Field, of which you are to take the Plot: Having set your Instrument in any convenient Place thereof, as at \odot ; and let Marks or Station-staves with Paper be set up in every Angle: Then set your Instrument so that the Needle hang directly over the *Meridian-Line* of the Cord, and there screw fast the Instrument.

Then direct your Sights to *A*, and you will find the Index cutting $36^{\circ} 45'$, which note down in your *Field-Book* in the second Column thereof, and measure the Distance from \odot to *A*, containing suppose

suppose 8 Chains and 10 Links, which set down also in the third Column of your *Field-Book*.

Then direct your *Sights* to B, the *Index* cutting 99 Deg. 15 Min. and the Distance from \odot to B, is 8 Chains and 75 Links, both which set down in your *Field-Book*, as before.

Do the like for the rest of the *Angles* from \odot to C, D, E, and F, and set them down, as you observe them with their Distances measured from the Station, as you see done in this following Table, which is a Copy of the *Field-Book*, and will shew you the Method how to Note down your Observations.

	D. M.	Ch. Lin.
A	36 45	8 10
B	99 15	8 75
C	163 15	10 65
D	212 00	8 53
E	287 15	8 15
F	342 00	9 55

Having thus finished your Work in the *Field*, the next Business must be to *Protract* the same; that is, to lay down a *Plot* thereof upon Paper or Parchment, which is done thus.

Draw a Line as NS, representing the *Meridian-Line*; then in part of that Line, as at \odot make a Point, representing your Place of standing in the *Field*; upon this Point place the Center of your *Protractor*, so that the Diameter thereof may be directly upon the Line NS.

Then against $36^{\circ} 45'$ on the Limb of the *Protractor*, set a Point representing the Degrees of your first observed Angle, and let the same be done with the second and third Observations.

To prick off the 4th, viz. 212. the *Protractor* must be turned downwards, because the Degrees are greater than a Semicircle. Then proceed to *protract* the rest of the Angles.

Then take away the *Protractor*, and laying a Ruler to the Station-point \odot , draw obscure Lines from thence to those Points, on which Lines set their respective Measures from your Scale; as 8 Chains 10 Links from \odot to A, and 8 Chains 75 Links from \odot to B, and so of the rest, as you have them down in your *Field-Book*.

Then connect these Points by the Lines AB, BC, CD, DE, EF, and FA, so shall you have the true Figure of the Field.

But this way obliges you to more Measuring with the Chain than is needful, and therefore is not so good for Practice in most Cases as another I shall by and by shew you; only it hath this Advantage, That you may soon know whether you have taken your Angles truly; for all about the Point $\odot = 36^{\circ}$.

2. To take the Plot of a Field at one Station, in any Angle thereof, from whence the other Angles may be seen.

Let ABCDEFG be the *Field*, and F the Angle, at which you would take your Observations.

Having placed your Instrument at F, turn it about (the North-Point of the Card from you) till through the *Sights* you espy the Mark at G; then fasten the Instrument, and move the Index till you see the Mark at A, the Deg. cut on the Limb being 20; then move it till you see B, where it cuts 40 Degrees: Do the same at C, and there it cuts 60 Degrees; likewise at D 77 Degr. and at E 100 Degr. All these Angles note down in your *Field-Book*; next with the Chain, measure all the Lines running from the Station, as from F to G 14 Chains, 66 Links, and from F to A. 18 Ch. 20 Links, and so of the rest, as you see them in this Table.

Ang.	D. M.	Ch. Lin.
G	00 00	14 60
A	20 00	18 20
B	40 00	16 80
C	60 00	23 20
D	77 00	16 95
E	100 00	8 50

To *protract* these Observations.

Draw a Line at pleasure as GF, upon which lay the Diameter of your *Protractor*, with the Center in F; then make Marks at every Angle round the *Protractor*, as you find them in your *Field-Book*, viz. against 20, 40, 60, 77, 100; which done, take away the *Protractor*, and draw Lines FA, FB, FC, FD, and FE, through each of these Marks; on which Lines set off the Distances by a Scale, as you find them in your *Field-Book*; and where the End of those Distances fall, let there be Lines drawn to connect them, as GA, AB, BC, CD, DE, EF, and FG, and you have your *Field* complete.

Note, That you may as well take the Plot of a Field at one Station, standing on any Side thereof, as in an Angle.

3. To take the Plot of a Field at two Stations, when the Field is so Irregular, that from one Station you cannot see all the Angles.

Let

Let C D E F G H I K L M N O be the *Field*, in which from no one Place thereof all the Angles may be seen. Therefore chuse two Places for your Stations, as A and B.

Set your Instrument at A, and look through the *Sights* towards your 2d Station B, and then fix your Instrument. And, as before taught, with the Index take all the *Angles* at that end of the *Field*, as C D E F G H I K, and measure the Distance between your Instrument and each Angle; as also the Distance between the two Stations.

Then remove your Instrument to the second Station B, and having made it fast, so as through the *Back-Sights* you may see the first Station A: Take that Angles at the end of the *Field*, as N O C K L M, and measure their Distances, as before: All which being done, your *Field-Book* will stand thus.

First Station.

	D.	M.	Ch.	Lin.
Ang.	25	00	20	75
C	31	00	8	10
D	67	00	9	85
F	101	00	10	80
G	137	00	7	00
H	262	00	6	70
I	316	00	13	70
K	354	00	24	50

The Distance between the two Stations A and B is 31 Ch. 60 Lin.

Second Station.

Ang.	D.	M.	Ch.	Lin.
N	3	30	4	20
O	111	00	7	00
C	145	00	15	60
K	205	00	8	40
L	220	00	15	00
M	274	00	11	20

To *Protract* this, draw a Right Line at adventure, as P A B B, whereon set from your Scale 31 Ch. and 60 Links (the Distance between the two Stations) making Marks with the Compasses, as A and B for your first and second Station.

Lay the *Protractor* to A, the North-end of the Diameter being towards B, and mark out the several Angles observed at your first Station, draw Lines, and set off the Distances measured.

Do the same at B, the second Station; and when you have marked out all the Distances between those Marks, draw the Bound-lines.

Note, If a *Field* be very irregular, you may after the same manner make 3, 4, or 5 Stations, if you please: Tho' tis much better to go round such a Field, and measure the Bounding-Lines.

4. To take the Plot of a Field at one Station, in an Angle (so that from that Angle you may see all the other Angles) by Measuring round about the said Field.

Suppose A B C D E the *Field*, and A the Angle appointed for the Station.

Place your Instrument in A, and turn it round till you see (through the *fixed Sights*) the Mark at B; then screw it fast, and turn the Index to C; observing what Degrees are there cut on the Limb, which suppose to be 68 Degrees; turn it further;

till you see D, and Note down the Degrees there cut, viz: 76 Degrees; do the like at E, and the Index will cut 124 Degrees: This done, measure round the *Field*, Noting down the Length of the Side-Lines between Angle and Angle.

5 B

Then

Then your Field-Book will stand thus.

Ang.	D. M.
C	68 00
D	76 00
E	124 00

Lines	Ch. Lin.
A B	14 00
B B	15 00
C D	7 00
D E	14 40
E A	14 05

To Protract which, draw the Line A B as you please, and applying the Center of the Protractor to A, (the Diameter lying upon the Line A B) prick off the Angles, and make Marks, through which draw Lines A C, A D, and A E, in which you may find the Points C, D, E, by the Measures taken, as you have them in your *Field-Book*, and taken of a Scale; then draw the Bounding-Lines, and you have done.

5. To take the Plot of a Park Wood, a very great Common, or a large Champian Field, by going round about the same, and making Observations at every Angle thereof.

Let A B C D E F G be a large Field or Wood, through which you cannot see to take the Angles, but must be forced to go round the same.

Place your Instrument at the Angle A, and lay the Index on the Diameter thereof, moving the whole Instrument about, till through the Sights you see the second Angle at B, and there fix it: Then turn the Index about backwards till you see the Angle at G, the Index cutting 97 Degrees, which is the Quantity of the Angle G A B; Measure the Line A B, it contains 12 Chains, 5 Links, which set down in your *Field-Book*.

Then remove your Instrument to B, the Index lying upon the Diameter, turn it about till you see the Angle at C, and there fasten it; and turn the Index backwards till you see the Angle at A; then set down the Degrees cut on the Limb, and the Measure of the Line B C in your *Field-Book*.

Remove to C, D, F, and G, making your Observations after the same manner; and measuring the Length of every Line, they'll stand thus in the *Field-Book*.

	D. M.	Ch. Lin.
A	97 00	12 5
B	120 30	4 45
C	132 00	8 85
D	125 00	13 4
E	121 30	7 70
F	80 00	5 67
G	227 00	7 87

The manner of Protracting this, is nearly the same as before.

How to discover whether the Angles made at their several Stations, be truly taken or not.

R U L E.

Multiply 180 Deg. by a Number less by 2 than the Number of Sides or Angles in your Plot, the Product shall be equal to the Sum of all the Angles observed, if you have wrought true, otherwise not.

Thus, there were seven Angles or Sides in the last Plot, therefore I multiply 180 by 5, the Product is 900, which is equal to all the Angles reckoned in the inside of the Plot: For the outward Angles are not included in the Rule.

6. To measure parallel to a Hedge (when you cannot go close along the Hedge itself) and also in such a case, how to take your Angles.

Suppose A B C to be a Field, and for the Bushes you cannot come nigher than Θ to plant your Instrument.

Then set up Marks, and with your Off-set Rod or Chain, if the Distance be large, take the Distance between the Instrument Θ , and the Hedge A B; which Distance set off again nigh B, and set up Marks at D: Likewise take the Distance between Θ and the Hedge A C, and accordingly set up Marks at E. Then take the Angle D Θ E, which will be the same as the Angle B A C: Do thus for the rest of the Angles. But when the Lines are measured, they must be measured of the same Length with the outside Lines, as the Line Θ D, measured from g to f.

ceeding from any Point assigned in any Side thereof.

Let ABC be the Triangular piece of Land, containing 60 Acres, to be divided between three Men: The first to have 15 Acres, the second 20, and the third 25 Acres; and the Lines of Division to proceed from D.

First, measure the Base, which is 50 Chains; then divide this Base into 3 parts; thus, saying, If 60 give 50, What shall 15 give? Answer, 12 Chains 50 Links for the first Man's Base, which set from A to E. Again, say, If 60 give 50, What shall 20 give? Answer, 16 Chains 66 Links for the second Man's Base, which set off from E to F; Then the third Man's Base must be 20 Chains 84 Links, viz. from F to C. This done, draw an obscure Line from D to the opposite Angle B, and from E and F draw the Lines EH and FG, parallel to BD. Lastly, from D, draw DH and DG, which shall divide the Triangle into three such parts as were required.

10. To divide a Triangular Piece of Land, according to any Proportion given, by a Line drawn parallel to one of the Sides.

ABC is the Triangular Piece of Land, containing 60 Acres, the Base AC is 50 Chains: This Piece of Land is to be divided between two Men, by a Line drawn parallel to BC, in such Proportion, that one have 40 Acres, the other 20.

1. Divide the Base, as has been before taught, and the Point of Division shall fall in D. AD is 33 Chains 33 Links; DC 16 Chains 67 Links.

2. Find a mean Proportion between AD and AC, by multiplying the whole Base 50 by AD 33.33, the Product is 16665000, of which Sum extract the Square Root, 'twill be 40 Ch. 82 Lin. which set from A to E; then draw ET parallel to BC, so the Triangle is divided as required.

11. To reduce a Trapezia into a Triangle, by Lines drawn from any Angle thereof.

Let ABCD be the Trapezia to be reduced into a Triangle, and B the Angle assigned.

Draw the obscure Line BD, and draw CE parallel to DB, produce the Base AD to E, and draw BE, which shall make the Triangle BAE equal to the Trapezia ABCD.

Now to divide this Trapezia according to any assigned Proportion, is no more but to divide the Triangle ABE, as before taught, which will also divide the Trapezia.

Example.

Suppose the Trapezia ABCD, containing 124 Acres, 3 Rods, and 8 Perches, is to be divided between two Men; the first to have 50 Acres, 2 Rods, and 3 Perches; the other 74 Acres, 1 Rod, and 5 Perches, and the Line of Division to proceed from B.

First, Reduce the Shares into Perches, and 'twill be 8083 for the first Man, and 11885 Perches for the second Man's Share.

Secondly, Measure the Base of the Triangle, viz. AE, 78 Chains 00 Links.

Then say, If 19968, the whole Content, give for its Base 78 Ch. What shall 8083, the first Man's Part, give; Answer, 31 Ch. 52 Links; which set off from A to F, draw the Line FB, so you divide the Trapezia as desired: The Triangle ABF being the first Man's Portion, and the Trapezia BCFD, the second's.

12. To divide an irregular Plot of any Number of Sides, according to any Proportion given, by a straight Line drawn through it.

As suppose the Field ABCDE contain 46 Acres to be divided in Halfs between two Men, by a Line proceeding from A.

First draw a Line at pleasure through the Figure as A F; then cast up the Content of either Half, and see what it wants, or what it is more than the true Half should be.

Thus I cast up the Content of A E G, and find it to be but 15 Acres; whereas the true Half is 23 Acres; 8 Acres being in the Part A B C D G more than in A E G; therefore I make a Triangle containing 8 Acres, and add it to A E G, as the Triangle A G I; then the Line A I parts the Figure into equal Halfs.

Thus you may divide any piece of Land of never so many Sides and Angles, according to any Proportion, by straight Lines drawn through it, with as much Certainty, and more expeditiously than by any other way yet known.

Another Example will make all plain.

Suppose the following Field, containing 27 Acres, is to be divided between three Men, each to have 9 Acres, and the Lines of Division to run from a Pond to a Field, so every one may have the Benefit of the Water, without going over one another's Land.

First, from the Pond \odot draw Lines to every Angle, as $\odot A$, $\odot B$, $\odot C$, $\odot D$, $\odot E$; and then the Figure is divided into 5 Triangles, each of which Measure, and put the Contents down severally; which Contents reduce into all Perches, and so will the Triangle,

$\left\{ \begin{array}{l} A \odot B \\ B \odot C \\ C \odot D \\ D \odot E \\ E \odot F \end{array} \right\}$	$\left\{ \begin{array}{l} 390 \\ 1238 \\ 911 \\ 1107 \end{array} \right\}$	Perches.
---	--	----------

The whole Content being 4320 Perches, or 27 Acres, each Man's Proportion being 1440 Perches.

From \odot to any Angle draw a Line for the Division Line, as $\odot A$: Then consider that the first Triangle A \odot B is but 674 Perches, and the second Triangle B \odot C 390, both together but 1064 Perches, less by 376 than 1440, one Man's Portion. You must therefore cut off from the third Triangle C \odot D, 376 Perches for the first Man's dividing Line, which thus you do: The Base D C is 18 Chains, the Content of the Triangle 1238; say then, If 1238 Perches give bare 18 Chains, What shall 376 Perches give? Answer, 5 Chains, 45 Links; which set from C to F, and drawing $\odot F$, you have the first Man's Part, viz. A \odot F.

Then see what remains of the Triangle C \odot D 376, being taken out, and you'll find it to be 862 Perches, which is less by 578 than 1440.

Therefore from the Triangle D \odot E cut off 578 Perches, and the Point of Division will fall in G. Draw the Line $\odot G$, which with $\odot A$ and $\odot F$, divides the Figure into three equal Parts.

13. To take the Horizontal-Line of a Hill.

When you measure a Hill, you must measure the Superficies thereof, and accordingly cast up the Contents. But when you Plot it down, because you cannot make a Convex Superficies upon the Paper, you must only Plot the Horizontal-Line or Base thereof, which you must shadow over with the Resemblance of a Hill. That Horizontal or Base-Line is found after this manner.

Suppose A B C D a Hill, whose Base you would know.

SUR

Your Instrument being placed at A, cause a Mark to be set up at B, so high above the top of the Hill as the Instrument stands from the Ground at A; then take the Angle B A D, 58 Deg. measure the distance A B, 16 Chains, 80 Links: Then say,

As Rad. : A B :: S, B A D : A D.

S, 90°, 00' : 16 Ch. 80 Lin. :: S, 32°, 00' 8 Ch. 90 Lin.

Then remove your Instrument to B, and take the Angle C B D, 46° Deg. measure the distance B C 21 Chains; then say,

As Rad. : B C :: S, C B D : D C.

S, 90d, : 21 Ch. :: S, 46d : 15 Ch. 12 Links.

The 15, 12 added to 8, 90, makes 24 Chains 2 Links, for the whole Base A C.

Otherwise thus.

Take the Angles B A C 58 d. and A B C 78 deg. subtract these two from 180 deg. there will remain the Angle C 44 deg. measure A B, then say,

As S, C : A B :: S, B : A C.

14. To find the Content of your Field in Acres and Parts of an Acre.

Since Mr. Gunter's 4 Pole Chain, all along here used, is supposed to be divided into 100 equal Parts or Links; and that every Acre contains 160 Square Perches or Poles. Therefore 160 Perches \times into 160 Perches, = a Square Acre. But the Chain being Decimally divided, so that in one 4 Pole Chain, there are 100 Links; therefore 10 Square Chains must make an Acre; that is, an Acre will contain 10000 Links.

Suppose therefore the Base of any Triangle in my Plot were 53 Chains 53 Links, whose Area in Acres and Parts of an Acre I would find by multiplying its half Altitude 8 Chains 25 Links, into that Base or Side; work just as in Decimals, thus:

$$\begin{array}{r} \text{C. L.} \\ 27\ 53 \\ 8\ 25 \\ \hline 13765 \\ 5506 \\ 22024 \\ \hline 2271225 \end{array}$$

Only from the Product I cut off five places, (or which is all one, Divide it by 10000) there remains 22 Acres .71225. To reduce which Decimal Fraction .71225 into Roods and Perches, I consider that there are 4 Roods in an Acre; therefore I multiply by 4, and cut off 5 places as before.

SUS

$$\begin{array}{r} .71225 \\ 4 \\ \hline 284900 \end{array}$$

This gives me 2 Rod and this Fraction;

$$\begin{array}{r} 84900 \\ 40 \\ \hline 3396000 \end{array}$$

which I multiply by 40, because there are 40 Perches in a Rod, and the Product is 33 96000, from whence cutting off 5 places as before, it gives me 33. Perches. So the whole Content is 22 Acres, 2 Rod, 33 Perches. See the Word Chain.

Knowing the Content of a Piece of Land, to find what Scale it was plotted by.

First, By any Scale measure the Content of the Plot; then say,

As the Content found, is to the Square of the Scale I tried by;

So is the true Content to the Square of the true Scale it was plotted by.

As suppose there is a Plot of a piece of Land containing 10 Acres, and I measure it by the Scale of 11 in an Inch, and find it to contain 12 Acres $\frac{1}{10}$ of Acre.

Then say,

As 12 $\frac{1}{10}$: 121 (=) Sq. :: 10 : 100.

And the Square Root of 100 is 10; therefore I conclude that Plot to be made by a Scale of 10 in an Inch.

How to change Customary Measure into Statute-Measure, and the contrary.

Say, As the Square of one sort of Measure, is to the Square of the other:

So is the Content of the one, to the Content of the other.

Thus: Suppose a Field measured by a Perch of 18 Foot contain 100 Acres, How many Acres shall the same Field contain by a Perch of 16 Foot $\frac{1}{2}$?

Say, If the Square of 16 $\frac{1}{2}$ Foot, viz. 272, 25, give the Square of 18, viz. 324, What shall 100 Acres Customary give? Answer, 119 $\frac{9}{10}$ Statute-Acres.

SURVEYING-Scale, the same with Reducing-Scale.

SURVIVOR, in Law, signifies the longer Liver of two Joint-Tenants, or of any two joined in the Right of any thing.

SUSPENSION, or *Suspense*, is a Temporal stop of a Man's Right; as when a Seignory, Rent, &c. by reason of the Unity of Possession thereof, and of the Land out of which they issue, are not in esse for a time, and *tunc dormiunt*, but may be revived or awaked, and so differs from Extinguishment, which dies for ever. And sometimes this Word Suspension is used in Common Law, as it is in the Canon Law, *pro minori Excommunicatione*.

SUSPENSOR *Testiculi*, the Name of a Muscle otherwise call'd *Cremaster*; which see.

SUSPENSOKIUM, is a Ligament of the Penis first discover'd by our Accurate Mr. Cowper the Surgeon

geon. It ariseth from the Anterior Part of the *Ossa Pubis*, and fix'd to the upper part of the *Dorsum Penis*, on each side its great Vein. Its Use is to assist the *Musculi Erigentes* in their Action.

SUTURA also, is a Connexion of the Sides or Lips of a Wound. This is of two sorts: Actual, which is done with a Needle of a triangular Point, a Pipe, or Cane, and waxed Thread: First in the middle of the Wound you must sew it together with a double Thread, and having made a Knot, cut it off; the rest of the Wound must be sewed up with single Thread; Care must be taken that the Stitches are not set too wide, nor too close, especially not too close, that there may be room for any corrupt Matter bred in the Wound to work out. The other sort of Suture is much like the way that the Skinners use to sew Skins together: This is proper in Wounds of the Intestines, and in Cuts of the Veins and Arteries.

Also the *Junctures* of the Parts of the Shells of Fishes to one another, are called *Sutures*.

SUTURA Ossium, a Suture in the *Juncture* of the Bones of the Skull, like the Teeth of Saws meeting together. Those which join the Parts of the Skull to the Bones of the upper Jaw, are of 3 sorts; the *Transversalis*, the *Ethmoidalis*, and the *Sphenoidalis*; which see under those Words. The Sutures joining the parts of the Skull are 4: The *Coronalis*, *Lambdoidalis*, *Sagittalis*, and *Squamosa*; which see.

SWABBER, the Title of an inferior Officer aboard a Man of War, whose Office it is to see that the Ship be kept neat and clean; in order to which, he is to see her washed well once or twice a Week at least, especially about the Gun-walls and Chains. He ought to burn Pitch or some such thing now and then between Decks, to prevent Infection; and to acquaint the Captain of such as are Nafty and Offensive.

SWAINMOTE, or *Swainmote*, signifies a Court touching Matters of Forest, and held by the Charter of the Forest thrice in the Year, before the *Verdorsors* as Judges. And it is as incident to a Forest, as Court of Pye-powder to a Fair.

SWALLOW-Tail, in Fortification, is a *single Tenaile*, that is narrower towards the Place than towards the Country. See *Queue d'aronde*.

SWEEP. The Seamen call the Mold of a Ship when she begins to compass in at the Rungheads, the Sweep of her; or the Sweep of the Futtock.

SWEEPING, at Sea, signifies dragging along the Ground, at the Bottom of the Sea, or Channel, with a Tree-fluked Grapnel, to find some *Hawser* or *Cable*, which is slipped from an Anchor.

SWEETBREAD. See *Pancreas*.

SWIFT in Motion, a Planet is said to be so, when by its own proper Diurnal Motion, he exceeds, or moves further than his mean Diurnal Motion: *Slow in Motion*, is when his Motion happens to be less than his mean Motion.

SWIFTERS, in a Ship, are Ropes belonging to the Main-masts, and Fore-masts, and help to succour or strengthen the Shrouds, and to keep the Masts stiff: They have Pendants fastened under the Shrouds at the Head of the Masts, with a double Block, thro' which the Swifter is reeved; which at the *standing Part* hath a single Block with a Hook, hitched into a Ring at the *Chain-Wale*, and so the Fall being haled up, helps to strengthen the Mast, and it is belayed about the Timber-heads of the lower Rails aloft.

SWIFTING of a Boat, is compassing her Gunwale round with a good Rope, to strengthen her in a Srels of Weather, that she be not shattered by the Violence of the Sea.

SWIFTING of a Ship, is either bringing her aground, or upon a Careen; for then they use to *Swift the Masts*, to ease and strengthen them, that all the Weight may not hang by the Head; which is done by laying fast all the *Pendants* of the *Swifters* and *Tackles* (with a Rope) close to the Mast, and as near to the Blocks as can be; and then to carry forward the Tackles, and there to *Bowse*, or hale them down as hard and taught as is possible. (So that the Sea Word of Command here is, *Ho! Bowse Men!* All this is done also to keep the Mast from rising out of the *Step*).

SWIFTING the *Capstan-Bars*, is straining a Rope all round the outer Ends of the *Capstan-Bars*, in order to strengthen them, and make them bear all alike, and together, when the Men heave or work there.

SWING-WHEEL, in a Royal Pendulum-Clock, is that Wheel which drives the Pendulum: This Wheel in a Watch is called the *Crown-Wheel*, as also in a Balance-Clock.

SUPERFICIAL Fourneau, a Term in Fortification, the same with *Caisson*, which is a wooden Chest, or Box with 3, 4, 5, or 6 Bombs in it, and sometimes 'tis filled only with Powder; and is used in a close Siege, by being buried under Ground with a Train to it, to blow up any Lodgment that the Enemy shall advance to. Therefore they usually express it thus: "After the Mine, "or Fourneau, had destroyed the *Bonette*, a *Caisson* "was buried under the Ground, thrown up, and "the Enemy advancing to make a Lodgment "on the Ruins of the *Bonette*, the *Caisson* was "fired, and blew up the Post a second time.

SYCOSIS, is an Excrecence of the Flesh about the Fundament; 'tis also an Ulcer, so called from the Resemblance of a Fig; this is of two kinds, one hard and round, the other soft and flat; out of the hard issues a very small Quantity of glutinous Matter; out of the moist proceeds a greater Quantity, and of an ill smell: These Ulcers grow in those Parts only which are covered with Hair; the hard and round chiefly in the Beard; the moist for the most part in the Scalp. *Blanchard*.

SYDERATION. See *Apoplexy*.

SYDERIAL Year. See *Year*.

SYLLEPSIS, or *Conceptio*, (in Grammar) is when the Sense of an Expression is to be conceived otherwise than is imported by the Words; and so the Construction is made accordingly as some define it. But *Vossius* saith, 'tis an Agreement of a Verb or an Adjective, not with that word which is most near, but with that which is most worthy, honourable, &c. in any Sentence, as *Rex & Regina beati*.

SYMBOLS. See *Characters*.

SYMMETRICAL, the same with *Commensurable*.

SYMMETRY, is usually taken in *Architecture* for the Proportion required, according to the Rules of *Geometry*, to make all the Parts of any Structure completely agree to, and with the Whole.

SYMPATHETICAL Inks, are such as can be made to appear or disappear very suddenly by the Application of something that seems to work by Sympathy.

There

There are some ways of preparing Inks of this Kind, which are really wonderful and surprizing, as well as curious and diverting.

The Experiments are these.

Take of good unslacked Lime, two or three Parts, according to the Strength and Goodness of the same, and one Part of *Yellow Orpiment*, (which to powder, had best be wrapt up in a thick Paper, and so beaten, to prevent the dangerous Steams that may affect the Head) both these being powdered and mix'd, put to them 15 or 16 times as much Water in weight, as there was of *Orpin*: Stop the Viol well with Cork and a Bladder, and set it in warm Embers, or some such Place; shaking the Viol now and then for 4 or 5 Hours; then warily decant the clear Part, or which is better, *filtrate* it.

In the mean time burn a piece of Cork thoroughly; and when it is well inflamed, quench it in common Water (or which is better, *Aqua Vita*, or *Brandy*) and by this means reducing of it to a friable Coal, grind it with a sufficient quantity of fair Water, in which you have dissolved a little *Gum-Arabick*, and so it will make a Liquor as black as common Ink, which will serve very well to write any thing with.

While these are doing, dissolve in three times as much distilled, or strong Vinegar, over warm Embers, a Quantity of *Red-Lead*, (or *Minium*) or of *Saccharum Saturni*, in three times as much Water, for 3 or 4 Hours, or till you find the Liquor have a very sweet Taste. This will likewise, as the first Liquor, be clear as common Water.

All things being thus ready (for you must be pretty quick at it) write on a piece of Paper what you will, with this last Liquor, with a clean, or new Pen, and when it is dry, nothing will appear.

Then over that place write with the Ink you made of the Cork, what you please; it will look just as if it had been written with common Ink, which let dry; then dipping a small piece of Rag, or Sponge, in the first Liquor, rub it on the Place written, and you will immediately see the Black writing vanish, and that written with the Invisible Ink, appear Black and Legible.

Take also a Book 4 or 5 Inches thick, and writing on the first Blank Leaf with the last Liquor, or the Invisible Ink; or putting in there a Paper so written, turn to the other end of the Book, and rub there with a Rag dipt in the first Liquor, on that part that is as nearly as you can guess, opposite to the Writing, and leave also the Rag there: And over it clap a folded Paper, and nimbly shutting the Book, strike 4 or 5 good Stroaks on it with your Hand, and then turning it t'other side uppermost, clap it into a Press, or lay it between two Boards with a good Weight on it for a Quarter of an Hour (or half that time will do) then taking it out, you'll find the Writing black and legible, which was written with the Invisible Ink.

This Process, Mr. Boyle communicated in his History of Gold, p. 322. and afterwards Lémery published it in his *Course of Chymistry*, with the Addition of the latter Experiment.

By whose help we may endeavour at a Solution of these strange Experiments, if we consider,

1. That the first of these Liquors is a Mixture of the Alkalizate, and fiery Salt of Quick-lime, with the Sulphureous Substance of the *Orpin*, which is a kind of *Arsenick*.

2. That the Blackness of the Ink, which is the second Liquor, proceeds only from the porous, light, and sooty Parts of the Cork; which are its Oily Parts very much rarified.

3. That the last Liquor (or the Invisible Ink) only the Parts of the Lead held up imperceptibly in the acid Liquor of Vinegar.

Hence then, the Reason of the disappearing of the Ink in the first Experiment, is from the penetrating Parts of the first Liquor, which consisting of an Alkalizate Salt, and a penetrating Oil, or Sulphur, doth make a kind of Soap, which soon dissolves the rarify'd Fuliginosity of the Ink, as common Soap takes away greasie Spots out of Cloaths, &c.

And the invisible Ink then appears black, because the Edges of the acid Liquor that hold the Parts of the Lead dissolved, being now broken by its Conflict with the Alkali of the first Liquor; the Parts of the Lead are, as it were, precipitated on the Paper, and so appear in their proper Colour, which is Black.

So that the Visible Ink disappears, because its black Parts are dissolved; and the Invisible doth appear, because its dissolved Parts are revived, or restored.

The second Experiment shews the strange piercing Subtility of the first Liquor.

You had best make all the Liquors in different Places, lest they should mingle, and so spoil the Experiment, as I have known them sometimes do.

Experiment the Third.

Dissolve a little white, or green Vitriol in Water; and then write with a clean Pen with the Solution, nothing will appear.

Boil Galls in Water, and dip a Rag of Linen in the Decoction, and with it rub the Place before written, and it will appear Black and Legible.

But if you rub over it with a Feather, or a Rag dipt in Spirit of Vitriol, (or its Oil) the Letters will disappear again.

Dip another Rag in Oil of Tartar per Deliquium, and rub on the Place, the Letters will appear again, but of a Yellowish Colour. *Lémery's Chymistry, last Edit. pag. 330.*

R E A S O N S.

The Coagulum of the Vitriol and Galls, is the Cause of the first Blackness, (as is seen in making common Ink) which the acid Spirit of Vitriol dissolves, and so the Letters disappear: But the Oil of Tartar breaking (as it uses to do in all Precipitations) the Force of this acid Spirit, restores the Coagulum, but spoils its Colour a little, by mingling it self with it.

SYMPATHETICK Powder, is only (said Lémery) Green, or Roman Vitriol, opened by the Sun-Beams

Beams penetrating into it, and imperfectly calcining it: The Vitriol is usually exposed to the Sun's Heat in the Month of *July*, but some use only Powder of Vitriol. When they use it, they spread some of the Powder upon a Linen-cloth dip't in the Blood of any Wound, and then pretend, that if the Cloth be many Miles off the wounded Person; yet he shall be healed: But this is so far from being true, notwithstanding the vaunting Stories of Sir *Ken. Digby* and others, that 'twill hardly have its Effect, if done in the same Room where the Patient lies; and he is certainly very much wanting to himself, who will use no other Help.

Vitriol hath its Parts in continual Motion; and 'tis probable, many *Effluvia* may go out from it; and some few of those, if Application be made to the Cloth, just by the Patient, may perhaps enter into the Wound, and help to stop the Bleeding, for Vitriol is a known *Stryck*; but he that will neglect all other Means, and depend only on this, may probably pay dear for his Credulity.

SYMPEPSIS, is a Coction of those Humours, which are growing into an Impostume.

SYMPHYSIS, is the joining of two Bones of which neither has a proper distinct Motion: This is either without any Medium, or else with it, as with a Cartilage, or Gristle, a Ligament, or Flesh, &c.

SYMPTOM, is a preternatural Disposition of the Body, occasioned by some Disease; this is either a Disease caused by another Disease; or else the Cause of a Disease proceeding from another Disease; or else simply a Symptom: This last is either some Action of the Body hindered, or disturbed, some Fault of the Excrement, or change of the Natural Temper. *Blanchard*.

SYMPTOMATICAL Fevers, according to some, are those which arise from the Inflammation and Putrefaction of Humours contained in some of the Bowels, of which kind are those *Fevers* that accompany the *Pleurisie*, *Inflammation of the Lungs*, and *Liver*, *Frenzy*, *Quinsie*, and other Inflammations, as Ulcers of the Internal or External Parts.

SYMPTOTES. See *Asymptotes*.

SYNACTICA, are Medicines that contract any Part.

SYNALÆPHA, is a Figure in the Dimension, or Scanning of a *Latin* Verse; whereby there is a Coalition of the two Vowels or Diphthongs, one of which ends, and the other begins two contiguous Words in a Verse, so that they make but one.

SYNARTHROSIS, is a joining of Bones by a Gristle, and is of two sorts, *viz. Sutura*, and *Gomphosis*, which see.

SYNCHONDROSIS, the same with *Synarthrosis*.

SYNCHYSIS, in *Grammar*, is a confused and disorderly placing of Words in a Sentence.

SYNCHYSIS, a Disease, is a preternatural Confusion of the Blood, or Humours of the Eyes. *Blanchard*.

SYNCOPALIS Febris, or the *Swooning Fever*; is that in which the Patient often swoons and Faints away. *Blanchard*.

SYNCOPATION, a Term in Musick, which is when a Note of one Part ends and breaks off upon the middle of a Note of another Part.

SYNCOPE, in Musick, is the driving a Note, when some shorter Note prefix'd at the beginning of the Measure, or Half-measure, is immediately

follow'd by two, three, or more Notes of a greater Quantity, before you meet with another short Note equivalent to that which began the driving, to make the Number even. As when an odd *Crotchet* comes before two, three, or more *Minims*, or an odd *Quaver* before two, three, or more *Crotchets*.

SYNCOPE, in *Physick*, is a sudden Prostration or Swooning, with a very weak, or no Pulse, and a Depravation of Sense and Motion.

SYNCOPE, in *Grammar*, is the taking away a Letter or Letters, out of the middle of a Word: As *Dixti* for *Dixisti*, *Repositum* for *Repositum*.

SYNCRITICA, are relaxing Medicines.

SYNDESMUS, or *Syndesmosus*, the same with a *Ligament*.

SYNDROME, is a Concurrence of several Symptoms in the same Disease.

SYNECDOCHE, a Trope in *Rhetorick*, where the Name of the the Whole is put for Part; or the Name of the Part for the Whole: As if we should say, *Europe for England*, or *England for Europe*.

SYNECDOCHE, in *Grammar*, is when the Ablative Case of the Part, or the Adjunct, is changed into the Accusative: As in that of *Virgil*:

Deiphobum vidi lacerum crudeliter Ora.

And in this:

Flores inscripti nomine Regum.

SYNECOPHONESIS, or *Synizesis*, is a Figure in *Grammar*, whereby two Vowels are contracted into one, as in this Verse of *Virgil*.

Seu lento fuerint Alvearia vimina texta.

Where the *ea* in *Alvearea*, are contracted into one Vowel.

SYNEDRENONTA, are common Symptoms which accompany Diseases; and yet neither flow from the Nature of the Disease, nor are necessary Concomitants of it; but do, notwithstanding, signify the Greatness, Continuance, &c. of the Disease.

SYNANCHE, is a sort of *Squinnacy*, which quite stops the Breath, or a preternatural Inflammation of the Muscles of the Jaws.

SYNEUROSIS, is an Articulation of Bones by a Ligament; as the Extremity of the *Ulna*, is joined to the Bones of the *Carpus*.

SYNGULTUS, the *Hiccough*, is a depraved Convulsive Motion of the Stomach, by which it endeavours to expel something that is hurtful, or offensive.

SYNIZESIS. See *Synecphonesis*.

SYNOCHA, is a continued intermitting Fever, this lasts for many Days with a great Heat, sometimes Putrefactions of the Blood; it is either *Quotidian*, *Tertian*, or *Quartan*. *Blanchard*.

SYNOCHUS, is a continued Fever without any Intermission, or Abatement of the Heat, which continues for many Days: This is either simple, or accompanied with Putrefaction. *Blanchard*.

SYNOD, a Meeting or Assembly of Ecclesiastical Persons concerning Religion: Of which there are four Kinds.

1. *General*, where Bishops, &c. meet of all Nations.

5 C

2. *National*,

2. *National*, where those of one Nation only come together.

3. *Provincial*, where they of one only Province meet.

4. *Diocesan*, where those of but one Diocess meet : See *Convocation*, which is the same with *Synod*, only the one is a Greek, and the other a *Latine Word*. *Cowel's Interpreter*.

SYNODICAL Month, is the Space of Time, (*viz*, 29 Days, 12 Hours, 45 Minutes) contained between the Moon's parting from the Sun at a Conjunction, and returning to him again ; during which Time she puts on all her Phases. And her

SYNODICAL Revolution, is that Motion whereby her whole System is carried along with the Earth round the Sun.

SYNONOMY, is when the same thing is expressed by several Words that have but one and the same Signification : As if one should say, *He went away, he escaped, he fled*.

SYNTASIS, is a preternatural Distention of the Parts.

SYNTECTOE, is a kind of Looseness that proceeds from the melting away of the Substance of the Body by a violent hot Distemper of the solid Parts such as sometimes happen in the Inflammation of the Bowels, and in a vehement burning Fever, Hectick, or Pestilential ; in which a fat Matter, as it were mixt with Oil or Grease, is voided by Stool.

SYNTENOSIS, is reckon'd by some to be the Union of one Bone to another, by a *Tendon* ; as the Knee-pan to the Thigh-bone and *Tibia*.

SYNTERETICK Medicines, are that Part of Physick, which give Rules for the Preservation of Health.

SYNTEXIS, is a Consumption and Colliquation of the Body, in which first the Flesh is wasted, and afterwards the Substance of the more solid Parts. *Blanchard*.

SYNTHESIS, is either the Frame and Structure of the whole Body ; or more strictly, the Composition of the Bones. 'Tis also used in *Mathematicks*, in Opposition to the Word *Analysis* ; in which Sense it signifies *Composition*, or the

SYNTHETICAL Method of Enquiry, or *Demonstration* in *Mathematicks*, is when we pursue the Truth chiefly by Reasons drawn from Principles before established, and *Propositions* formerly proved, and proceed by a long regular Chain, till we come to the Conclusion : As is done in the Elements of *Euclid*, and in almost all the *Demonstrations* of the Ancients. This is called *Composition*, and is opposed to the Analytical Method, which is called *Resolution* ; which see.

SYNTHESIS is also used by the *Grammarians*, to signify an Agreement of the Parts of a Sentence as to Sense, but not as to the Words.

SYNULOTICKS. See *Cicatrifantia*.

SYNYMENSIS, is taken to be the uniting of Bones together by a *Membrane*, as in Infants, the Bones of the *Syniput*, with the *Os Frontis*.

SYPHON, is a Tube, or Pipe of Glats, or Metal, which is usually bent to an Acute Angle, and having one Leg shorter than the other ; they are frequently to draw off Liquors out of one Barrel or Vessel into another, without raising the Lees,

or Dregs, and are called *Cranes*. Sometimes Glats Tubes or Pipes, tho' strait, are called *Syphons*.

For the Cause of the running of Water, or other Liquors, through the *Syphons* or *Cranes* : See *Hydrostaticks*, *Paradox* 10.

SYRINGE, is an Instrument which is used in injecting Liquors into Wounds, Ulcers or any diseased Parts of the Body.

SYRINGOMATA, are Chirurgeons Knives, which they open *Fistula's* with.

SYRINGOTOMIA, is the Incision of the *Fistu'a*.

SYSSARCOSIS, is the Connexion of Bones by Flesh. *Blanchard*.

SYSTEM, in Musick, is the Extent of a certain Number of *Chords*, having its Bounds toward the *Grave* and *Acute*, which hath been differently determined by the different Progress made in Musick, and according to the different Divisions of the *Monochord*.

The System of the Ancients was composed of four *Tetrachords*, and one *Supernumerary Chord*, the whole making Fifteen Chords.

SYSTEM properly is a regular orderly Collection, or Composition of many things together.

Thus the *Solar System*, is the Aggregate Union, or orderly Disposition of all those Planets which move round the *Stn* as their Centre, in determin'd Orbits, and never deviate farther from him than their proper and usual Bounds. And a

System of Philosophy, is a regular Collection of the Principles and Parts of that Science into one Body, and a treating of them Dogmatically, or in a Scholastical Method ; which is called the *Systematical Way*, in Contra-distinction of the *Way of Essay*, wherein the Writer delivers himself more loosely, easily and modestly.

The Learned Dr. *Hook*, did in the Year 1674, at the End of his Attempt to prove the Motion of the Earth by Observation, promise that he would explain a System of the World, differing in many things from any then known, and yet exactly agreeable to Mechanical Principles. Which System he there says, depends on these three Suppositions, *viz*.

First, That all the Heavenly Bodies have a gravitating or attracting Power towards their own Centers, whereby they attract not only their own Parts, and keep them from flying off from them, but also all other Celestial Bodies within the Sphere of their Activity.

Secondly, That all Bodies put into a direct and simple Motion, will so continue to move forwards in a strait Line, till they are by some or other more effectual Power bent or deflected into a Motion, which describes some Curve Line.

Thirdly, That these attractive Powers are so much the more powerful in operating by how much the nearer the Body wrought upon, is to their own Centers.

All which is abundantly confirmed in Sir *Isaac Newton's Admirable Principia Philosophiæ Mathematicæ*.

SYSTOLE, in *Anatomy*, is the Contraction of the Ventricles of the Heart, whereby the Blood is forcibly driven into the great Artery.

SYSTOLE

SYSTOLE, in *Grammar*, is part of the Poetical License, whereby a long Syllable is made short: As in that of *Virgil*:

— *Tulerunt fastidia Menses.*

SYSTYLE, in *Architecture*, is a Building where the Pillars stand thick, but not altogether so close as in the *Pychnostyle*; the Inter-columniation; or

Distance between them, being only two Diameters of the Column.

SYZYGIE, in *Astronomy*, is the same with the Conjunction of any two Planets, or Stars, or when they are both referred to the same Point in the Heavens; or when they are referred to the same Degree of the Ecliptick, by a Circle of Longitude passing through them both.

T A C

TABES. See *Atrophia*.

TABES dorsalis, a Consumption in the spinal Marrow, incident to those who are too much addicted to Venery, they are without a Fever, eat well, and yet waste, or consume away: If you ask one in this Disease an account of himself, he will tell you, that there seems as if so many Pisnires did crawl from his Head down upon his spinal Marrow; when he eases Nature, either by Urine or Stool, there flows thin liquid Matter like a Semen plentifully; when he goes or runs any way, but especially by a steep Place, he grows weak and short-breathed, his Head is Heavy, and his Ears tingle; so in process of Time he dies of a Fever called *Lipiria*, where the External Parts are cold, and the Internal burn at the same time. *Blanchard*.

TABLE, in *Architecture*, is a smooth and simple Part of a different Figure; but most commonly in Form of a long Square, or of a Triangle.

Projecting Table, is that which jets out beyond the naked Face of a Wall, Pedestal, or any Part whereof it makes the Ornament: And a

Raked Table, is that which is hollow'd in the Square of a Pedestal, or elsewhere.

TABLETS, or solid Electuaries, are much the same with *Lozenges*, being made usually of Sugar and Powder, &c. incorporated well together, and given in many Diseases, especially those of the Lungs and Breast.

TABLING of Fines, is the making a Table for every County where his Majesty's Writ runs, containing the Contents of every *Fine* passed in any one Term, as the Name of the County, Towns, and Places, wherein the Lands or Tenements lie; the Name of the Demandant and Deforçant, and of every Manor named in the *Fine*.

TABUM, is a thin sort of Matter that comes from an ill Ulcer. *Blanchard*.

TACK, in a Ship, is a great Rope having a *Wale-knot* at one End, which seized or fastened into the Clew of the Sail; so is reeved first thro' the *Cheefe Trees*, and then is brought thro' a Hole in the Ship's Side. Its Use is to carry forwards the Clew of the Sail, and to make it stand close by a Wind: And whenever the Sails are thus trimmed, the Main-tack, the Fore-tack, and Mizen-tack are brought close by the Board, and haled as forward on as they can be. The Bowlings also are so on the Weather side; the Lee-sheets are haled close aft, and the Lee-braces of all the Sails, are likewise braced aft. Hence they say, a Ship *Sails*, or *stands close upon a Tack*, i. e. close by the Wind. *Hale aboard the Tacks*; that is, Bring the Tack

T A I

down close to the Chefs-trees. *Ease the Tack*, i. e. Slacken it, or let it go, or run out. *Let rise the Tack*, i. e. Let it all go out. The Tacks of a Ship are usually belayed to the *Bitts*, or else there is a *Chevil* on purpose to fasten them.

TACK about: The Word, when a Ship's Head is to be brought about so as to lie a contrary Way; to do which, First they make her stay, (See *Stay*) and when she is stay'd, they say, She is *Pay'd*. The next Word is, *Let rise and Hale*, that is, Let the *Lee-tack rise*, and *Hale aft the Sheets*, and so trim all the Sails, by a Wind as they were before; for they cast off that which was before the *Weather-Bowling*, and set up the other taught; and so they do also by all *Sheets*, *Braces* and *Tacks*, which a Ship that is trimmed by a Wind must have.

TACKLES, in a Ship, are small Ropes running in three Parts, having at one End a *Pendant* with a Block fastened to them, or else a *Lannier*; and at the other End, is a Block and an Hook to hang any Goods upon, which is to be heaved into the Ship, or out of it.

There are several sorts of these *Tackles*.

1. The *Boat Tackles*, which serve to hoist the Boat in and out, as also for many other Uses: These stand on the Main-mast Shrouds, the other on those of the Fore-mast.

2. The *Tackles* belonging to the Masts, these serve as a kind of Shrouds, to keep the Masts from straining.

3. The *Gunnery-Tackles*, with which the Ordnance are hoisted in and out.

4. There is also another called *Winding-Tackle*; which see under that Word.

There is also another kind of *Tackle* which is called a *Burnett*. See *Burnett*.

TACTILE Quantities, are such as have a primary Relation to the Sense of Feeling, or to our Touch: As Heat and Cold, &c.

TÆNIA, in *Architecture*, is a Member of the *Doric* Capital, which resembles the Shape of a square Fillet, and serves instead of a *Cymetium*, being fastened, as it were, to a Capital below the *Triglyphs*, whereof it seems to be the Base.

TAFFEREL, is the uppermost Part, Frame, or Rail of a Ship abaft over the Poop.

TAILE, in common Law, signifies two several Things both grounded upon one Reason. First, it

is to be used for the *Fee*, which is opposite to *Fee-Simple*, by reason it is so minced or parted, as it were, that it is not in the Owner's free Power to dispose, but is by the first Giver cut or divided from all others, and tied to the Issue of the Donee: And this Limitation of *Tail*, is either *General*, or *Special*.

Tail General, is that whereby Lands or Tenements are limited to a Man, and to the Heirs of his Body begotten; and it is so called, how many Wives soever the Tenant holding by this Title, shall have one after another in Lawful Marriage; his Issue by them all, have a Possibility to inherit one after another.

Tail Special, is when Lands or Tenements limited to a Man and his Wife, and the Heirs of their two Bodies begotten; and hath this Term of *Special*, because if the Man bury his Wife before Issue, and take another, the Issue by his second Wife cannot inherit the Land, &c. Also, if the Land be given to a Man and his Wife, and their Son R. for ever; this is *Tail Special*.

TAIL after Possibility of Issue Extinct, is where Land is given to a Man and his Wife, and to the Heirs of their two Bodies, the one over-lives the other without Issue between them begotten; he shall hold the Land for Term of his own Life, as Tenants in *Tail after Possibility of the Issue Extinct*; and notwithstanding that he do waste, he shall never be impeached of it: And if he Alien, he in the Reversion shall not have a Writ of Entry *in consimili Casu*, but he may enter, and his Entry is Lawful.

TAILLOIR. See *Abacus*.

TAINT, in Law, signifies Substantively, either a Conviction; or Adjectively, a Person Convicted of Felony or Treason, &c. See *Attaint*.

TAKE and *leave*, they say at Sea, that when a Ship fails so well that she can come up with another, or out-fail her when she pleases; that she can *Take and Leave upon her*, whenever she will.

TALES, in Law, is taken for a supply of Men, impannelled upon a Jury or Inquest, and not appearing, or at their Appearance challeng'd by either Party as not indifferent; in which Case the Judge upon Motion, grants a Supply to be made by the Sheriff of one or more such there present; and hereupon the very Act of supplying is called a *Tales de Circumstantibus*: But he that hath had one *Tales* either upon Default or Challenge, may not have another to contain so many as the former: For the first *Tales* must be under the principal Panel, except in a Cause of Appeal, and so every *Tales* less than other, until the Number be made up of Men present in Court, and such as are without Exception; yet this general Rule is not without some Exceptions, as appears by *Stamford Pl. Cor. Lib. 3. Cap. 5*. These commonly called *Tales*, may in some sort, and indeed are called *Meliores*, viz. when the whole Jury is challenged.

TALLY the Sheats, is a Word of Command at Sea, when the Sheats of the Main-sail or Fore-sail are to be halled aft. See *Sheets*.

TALON, a small Member in Architecture composed of a square Fillet, and a straight *Cymesium*. It differs from the *Astragal*, which is a round Member, whereas the *Talon* consists of two Portions of a Circle, one without, and the other within; and when the Concave Part is uppermost, it is called *Reversed Talon*.

TALPA, is a Tumor so called, because that as a Mole (in Latin *Talpa*) creeps under Ground; so this feeds upon the Skull under the Skin: It may be referred to the Species of *Athermas*; which see. *Blanchard*.

TALUS, the same with *Astragalus*. See it described under the word *Torsus*.

TALUS, or *Talus*, properly signifies any Thing that goes sloping, as the *Talus* of a Wall in Masonry, when its thickness is diminished by Degrees as it rises in height. But in *Fortification*, the *Talus* of a *Bastion* or *Rampart*, is the Slope allowed to such a Work whether it be of Earth or Stone, the better to support its Weight.

TALUS Exterior, of a Work, is its Steepness on the Sides of the Field; and is always made as little as possible, to prevent the Enemies *Scalado*, unless the Earth be bad, then it is absolutely necessary to allow a considerable *Talus* for its *Parapet*.

TALUS Interior, of a Work, is its Steepness on the inside towards the Place.

TAMPKIN, *Tampion*, or *Tampin*, at Sea, is a round piece of Wood filled with the Muzzle of a great Gun, which serves to stop it so, that no Water or Rain may get in to wet the Powder.

TANGENT, of a Parabola, (or other Conick Section, or Geometrical Curve) is a Right Line drawn, cutting the Ax produced, and touching the Section in one Point without cutting it.

In *Philos. Transact. N. 90*. there is an easie Method of *Slusius*, to draw Tangents to all Geometrical Curves without any Labour of Calculation: The Demonstration of which you have afterwards, *Hunts 95* communicated by the same Author, and is contained in these three *Lemmata*.

1. The Difference between any two Dignities, or Powers of the same Dimensions or Degrees divided by the Difference between the Roots of those Powers, gives several Parts or Members of the next inferior Powers, which may be formed from those two Roots, as from a Binomial, thus.

$$\frac{x \ x x - y \ y y}{x - y} = x \ x + x \ y + y \ y.$$

2. There are always so many several Members in any Degree or Power raised from a Binomial, as are the Unites in the Exponent of the Power next above it. Thus in the Square of a Binomial there are three Members, in the Cube, there are four, &c.

3. If any Quantity divide 2 others whose Ratio is given, the Quotients will be also reciprocally in the same given Ratio; or that the Quotients of any two Numbers, or Quantity, divided by one and the same Quantity, are as the Dividends.

This premised, Let there be any *Curve*, as D Q, whose Points are all referable to any Right Line given, as E A B, whether that Right Line be the Diameter, or not; or whether there be more given Right Lines than one, if their Powers do but come into the Equation, 'tis enough.

And in all his Equations he puts V always for the Line D A, y for B A; and for E B, and the other given Lines, he puts b, d, &c. i. e. always, Consonants.

Then supposing DC to be drawn touching the Curve in D, and meeting with EB, produced in C, he always calls the sought Line CA, by the Name of a .

To find which he gives this general Method.

RULE I.

He rejects out of the Equation all Members which have not either V or y with them; then he puts all those that have y on one side, and all those which have V on the other, with their Signs $+$ or $-$. And the latter for Distinction and ease-sake, he calls the *Right*, the former the *Left Side*.

RULE II.

On the Right Side, let there be prefix'd to each Member, the Exponent of the Power which u hath there: Or which is all one, Let that *Exponent* be multiplied into all the Members.

RULE III.

Let the same be done also on the Left Side, multiplying each Member there by the *Exponent* of the Power of y .

Adding this moreover, That one y must (in each Member) be always changed into a .

This done, I say, that the Equation thus reformed, will shew the Method of drawing the required Tangent to the Point D; and when that is given, as also y , u , and the other Quantities expressed by Consonants, a cannot be unknown.

Let there be this Equation $b y - y y = V V$, in which EB is b , BA is y , DA is V , and let a , or AC be required to find the Point C, from whence CD being drawn, shall be a true Tangent to that Curve QD, in D.

In this Example nothing is to be ejected out of the Equation, because y or V , are in each Member: 'Tis also so dispos'd as required by Rule 1. To each part therefore there must be prefix'd the Exponent of the Powers of y and V , as in Rule 2; and on the Left Side let one y be changed into a : And then the Equation will be in this Form, $b a - 2 y a = 2 V V$, which Equation reduced, gives easily the Value of $a = \frac{2 V V}{b - 2 y} = A C$. And so the Point C is found, from whence the Tangent DC may be drawn.

To determine which way the Tangent is to be drawn, whethertowards B or E, he directs to consider the Numerator and Denominator of the Fraction, which at last is found equal to a . For,

1. If in both Parts of the Fraction, either all the Signs are Affirmative, or if the Affirmative ones are more in Number, then the Tangent is to run towards B.

2. If the Affirmative Quantities are greater than the Negative in the Numerator, but equal to them in the Denominator, the Right Line drawn thro' D, and touching the Curve in that Point, will be parallel to AB: For in this Case, a is of an infinite Length.

3. If in both Parts of the Fraction, the Affirmative Quantities are less than the Negative, changing all the Signs, the Tangent must be drawn now also towards B: For this Case, after the Change, comes to be the same with the first.

4. If the Affirmative Quantities are greater than the Negative in the Denominator, but in the Numerator are less, or *vice versa*; then changing the Signs in that Part of the Fraction where they are less, the Tangent must be drawn a contrary way; i. e. AC must be taken towards E.

5. But whenever the Affirmative and Negative Quantities are equal in the Numerator, let them be how they will in the Denominator, a will vanish into nothing: And consequently either AD it self is the Tangent, or else EA; or at least, a Line Parallel to EA, as will easily be found by the Data.

This he gives plain Examples of, in Reference to the Circle, thus.

Let there be a Semi-circle, whose Diameter is EB, in which there is given any Point; as D, D, D, &c. from which the Perpendicular DA, is let fall to the Diameter.

Let DA = V , BA = y , BE = b : Then the Equation will be $b y - y y = V V$, and drawing the Tangent DC, AC or $a = \frac{2 V V}{b - 2 y}$

Now if b be greater than $2 y$, the Tangent must be drawn towards B, if less, towards E, if it be equal to it, it will be Parallel to EB, as was said in the 1st, 2d, and 4th Rules.

Let

Let there be another Semi-circle inverted; as, NDD; the Points of whose Periphery are referred to the Right Line BB, parallel and = to the Diameter.

Let NB be called d ; and all things else, as before; then the Equation will be $by - yy = dd + VV - 2dV$; which being managed according to his Rules, you have $a = \frac{2VV - 2dV}{b - 2y}$

Now since V here is supposed to be always less than d ; if b be greater than $2y$, then the Tangent must be drawn towards E; if equal, it will be parallel to BB; if less, changing all the Signs, the Tangent must be drawn towards B, as by Rule 4, 5, and 3. But there could be no Tangent drawn, or at least, EB would be it, if NB had been taken equal to the Diameter.

Let there be another Semi-circle, whose Diameter NB, is perpendicular to EB, and to which its Points are supposed to be referred.

Let NB be called b , and all things else as above; the Equation will be $yy = bV - VV$, and $a = \frac{bV - 2VV}{2y}$

If now b be greater than $2V$, the Tangent must be drawn towards B, if lesser, towards E, if equal, DA will be the Tangent; as by Rule 1, 4, and 5, appears.

N.B. In the *Alta Eruditorum* for December, 1682, there is an universal Method for drawing Tangents to all Curves, which is an Improvement of this.

TANGENT of a Circle in Geometry, is a Right Line, as TR drawn without the Circle, perpendicular to some Radius, as CR, and which touches the Circle but in one Point.

PROBLEM.

To draw from a Point given, as a , the true Tangent ae , to any given Circle, as cbe .

Join the Point a and the Center of the Circle, by drawing the Line ac . Then with the Radius ac on c , describe another Circle; erect a Perpendicular on b , which shall cut the latter Circle in d ; draw de , cutting the former Circle in e ; then ae being drawn, is the Tangent required.

Demonstration.

The Line ae is a true Tangent, because perpendicular to the Radius ce , and 'tis perpendicular to ce , because cea is a Right Angle; and cea is a Right Angle, because 'tis equal to cbd , (which was made so by Construction) and 'tis equal to cbd , because the Triangle cbb , is equal to the Triangle aoc , as having two Sides and one Angle equal: Wherefore the Angle cea , is equal to the Angle cbd , which is a Right Angle. Q. E. D.

Another very expeditious way of drawing a Tangent to a Circle, is this.

Let

Let the Circle be RNC , the Point of Contact N ; transfer the Radius NC , any where from N , downwards into the Position RC ; so that RN be equal to RC ; then with RC on the Center R , strike a Semicircle, and a Ruler laid from C thro' R , will find the Point T ; from whence TN being drawn, will be a true Tangent, because the Angle TNC being in a Semicircle, is a Right one.

PROPOSITION I.

If two Tangents be drawn to any Circle from a Point (a) without, these Tangents shall always be equal.

I say, $ad = ab$.

Demonstration.

The Triangle dbc being an Isosceles, the Angle $cbd = \text{Angle } cdb$; the Right Angles adc , and abc are also equal: Wherefore if from these right and equal Angles, you severally take the equal Angles cbd , and cdb , the Remainders abd , and adb , must be equal, and consequently the opposite Sides ad , and ab , to those Angles must be equal. *Q. E. D.*

PROP. II.

If a Tangent (aT) and a Secant (ad) be drawn from the same Point (a) without a Circle; the Tangent will be a mean Proportional between the whole Secant (aT) and the Part (ac) without the Circle.

Or, as Euclid expresses it.

The Square of the Tangent (aT) is equal to the Rectangle made by the whole Secant (ad) and the external Part (ac) That is, $aT^2 = ad \times ac$.

Draw cT , and Td .

Demonstration.

Then will the Triangles Tac , and Tad , be similar; for the Angle a is common to both, and $aTc = d$, because made by a Tangent aT , and a Secant cT . Therefore $ca : aT :: aT : ad$. That is, aT is a mean Proportional between ca , and ad ; and also $\square aT = \square dae$. *Q. E. D.*

COROLLARY I.

Hence may a Line be easily divided, according to extreme and mean Proportion; if from a Secant-wise to the Circle, you draw a Line so as that the Part within be equal in length to the Tangent. Thus, Let the prick'd Line be so drawn from a , that the Part within the Circle be equal to T . Then 'tis plain, if the Part without be called e , by this Proposition,

$$ee + eT = TT.$$

TANGIBLE Bodies, are such as are discoverable and sensible by our Feeling, or Touch.

TAPER-BORED, in Gunmery, a Piece of Ordnance is said to be Taper-bored, when it is wider at the Mouth, than towards the Breech.

TARAXIS, is a Perturbation of the Humours of the Eye, the Stomach, or the Entrails. *Blanchard.*

TARE and *Tret*, *Tare* is the Weight of Box, Straw, Cloths, &c. wherein Goods are packed.

The other, *viz.* *Tret*, is a Consideration allowed in the Weight for Waite, in emptying and reselling the Goods.

TARIF, (in *Arithmetic*) is either a small Table of the Divisor multiplied by the 9 Digits to expedite Multiplication; or else a Proportional Table contrived for the expediting a Question in the Rule of Fellowship, when the Stocks, Losses and Gains are very numerous.

TAR-PAWLING, in a Ship, is a piece of Canvas well Tar'd over, to lay on any Place to keep off Rain.

TARSUS, is a Cartilaginous Extremity of the Eye-lids, whence the Hairs spring, called *Cilium*. *Blanchard*.

TARSUS, is the space between the lower End of the two Focils, and the Beginning of the Five long Bones which sustain, and are articulated with the Toes: Some call this the *Instep*, but that is the *Metatarsus* rather.

The *Tarsus* hath seven Bones, which differ from one another very much in both Shape, and Bigness.

The first, is the *Talus* called also *Astragalus*; the *Ankle* or *Huckle-bone*: This Bone has above a convex Head with a shallow *Sinus* in it, articulating with the *Tibia*: By the Process of which *Tibia*, which makes the Inner Ankle, it is hedg'd in, as it were, on the inside, as it is by that of the *Fibula* on the outer; before, it hath a long Neck, on which grows a round Head, that enters into the *Sinus* of the *Os Naviculare*; on which jointing the Foot is moved side-ways: Its inner side is rough, and above hath a Transverse *Sinus* to receive the Ligament of the *Tibia*, and below there is a descending *Sinus*, by which the Tendons of the Muscles of the Foot pass: At the bottom of all there is a *Sinus* behind, and Protuberance before, by which it is articulated with the *Os Calcis* by a *Ginglymus*.

The second Bone of the *Tarsus*, is the *Os Calcis*, or *Calcaneum*, which see.

The third, is the *Os Scaphoides*, *Naviculare*, or *Cymbiforme*, which see.

The remaining Four stand all in one Rank, being less than the three former; and the first, articulates with the *Os Calcis*; the other three, with the *Os Naviculare*: There is no Cartilage between them, but they are knit together on the outside like a Cartilaginous Ligament. The first of these is called *Cubiforme*, having six almost equal sides, is the greatest of these Four, and is seated on the outside of the Foot. See *Cubiforme*. The other three are called *Ossa Cuneiformia*, from their Wedge-like Shape; for above they are thick, and below they are thin. See that *Word*.

TARTAR Emetick. See *Emetick Tartar*.

TARTAR Soluble. See *Soluble Tartar*.

TARTAR Vitriolate, is made by pouring Spirit of Vitriol on Oil of Tartar, *per Deliquium*, by little and little; and when the Effervescence is over, placing the Glass in the Sand, and evaporating the Moisture with a small Heat, that a very white Salt may remain at the Bottom. This is the Tartar Vitriolate; 'tis a good Apertitive, and a little Purgative Medicine, and works also by Urine: Dose from 10 to 30 Grains.

TAST; is probably caused by the Salts that are in Bodies; which, according to their various Configurations, affect the Tongues as variously; and tickling, or otherwise moving the Extremities of these small Nerves, which terminate in the *Papille* of the Tongue, communicate a pleasant or ungrateful Sensation to the Brain.

The Organ of Taste seems to be neither the Membranes, nor the Nerves of the Tongue, (properly speaking) nor the *Glandule Amygdalinae*; but those little Eminences, or *Papilla*, which are found on the Tongues of all Animals.

For First, those *Papilla* are found plentifully from the Root of the Tongue to the *Tip*; but none from thence to the *String*; or at least but very few.

Secondly, any *Salt*, or strong tasted Object, being placed on the Parts void of those *Papilla*, affects not the Taste at all.

Thirdly, In those *Papilla*, in the Tongues of Live Animals, may (by a Microscope) be discerned many small Holes supply'd at the Bottom by small Nerves, which communicate the Sensation to the Brain.

That various Tastes may be Mechanically produced, and that Sapours do depend on the Shape, Size, Motion, &c. of the small Saporifick Particles of the Saporous Body.

The Honourable Mr. Boyle, hath abundantly made out by Experiments and Observations, about the Mechanical Production of Tastes.

Dr. Grew, in his Lecture about the Diversities of Taste, read before the Royal Society, March 25th 1675. distinguishes Tastes into Simple and Compound.

By the former of which, he understands such as are Simple or Single Modes of Tastes, altho' mingled with others in the same; thus, the Taste of a Pepin, is *Acid-dulcis*; of Rhubarb, *Amara-stringent*, and therefore compounded in both; but yet in the Pepin the Acid is one Simple Taste, and the Sweet another; as distinct as the Bitter, and Astringent are in the Rhubarb.

Two Faults, saith the Doctor, have here been committed: The *Defective Enumeration of Simple Tastes*, and *Reckoning them Indistinctly among such as are compounded*.

Simple Tastes, (of which usually are reckoned not above six or seven Sorts) are, at least, *sixteen*.

1. *Bitter*, as in Wormwood, whose contrary is,
2. *Sweet*, as in Sugar.
3. *Sower*, as in Vinegar; whose contrary is,
4. *Salt*.
5. *Hot*, as in Cloves; to which is opposite,
6. *Cold*, as in *Sal Prunelle*; for we may as properly say, a *Cold Taste*, as an *Hot one*; since there are some Bodies which do manifestly impress the Sense of Cold upon the Tongue, tho' not to the Touch.
7. *Aromatick*; to which is contrary,
8. *Nauseous*, or malignant.
9. He thinks also, that Tastes may be distinguished into such as are *Soft*, which are either *Vapid*, as in Water, Starch, Whites of Eggs, &c. or *Unctuous*, as in Oils, Fat, &c.
10. Or such as are *Hard*.

Of which he reckons four Kinds. As,

1. *Penetrant*, which worketh it self into the Tongue, without any Pungency; as is found in the Root and Leaves of Wild Cucumber.

2. *Stupefacient*, as in the Root of black Hellebore; which being chewed, and for some Time retained upon the Tongue, affects the Tongue with a Numbness, or Paralytick Stupor.

3. *Astringent*, as in Galls. And,

4. *Pungent*, as in Spirit of *Sal Armoniack*, which two Tafts he makes contrary to the *Unctuous*; as *Penetrant*, and *Stupefacient*, are contrary to the *Vapid* one.

The compounded Tafts are very numerous, but we have Words to express but six of them. As,

1. *Austere*, which is *Astringent* and *Bitter*; as in the green and soft Stones of Grapes.

2. *Acerb*, properly so called, is *Astringent* and *Acid*; as in the Juice of unripe Grapes.

3. *Acrid*, which is Pungent and Hot.

4. *Muriatick*, is Salt and Pungent; as in common Salt.

5. *Lixivious*, which is Saltness joined with some Pungency and Heat.

6. *Nitrous*, which is Saltness, joined with Pungency and Cold.

TAUGHT, in the Sea Language is the same as setting a Rope stiff, or fast. They say, *Sett Taught the Shrouds*, to Stays, or any other Ropes which are too slack, and loose.

TAUNT, when the Masts of a Ship are too tall for her, they say she is *Taunt-masted*, or that her Masts are very *Taunt*.

TAURUS, is the second Sign of the *Zodiack*.

TAUTOLOGY, is a vain Repetition of Words, which serves only to lengthen out Discourse, and tire the Reader.

Tautological Echo's, are such as repeat the same Sound of Syllable many times; whereas those which repeat many Syllables or Words distinctly, are called *Poly syllabical Echo's*.

TAW: The Heralds have an Ordinary which they reckon among the Crosses, called by this Name, and of this Figure.

TECHNICAL, is sometimes the same with *Artificial*, and expresses whatever relates to the Arts and Sciences, as the *Term*, *Rules*, &c. So that the Terms of Art are commonly called *Technical Words*.

TEETH. The Teeth are called in *Latine*, *Dentes*, quasi *Edentes*, from their Office of eating, or chewing. They are fixed in their *Alveoli*, three manner of Ways.

The first and chief is by their Articulation with the Jaw-bones, by *Gomphosis*.

The second is, by the Nerve which is inserted into their Root by *Syneurosis*.

And the last is, by the Gums, which cleave to the outside of their Roots by *Syssarcosis*.

Their *Substance* is the hardest of all other Bones, but more especially that Part of them that stands out naked above the Gums. This Part, *Dr. Harvey* thinks ought to be esteemed rather stony than bony, and yet not the whole of it neither, but only the outside, or *cortex*, which like a Shell covers the Bony; which being broken off, or decayed, the Bony quickly rots, and moulders away: Upon which account it is, that when the Gums are eaten away, so that some part of the Tooth, which is not defended with this stony *cortex*, is laid bare, it is eroded; when that Part that naturally stands out of the Gums, and is by such a solid Substance secured, suffers no such Injury; the stony Part is not covered with any *Periosteum*, but that Part which is within the Sockets of the Jaw-bones, is invested with a thin Membrane; which, he says, is not the true *Periosteum*, (though that invests the Socket wherein they stand) but is propagated from that Membrane that covers the Gums, and is common to the whole Mouth, which does not terminate with the Gums, but when it comes to their extreme Edge, turns in, and is reflected between the other side of the Gum, and the Tooth, descending into the *Alveolus*, or Socket, and adhering on one side, immediately to those Parts of the Teeth which lie within; and on the other, to the hard fleshy Substance of the Gums, which with this, is communicated to the Roots of some Teeth (especially in the upper Jaw) to fasten them more firmly in their Sockets; and where none of this hard Flesh intervenes, it coalesces, as it were, into one Membrane with the *Periosteum*, that covers the inside of the Socket. By this Membrane, and the Nerve inserted into the Root of every Tooth, these lower Parts of the Teeth become exquisitely Sensible.

The Grinders have a manifest *Cavity* within (but the *Incisores* and *Canini*, but an obscure one) whereinto by the very small Holes of their Roots, they each receive a Capillary Artery from the *Carotides*, a Vein from the Jugulars, and a Twig of a Nerve from the fifth Pair. The Vein, Artery, and Nerve are united together, and clad with a common Membrane when they enter the Jaw, within which they have a proper Channel to run along in, under the Roots of the Teeth, sending Twigs to each, as they pass under them.

The Rudiments, or *Principles* of the Teeth, are bred with the other Parts of the Womb, but lie hid for some Months within the Jaws and Gums: These Principles are partly Bony, and partly Mucous, and both Parts are at first included in a Membranous, and somewhat Mucous *Folliculus*, or Case, which in Process of Time they break through (some sooner, other later) their Bony Part ascending upwards out of the Gums; and their Mucous Part (hardening by degrees) descending downwards into the Jaw so far as there is space for it; the *Folliculus* it self turning to a kind of Cement, whereby the Tooth is fastened to the sides of the *Alveolus*.

At what time, and at what order, they break forth out of the *Alveoli*, is known to every Nurse: Omitting therefore to speak of that, I shall only Note, That the Teeth alone, of all the Bones in the Body, continue to grow so long as a Man Lives (and they continue in his Head) for else they would be soon worn to the Scrumps by their daily Use; and we see that when a Tooth is lost out of either Jaw (in the oldest People) that which

is opposite to it in the other Jaw, will commonly grow longer than the rest, having none to grind against: Though it must be confest, that the seeming length of old Peoples Teeth, is more owing to the falling away of their Gums, than the growth of their Teeth.

When Children come to be seven or eight Years old, they change several of their Teeth; but very rarely, if ever, all. The *Incisors*, or Fore-teeth; the *Canine*, or Eye-teeth; and the foremost Double-teeth most change; but the rest of the Double-teeth very few. Now concerning this changing of the Teeth, we must know, that the Old ones do not come out by their Roots, but their upper Part only drops off, their Roots remaining still in the Socket of the Jaw; which (being like Seed for the new ones) by degrees grows up above the Gums, to supply the Place of that which is fallen off. Commonly about the twentieth Year (or upwards) there spring out two Double-teeth behind the rest, which till then, had lain hid in their Sockets. These are called *Genuine Teeth*, or *Dentes Sapientie*; because Men are then come to Years of Discretion.

As for the Number of them, commonly there are found sixteen in each Jaw; if there fall out any difference in Number, as to individual Persons, it generally falleth out in the *Molares*.

There are three Ranks, or Sorts of Teeth.

Those of the *first* Rank (for the foremost) are called *Incisors*, Cutters. Most commonly four are found in each Jaw; they have but one Root, or Fang; and so easily fall, or are pulled out. These first make way out of the Gums in Children, because the Tops of them are sharpest.

Those of the *second* Rank, are called *Canini*, or Dog-teeth, from their length, hardness, and sharpness above the rest: In each Jaw there are two; at each side of the Cutters, one. They are otherwise called *Eye-teeth*, either from an Opinion that their Roots (*viz.* of the upper) reach as far as the Eyes, or that the same Nerve that moves the Eye, sends a Twig to these Teeth; neither of which Concepts are true: The Roots of these are single, as those of the *Incisors*, but they are both sometimes crooked; and if such People in whom they are so, chance to have one of them drawn, they can hardly be pulled out, without breaking off a Piece of the *Alveolus*, in which they are fix'd.

Those of the *third* Rank, are called *Molares*, Grinders, because, like Mill-stones, they grind the Meat. Most commonly they are twenty in Number, five in each side of both Jaws. The two foremost that stand next to the Dog-teeth, are less than the rest, having but two Knobs at the Top; but the three hindmost are larger, and have four, being in a manner Four-square.

The two foremost also, have but two Roots at most; but the three hindmost commonly three or four. But those of the upper Jaw, have for the most part, one Root more than those which are opposite to them in the lower; or however their Roots are larger.

The Reason whereof may be,

First, Because they are Pendulous, and so are the apter to drop out: And,

Secondly, Because the Substance of the upper Jaw is not so firm, as that of the lower.

The Use of the Teeth, is principally to chew the Meat, to prepare it for the Stomach, that it may the easier concoct it into Chyle. The *Incisors* bite of the Morfel, the Dog-teeth break it, and the Grinders make it small; wherefore they are flat in the Top, that they may the better receive and keep the Meat; and rough, that they may grind it the better. The Teeth contributes also to the Formation of the Speech, especially the Fore-teeth; for those that have lost them, Lisp, as we say, and cannot pronounce plainly such Syllables as have C, X, &c.

TEINT, is a French Term in Painting, signifying that Artificial Colour, of which any Object is compos'd.

TELEPHIUM, is the same Ulcer with *Chironia*, (which see;) it is so called from one *Telephus*, who was a long time troubled with this Disease. *Blanchard.*

TELESCOPE, is an *Optick* Instrument which serves to discover Objects at a Distance.

If a Telescope consists only of a Convex Object-glass and an Eye-glass of a much greater Convexity, (or which is a Portion of a much lesser Sphere) than the Object-glass is, (which is the common Form of the Telescope for the Night.) Then will the apparent Magnitude of the Object seen through it, be to the Object seen by the naked Eye at the Station of the Object-glass: as the Focal Length of the Object-glass, to the Focal Length of the Eye-glass. *Molineux Dioptr. Nov. Prop. LXII.* Thus,

Suppose the Focal Length of the Object-glass be 12 Foot, or 144 Inches, and that of the Eye-glass 3 Inches; then the apparent Diameter of the Object seen through the Glass, to that seen by the naked Eye, will be as :: 144 to 3, or as 48 to 1. Wherefore such a Telescope will be said to magnifie the Diameter of the Object 48 times, and its Surface 2344 times (*i. e.* the Square of 48.)

Wherefore if the same Object-glass be combin'd with an Eye-glass, whose Focus is 1: and at another time with an Eye-glass whose Focus is 2. the former Telescope will magnifie twice as much as the latter.

Also, if two Telescopes have different Lengths, and the Focus of the Eye-glass of the *Shorter* be in the same Proportion to the Focus of its Object-glass: as the Focus of the Eye-glass of the *Longer* bears to its Object-glass; then those two Telescopes will magnifie alike.

But yet long Telescopes are of very great Use, and 'tis impossible to make short ones perform as well: For,

1. Object-glasses of a shorter Focus, will not bear Eye-glasses proportionally short, without colouring the Object, or rendering it dark and obscure.

For Instance: Suppose a very good 12 Foot Object-glass will receive an Eye-glass of no shorter Focus than 3 Inches, with clearness and distinctness; yet however an Object-glass of 24 Foot, equally good, will bear an Eye-glass of less than 6 Inches Focus (perhaps of 5 or 4 Inches Focus) with equal clearness and distinctness.

And then, tho' an Object-glass of 12 Foot, with an Eye-glass of 3 Inches will magnifie but 48 times, as is above proved; yet an Object-glass of 24 Foot, with an Eye-glass of 4 Inches, will magnifie

nise 72 times; which is nearer one third more than the former; and this is a vast Advantage.

2. The Image of the Moon, or other Object, in the distinct Base of an Object-glass of 24 Foot, is twice as long as the Image of the distinct Base of an Object-glass of 12 Foot: And consequently the Image in the former will be much more plain and distinct.

Hence may be concluded also, That if the Object-glass be formed on a less Sphere than the Eye-glass, the Appearance of Objects will be diminished in the aforesaid Proportion; as is plain by the Case, when a Telescope is inverted.

Therefore all Persons which relate Phenomena, observed by their Telescopes, or Microscopes, ought to mention not only the Length of the Tube in general, but also to express the particular Focus of both Eye-glass and Object-glass, together with the Aperture of the Object-glass; or else one cannot well judge of the Degree of magnifying.

To determine the Angle received by a Telescope of this Form, Mr. Molineux gives this Rule.

As the Distance between Object and Eye-glass, is to half the Breadth of the Eye-glass :: Radius to the Tangent of the Angle.

If a Telescope consist of a Convex Object-glass, and 3 Convex Eye-glasses, (which is the usual Form of Telescopes to be used by Day:) Then the Distance between the first Eye-glass and the second, must be the Sum of their Foci; the Distance between the second and third Eye-glasses, must be also the Sum of their Foci; so that all the Glasses are distant from the next adjacent Glasses the Sum of their Foci; only indeed there may be some little Variety in the Distance between the first and second Eye-glass; which is the Reason there is a Draw always made there, to alter it at pleasure.

This Telescope is only a double one of the former Sort, and as the former Inverts the Objects, this Inverts that Inversion, by the Addition of two more Glasses, and consequently represent all things Right, or makes them appear Erect.

Telescopes may be made with Concave Eye-glasses, but then the Area of the Object will be proportioned always to the Breadth of the Pupil of the Eye of the Beholder; whereas in a Convex Eye-glass, 'tis determin'd by the Breadth of that Glass.

The practical Rule for combining, or putting together this Day-Telescope of Four Glasses, is this:

Take the two first Eye-glasses, and combine them by Trials, so as to make a distinct inverted Telescope, consisting of a Convex-object-glass, and a Convex Eye-glass of a less Sphere.

Then take the Object-glass, and first Eye-glass, and combine them by Trials also.

Lastly, Take both these Telescopes, and without altering the Distances of their Glasses, in either of them singly; by Trials combine both these Telescopes, till the Appearance be clear and distinct.

But what is here done by Trials, may be effected by actual Mensuration, or designing out the Distances of the Glasses from each other, by knowing their Focal Distances.

TELESCOPE Aerial, so Mr. Ch. Hugen calls a Telescope, (described in *Phil. Transf.* Numb. 161.) which was made for the Night, and to be used without a close Tube, (because there is no need of one in a dark Night) and by that means a long Telescope becomes much lightened; and more easily manageable.

TELESCOPE Reflecting, of Sir Isaac Newton, is made thus: The Tube of it, which is large, is open at the end, which respects the Object; the other end is close, where a concave metalline *Speculum* is laid; and near the open end, there is a flat oval *Speculum* made as small as may be, the less to obstruct the entrance of the Rays of Light into the Tube by it, and inclined towards the upper part of the Tube, where is a little Hole furnished with a small *Plane Convex* Eye-glass: So that the Rays coming from the Object, do first fall upon the Concave placed at the bottom of the Tube, and are thence reflected to the upper end of it, where they meet with the flat *Speculum* obliquely posited, by the Reflection of which they are directed to the little *Plano-convex* Glass, and so to the Spectators Eye, who looking downwards, sees the Object which the Telescope is turned to. This Instrument is described more at large in *Philos. Transf.* N. 81.

After this first Essay, the learned Inventor made another Instrument of the same Nature, with which he saith, that he could read in the *Philosophical Transactions* opened in the Sun-shine, at an hundred Foot distance, and discern some of the Words at the distance of 120; its Aperture (define next the Eye) was then equal to above an Inch and $\frac{1}{2}$ of the Object Metal.

The Advantages of this Telescope would be very great, if it could be brought to its desired Perfection. But it is liable to two Inconveniences. First, That 'tis not very easie by it to find the Object you would see; though this a little Use and Practice would obviate; at least, placing a small Prospect-Glass on the outside parallel to the Axis of the Caviry of the Catoptrick Tube, you might readily enough find the Object by that, and then the Tube it self would be right. The 2d and much greater Inconvenience is the concave metalline Object *Speculum* being subject to Tarnish, so that it will not continue long good. But if any Person could be so happy as to find out a good metalline mixture that would polish finely, reflect vividly, and hold without rusting or tarnishing, it would be a Discovery of very great Advantage, both to Telescopical and Microscopical Improvements.

TELESCOPICAL-Stars, are those that are not visible to the naked Eye, but discoverable only by the Help of a Telescope.

TEMPERATE Zone.

TEMPORALIS, also *Crotaphites*, is a Muscle of the upper Jaw, which has a large Semicircular fleshy beginning, from part of the *Os Frontis*, *Sincipitis*, *Sphenoides*, and *Temporalis*; from these Places its Fibres pass (like Lines drawn from a Circumference to a Center) under the *Os Jugale*, from whence also arise some fleshy Fibres joining with the former at their united, partly tendinous, and partly fleshy Insertion, to the upper part of the *Processus Corone* of the lower Jaw: This, with its Partner, draws the lower Jaw upwards.

TEMPORARUM Ossæ, are Bones of the Scull situated in the lower part of the sides of the *Cranium*; their upper part, which is thin, consisting only of

one Table, is of a circular Figure, and is joined to the *Ossa Parietalia* by the *Sutura Squamosa*; their lower part, which is thick, hard, and unequal, is joined to the *Oss Occipitis*, and to the *Oss Sphæroides*, this part is called *Oss Petrosum*; they have each three external *Apophyses* or *Processes*, viz. *Processus Zygomaticus*, *Mammillaris* or *Mastoidæus*, and the *Processus Styloformis*, and one Internal. In the temporal Bones, there are 2 Internal, and 4 External Holes. The first of the Internal, is the Hole thro' which the Auditory Nerve passes; the second is common to it and the *Oss Occipitis*; the 8th pair of Nerves, and the lateral *Sinus* passes through it. The first of the External, is the *Meatus Auditorius Externus*; the second is opened behind the Palate, it is the end of that Passage which comes from the Barrel of the Ear to the Mouth. The 3d is the Orifice of the Conduit, by which the Carotid Arteries enter the *Cranium*; and the fourth is behind the *Processus Mastoidæus*; by it passes a Vein which carries the Blood from the external Teguments to the lateral *Sinus*; sometimes this Hole is wanting; there is another which is between the *Processus Mastoidæus*, and the *Styloformis*, thro' which the *Portio dura* of the Auditory Nerve Passes. They have each a *Sinus* lin'd with a Cartilage under the *Meatus Auditorius*, which receives the condyle of the lower Jaw.

TEMPORARY Fortification. See *Fortification*.

TENAILLE, in Fortification, is a kind of Out-work resembling a *Horn-work*, but generally somewhat different, in regard that instead of two Demibastions, it bears only in Front a Re-entring Angle between the same Wings without Flanks; and the Sides are parallel: But when there is more breadth at the Head than at the Gorge, these *Tenailles* are called *Queue d'Yrlande*.

TENAILLE Double or Flank'd, is a Work whose Front consists of four Faces, making two Re-entring Angles, and three *Saliant*; the Wings or Sides of this Work being in the like manner correspondent to the Front of the Gorge.

TENAILLE Simple, is a Work having its Front form'd by two Faces, which make a Re-entring Angle, the Sides running directly parallel from the Head to the Gorge.

TENAILLE of the Place, is that which is comprehended between the Points of two neighbouring Bastions; that is to say, the *Curtain*; the two *Flanks* that are rais'd on the Curtain, and the two Sides of the *Bastions* which face one another: So that 'tis the same with what is otherwise called, *The Face of a Fortrefs*.

All *Tenailles* are defective in this respect, That they are not Flanked or Defended towards their inward or dead Angle; because the height of the Parapet hinders seeing down before the Angle, so that the Enemy can lodge himself there under Cover: Wherefore *Tenailles* are never made but when they want time to make a *Horn-work*.

TENANT, or *Tenant*, is one that holds or possesses Lands or Tenements by any kind of Right, either in Fee for Life, Years, or at Will. And 'tis used in Law, with divers Additions, as *Tenants in Dower*, which is she that possesses Land by Virtue of her Dower.

Tenant per Statute-Merchant, that holds Land by Virtue of a Statute forfeited by him.

Tenant in Frank-Marriage, is he that holds Lands or Tenements by Virtue of a Gift thereof

made to him upon Marriage between him and his Wife.

Tenant by the Courtessie, that holds for his Life, by reason of a Child begotten by him of his Wife, being an Inheretrix, and born alive.

Tenant by Elegit, that holds by Virtue of the Writ called an *Elegit*.

Tenant in Mortgage, that holds by means of a Mortgage.

Tenant by the Verge, in ancient Demesne, is he that is admitted by the Rod in the Court of ancient Demesne.

Tenant by Copy of Court-Roll, is one admitted Tenant of any Lands, &c. within a Manor, which Time out of Mind, have been demisable, according to the Custom of the Manor.

Tenant by Charter, is he that holdeth by Feoffment in Writing, or other Deed.

Tenant in Chief, that holdeth of the King in Right of his Crown.

Tenant of the King, is he that holds of the Person of the King, or as to some Honour.

Very Tenant, that holds immediately of his Lord: For if there be Lord, *Mesne* and *Tenement*, the *Tenant* is *very Tenant* of the *Mesne*, but not to the Lord above.

Joint-Tenants, that have equal Right in Lands and Tenements, by Virtue of one Title.

Tenants in Common, that have equal Right, but hold by divers Titles.

Particular Tenant, that holds only for this Term.

Sole Tenant, is he that hath no other joined with him.

Several Tenant, is opposite to *Joint-Tenants*, or *Tenant in common*.

Tenant al Præcipe, is he against whom the Writ *Præcipe* is to be brought.

Tenant in Demesne, is he that holdeth the Demesne of a Manor for a Rent without Service.

Tenant in Service, is he that holdeth by Service.

Tenant by Execution, is he that holds by Virtue of an Execution upon any Statute, Recognisance, &c.

There was also, *Tenant by Knight-Service*, *Tenant in Burgage*, *Tenant in Socage*, *Tenant in Frank-fee*, *Tenant in Villenage*. And there is *Tenant in Fee-simple*, *Tenant in Fee-tail*, *Tenant upon Suffurance*, &c.

TENAR, (the same with the *Abductor Pollicis*) is with some, the Name of the Muscle which serves to draw the Thumb from the Fingers.

TENASMUS. See *Tenismus*.

TENDER, in a legal Sense, signifies as much as carefully to offer, or circumspectly endeavour the Performance of any thing belonging to us. As to *tender Rents*, is to offer it at the Time and Place where and when it ought to be paid. To *tender his Law of Summons*, is to offer himself ready to make his Law, whereby to prove that he was not Summoned.

TENDON, is a similar nervous Part annexed to Muscles and Bones, whereby the voluntary Motion of the Members is chiefly performed. The Generality of Surgeons scarce ever distinguish betwixt a *Tendon* and a Nerve.

TENEMENT, signifies the House or Land that a Man holdeth of another, and when join'd with *Frank*, it contains Lands, Houses and Offices, where-

wherein we have Estate for Term of Life, or in Fee.

TENEMENTIS *Legatis*, is a Writ that lies to London, or any other Corporation, (where the Custom is, That Men may demise Tenements as well as Goods and Chattels by their last Will) for the Hearing any Controversie touching the same, and for rectifying the Wrong.

TENENTIBUS *in assis non onerandis*, &c. is a Writ that lieth for him to whom a Disseisor hath alienated the Land whereof he disseiseth another, that he be not molested for the Damages awarded, if the Disseisor have wherewith to satisfy them himself.

TENESMUS, *Tenasmus*, is a continual Desire of going to Stool, yet attended with an Inability of doing any thing, but sometimes voiding of bloody and slimy Matter. *Blanchard*.

TEN-FOOT Rod. See *Station-Staff*.

TENNY, or *Tawny*, the Herald's Term for a bright Colour made of Red and Yellow mixed; and is expressed in Engraving by thwart Strokes or Hatches like *Purple* in the Coats of all below the Degree of Noble, 'tis called *Tenn*, but in those of Nobles 'tis called *Hyacinth*, and in Princes Coats by the Name of the *Dragon's Head*.

TENOR, is the Name of the first Mean or middle Part in Music.

TENORE *indictamenti mittendo*, is a Writ whereby the Record of an Indictment and the Process thereupon is called out of another Court into the *Chancery*.

TENSORS, or *Extensors*, are those common Muscles that serve to extend the Toes, and have their Tendons inserted into all the lesser Toes.

TENTHS, is that yearly Portion or Tribute which all Ecclesiastical Livings pay to the King.

TENURE, a Term in Law, signifying the manner whereby Tenements are holden of their Lords; what may make a *Tenure*, and what not. See *Perrkins Cap. 10. Reservation 70*, where you'll find most of those *Tenures* that are now used in *England*.

TEREBRUM. See *Mediolus*.

TERES Major, is a Muscle which arises from the inferior Angle of the *Scapula*, and becoming a round fleshy Body, ascends obliquely with the former, but then passeth under the superior Head of the *Gemellus*, and makes a short flat Tendon, inserted below the Neck of the *Os Humeri*, close to that of the Muscle called *Aniscaptor* or *Latissimus Dorsi*.

TERES Minor, is a Muscle of the Arm, so called from its Figure and Magnitude; to distinguish it from the *Terres Major*.

This Muscle is in some Bodies confounded with the *Infraspinatus*, but in others it is distinct. It arises fleshy from the lower Part of the inferior Costa of the *Scapula*, and descends obliquely over the superior Head of the *Gemellus Major*, where becoming tendinous, it is inserted to the Head of the *Os Humeri*: When this acteth, the Arm is moved backwards and downwards.

TERGIFOETOUS Plants, such Herbs (as the *Capillaries*) as bear their Seeds on the back sides of their Leaves, are for that reason called by some Botanists *Tergifetae*.

TERM, in Geometry, is sometimes taken for the Bounds and Limits of any thing; as a Point is the Term of a Line, a Line of a Superficies, and a

Superficies of a Solid: And this is what the Schools call *Terminus Quantitatis*.

TERM, in Law, signifies the Bounds and Limitation of Time, as a Lease for Term of Life or Years. But 'tis most commonly used for that Time wherein the Tribunals or Places for Judgment are open to all that think fit to complain of Wrong, or to seek their own by due Course of Law, or Action; the rest of the Year is called *Vocation*.

Of these Terms there be Four in every Year, during which Time Matters of Justice are dispatched.

One is called *Hillary Term*, which begins the 23d Day of January, or if that be Sunday, then the next Day after, and endeth the 12th of February following.

The Second is *Easter Term*, which begins the Wednesday Fortnight after *Easter-day*, and ends the Monday next after *Ascension-day*.

The Third is *Trinity Term*, beginning the Friday next after *Trinity-Sunday*, and ending the Wednesday Fortnight after.

The Fourth is *Michaelmas Term*, which begins the 23d of October, unless it be Sunday, and then the Day after, and ends the 28th of November following.

TERMINTHUS, is a Swelling in the Thighs, with a black Pimple at the top as big as the Fruit of the Turpentine-Tree. *Blanchard*.

TERMS of an Equation in Algebra, are the several Names or Members of which it is composed, and such as have the same unknown Letter, but in different Powers or Degrees. For if the same unknown Letter be found in several Members in the same Degree or Power, they all pass but for one Term.

Thus in this Equation $aa + ab = R$, the three Terms are, aa , ab and R .

And in this, $aa + ab + ac = R d + d c$; the Terms are aa , $ab + ac$, and $R d + d c$; which are but 3, because $ab + ac$, having a in the same Dimensions in both Parts, is taken but for one Term. Hence the first

Term in any Equation must be that, where the unknown Root hath the highest Dimensions; and that Term which hath the Root in it of one Dimension of Power lower, is called the *second Term*, and so on.

Des Cartes shews a Method of taking away the second Term of any Equation, and the Method is very well known, and in common Use. But there is one D. T. mentioned in the *Acta Eruditorum*, May 1683, which gives a general Analytical Method for taking away all the intermediate Terms of an Equation; which (he saith) was never done before, and was thought Impossible by many.

TERMS of Proportion, in Mathematicks, are such Numbers, Letters or Quantities, as are compared one with another.

Thus if $4.8::6.12$ then a, b, c, d ; or $4, 8, 6, 12$, are called the Terms; of which a is called the first Term, b the second Term, &c. a and c are called the two Antecedents, and b and d the two Consequents.

TERRA *Damnata*. See *Earth*.

TERRA *extendenda*, is a Writ directed to the Escheator, &c. willing to enquire and find out the true Yearly Value of any Land, &c. by the Oath of Twelve Men, and to certify the extent into the *Chancery*, &c.

TERRA

TERRAQUEOUS, in Geography, signifies the Globe of Earth and Water, as they both together constitute one Spherical Body.

TERRE-PLAIN, in Fortification, is the Platform or Horizontal Surface of the Rampart lying level, only with a little slope on the outside for the Recoil of the Cannon.

It is terminated by the Parapet on that Side toward the Field, and by the *Inner Talus* on the other toward the Body of the Place.

TERRE-Tenant, is he who has the actual Possession of the Land, which otherwise is called *Occupation*.

Thus a Lord of a Manor hath a Free-holder, who letteth out his Free-hold to another to be Occupied.

This Occupier (having the actual Possession) is called the *Terre-Tenant*.

TERELLA: When a Loadstone is turned into an exact Spherical Figure, and is placed so that its Poles and Equator, &c. do exactly correspond to the Poles and Equator of the World; it is called by *Gilbert pureszyn*, or *Terrella*, a little Earth; because it is a very just Representation of the Great Magnetical Globe which we inhabit.

It was believed that such a Terrella as this, if nicely poised and placed in a Meridian, like a Globe, would be turned round in 24 Hours, as the Earth is by the Magnetick Particles that pervade it; but this by plain Experience is to be found a Mistake.

TERRESTRIAL Globe. See *Globe*.

TERRESTRIAL Line. See *Line Terrestrial*.

TERRIS, *bonis & cattallis rehabendis post purgationem*, is a Writ that lies for a Clerk, to recover his Lands, Goods or Chattels, formerly seized, after he hath cleared himself of that Felony, upon Suspicion whereof he was formerly Convicted, and delivered to his Ordinary to be purged.

TERRIS & cattallis tentis ultra debitum levatum, is a Writ Judicial, for the restoring of Lands or Goods to a Debtor that is Distrained above the Quantity of a Debt.

TERRIS Liberandis, is a Writ that lies for a Man Convicted by Attaint, to bring the Record and Process before the King, and to take a Fine for his Imprisonment, to deliver him his Lands and Tenements again, and to release him of the *Strip* and *Waste*.

It is also a Writ for the Delivery of Lands to the Heir after Homage and Relief performed, or upon Security taken, that he shall perform them.

TERSION, is Wiping or Cleansing the outside of any Body.

TERSOR. See *Latissimus Dorsi*.

TERTIAN *Ague*, or Fever, is that which intermits intirely, and then returns again every third Day inclusively.

TERTIATE: To Tertiate a Great Gun, is to know the thickness of the Metal at the Touch-hole, the Trunnions, and at the Muzzle; by which to judge of the Strength of a Gun, or whether it be well *Fortified* or not. This is usually done with a Pair of Calliper Compasses; and if the Piece be *Home-bored*, the Diameter less by the height divided by 2 is the Thickness at any Place.

TEST, the same as the *Cuppel*, or Coppel, an Instrument used by Chymists and Refiners, to purifie Gold or Silver. See *Cuppel*.

TESTACEOUS *Fishes*, are such whose strong and thick Shells are entire and all of one piece; as the Oyster, Escollop, Cockle, &c. But those whose Shells are softer and thinner, and which are divided into distinct Joints, and composed of several Pieces, such as Lobsters, Crawfish, Crabs, &c. are called *Crustaceous Fishes*.

TESTAMENT, is the Last Will or Declaration of the Mind of a Person deceased; and is of two kinds, *viz.* A *Testament in Writing*, and A *Testament in Words*, which is called a *Nuncupative Testament*; which is, when a Man being Sick, and for fear lest Death, want of Memory, or Speech, should come so suddenly upon him, that he should be prevented if he stay'd the Writing of his *Testament*, desires his Neighbours and Friends to be Witnesses of his Last Will, and then declares the same before them by Words, which after his Decease, is proved by Witnesses, and put in Writing by the Ordinary, and then stands in as good Force as if it had at the first, in the Life of the Testator, been put in Writing, except only for Lands, which are devisable but by a *Testament* put in Writing in the Life of the Testator.

TESTATUM, is a Writ in Personal Actions, as if the Defendant cannot be arrested upon a *Capias* in the County where the Action is laid, but is returned *non est inventus* by the Sheriff.

The Writ shall be sent into any other County, where such Person is thought to have wherewith to satisfy; and is called a *Testatum*, because the Sheriff hath formerly testified, That the Defendant was not to be found in his Bayliwick.

TESTE, is a Word commonly used in the last Part of every Writ, wherein the Date is contained, which begins with these Words, *Teste meipso*, &c.

TESTES; the Testicles of a Male are justly reckoned among the principal Parts, because they are necessary to the Conservation of the *Species*.

But before I proceed to an Anatomical Description of them, 'tis necessary to say something of the *Vasa Preparatoria*, which prepare the Matter out of which the *Semen* in the Testicles is elaborated; as I shall afterwards describe the *Vasa Deferentia*, that so the Reader may have this great and wonderful *Apparatus* all before him at one View.

In Man, some of the *Vasa Preparatoria* afford Matter for the *Semen*, as the *Arteriae Spermaticae*; others bring back again the Blood that is superfluous, to the making of the *Semen*, and to the Nourishment of the Testicles; and these are the *Venae Spermaticae*; and both these Arteries and Veins were formerly called *Vasa Preparatoria*: Some make the *Semen*, as the Testicles; some convey it from thence to its Conservatory or Store-house, as the *Vasa Deferentia*: Some contain the *Semen* till the time of Copulation, and these are the *Vesiculae Seminales*: Some discharge the *Semen* into the Matrix in Coition; this is done by the *Penis*; and some, lastly, moisten the Passage (*viz.* the *Urethra*) whereby the *Semen* issues, and those are the *Prostrates*. Of all which in Order. And first of the

Vasa Preparatoria, which are said to prepare Matter for the *Semen*, these are of two sorts, *Arteries* and *Veins*.

The *Arteries* are two, and spring from the Trunk of the *Aorta*, commonly two Fingers breadth under the Emulgents, not from its Side, but out of its Fore-part, the right whereof climbing over the Trunk

Trunk of the *Vena Cava*, runs obliquely to the Vein of that same Side; as also the left, marches to the Vein of that Side.

The *Veins* are also two. The right arises usually from the Trunk of the *Vena Cava*, a little below the Emulgent; the left from the Emulgent itself, for otherwise it must have gone over the *Aorta*, whereby it might have been in Danger of breaking; or rather, by the continual Pulse of the Artery, the Recourse of the Venal Blood might have been retarded.

Now both these Veins and Arteries, a little after their rise, meet, and are invested both in one Membrane, made of the *Peritoneum*, and then run straight through the Region of the Loins above the Muscles *Psoæ* on each side, and above the *Ureters*, as they go, bestowing little Slips here and there upon the *Peritoneum*, between whose Duplication they descend, and so arrive at its Processes. The Veins divide very often into many Branches, and by and by inosculate and unite again; but the Arteries go along by one Pipe only on each side, until within 3 or 4 Fingers breadth of the Testicles, where each is divided into two Branches, the less whereof runs to the *Epididymis*, the larger to the Testicle; and as I said, they descended between the Membranes of the *Peritoneum*, so they pass into the *Scrotum* between them, not perforating the inner in the Processes, as in Dogs and other Creatures, wherein the Processes of the *Peritoneum* are hollow like a Quill; but in Man, the inner Membrane of the *Peritoneum* shuts the Hole, lest the Intestines fall by it into the *Scrotum*; of which there is greater danger in him, (and we see it often happen) because of his going upright. But to return to the *Vasa Preparatoria*.

It has been generally taught, That there are divers Inosculations of the Arteries with the Veins in their Passage, whereby the Venal and Arterial Blood are mixed; but this Opinion is now exploded, for that granting the Circulation of the Blood, it is impossible: For the Blood in the Arteries descends towards the Testicles, and that in the Veins ascends from them, so that if these two Vessels should open one into the other, the Blood in one of them must needs be driven back, or else stagnating, distend and break the Vessels. But the Truth is, the Blood both for Nourishment of the Testicles, and the making of the *Semen*, flows down by the Arteries only, and that in an even undivided Course, without any of those Windings and Twirlings like the Tendrels of Veins talk'd so much of (as the Curious *de Graaf*, from his own frequent Inspection, testifies) and the Veins bring back from the Testicles what of the Blood remains from their Nourishment and making of the *Semen*; and these, indeed, come out of their inmost Membrane, by almost innumerable Roots, by which they imbibe the said Blood, and are most admirably interwoven and inosculated one with another, till about Four or Five Fingers breadth above the Testicle; which Space is called *Corpus Pyramidale*, *Plexus Pampiniformis*, or *Varicosus*.

But these Veins are so far from preparing the *Semen*, as that they only bring back what was superfluous from the making of it. And, indeed, the Arteries in Men, do no more merit the Name of *Preparatories*, in respect to the *Semen*, than the Gullet in respect to the Chyle, or the *Ductus Thoracicus Chyliferus* in regard to the Blood; for their

Blood acquires no sensible Alteration till it come to the Testicles themselves. But however, we continue the old Names, declaring only against the Reason of them. And we will only note two things more.

First, That the Spermatick Veins have from their rise to their End, several *Valves* which open upwards, and so suffer the Blood to ascend towards the *Cava*, but not to slide back again.

2dly, That tho' the Spermatick Arteries go such a direct Course in Men, as has been said; yet in Brutes they are more complicated and twitted with the Veins, but without any *Anastomoses* of one into the other.

These *Vasa Preparatoria* thus described, proceed we to the *Testes*.

These have Arteries and Veins (as is said above) from the former *Vasa Preparatoria*, which some have thought to reach only to the inmost Coat, called *Tunica albuginea*, because they are not conspicuous in the inner Substance of the Testicles. But tho' this may be true of the Veins which only receive the superfluous Arterial Blood, and have nothing to do with the *Semen*, yet it is not true of the Arteries, namely, of the most numerous branches of them. Indeed Blood is seldom seen in the Substance of the Testicles; but that comes to pass by reason that the Arterial Blood presently loses its Colour, and by the Semenifick Faculty of the *Testes* is turned into *Semen*, which being whitish, of the same Colour with the Vessels, makes them indiscernible; yet in those Men that have died of languishing Diseases, and whose *Testes* have their Faculty impair'd.

Diemerbroeck affirms, That he has oft discover'd sanguiferous Vessels in the inmost Parts of the *Testes*, and has shew'd them to many in the Publick Anatomical Theatre.

As for Nerves, *Dr. Willis* says, he could never observe more to go to them than one from a Vertebral Pair, and that too was most of it spent upon the Muscle *Cremaster*.

Diemerbroeck agrees to one Nerve, but thinks it proceeds from the sixth Pair, (which is *Dr. Willis's Intercostal*, as distinguish'd from that commonly called the Sixth, but his Eighth.) Others will have Branches from both these Nerves to go to them. Concerning the Use of these Nerves there is great Controversie. *Dr. Glisson, Wharton, &c.* will have them to convey a *Succus Genitalis*, which makes the greatest part of the *Semen*. *Dr. Willis*, as he denies (in *Cerebri Anatom. cap. 27.*) any *Succus Nutritivus* to be conveyed by the Nerves to other Parts; so that any *Succus Genitalis* is brought by them hither, but only Animal Spirits.

And whereas, to strengthen the former Opinion, 'tis usually objected, That the *Semen* must needs consist of a Nervous Juice, and plenty of Spirits brought from the Brain, because of the great Debility and Enervation that is induced upon the Brain and Nerves, by the too great Expence of it. He thus answers, That this comes to pass, because after great Profusions of the *Semen*, for the repletion of the same Humour, (whereof Nature is more solicitous, than for the benefit of the Individual) a greater tribute of Spirituous Liquor is required from the Blood, to be bestowed on the Testicles. Wherefore the Brain being defrauded of

of a due Income and Afflux of the said Spirituous Liquor, languishes; and so the Animal Spirits failing in the Fountain, the whole Nervous System becomes depauperated and flaggy. Whereto may be added, That also the Animal Spirits themselves that actuate the *Prostates*, being derived from the Spinal Marrow, are much wasted by Venereal Acts: So that for this Reason besides, the Loins are enervated.

In this Answer *Bartholin* acquiesces: And *de Graef*, *Diemerbroeck*, &c. confess, indeed, That the Spirituous Arterial Blood is impregnated with Animal Spirits from the Nerves; but affirm, That the Matter out of which the *Semen* is elaborated, is only the said Blood; and to these we subscribe.

Lympheducts they have also a rising from betwixt their Coats, and ascending upwards into the *Abdomen* under the *Vasa Deferentia*. These have many Valves looking upwards, which hinder any thing from descending by them to the *Testes*, but permit the *Lympha* to ascend, which they convey into the Chyliferous Vessels. *Malpighi* thinks it probable that some fall is derived to the Seminary Vessels for the Generation of the *Semen*, or at least to be mixed with it, seeing most Creatures grows the fatter upon being Castrated.

They have two sorts of Coats, Proper, and Common. The Common invest both the *Testes*, (constituting the *Scrotum*) and are two, The outermost consists of the *Cuticula* and true Skin (here thinner than in other Places.) It is soft and wrinkled, and is generally affirmed by Anatomists to be without Fat. On the outside it has a Suture or Seam that runs Lengthways of the *Scrotum*, and divides it into the Right and Left side. The other or inner common Coat, is a carnosous Membrane, which seems to be Muscular, because of the Power it has to contract and wrinkle it self. It is called *Jugros*, and adheres to the proper Coat next under it (call'd *Vaginalis*) by many Membranous Fibres.

This is the common Account of this Part that all Anatomists have usually given; but lately Dr. *Fred. Ruysch* affirms, That it has the *Membrana adiposa* also under the *Carnosa*; or rather, That the *Carnosa* is fatty, (on the inside) as it is in other Parts of the Body. And besides, he says, that in the *Scrotum*, there is a *Septum* within dividing it into two Parts; of which, says he, you have nothing in *Vesalius*, *Bartholin*, *de Graef*, &c. Men that have otherwise deserved very well of Anatomy: And what wonder, seeing all things about the *Scrotum* of one newly dead, are so slippery and moveable, that the true Constitution of the *Septum* can hardly appear. Wherefore, if any one would demonstrate this, the *Scrotum* is to be blown up, and to be cut open after 'tis dried, by which means the *Septum* yields it self to view, and has an Infinity of Blood-vessels running through it.

Thus he: This *Septum*, *Verheyen* says, is the same Substance with the carnosous Membrane above described, from which it seems to arise in the same manner as the *Mediastinum* from the *Pleura*. To each side of it the *Testes* are firmly knit, by means of their outer Proper Coat, and its Use is partly to sustain the *Testes*; and to hinder them from hitting against one another; and partly to help the carnosous Membrane to wrinkle, and purse up the *Scrotum*.

The proper Coats are also two, and these enclose each Testicle apart. The outer is called *Elitroides*, or *Vaginalis*; because it contains the Testicle as a *Sheath*. It is a thick and strong Membrane, having many Veins; in the outside it is uneven, by reason of the Fibres, by which it is knit to the *Dartos* and *Septum*; but in the inner side it is smooth. This is nothing else but the production of the *Peritonæum*, even as the *Scrotum* is of the Skin and *Membrana carnea* of the *Abdomen*. Into this Coat is inserted the Muscle *Cremaster*, of which presently.

The inmost is *reueóñs*, the *Nervous Membrane*, called *Albuginea*, from its Colour. It is white, thick and strong, framed of the External Tunicle of the *Vasa preparantia*: It immediately enwraps the Testicles, towards which it is rough, but on the outside next the *Vaginalis*, it is smooth; and between these two, the Water is contained in an *Hernia aquosa*.

Into the outer of the proper Membranes (as was said) is inserted the Muscle *Cremaster*. These Muscles (to each Testicle one) have their Rise from the *Os Pubis*; and almost encompassing round the Processes of the *Peritonæum*, descend with them to the Testicles; where their Carnous Fibres run through the whole length of this same *Tunica Vaginalis*, especially in its lower Part, and so keep the Testicles suspended, from whence they have their Name (from *ὑψεύζω* *Suspendo*) from their spreading themselves thus on the outer side of the outer proper Coat.

Riolanus reckons them for a third proper Coat, calling it *Erythroides*; and because of its Carnous Fibres, it makes the *Vaginalis* look Red; such as take it not for a distinct Coat, do give the Name of *Erythroides*, also to the *Vaginalis*, calling it by either Name indifferently. These Muscles pull up the Testicles in the Act of Generation, that the Vessels being slackened, may the more readily void the *Semen*; and at other times they help to sustain their Weight.

The Muscles in Sickness, and old Age become flaggy, and so the *Scrotum* relaxing it self, the Testicles hang low.

Upon the *Testes* as yet clad with the *Tunica Albuginea*, are fixed the *Epididymide* (called also *Parastata*, *Standers by*, or *Assistants*) enwrapped in the same Coat with the Spermatick Vessels; they adhere closer to the Testicles at their ends, than in the midst.

De Graef defines them to be Vessels making with their various Windings, that Body that is fixed on the Back of the Testicles.

To find out their Substance he directs us thus:

First, Take off the Membrane that encompasses them, and knits them to the Testicles, and then there will appear many Windings, which with the Edge of a Knife, may without hurting the Vessels be so easily separated one from another, that they may be drawn out into a length like a thing folded; for they are only folded from one side to the other, and are kept in that site, by the Membrane received from the *Tunica Albuginea*, (or Spermatick Vessels.)

But when you have unravell'd half of them, you must cut another very thin Membrane, and then you will see other Vessels lie just like these, and may be unloosed like them: And the whole

whole being unravel'd, the thicker they are by how much further from their Origin, which is implanted into the upper Part of the Testicle, by six or seven Ramifications; which having run so far, as where they join into one Duct, make it as thick as a small Thread; and this by degrees so thickens, that being encreas'd like a Chord, it makes the *Vas Deferens*.

So that (saith he) it is clear from hence:

First, That the *Testes* do not differ from the *Epididymide* (or *Parastate*) saving that those consist of divers Ducts; but these, after their six or seven Roots that arise out of the Testicle are united, (which they are in a short Space) but of one, only a little thicker.

Secondly, That the *Epididymide* differ not from the *Vasa differentia*, saving that the former go by a serpentine winding Passage, and these by a freight; and that those are a little softer and narrower.

Out of the *Epididymide* at their smaller End, arise the two *Vasa deferentia*, otherwise called *Ejaculatoria*, as if in the *Coitu*, the *Semen* were ejaculated from the *Testes* through them; which indeed was the common Opinion, till the *Vesiculae seminales* were found out, which are now known to be the Store-houses of the *Semen*, and not the *Testes*; so that the *Vasa deferentia* deserve not the Name of *Ejaculatoria*, except it be that Part of them which reaches from the *Vesiculae seminales* to the *Prostate*, through which indeed, the *Semen* is ejaculated in *Coitu*.

They are white, hardish Bodies, like a pretty large Nerve, with a Cavity not very discernible, but which may be made so, if one open one of them six or seven Fingers breadth above the Testicle, and then either blow into it with a small Pipe, or squirt some colour'd Liquor into it, with a Syringe towards the *Testes*; for then the Vessel will be distended, and the Colour will run along its Cavity towards the *Epididymide*: Or if you either blow or squirt Liquor by a Syringe, the other way towards the *Vesiculae seminales*, the said *Vesiculae* will be distended.

Now from the *Epididymide* these *Vasa deferentia* ascend, and pass out of the *Scrotum* into the *Abdomen*, the same way by which the *Vasa preparantia* came down, viz. by the Process of the *Peritoneum*. When they are entered the *Abdomen*, they are carried presently over the *Ureters*, and turning back again, they pass to the back-side of the Bladder; between which, and the *Intestinum rectum*, they march at a little Distance the one from the other, till about the Neck of the Bladder, where they grow wider and thicker; and then just as they are going to meet, their sides open into the *Vesiculae seminales*, in which they deposit the *Semen*, but not terminating here, but coming close together, and growing smaller and smaller, they go on and end at the *Urethra*, betwixt the *Prostate*. At their ending *Verheyen* (with some others) affirms there is a little *Septum* between them, with a Caruncle (which they call a *Cock's Head*) to hinder the *Semen* that comes out at one Orifice, to go in by the other; and the two Orifices by which the *Semen* is ejaculated into the *Urethra*, are called the *Eyes of the Cock's Head*.

These *Vesiculae* are little Cells like those in a Pomegranate, or something like a Bunch of

Grapes; *De Graef* compares them to the Guts of a little Bird diversly contorted; They consist of one thin Membrane, through which some small Twigs of both Veins, Arteries and Nerves run. They are about 3 Fingers-breadth long, and i broad; but in some Places broader, some narrower, as they run in and out. They are two (one for each *Vas deferens*) divided from one another by a little interstice; and they do severally by a peculiar Passage, emit the *Semen* contained in them into the *Urethra*. They are very anfractuous and winding, and (as was said) consist of many little Cells, and they should not pour out all the *Semen* contained in them in one Act of Coition, but might retain it for several: They have no Communication one with another, not even in their very opening into the *Urethra*; but the *Semen* is brought to the *Vesiculae seminales* on the right side, by the right *Vas deferens*, issues by its proper passage into the *Urethra*; and that which is brought to the left likewise; so that if by any accident the *Vesiculae*, or one side be burst, or cut (as in cutting for the Stone they generally are) yet those on the other being entire, may still suffice for Generation: Now when the Seed is emitted out of these *Vesiculae* in the Act of Coition, it passes out the same way it came in, which in this Case may easily be (though otherwise it be unusual, there should be a contrary Motion in the same Vessel) for as it comes in from the *Vasa deferentia*, it drills along gently without any force; but in *Coitu*, when the Muscles in the *Penis*, and all the bordering Parts are much tumified, it is expressed, or ejaculated out of them with some Violence, and passing along their Neck (which is a Continuation of the *Vasa deferentia*) ounces through a Caruncle into the *Urethra*, for there is one Plate as a Valve before the Orifice of each of them, partly to hinder the coming of the Urine into them, partly to hinder the involuntary Effusion of the *Semen*.

Now, though naturally, the little Holes through which the *Semen* passes out of the Necks of the *Vesiculae* into the *Urethra*, be almost imperceptible; yet if they be either eroded by the Acrimony of the *Semen* (such Acrimony as is contracted by impure Embraces, or in Claps (as they call them); or if of themselves they be debilitated and so become more lax (as sometimes happens to old and impotent Men that meddle too much) then there happens a *Gonorrhoea*, or continual efflux of the *Semen*. And so *Vesalius* and *Spigelius* have observed them much dilated, in dissecting such as have died with a *Gonorrhoea* upon them.

The *Prostate* are placed near to the *Vesiculae seminales*, *de Graef* calls them *Corpus glandulosum*, supposing them to be one Body, and only divided by the common Ducts of the *Vesiculae seminales*, and *Vasa deferentia* coming through the midst of it.

They are of a white, spongy, and glandulous Substance, about as big as a small Wallnut, encompass'd with a strong and fibrous Membrane from the Bladder to the beginning of whose Neck they are joined at the Root of the *Penis*: In shape they come nearer to an Oval, save that on their upper and lower sides, they are a little deprest, and in that end by which the *Vasa deferentia* enter, they are something hollow like a Tunnel. The Sphincter Muscle of the Bladder encompasses them so that so far as they cover the Neck of the Bladder, the Sphincter touches it not, they coming

between. They have all sorts of Vessels, which run mostly on the outer side ; in their inner Part, they have ten or more small Ducts, which all unload themselves into the *Urethra*, by the sides of the Caruncle, through which the *Semen* passes from the *Vesicula* into the *Urethra*, and themselves have each one a small one to stop its Orifice, lest the Liquor that is contained in the *Prostate* should continually flow out, or the Urine should flow in : And these small Ducts, I suppose, are continued from those *Vesiculae*, which appear in the *Prostates* of those that die (any way) suddenly after Coition. For in such the spongy part of the *Prostate* is very turgid with a ferous Liquor ; and in their inner part may be found the same *Vesiculae*, like to *Hydarides*, which if you press upon, they will discharge themselves in the above said Ducts.

What the Liquor they contain should be, or what is their Use, there is a great Variety of Opinions : Some think that the *Semen*, that flows from the Testicles, is further elaborated here : But that cannot be ; for that the *Vasa deferentia* deposit nothing in them, but all into the *Vesicula Seminales*. Others think that from the Blood there is separated in them an acrimonious, and ferous Humour, which serves for procuring the Tirillation in Coitu. As to this, *de Graef* appeals to the Taste of it, which has nothing of an Acrimony.

Dr. Wharton thinks they make a particular kind of *Semen*, as the Testicles do another, and the *Vesicula Seminales* a third ; That these last make a *Semen* different from that made in the Testicles, is grounded on a Mistake in Anatomy, viz. That the *Vasa deferentia* have no Communication with the *Vesiculae* ; whereas they apparently open into them, and deposit in them all the *Semen* they contain ; that the *Prostate* make a peculiar sort, he endeavours to prove, because castrated Animals emit some *Semen*. But that is but precarious ; for tho' they emit something, 'tis not necessary it should be any true *Semen* : Or if it be, it may well be supposed to proceed from the *Vesicula Seminales*, that were full when the Animal was castrated. For, for this Reason it has been observed, that presently after the Castration they have sometimes got the Female with Young, but not afterwards, when that Stock was spent. *Bartholin*, with many others, thinks they make an oily, slippery, and fatty Humour, which is pressed out, as there is need, to besmear the *Urethra*, whereby to defend it from the Acrimony of the *Semen*, and Urine, and lest it should dry up. This Humour *Malpighius* thinks to be conveyed hither by the *Ductus adiposi*, and quotes *Sevorinus*, affirming that he has observed a plain Vessel in the Fat of the Kidneys, tending to the Spermatick Vessels. He ascribes the same Use to it as *Bartholin*, &c. *Diermbroeck* confesses, that 'tis necessary the inside of the *Urethra* should be kept moist, and slippery, but thinks that is done here, as in the Bladder, Intestines, and many other places, from some muced Part of the Nourishment of the *Urethra* it self, and concludes that the *Vasa deferentia* deposit not all the *Semen* into the *Vesicula seminales*, but carry a smaller Part to these *Prostate*.

De Graef denies, that the *Vasa deferentia* convey any thing to them, or have any Communication with them ; and therefore believes, that the Humour that is separated in the *Corpus glandulosum* (as he calls the *Prostate*) serves for a *Menstruum*, or Vehicle of the *Semen*, which flow-

ing but in small Quantities, through small Pores into the *Urethra* ; it was necessary, that this Humour should be mixt with it, that it might the better reach the Womb. Whatever this Humour be, it is squeezed out partly by the Intumescence and Erection of the *Penis* ; and partly by the Compression of the Sphincter of the Bladder, that girds the *Prostate* about.

These *Prostates* are often (at least partly) the Seat of the *Gonorrhoea* ; and the Humour that they contain, is that which is shed.

TESTES Cerebri, are the two lower and lesser Protuberances of the Brain, so call'd from the likeness they have to Testicles. These with the *Nases* which lie above them, and the *Protuberantia Seriatæ*, are the Origin of the *Modulla oblongata*. The Uses of these *Testes* you may see in *Willis's* Anatomy of the Brain ; but they seem but conjectural.

TESTUDO, is a soft large Swelling, or not very hard, in the Head, broad, in Form of an Arch-Dome, or the Back of a Tortoise, from which resemblance it takes its Name. At the beginning it grows like a Chest-nut, afterward like an Egg, wherein is contained a soft Matter clothed with a certain Tunick, (whence some refer this sort of Tumour to *Meliceræ*, which see) which sticks so close to the Skull, that many times it infects and corrupts it. *Blanchard*.

TETANUS, or *Tetanon*, is a Contraction, whereby a Limb grows rigid and inflexible. The cause of it is sometimes a Relaxation or Palsy in some other Muscles, which when they are relaxed, the opposite Muscles act too strongly ; so that they draw the Part wholly to themselves, which ought to consist as it were in an *Equilibrium* betwixt both. Yet sometimes such a permanent Contraction may proceed from the Tendons being loaded and obstructed with ferous Matter, which thereupon grow rigid and stiff.

This Distemper is frequent in the Scurvy, so that the Patient can extend neither Joint nor Limb. The Tendons in the Back are sometimes contracted into a round globular Form, which by reason of such an Afflux of Humours upon them, draw the Bones out of their due places, and cause an Hunched Back, or a stooping or bending of it. It is usually distinguished into *Universal* ; of which there are three sorts, *Emprosthotonos*, *Opisthotonos*, and *Tetanos*, properly so called ; and *Particular*, which respects a certain Member, or a particular Joint. *Blanchard*.

TETRACHORD, in Musick, is a Concord or Interval of 3 Tones.

The *Tetrachord* of the Ancients, was a Rank of four Strings, accounting the *Tetrachord* for one Tone, as it is often taken in Musick.

TETRADIAPASON, a Quadruple Diapason is a Musical Chord, otherwise called a Quadruple Eighth, or Nine and Twentieth.

TETRAGONIAS, a Comet whose Head is of a Quadrangular Figure, and its Tail or Train, long, thick and uniform, and does not differ much from the Meteor called *Trabi*.

TETRAGONISM, with some foreign Writers, is the same as the Quadrature of the Circle.

TETRAGONUS. See *Quadratus Genæ*.

TETRAHEDRON. See *Regular Bodies*. N. B. these following Figures being cut in Past-board and folded up, will either of them represent the *Tetrahedron*.

TETRAPE-

TETRAPETALOUS Flower, of a Plant, is that which consists of but four single coloured Leaves (which the Botanists call *Petala*) set round the *Stylus* to compose the Flower.

Plants having a Tetrapetalous Flower, constitute a *distinct Kind*, and by Mr. Ray are divided into,

1. Such as have an uniform Tetrapetalous Flower, and their Seed-vessels a little oblongish, which therefore he calls *Siliquose*.

As the *Keiri* or *Leucoium Luteum*, and the other common *Leucoium*; the *Dentaria*, the *Leucoium Siliquosum*, *Alysson*, *Viola Lunariz*, *Paronychia*, *Hesperis*, *Alliaria*, *Rapa*, *Napus*, *Sinapis*, *Rapistrum*, *Eruca spuria*, *Erysimum*, *Cardamine*, *Turritis*, *Pilosella Siliquosa*, and the *Raphanus Rusticanus* and *Aquaticus*.

2. Such as have their Seed-case or Vessel shorter, which therefore for distinction he calls *Capsulate* and *Siliculosa*; as the *Myagrum*, *Draha*, *Leucoium Siliqua subtorunda*, *Cochlearia*, *Nasturtium*, *Lepidium vulgare*; *Thlaspi*, *Brasica marina*, *Glastrum*, *Eruca marina*, &c.

3. Such as have a kind of, or seeming Tetrapetalous Flower, i.e. a Monopetalous one divided deeply into 4 Partitions, and these he calls *Anomalous*; as the *Papaver*, *Agremone*, *Veronica*, *Tithymallus*, *Plantago*, *Coronopus*, *Psyllium*, *Lysimachia Siliquosa*, *Alfina spuria*, &c.

TETRAPHARMACUM, is a Medicine consisting of four Ingredients, as *Unguentum Basilicum*.

TETRAPOTOTES, are in Grammar, such defective Nouns, as have only four Cases; as, *Plus*, which wants the *Dative* and *Vocative* Singular.

TETRASTYLE, in Architecture, is a Building which hath four Columns in the Faces before and behind.

TEXTURE. The Texture of any Natural Body, is that peculiar disposition of its constituent Particles, and making it have such a Form, or be of such a Nature, or be endowed with such Qualities.

THALAMI Nervorum Opticorum, are two Prominences of the lateral Ventricles of the *Cerebrum*, so called, because the Optick Nerves rise out of them. They are Medullary without, but a little Cineritious within. They are of an oblong Figure.

THAUGHTS, or *Thoughts*, are the Benches on which the Rowers sit in a Boat to Row.

THELONIA rationabili habendo pro Dominis habentibus Dominica Regis ad firmam, is a Writ that lies for him that hath of the King's Demefne in Fee-farm, to recover reasonable *Toll* of the King's Tenants there, if his Demefne have been accustomed to be *Tolled*.

THELONTUM, or *Brevie essendi quieti de Thelonio*, is a Writ lying for the Citizens of any City, or Burgeses of any Town, that have a Charter or Prescription to free them from *Toll*, against the

Officers of any Town or Marker, who would constrain them to pay *Toll* of their Merchandize, contrary to the said Grant or Prescription.

THENOR, or *Tenor*, according to some, is the Name of an abducent Muscle which draws the Thumb from the Fore-finger.

THEODOLITE, is an Instrument used in Surveying, and taking of Heights and Distances.

It consisteth of several Parts: -As,

1. *A Circle of Brass*, divided into four Quadrants, representing the four Cardinal Points of the Compass, *East*, *West*, *North* and *South*, and noted with the Letters, N. S. W. E.

Each of these *Quadrants* is divided into 90 Degrees, and subdivided as the Largeness of the Instrument will permit, commonly by *Diagonals*.

These four Quadrants are to be numbered by 10, 20, 30, &c. both ways beginning at the *North* and *South* Points, and ending with 90, at the *East* and *West* Points.

2. *A Box and Needle*, so conveniently contrived to stand upon the Centre of the Circle, upon which Centre, the Instrument, the *Index*, with its *Sights*, must be made to turn about, and yet both the Instrument, and the *Box* and *Needle* remain firm. At the bottom of the *Box* there must be a *Card* or *Mariner's Compass* fixed, answerable to the Letters E. W. N. S. upon the Instrument.

3. *A Socket* on the Back-side, (either Plain or with a *Ball*, which is much better) to be put upon the Head of a three-legged Staff.

4. *A Staff* to set the Instrument upon; the Neck at the Head whereof must be made to go into the *Socket* on the Backside of the Instrument.

Its Use is for taking *Heights* and *Distances*, as also taking of *Angles*, in Surveying of Land, &c.

To take the Quantity of an Angle by the Theodolite.

As suppose the Angle A, of a Field, two of whose Sides is A B or A C.

Place your Instrument in the Angle A, or as near as possible, and let Marks be set up near B and C, so far off the Hedges as your Instrument at A stands (which yet is not necessary) then turn the Instrument about, till through the fixed Sights you see the Mark at B, there screw it fast; next turn the moveable Index, till through the Sights thereof

you see the Mark at C, then the Degrees upon the Limb cut by the Index, gives the Angle B A C.

THEOREM, is a Speculative Proportion, demonstrating the Properties of any Subject: This is either,

1. *Universal*, which extends universally to any Quantity without Restriction; as, *That the Rectilinear angle of the Sum and Difference of any two Quantities, is equal to the Difference of their Squares.*
2. *Particular*, when it extends only to a particular Quantity.
3. *Negative*, which demonstrates the Impossibility of an Assertion; as, *That the Sum of two Biquadrate Numbers cannot make a Square.*
4. *Local*, which relates to a Surface; as, *That Triangle of the same Base and Altitude are equal.*

5. *A plain Theorem*, is that which relates to either a Rectilinear Surface, or to one terminated by the Circumference of a Circle; as, *That all Angles in the same Segment are equal.*

6. *A solid Theorem*, is that which treats about a Space terminated by a solid Line; that is, by any of the three Conick Sections; as, *If a Right Line cut two Asymptotick Parabolas, its two Parts terminated by them shall be equal.*

7. *A Reciprocal Theorem*, is one whose Converse is true; as, *That if a Triangle have two equal Sides, it must have two equal Angles.* The Converse of which is true, *That if it have two equal Angles, it must have two equal Sides.*

THERAPEUTICA, is that part of Physick, which delivers the Method of Healing.

THERIOMA, is a wild cruel Ulcer, like *Carcinoma*; which see. *Blanchard.*

THERMÆ, are the Bath or other Medicinal Waters which are Hot. 'Tis most probable, as *Dr. Woodward* well observes, (*Nat. Hist. of the Earth, p. 144.*) That these do not owe their Heat to any Colluctation or Effervescence of the Minerals in them, but to the *subterranean Heat or Fire*, which communicates with them by some *Spiracle or Canal*, by which a greater Quantity of Heat is derived thither, than to ordinary Springs. Tho' *Mr. Charas* hath lately revived the former Opinion. *Vid. Memoirs Mathemat. & de Physique, A. D. 1692.*

THERMANTICA, are healing Medicines.

THERMOSCOPE, or *Thermometer*, is a Philosophical Instrument, usually made of Glass, filled with tinged Spirit of Wine, or some other proper Liquor; and designed to measure, or estimate the Heat and cold of any particular Place; or of the same Place in different Seasons, and at different Times.

At the Bottom is a pretty large Ball filled with the Spirit or tinged Liquor, with a Stem rising, to about three or four Foot perpendicular. To adjust the Divisions, or Degrees of which; the Ball may be placed in Water, which is just beginning to freeze, and then noting the height of the Spirit in the Stem, place against that O, and graduate it afterward, up and down, for Heat and Cold.

Dr. Hook, in order to adjust these Graduations with the greater Accuracy, hath contrived, and

described an Instrument for that purpose. See *Micrograph. Pag. 38.*

The Way of filling Thermoscopes, or such other small Glass Tubes, with Spirit of Wine, or Water.

Take the Ball of the Glass, and first warm it gently between your Hands, then seal it very well (tho' gently) before a good Fire, turning it round, that it may be equally warm, for without this Caution, you'll endanger breaking it. Then applying the Ball to the Flame of a Lamp or Candle, turning it about in it, heat it as hot as you can, without melting the Glass, and then speedily immersing the open end of the Pipe into a Vessel of that Liquor you intend to fill it withal, the Liquor will rise into it, and fill it very near full.

The Reason of which ascent of the Liquor is, That the Air within the Ball and Tube, being expelled in great Measure by the Heat, or at least, rarified there to a very great Degree; the immersed open End of the Tube keeps off the Pressure of the Incumbent Atmosphere on that part of the Liquor that the end of the Tube covers; but the Atmosphere presses on all other Parts of the Liquor in the open Vessel; and consequently (there being none, or but a very small Quantity of Air within the Tube to hinder it) forces it by its weight, up into the Tube, till it gain an Equilibrium with the Pressure, or Weight of the Air without.

If by this Method the Tube cannot be filled full enough, the rest may be supplied by a small Glass-Funnel, whose Shank must be drawn out exceeding slender, and inserted into the Orifice of the Tube; and then by blowing, you may force with your Breath the Spirit of Wine into the Tube, so as to fill it quite, or to what Degree you please.

Dr. Hook, in his *Micrographia*, hath an Engine for graduating Thermometers, to make them true Standards of Heat and Cold.

THLIPSIS, is a Compression of the Vessels in an Animal Body. *Blanchard.*

THORACICA Inferior, a Branch of the Subclavian Veins, spreading it self upon the side of the Breasts by several Branches, which communicate by *Anastomosis*, with the Branches of the *Azygos*, under the Muscles of the Breast.

THORACICA Superior, is a Branch of the Subclavian Vein, arising from the *Basilica*, and goes to the *Mammilla* and Muscles of the Breast.

THORAX, or *Medius Venter*, the Chest; is all the Cavity which is circumscribed above, by the Neck-bones; below, by the *Diaphragme*; before, by the Breast-bone; behind, by the Back-bones; on the Sides, by the Ribs; it is of an Oval Figure, contains the Heart and Lungs, and is cover'd on the inside with a Membrane called *Pleura*.

Hippocrates and *Aristotle*, took all that Space from the Neck-bone, to the very Secrets, both the middle and lowermost Cavity, for the Thorax.

THOUGHTS, or *Thoughts*, so the Seamen call the Seats or Benches, on which the Men sit down to row in a Boat.

THOWLES, are those Pines in the Gunnel of a Boat, between which the Men put their Oars when they row.

THREE-LEGG'D-STAFF, is an Instrument consisting of Wooden Leggs, made with Joints to shut all together, and to take off in the middle, for the

Thunder vid U. 2.

the better Carriage ; and on its Top is usually a Ball and Socket to support and adjust Instruments for Astronomy, Surveying, &c.

THROMBUS, is a Coagulation of Blood or Milk into Clots or Clusters. *Blanchard*,

THYMUS, is a conglobate Glandule in the Throat, growing to the upper part of the *Mediastinum*, and seated between the Divisions of the Subclavian Veins and Arteries ; it is whitish, soft and spongy, and larger in Children, and in Women, than in Men. The Jugular Veins and Arteries pass thro' the Gland as they go up the Neck, but this don't send any conspicuous Twigs or Branches to it : Its Use seems to be to prop and strengthen the Divisions of the *Aorta* and *Cava*, and to defend them from being compressed by the *Clavicula* when we stoop forwards, and perhaps in Infants in whom it is large, and consists in 3 Glands, it may contribute towards the refining and depurating of the Chyle ; and possibly it may hinder (as *Verheyen* thinks) and too hasty Mixture of the Chyle with the Blood in Children.

THYROARYTENOIDES, is a Pair of large Muscles, that proceed from the Cartilage, called *Scutiformis*, and extending themselves forward to the sides of the *Arytenoides* ; the fourth and fifth Part of the *Larynx*, serve to contract, and close the opening of the *Larynx*.

THYREOIDEÆ Glandule, are two of a viscous, solid Substance, wonderfully adorned with Vessels of all sorts, and hard Membranes, almost of the bigness, and shape of an Hen's Egg, situate at the lower Part of the *Larynx*, at the sides of the Cartilages, called *Scutiformis*. Their Use seems to be to separate a Liquor from the Lubrication of the *Larynx*, whereby the Voice is rendered firm, smooth and sweet ; and they contribute also to the roundness of the Neck, by their filling up the empty Spaces about the *Larynx*.

THYROIDES, is the Cartilage, called *Scutiformis*, of the *Larynx* : Also the Hole of the *Os Pubis*, is by some called by this Name. See *Scutiformis*.

THYRSUS, is a Word used by the Botanists, for the upright, and tapering Stalk : And 'tis often used for *Spica*, which is an Ear, or Blade of Corn.

TIBIA, the Leg, is the Part betwixt the Knee and the Ankle : It consists of two Bones ; one outward, called *Focile Minus* ; another inward, and larger, which has usurped the Name of the whole, and is called *Tibia* ; others call it *Focile Majus*, and *Canna Major* : The upper End has a Process, which is received by a Cavity in the Thigh, and two oblong Cavities to admit the Heads of the Thigh-bone ; the Depth of which Cavities is encreased by a Cartilage that is annexed thereunto by Ligaments : This Cartilage is moveable, soft, slippery, moistened with an unctuous Humour ; thick in its Circumference, and smaller towards the Center, whence it is called *Lunata*, made like an Half Moon ; there are rugged sharp Ligaments before, which encrease the Lunary Cartilages : The fore Part, which is acute and long, is called *Spina* : There is below a prominent and gibbous Process in the inner Side, nigh the Foot ; and is called *Malleolus Internus*, the inner Ankle-bone.

TIBIALIS Anticus, a Muscle of the *Tarsus*, so called from its Situation on the Fore-part of the *Tibia* : It's also by *Spigelius* called, *Musculus Cate-næ*, because when it is divided, the Patient is

forced to use a Sling, to support the Foot in walking : Its Origination is fleshy from the lower Part of the superior Appendage of the *Tibia*, between the Prominence, where the great Tendon of all the extending Muscles of the Leg is inserted, and the Origination of the *Musculus Extensor magnus Digtorum Pedis* : It also continues a disengaged fleshy Origination, for near two Thirds of the superior Part of the said *Tibia*, externally Laternal, next the *Fibula* ; which composing a fleshy Belly, lessens it self in half its Progress, and growing into a strong, and somewhat round Tendon, descending obliquely over the inferior Part of the said *Tibia* ; and under the Annular Ligament, is inserted to the inside of the *Os Cuneiforme Majus*, that sustains the *Os Metatarsus Pollicis* : This pulls the Foot upwards and forwards, directly.

TIBIALIS Posticus, is a Muscle of the Foot, which being placed on the Back-part of the *Tibia* ; is also called *Musculus Nauticus*, because Mariners chiefly use it in climbing up the Masts of their Ships. It lies partly under the *Flexor tertii internodii Pollicis*, which Muscle must be partly raised together with the *Flexor tertii internodii Digtorum Pedis*, before we can have a clear sight of it. It appears Biventral, arising partly Tendinous, and partly fleshy from the Superior and Back-part of the *Fibula* ; as also from the Ligament that is contained between the said Bone and the *Tibia* ; in near half its Progress it becomes less, and grows fleshy again, and making a strong round Tendon which runs in a *Sinus*, on the Back-part of the lower Appendage of the *Tibia*, called the *Malleolus Internus* under an Annular Ligament, and is inserted to the *Os Naviculare*, internally and laterally. This draws the Foot upwards and inwards.

TIDE, the Word *Tide* signifies as well the Ebbing as the Flowing of the Sea ; the former of which the Seamen call *Tide of Ebb* ; the latter, *Tide of Flood*. A *Windward Tide*, is when the Tide runs against the Wind. A *Leeward Tide*, is when the Wind and Tide go both the same way ; when the Tide runs very strong, they call it a *Tide-Gate*. *To tide it over*, or *up* into any Place, is to go in with the Tide of Flood or Ebb, as long as that lasts, and then to stay at an Anchor all the Time the contrary Tide lasts, and then to set in again, when the same Tide returns. It's said to flow *Tide* and *Half-tide*, when the Tide runs three Hours (which is four Points of the Compass) in the *Offing*, longer than it doth by the Shore. By longer, they do not mean more Hours, for it always Ebbs and Flows six Hours, but that if it be high Water a Shoar at Twelve a Clock, it will not be so in the *Offing* till Three, which is the Bound, and Time for the running of a Half-tide. If it Ebbs and Flows more, they say, It runs Half-tide, and half Quarter, that is five Points ; when they are to go into a Harbour over a Bar or Sand, their Word is, that they will bring the Tide with them ; that is, they will come in with the Flood, that so they may get over the Bar or Sand safely.

TIDES. Mr. *Henry Philips* in *Philosoph. Trans.* N. 34. gives the following Proportion for finding the Tides.

First, Divide a Circle into 12 equal Parts, or Hours, according to the Moon's Motion, or Distance from the Sun, from the New Moon to the Full.

Secondly, Let the Diameter of the Circle be divided into 90 Parts or Minutes, that is according to the Time of the Difference of Tides between the New, or Full Moon, and the Quarters, which is one Hour and a half.

Thirdly, Make Perpendicular Lines cross the Diameter of the Circle, from Hour to Hour.

Fourthly, Reckon the Time of the Moon's coming to the South in the Circumference of the Circle, and observe the Perpendicular Line that falls from that Point upon the Diameter; and the Proportional Minutes cut thereby, will shew how many Hours or Minutes are to be subtracted from the Time of high Tides at the New and Full Moon, that so you may have the true Time of the Tides that present Day.

Example.

At London, on the Day of the New and Full Moon, it is High-tide at 3 of the Clock; that is, when the Moon is 3 Hours past the Meridian: And so by the common Rule, the Moon being about 4 Days old, it will be South about 3 of the Clock, and it will be High-tide 3 Hours afterwards; that is, at 6 of the Clock. But now by this Rule, if you count this Time of the Moon's coming to the South, in the Circumference, the Perpendicular Line which comes from 3 to 9, cuts the Diameter in the half at 45 Minutes: Which shews, that so much is to be abated from the Time of High-water in the New and Full Moon: So that it is High-tide 45 Minutes before 6 of the Clock; that is, at 5 Hours, 15 Minutes, and not at 6 of the Clock, according to the common Rules.

The like you may do for any other Port or Place, knowing the Time of High-water, at the New and Full Moon in that Place: And this may be more readily done, if you set down the Time of High-water at the New and Full Moon under the Diameter, as is done for London in this Example, where 'tis High-tide at 3 of the Clock. So that when the Moon is South at 3 of the Clock, the Perpendicular cuts the Diameter at 2 Hours, 15 Minutes; which added to the Time of the Southing, gives 5 Hours, 15 Minutes; and so when the Moon is South at 9 of the Clock, by adding 2 Hours, 15 Minutes, you have the Time of High-water, which is 11 Hours, 15 Minutes.

And thus you may easily make a Table, which by the Southing of the Moon, shall readily tell you the Time of High-tide at any Time of the Moon.

Note, If the Difference be not so much between the Neap-tides and Spring-tides, in other Places as it is in this our Example, the Diameter must be divided into fewer Parts.

Our learned Astronomer Mr. Flamsteed, *Philos. Trans.* N. 143. gives us a new and more correct Tide-Table, (which he also now publishes every Year) improving what Mr. Philips had begun, by observing that the Tides did not usually hold out so long as Mr. Philips's Calculation made them to do. He found by above 80 Observations of the High-waters at Tower-wharf and Greenwich, That the greatest Differences between the Moon's true Southing, and the High-waters, were not, as Philips said, at Full, New, and Quarter Moons, but the greatest near the Neaps, and the less near the highest Spring-tides.

There is an Hypothesis to solve the Motion of the Tides, mentioned in *Philosoph. Trans.* N. 16. from that Learned Mathematician Dr. Wallis: In which, he supposes the Earth and Moon to move round the Sun, in a Circle, or Ellipse, described by their common Centre of Gravity. But this Hypothesis places the highest Annual Tides not near the Equinoxes, but about Candlemas and All-hollantide; that is, in the beginning of February and November. But I could never find that the Thing was so in Fact; but that on the contrary, they are always greatest at or near the Equinoxes, as hath been generally observed: I shall therefore refer the Reader to the Ingenious Hypothesis itself, without giving any particular Account of it here.

The true Theory of the Tides extracted from that admirable Treatise of Sir Isaac Newton, Intituled, *Philosophiæ Naturalis Principia Mathematica*; By that Excellent Mathematician, Captain Halley.

The Principle upon which this Author proceeds to explain most of the great and surprising Appearances of Nature; is no other than that of Gravity, whereby in the Earth all Bodies have a Tendency towards its Centre, as is most evident: And from undoubted Arguments 'tis proved, That there is such a Gravitation towards the Centre of the Sun, Moon, and all the Planets.

From this Principle, as a necessary Consequence, follows the Spherical Figure of the Earth and Sea, and of all the other Celestial Bodies; and tho' the tenacity and firmness of the solid Parts, support the Inequalities of the Land above the Level; yet the Fluids pressing equally, and easily yielding to each other, do soon restore the Equilibrium, if disturbed, and maintain the exact Figure of the Globe.

Now this Force of the Descent of Bodies towards the Centre, is not in all Places alike, but is still less and less, as the Distance from the Centre encreases: And in the said Book it is demonstrated, That this Force decreases as the Square of the Distance encreases; that is, the Weight of Bodies, and the Force of their Fall is less, in Parts more removed from the Centre, in the Proportion of the Squares of the Distance.

As

As for Example.

A Ton Weight on the Surface of the Earth, if it were rais'd to the height of 4000 Miles, which let be the Semidiameter of the Earth, would weigh but a Quarter of a Ton, or 500 l. Weight.

If to 12000 Miles, or 3 Semi-diameters from the Surface; that is, 4 from the Centre, it would weigh but 1 sixteenth Part of the Weight on the Surface, or a Hundred and a Quarter: So that it would be as easie for the Strength of a Man at that height, to carry a Ton Weight, as here on the Surface to carry a Hundred and a Quarter.

And in the same Proportion does the Velocities of the Fall of Bodies decrease: For whereas on the Surface of the Earth, all things fall 16 Foot in a Second, at one Semi-diameter above; this Fall is but 4 Foot; and at 3 Semi-diameters, or 4 from the Centre, it is but $\frac{1}{16}$ of the Fall at the Surface, or but one Foot in a Second, and at greater Distances both Weight and Fall become very little; but yet at all given Distances, is still something, tho' the Effect become insensible.

At the Distance of the Moon (which suppose to be 60 Semi-diameters of the Earth) 3600 Pounds Weight but one Pound, and the Fall of Bodies is but $\frac{1}{1600}$ of a Foot in a Second, or 16 Foot in a Minute; that is, that a Body so far off descends in a Minute no more than the same at the Surface of the Earth would do in a Second of Time.

And as was said before, the same force decreasing after the same manner, is evidently found in the Sun, Moon, and all the Planets; but more especially in the Sun, whose Force is prodigious becoming sensible even at the immense distance of Saturn. This gives room to suspect that the force of Gravity is in the Celestial Globes proportional to the Quantity of Matter in each of them: And the Sun being at least 10000 times (for Instance, tho' he is far bigger) as big as the Earth, its Gravitation or attracting force, is found to be at least 10000 times as much as that of the Earth, acting on Bodies at the same Distances.

Whence also, all the surprizing Phenomina of the Flux and Reflux of the Sea he shews in the like manner to proceed from the same Principle.

If the Earth were alone, that is to say, not affected by the Actions of the Sun and Moon, it is not to be doubted, but the Ocean being equally prest by the force of Gravity towards the Centre, would continue in a perfect Stagnation always at the same height, without ever ebbing or flowing; but it being by him demonstrated, That the Sun and Moon have a like Principle of Gravitation towards their Centers, and that the Earth is within the Activity of their Attractions, it will plainly follow, That the Equality of the Pressure of Gravity towards the Centre will thereby be disturbed; and tho' the smallness of these Forces, in respect to the Gravitation towards the Earth's Centre, render them altogether imperceptible by any Experiments we can devise, yet the Ocean being fluid, and yielding to the least force, by its rising, shews where it is least prest, and where it is more prest by its sinking.

Now if we suppose the force of the Moon's Attraction to decrease as the Square of the Distance from its Center increases, (as in the Earth, and other Celestial Bodies) we shall find, that where the Moon is perpendicularly either above or below the

Horizon, either in Zenith or Nadir, there the force of Gravity is most of all diminished, and consequently that there the Ocean must necessarily swell, by the coming in of the Water from those Parts where the Pressure is greatest, viz. in those Places where the Moon is near the Horizon; but that this may be the better understood, I was thought needful to add the following Scheme, where M is the Moon, E the Earth, C its Centre, Z the Place where the Moon is in the Zenith, N where the Nadir.

Now by the Hypothesis it is evident, that the Water in Z, being nearer, is more drawn by the Moon, than the Centre of the Earth C, and that again more than the Water in N; therefore the Water in Z has a Tendency towards the Moon, contrary to that of Gravity, being equal to the Excess of the Gravitation in Z, above that in C. And in the other Case, the Water in N tending less towards the Moon, than the Centre C, will be less prest'd, by as much as is the Difference of the Gravitations towards the Moon in C and in N.

This rightly understood, it follows plainly, that the Sea, which otherwise should be Spherical, upon the Pressure of the Moon, must form it self into a Spheroidal, or Oval Figure, whose longest Diameter is where the Moon is Vertical, and shortest where she is in the Horizon; and that the Moon shifting her Position, as she turns round the Earth once a Day, this Oval of Water shifts with her, occasioning thereby the two Floods and Ebbs observable in each 25 Hours.

And this may suffice as to the general Cause of the Tides: It remains now to shew how naturally this Motion accounts for all the Particulars that have been observed about them; so that there can be no room left to doubt, but that this is the true Cause thereof.

The Spring-tides, upon the New and Full Moon; and the Neap-tides, on the Quarters, are occasion'd by the attractive Force of the Sun, in the New and Full, conspiring with the Attraction of the Moon, and producing a Tide by their united Forces; whereas in the Quarters, the Sun raises the Water where the Moon depresses it, and on the contrary; so as the Tides are made only by the Difference of their Attraction.

That the force of the Sun is no greater in this Case, proceeds from the very small Proportion the Semi-diameter of the Earth bears to the vast Distance of the Sun.

It is also observed, That *ceteris paribus*, the Equinoctial Spring-tides in March and September, or near them, are the highest, and the Neap-tides the lowest; which proceeds from the greater Agitation of the Waters, when the fluid Spheroid revolves about a great Circle of the Earth, than when it turns about in a lesser Circle; it being plain, that if the Moon were constituted in the Pole, and there stood, that the Spheroid would have a fixt Position, and that it would be always High-water under the Poles, and Low-water every where under the Equinoctial; and therefore the nearer the Moon approaches the Poles, the less is the Agitation of the Ocean;

Ocean, which is of all the greatest, when the Moon is in the Equinoctial, or farthest distant from the Poles.

Whence the Sun and Moon, being either conjoin'd or opposite in the Equinoctial, produce the greatest *Spring-tides*; and the subsequent *Neap-tides* being produced by the Tropical Moon in the Quarters, are always the least *Tides*; whereas in June and December the *Spring-tides* are made by the Tropical Sun and Moon, and therefore less vigorous; and the *Neap-tides* by the Equinoctial Moon, and therefore are the stronger.

Hence it happens, that the Difference between the *Spring* and *Neap-tides* in these Months, is much less considerable than in March and September.

And the Reason why the highest *Spring-tides* are found to be rather before the *Vernal*, and after the *Autumnal Equinox*, viz. in February and October, than precisely upon them, is, because the Sun is nearer the Earth in the Winter Months, and so comes to have a greater Effect in producing the *Tides*.

Hitherto we have considered such Affections of the *Tides* as are universal, without Relation to particular Cafes; what follows from the differing Latitudes of Places, will be easily understood by the following Figures.

Let A P P E P be the Earth covered over with very deep Waters, C its Centre, P P its Poles, A E the Equinoctial, F f the Parallel of Latitude of a Place, D d another Parallel at equal Distance on the other side of the Equinoctial, H h the two Points where the Moon is Vertical, and let K K be the great Circle wherein the Moon appears Horizontal.

It is evident, that a Spheroid described upon H h and K K, shall nearly represent the Figure of the Sea; and C f, C D, C F, C d, shall be the Heights of the Sea in the Places f, D, F, d, in all which it is *High-water*: And seeing that in 12 Hours time, by the diurnal Rotation of the Earth, the Point F is transfer'd to f and d to D: The Height of the Sea C F, will be that of the *High-water*, when the Moon is present, and C f that of the other *High-water*, when the Moon is under the Earth; which in the Cafe of this Figure is less than the former C F.

And in the opposite Parallel D d, the contrary happens: The rising of the Water being always alternately greater and less in each place, when it is produced by the Moon declining sensibly from the Equinoctial, that being the greatest of the two *High-waters* in each Diurnal Revolution of the Moon, wherein the approaches nearest either to the Zenith or Nadir of the Place. Whence it is, that

the Moon in the Northern Signs in this part of the World, makes the greatest *Tides* when above the Earth, and in the Southern Signs when under the Earth; the Effect being always the greatest where the Moon is farthest from the Horizon, either above or below it.

And this alternate Increase and Decrease of the *Tides*, has been observ'd to hold true on the Coast of England, at Bristol by Captain Stummy, and at Plymouth by Mr. Colepreffe.

But the Motions hitherto mention'd, are somewhat altered by the Libration of the Water, whereby tho' the Action of the Luminaries should cease, the Flux and Reflux of the Sea would for some time continue: This Conservation of the impressed Motion diminishes the Difference that otherwise would be between two consequent *Tides*, and is the Reason why the highest *Spring-tides* are not precisely on the New and Full Moons, nor the *Neaps* on the Quarters; but generally they are the third *Tides* after them, and sometimes later.

All these things would regularly come to pass, if the whole Earth were covered with Sea very deep; but by reason of the shoalness of some places, and the narrowness of the Straits, by which the *Tides* are in many Places propagated, there arises a great diversity in the Effect, and not to be accounted for, without an exact Knowledge of all the Circumstances of the Places; as of the Position of the Land, and the Breadth and Depth of the Channels by which the *Tide* flows; for a very slow and imperceptible Motion of the whole Body of the Water, where it is (for Example) two Miles deep, will suffice to raise its Surface 10 or 12 Feet in a *Tide's* Time; whereas, if the same Quantity of Water were to be conveyed upon a Channel of 40 Fathom deep, it would require a very great Stream to effect it, in so large Inlets as are the Channel of England, and the German Ocean; whence the *Tide* is found to set strongest in those Places where the Sea grows narrowest, the same Quantity of Water being to pass through a smaller Passage: This is most evident in the *Streights* between Portland and C. de Hoguë in Normandy, where the *Tide* runs like a Sluce, and would be yet more between Dover and Calais, if the *Tide* coming about the Island from the North did not check it. And this Force being once impress'd upon the Water, continues to carry it about the Level of the ordinary height in the Ocean, particularly where the Water meets a direct Obstacle, as it is in St. Maloes; and where it enters into a long Channel, which running far into the Land, grows very strait as its Extremity; as it is in the Severn-Sea, at Chepstow and Bristol.

This shoalness of the Sea, and the Intercurrent Continents, are the Reason that in the open Ocean the Time of *High-water* is not at the Moon's Appulse to the Meridian, but always some Hours after it, as it is observed upon all the West Coast of Europe and Africa; from Ireland to the Cape of Good Hope: In all which, a South-West Moon makes *High-water*; and the same is reported to be on the West of America.

But it would be endless to account all the Particular Solutions, which are easie Corollaries from this Hypothesis; as, why the Lakes, such as the Caspian-Sea, and Mediterranean-Sea; such as the Black-Sea, the *Streights*, and Baltick, have no sensible *Tides*: For Lakes, having no Communication with the Ocean, can neither increase or diminish

minish their Water, whereby to rise, and fall; and Seas that communicate by such narrow Inlets, and are of so immense an extent, cannot in a few Hours time receive, or empty Water enough to raise, or sink their Surface in any thing sensibly.

Lastly, to demonstrate the Excellency of this Doctrine, the Example of the Tides in the Port of *Tunking* in *China*, which are so extraordinary, and differing, from all others we have yet heard of, may suffice. In this Port there is but one Flood, and Ebb in 24 Hours; and twice in each Month, viz. when the *Moon* is near the Equinoctial, there is no Tide at all, but the Water is Stagnant; but with the *Moon's* Declination there begins a Tide, which is greatest when she is in the Tropical Signs; only with this difference, that when the *Moon* is to the North-ward of the Equinoctial, it Flows when she is above the Earth, and Ebbs when she is under, so as to make *High-Water* at *Moon* setting, and *Low-water* at *Moon's* rising: But on the contrary, the *Moon* being to the Southward, makes *High-water* at rising, and *Low-water* at setting, it Ebbs all the time she is above the Horizon. As may be seen more at large, in the *Philosoph. Transact.* N. 162.

The Cause of this odd Appearance, is proposed by Sir *Isaac Newton*, to be from the concurrence of two Tides, the one propagated in 6 Hours, out of the great *South Sea*, along the Coast of *China*; the other out of the *Indian Sea*, from between the Islands, in 12 Hours, along the Coast of *Malacca*, and *Cambodia*.

The one of these Tides, being produced in North-Latitude, is, as has been said, greater when the *Moon* being to the North of the Equator, is above the Earth, and less when she is under the Earth.

The other of them, which is propagated from the *Indian Sea*, being raised in South Latitude, is greater when the *Moon* declining to the South is above the Earth, ~~and~~ less when she is under the Earth; so that of these Tides, alternately greater and lesser, there comes always successively two of the greater, and two of the lesser together every Day; and the *High-water* falls always between the times of the arrival of the two greater Floods; and the *Low-water* between the arrival of the two lesser Floods. And the *Moon* coming to the Equinoctial, and the alternate Floods becoming equal, the Tide ceases, and the Water stagnates; But when she has passed to the other side of the Equator, those Floods which in the former order were the least, now becoming the greatest, that which before was the time of the *High-water*, now becomes the *Low-water*, and the Converse; so that the whole appearance of these strange Tides, is without any forcing naturally deduced from these Principles, and is a great Argument of the certainty of the whole Theory.

The Theory of *Des Cartes*, whereby he endeavours to explain the Phenomena of Tides, supposes the *Moon* to move round the Earth in an Ellipsis, in whose Centre the Earth is placed, so that by this means the *Moon* will have two *Apogaeums*, and two *Perigaeums*; and according to him the must always be in one of her *Prigaeums*, at the time of her Opposition, or Conjunction; so that then he supposes her to press more strongly upon the Sea, than she doth at her Quadratures, when he saith she is in her *Apogaeum*, and consequently hath a weaker Pressure: But now besides that, if this were so

it would not solve the thing, the Fact it self is notoriously False; for the *Moon* is as often in her *Apogaeum* at New, and Full, as she is in her *Perigaeum* at those times; tho' it seldom happens, that she is exactly in either, at her Lunations; Vid. Mr. *Keil's* Examination of *Burnet's Theory*, Introduct. P. 17.

Dr. *Gregory* in his *Astronomy*, Book 4. Prop. 65 P. 384. demonstrates also, That if the Globe of the Earth, were every where covered over with a deep Sea (not now considering the Figure, which would arise from its Revolution, round its Axis) it would put on the Figure of an oblong Spheroid, whose Axis produced, would pass through the *Moon*; and this by Reason of the Gravitation of the Parts of the Water towards the *Moon*: And for the same Reason, the Earth would put on an oblong Spheroidal Figure, whose produced Axis, would also pass thro' the Sun.

And then in the next Proposition he proves, That the Flux, and Reflux of the Sea, is occasioned by the Water covering our Globe, its putting on two oblong Spheroidal Figures, whose Axes produced, would pass thro' the *Moon* and Sun.

And this true Cause of the Tides, he saith, was first discovered by the great *Kepler*, and afterwards improved very much, by our Incomparable Sir *Isaac Newton*; which shewed that the Sea must needs rise both under the *Moon*, and in the Part Diametrically opposite to that.

And this Spheroidal Figure of the Water of the Sea, which like two Mountains is stretcht out, one towards the *Moon*, and the other to the Part opposite to her, is continually moving, or shifting according to the daily Motion of the *Moon*, which it follows; (or rather indeed, the Earth moving towards the East in its daily Motion, shifts it self away from these Mountains of Water, which keep as it were immovable under and opposite to the *Moon*, as the more slowly moves towards the East) hence I say it must needs be, that the Water must twice rise and fall in 25 Hours; in which time the *Moon* moves from the Meridian of any Place, to the same again.

And because the Water of the Earth will swell, or be raised in those Places to whom the Sun is in the Zenith, or Nadir; (as he proves, Prop. 64.) altho' much less than when the *Moon* is so posited: Therefore in the Conjunction, and Opposition of these Luminaries, the aforesaid Protuberance of the Water will be conjoined; and consequently then the highest Spring-Tides; and the lowest Ebbs will be when both those Luminaries are in the Horizon of any Place; because the Water is then elevated, and now depressed by the conjoint Force of both.

But in the Quadratures of the Luminaries, the Sun elevates the Water where the *Moon* makes it fall, and makes it fall where the *Moon* elevates it; so that the Elevation of the Water depending only on the difference of these Forces, will be the least of all, and so for the Depression. Between the Syzygies, and the Quadratures, the Effects of the Luminaries on the Water, will be at a mean between the two former.

When the *Moon* is in the Equinoctial, the two opposite Protuberances, or Eminences of the Water, will be also in the Earths Equator, and each of them describing that greatest Circle of the Earth, by its Diurnal Revolution, it will move swifter, and when it is thrown towards the Shoars, will

rise higher there; besides that, something must also be allowed for the Equatorial Diameter of the Earth, being its longest, and consequently the Water there being something nearer to the Luminary, will be raised higher, by their Influence, than in other Parts.

And therefore whenever the Luminaries are either in Conjunction, or Opposition, in the Equator, their Forces will be conjoined to raise or elevate the Sea at the Equator; as happens at the Syzygies next the Equinoxes, or in or near March and September, when we have always the greatest Annual Tides; as the Tides at the Quadratures of those Moons, are always the least, or most Neap.

Again, the Tides, (other things considered) are always greatest when the Luminaries are in Perigæo, and least when they are in Apogæo; and since this is the Case of the Moon in every Lunation, but of the Sun only in the Winter, this joined to the former, occasions that the greatest Tides in the Syzygies, and the least in the next Quadratures, do precede the Vernal Equinox, and follow the Autumnal one.

Hitherto the Properties of the Tides have been considered only universally, as they affect the whole Globe of the Earth; it remains, that those should be next spoken of, which arise from the different Latitudes of different Places.

To which purpose, let BEKAQH represent the Earth, whose Centre is at T, its North Pole A, the other B: EQ the Equator, and CD, FG, two Parallels to it, one toward the North, the other toward the South.

Let the Water round the Earth conform it self into an Oblong Spheroid, (because of the Moon's being near it) whose Axis KH, produced towards H, shall pass through the Moon: Then shall TH, or TK, be the greatest height of the Water, (reckoning from the Centre T) and TM, or TN, the least; which latter is equal to the height of the Water in any Point of the Circle NM: *v. gr.* where ever it meets with the Parallels, CD, FG, as suppose in X or Y.

Also the Right Lines TC, TF, TD, and TG, (being supposed to be drawn) will denote the height of the Water in the several Points C, F, D, and G: Then drawing the Circle PO, parallel to NM, the supposed Right Lines, TO, TV, TS, TR, and TP, will be the heights of the Water in the Points O, V, S, R and P, where the said Circle meets with the Equator and its Parallels.

This being supposed, Let us consider any Place on the Earth, by its Diurnal Rotation, to describe the Parallel CD: It is then plain, that when the Place is at D; TD will then be the greatest height of that Water, when the Moon is in the Meridian of the Place; but the Water will be at lowest, when that Place hath moved to X; and then highest again when it is come to C, as hath been before shewn.

But now because TD is longer than TC, (as being nearer to the longest of all TH) in the present Case, when the Moon declines towards the elevated Pole, the height of the Water will be greater when the Moon is in the Meridian, above the Horizon, than when in the same Circle below it.

In like manner TG, will be less than TF, (as being nearer the shortest of all TM) that is in the Place, describing the Path, or Circle FG, by the Earth's Diurnal Motion. TG, will be the greatest height of the Water, happening while the Moon declines toward the depressed Pole A, and is on the Meridian above the Horizon; but this is less than its greatest Altitude which happens when the Moon comes to the other half of the Meridian.

Moreover, the Difference of this Tide, now greater, now lesser (in Places situate without the Equator, according as the Moon moves towards the visible, or latent part of the Meridian) will be greater, if it be conjoined with the Causes abovementioned, and which will produce a like Effect, *V. gr.* at the Solstices; for then in the Syzygies, both the Luminaries do most of all decline from the Equinoctial; and such a Declination, (it hath been shewed) occasions the Alteration of the Tides.

And this effect will yet be increased when the ascending Node of the Moon's Orbit, passes the Vernal Equinox; for then the Moon conjoined to the Sun, declines towards the North, or South, by the Quantity of her greatest Latitude, above the Declination which is equal to the Sun's greatest Declination.

All which things are in this State if the Earth be supposed to be quite covered over with Water, to a great Depth; but because of the Land, Islands, Straits, &c. there will be an infinite Variety in the Phenomena of the Tides; yet there is no doubt, but if that the Situation of Places, &c. be well considered, and Observations of the Tides there exactly made, all things will be found to agree very well with this Theory, and to be easily accountable from it.

TIERCE, or a *Third*, is a Term in *Musick*, signifying a certain Division of the *Monochord*, in which if the Terms be as 5 to 4, 'tis called, a *Tierce Major*, or a *Diton*; but if the Terms are as 6 to 5, then 'tis called a *Tierce Minor*, or *Demi-Diton*.

TIES aboard a Ship, are those Ropes by which the Yards do hang: And when the Halliards are strained to hoist the Yards, these *Ties* carry them up.

TILLER, the very same with the Helm of a Ship: It is most properly used in a Boat where that which would be the Helm in a Ship, is called the *Tiller*.

TIMBRE, (or rather *Timmer*, saith *Guillum*) is the Herald's term for the Crest which in any Achievement stands a top of the Helmet.

TIME, in *Musick*, is that quantity, or length whereby is assign'd to every particular *Note*, its due Measure, without making it either longer or shorter than it ought to be; and it is twofold, viz. *Duple* or *Common*, and *Triple*.

Duple, or *Semi-breve time*, generally called *Common*, because most used, is when all the *Notes* are encreased by two: As 2 *Longs* make a *Large*, 2 *Breves* a *Long*, 2 *Semi-breves* a *Breve*, 2 *Minims* a *Semi-breve*, 2 *Crotchets* a *Minim*, 2 *Quavers* a *Crotchet*, 2 *Semi-quavers* a *Quaver*, and 2 *Demi-Semi-quavers* a *Semi-quaver*.

This sort of *Time* is usual in *Anthems*, *Almains*, *Pavans*, *Fantasies*, &c.

Triple Time, is that wherein the Measure is counted by *Threes*: As one *Semi-breve* is equivalent to 3 *Minims*, one *Minim* to 3 *Crotchets*, &c. So that this swifter *Time* or Measure is proper for *Airy Songs*, and *Light Lessons*: As *Courants*, *Sarabands*, *Figgs*, &c.

To these sorts of *Time* may be added, *Sesquialteran Proportion*, which signifies a *Triple Measure* of three *Notes*, to two such like *Notes* of the *Common Time*.

TIME, is a certain Measure depending on the Motion of the *Luminaries*, by which the Distance and Duration of things is measured; and is either *Astronomical*, which is simply taken from the Motion of the Stars: Or *Civil*, which is *Astronomical Time* accommodated to *Vulgar Uses*.

Astronomical, *Mathematical*, or *Absolute Time*, flows equably in its self without Relation to any thing External; and by another Word is called *Duration*.

But *Relative*, *Apparent*, or *Vulgar Time*, is the sensible, and external Measure of any Duration estimated by Motion, and this the *vulgar Uses*, instead of true *Time*.

TIN-GLASS. See *Bismuth*.

TINEA, when a sort of running Sores in the Head, full of little Holes (called *Achores*) continue long, or be too slowly or ill cured, they grow into *Tinea's*, i. e. crusty stinking Ulcers of the Head, which gnaw, and consume its Skin; therefore 'tis deservedly reckoned amongst the Diseases of Children, but when they are a little grown; for tho' adult Persons are sometimes troubled with this Disease, yet they contract the rudiments, and Seeds of it in their Infancy. It is called *Tinea*, which signifies a Moth, from those little Worms which eat, and consume Cloths; because those Ulcers prey upon the Skin of the Head, as those Animals upon Cloths. What the *Greeks* called this Distemper, is not so obvious. *Blanchard*.

TINCTURE, the *Heralds* call the Colours in an Escutcheon, or Coat of Arms, *Tinctures*.

TINCTURE, in Chymistry, is a Dissolution of the more fine, and volatile Parts of a mixt Body in Spirit of Wine, or some such proper Menstruum. The Matter is bruited in a Mortar, and then put into a Matras, and on it the Spirit of Wine (usually) is poured to the height of two, or three Fingers above it: Then the Glass is close stopp'd and set in Digestion in a Sand Heat for four or five Days, till the Spirit is well impregnated, and hath received an high Colour, or Tincture from the Matter. Thus the Tincture of Cinnamon, and all Odoriferous Vegetables are drawn.

And when Tinctures are drawn from Minerals, or Metals; this Spirit is the common Menstruum made use of.

TINNITUS Aurium, is a certain buzzing, or tingling in the Ears, proceeding from Obstruction, or something that irritates the Ear, whereby the Air that is shut up, is continually moved by the beating of the Arteries; and the Drum of the Ear is lightly verberated; whence arises a buzzing, or noise.

TIRE, or as the Seamen pronounce it *Teer* of Guns, are a Rank of them placed along a Ship's side, either above, upon Deck, or below: The former of which, are called the *upper Tire of Guns*; the latter, the *lower Tire*. There is also in some Ships half a *Tire* on the *Fore-deck*, and *Half decks*.

TITE, the Seamen say a Ship is *Tight* or *Tite*, when she is so staunch as to let in but very little Water; and this is known by the smell of the Water Pump out, for if she let in but little Water, it will always stink, otherwise not.

TITILLATION, is that Sensation we have in any Part of the Body when tickled.

TITLE of Entry, is when one is seized of Land in *Fee*, makes a Feoffment thereof on Condition, and the Condition is broken; after which the Feoffor hath *Title* to enter into the Land, and may do so at his Pleasure, and by his *Entry* the Freehold shall be said to be in him presently: And 'tis called *Title of Entry*, because he cannot have a Writ of Right against his Feoffee upon Condition, for his Right was out of him by the Feoffment, which cannot be reduced with *Entry*, and the *Entry* must be for the Breach of the Condition.

TIMESIS, is a Figure in the Grammar, whereby a compound Word hath its Parts separated from one another, by the Interposition of some other Word, as in this of *Terrence*.

Quæ meo cunque animo lubitum est facere.

Where *Quæ* and *cunque*, are divided by putting *meo* between them.

TOISON d'Or, (French) the Term in Heraldry for a golden Fleece, which is sometimes born in a Coat of Arms.

TOLL, or *Tboll*, in common Law, hath two Significations. First, It is used for a Liberty, to buy, and sell within the Precincts of a Mannor. Secondly, For a Tribute, or Custom paid for passage, &c. Some Interpret it to be a Liberty, as well to take, as to be free from *Toll*; for they who are Enfeoffed with *Toll* are Custom-free.

TOLT, is a Writ, whereby a Cause depending in a Court-Baron, is removed to the County-court; and is so called, because it does *Tollere loquelam*, from the one Court, to another.

TOMENTUM, properly signifies *Flocks*, or *Locks* of Wool; but by Botanists 'tis used for that soft Downy Matter which grows on the Tops of some Plants; which therefore are denominated from hence; as *Græmen Tomentosum*, *Carduus Tomentosus*, &c.

TOMETICA, the same with *Attenuantria*.

TOMOTOCIA, the same with *Hysterosomia*. *Blanchard*.

TONDINO, a Term in Architecture. See *Astragal*.

TONE, a Term in Musick, signifying a certain Degree of Elevation, or Depression of the Voice, or some other Sound. *Musicians* commonly determine it to be the sixth Part of an *Octave*, in which Sense, the *Octave* is said to be composed of Five *Tonets*, and two *Semi-tones*; and the *Tone* to be the

Difference between the fourth and fifth. A *Tone*, or whole Note is divided into nine Particles call'd *Comma's*, five of which are assigned to the greater *Semi-tone*, and four to the lesser.

TONICA, are those things which being externally applied to, and rubb'd into the Limbs; strengthen the Nerves, and Tendon. *Blanchard*.

TONNAGE, is a Custom or Impost paid to the King, for Merchandise carried out, or brought in Ships, and such like Vessels, according to a certain Rate upon every Tun.

TONSILLÆ, the Almonds of the Ears, as they are vulgarly call'd, are two Glands seated at the Root of the Tongue, on each side of the *Uvula*, and at the Top of the *Larynx*, covered with the common Membrane that invests all the Mouth.

Dr. *Wharton* says, That tho' they seem two, yet they are really but one, being continued to one another by a thin and broad Production, which is of the same glandulous substance with themselves. He says, They are of a yellowish Colour, and compares their Substance to concreted Honey, only they are of a more firm Consistency, but they look sandy like it: They have small Vessels from the *Jugular Veins* and *Arteries*, and *Nerves* from the fifth Pair.

They have each a large oval common Duct, or *Sinus* that opens into the Mouth so wide in an Ox, that one may put the tip of the little Finger into it. Into this many lesser open, and by a discharge into the Mouth, &c. the Liquor that is separated in the Gland.

Fallopian hath observ'd this Aperture or *Sinus*, to look like a small Ulcer when the Gland has been swelled, and sometimes by unskilful Persons, to have been treated as such, when it has only been forced to gap a little too much through the too plentiful Defluxion of Humours upon the Gland.

The Use of these Glands was by the Ancients supposed to be only to separate a certain mucous, or pituitous Matter from the Blood, for the moistening, and lubricating of the *Larynx*, Tongue, Fauces, and Gullet: But Dr. *Wharton*, and as many as attribute a fermentative Quality to the *Saliva*, ascribe a more noble Use to them; viz. to make a Ferment to further the Concoction of the Stomach: Yea, Dr. *Wharton* (but I think mistakingly) thinks that they are the chief Instrument of Taste.

TOP (of a Ship) is a round Frame of Boards lying upon the Cross-trees near the head of the Mast: Here they furl or loose the Top-sail, &c.

TOP-ARMOURS, are a kind of Cloths hung about the Round-tops of the Masts for show; and also to hide the Men which are in the top in a Fight, who lie there to sling Stink-pots, &c. or to fire small Shot down on the Enemy in case of Boarding.

TOP-GALLANT-Masts of a Ship are two, viz. *Main-top-gallant-Mast*, and *Fore-top-gallant-Mast*: And these two are small round Pieces of Timber, set on to their respective *Top-Masts*; on the Top of which Masts are set the Flag-staffs, on which the Colours, as Flags, Pendants, &c. hang.

TOP-MASTS of a Ship are 4; which are made fast, and settled unto the Heads of the *Main-Mast*, *Fore-Mast*, *Missen-Mast*, and *Boltsprit* respectively.

TOP-ROPES, are those with which the *Top-Masts* are set, or struck. They are reeved thro' a great Block, which is seized on one side under the Cap, and then they are reeved thro' the *Heel* of the *Top-Mast*, where is a Brais *Shiver* placed athwart Ships; after this they are brought up and fasten'd

on either side the Cap with a Ring: The other part of them comes down by the *Ties*, and so is reeved into the *Knighthead*; and when it is to be heaved, is brought to the *Capstan*: These *Top-Ropes* belong only to the *Main*, and *Fore-Mast*.

TOPHUS, is a stony Concretion in any Part of an Animal Body; which is also frequently called a *Tophaceous Matter*.

TOPICK in Medicine, signifies what is outwardly applied to the Patient's Body, to cure him of his Distemper.

TOPICK in *Logick*, is a *Ground*, or *Subject* on which to found, or from whence to draw an Argument in Disputation.

TOPINARIA, is the same with *Talpa*. *Blanchard*.

TOPOGRAPHY, is a particular Description of some small quantity of Land, such as that of a Mannor, or particular Estate, &c. or such as Surveyors set out in their Plots, or make a Draught of, for the Satisfaction, and Information of the Proprietors.

TOPPING the Lifts, is the same as haling the Top-sail Lifts; and therefore they say *Top a Star-board*, or *Top a Port*; that is, hale upon the Star-board or Larboard Lift. See *Lifts*.

TORCE, a Term in Heraldry for a Wreath; which see.

TORCULAR *Herophili* in Anatomy, is that Place where the four Cavities of the *Dura Mater*, or thick Skin of the Brain are joined.

TORE, or *Torus* in Architecture, or as 'tis sometimes spelt *Thore*, is that round Ring which encompasses in the Column, between the *Plinth* and the *Lift*. This is the third Member of the Base of a Column; it seems like a round Cushion, swelling out with the Weight of the Incumbent Pillar.

TORICELLIAN Experiment, so called from its Author, and Inventor *Toricellius* an Italian; is when a Glass Tube of about 3 Foot in Length, and $\frac{1}{2}$ of an Inch Bore being sealed (or closed in the Fire) at one end, is at the other quite filled with Quick-silver; and then being stop't with the Finger, hath its unsealed end thrust down under the Surface of some Quick-silver, contained in a Vessel; and then the Finger being removed from the Orifice, and the Tube put into an erect Posture, the Mercury will descend, or run out till it remain in the Tube, to the height of between 28 and 31 Inches, leaving in the top of the Tube an apparent empty Space.

This Quick-silver thus suspended, hath been found to encrease or lessen its height in the Tube, according as the Weather alters for dry or wet; and therefore when hung in a Frame with a Plate of Divisions for this purpose, 'tis called the Quick-silver Weather-glass, the *Mercurial Barometer*, or *Baroscope*; which Words see.

That the Cause of the Suspension of the Mercury in this Tube, is occasion'd by the Weight of the Atmosphere incumbent on the Orifice of the Tube, and the stagnant Mercury in the Basin over it; is the received Opinion, and seems proved by these Experiments and Reasons.

First, That when a Tube, in which this *Toricellian Experiment* is duly made, is placed (Cistern and all) in the Receiver of the Air-pump; after one Suction the Mercury will descend, and so still will it go lower and lower at every Suction of the Air

Air out, 'till at last the Surface of the Mercury within the Tube, will be a very little higher, than that which is in the Basin: But as soon as the external Air is let into the Receiver again, it will by its Spring (which is always equal to the Gravity of the Atmosphere) so press on the Surface of the Mercury in the Cistern, as to force it up again into the Tube with such Violence as will endanger breaking it, and it will (when quiet) regain near its former height in the Tube.

2. It hath been found by repeated Trials, that the included Mercury will sink if the Tube be carried up to the top of an high Hill, or up but to the Top of an high Tower, Steeple, &c. the reason of which appears to be, that the Column of incumbent Air which pressed upon it before, being now lessened in length by the Altitude of the Hill, must needs gravitate less than at the Bottom, and consequently cannot bear the Mercury up so high in the Tube. And this Mr. Boyle takes to be a kind of *Experimentum Crucis*, determining plainly the Cause of the Mercury Suspension.

3. If after the Experiment is made and the Mercury settled, you lift the Tube out of the stagnant Mercury, the external Air will press in with that Violence, and drive the Mercury up to the Top of the Tube so forcibly, as will endanger the breaking out of the sealed end.

TORID Zone. See *Zone*.

TORRIED, *i. e.* Roasted, it was formerly the usual way to *Torriste* Opium, or roast it against the Fire, before any Medicinal Preparation was made with it, in order to get out some malignant Parts that they tasted were in it before: But by this Means its volatile Spirits and Sulphur in which its great Virtue consists were evaporated and destroyed. And indeed 'tis found by Experience, that in most Cases *Crude Opium* is better than any other Preparation of it whatsoever.

TORTEAUXES, a bearing in Heraldry. See *Balls*.

TORUS, in Architecture, is a round, thick Circle running round the Base of a Pillar, resembling the form of a great Ring.

TOTTED, a good Debt to the King, is by the *foreign Opposer*, or other Officer noted for such, by writing this Word *Tot* to it.

TOUT temps prêt & uncore est, is a kind of a Plea in way of Excuse, or Defence for him that is sued for any Debt, or Duty belonging to the Plaintiff.

TOW, whatever is drawn after a Ship, or Boat with a Rope, &c. is said to be *Towed* after a Ship, or to be in her *Tow*.

TOXICA, are poisonous Medicaments, where-with *Barbarians* use to anoint their Arrows. *Blanchard*.

TRABEATION, in Architecture, is the same with *Entablature*, viz. the Projecture on the Top of the Walls of Edifices which supports the Timber Work of the Roof. *Trabeation*; or *Entablature*, is different according to the several Orders and comprehends the Architrave, Frize, and Cornice.

TRACHEA, the same with *aspera Arteria*; which see.

TRACHOMA, is a Scab, or Asperity of the inner Part of the Eye-lid. *Blanchard*.

TRAGÆA, a Term in Pharmacy; the *Tragæa*

differ not from Powders, but that the Ingredients whereof they are prepared, are not beat so small: And they are applied either in Fumigations, or externally to the Body, by being put into a Linen Bag, and then into Wine or other Liquor, that they may communicate their Strength, and Qualities to it: Sometimes also they are compounded of some sorts of Antidotes, or Counter-poisons, and other odoriferous things, and of simple Medicines reduced into a Powder, with an Addition of Sugar, in order to be taken inwardly. *Blanchard*.

TRAGUS, as *Hircus* (because 'tis sometimes Hairy) is one of the Protuberances of the *Auricula*, being that next the Temple, as that which is opposite to it, and to which the soft Lobe of the Ear is annexed, is called *Antitragus*.

TRAJECTORY, of a *Comet*, is the Line which by its Motion it describes; which *Hewelius* in his *Cometographia*, will have to be nearly a Right one; but it seems rather to be a very Excentrical Ellipsis.

The Excellent Sir *Isaac Newton*, in *Prop. 41.* of his third Book, shews how to determine the Trajectory of a *Comet* from three Observations; and in his next and last Proposition, how to correct a Trajectory graphically described. See *Comets*.

TRAIL-BOARD, in a Ship, is a carved Board on each side of her Beak, reaching from her Main Stem to the Figure, or to the Brackets.

TRAIN, is the Number of Beats which the Watch maketh in an Hour or any other certain time.

TRANCHE, a Word used by the *French* Armors, to express a manner of *Counterchanging* in an Ecutcheon of this Form.

But our *English* Herald's Blazon it thus, he beareth, *Per Pale Argent and Azure, per Bend Counterchanged*.

TRANSCENDENTAL Curves are such; as when their Nature, or Property comes to be expressed by an *Equation*, one of the variable, or flowing Quantities there, denotes a *Curve Line*; and when such *Curve Line* is a *Geometrick* one, or one of the first Degree, or Kind; then the *Transcendental Curve* is said to be of the second Degree or Kind, &c.

TRANSCENDENTAL Quantity. See *Quantity*.

TRANSCRIPTO pedis finis levati mittendo in Cancellarium, is a Writ for the certifying the Foot of a Fine, levied before Justice in Eyre, &c. into the Chancery.

TRANSCRIPTO Recognitionis factæ coram Justiciariis itinerantibus, &c. Is a Writ for the certifying of a Recognizance, taken before Justices in Eyre, &c. into the Chancery.

TRANSFUSION of the Blood, out of one Animal into another, is thus performed: Bind and lay them both down on a Table, and then making strong Ligatures round each of their Necks, open the *Right Jugular Vein* and *Carotid Artery*, of the Man, (if you can get one to try) and the *Left* of the Sheep, &c. (or vice versa): Then dextrously fitting two small Quils, or Pipes, cross-ways from Vein to Artery, so that the Arterious Blood of the Sheep, may run into the Veins of the Man, and the Vepal Blood into his Arteries, the Sheep receiving his after the same manner: And when the rational and sagacious Looks of the Sheep, and the

the Sheepish ones of the Man begin to appear plainly distinguishable, the Operation is well over; separate them and bind up their Wounds; and 'tis done.

Of this *Transfusion*, (if any one hath a fancy to try it) he may find a more large Account in *Philosoph. Transact.* N. 20.

'Twas first (as is said) practis'd by Dr. *Lower*; and by the Honourable Mr. *Boyle* communicated to the *Royal Society*.

And in N. 26. P. 479. of *Philosoph. Transact.* there is an account, that one Mr. *Gayant* of *Paris*, by Transfusing the Blood of a Young Dog into an Old one that was exceedingly Decrepid, and bare his Age very poorly, made the Old Curr so Lively and Brisk, that in two Hours after the Operation was over, he leapt and friskt about with very Youthful Agility.

*So that, Transfusion of the Blood,
Which makes Fools Cattle, did him Good.*

Hudibr.

TRANSGRESSIONE, is a Writ commonly called, a Writ or Action of Trespass, of which *Fitz-Herbert* reckons two sorts. One *Viscountiel* so called, because it is directed to the Sheriff, and is not returnable, but to be determined in the County; the form whereof, differs from the other, because it hath these Words, *Quare vi & armis*, &c. The other is term'd a Writ of *Trespass* upon the Case, which is to be sued in the King's Bench, or Common Pleas, in which are always used these Words, *vi & armis*. See *Trespass*.

TRANSIT, in *Astronomy*, signifies the passing of any Planer just by or under any Fixt Star; or of the Moon in particular, covering or moving close by any other Planer.

TRANSITION, in *Musick*, is when a greater Note is broken into a lesser, to make smooth, or sweeten the roughness of a Leap, by a gradual *Transition*, or passing to the Note next following: whence it is commonly called, the *breaking of a Note*, being sometimes very necessary in musical Compositions.

TRANSLATION, in *Law*, signifies the setting from one Place to another, as to remove a Bishop from one Diocese to another, is called *Translation*, and such a Bishop Writes not *Anno Consecrationis*, but *Anno Translationis nostrae*.

TRANSMUTATION, in *Geometry*, is to reduce, or change one Figure or Body, into another of the same Area, or Solidity, but of a different Form, as a Triangle into a Square; a Pyramid into a Parallelopiped, &c.

TRANSMUTATION of *Metals*, is what the Alchymists call the *grand Operation*, or finding the *Philosophers Stone*; which is such a curious universal Seed of all Metals, that if you melt any Metal in a Crucible, and then put in but a little of this *Stone* or *Powder of Projection*, (as they often call it) into the melted Metal, it will immediately, (as they tell you) turn it into Gold, or Silver, according as they use it.

The Famous Dr. *Dickinson* in his Book de *Quintessentia Philosophorum*, tells the World he was twice shewed this mighty Feat, by an Adept that went by the name of *Mundanus*: To which I shall only say, as Mr. *Boyle* used to do in such Cases, *be that hath seen it, hath more reason to believe it, than he that hath not.*

You have in *Lemery*, Dr. *Dickinson*, and others, long Accounts of the Impositions, and Cheats of several pretended Adepts: How they fix *Mercury* with *Verdegrease*, and then Colour it deeper (for the *Verdegrease* will give it a yellow Colour) with *Turmerick Cadmia*, &c. and then they would pass it thus off for true Gold: But if you should go about to try it by the *Copple*, it will all fly away in Fumes. And indeed nothing produced this way ought to be adjudged true Gold, (unless it have all the Properties of true Gold, for all is not so that Glisters, and looks yellow) that is, it must be able to endure *Coppelling*, *Cementation*, *Purification* with *Antimony*, and the *Depart*. It must have the *Malleability*, and great *Ductility* of that Metal; and especially its true *Specifick Gravity*, i. e. it must be to Water, as 19, or 18 and $\frac{1}{2}$ is to 1, or else 'tis some way false and Counterfeit. And this last Test of Specifick Gravity, would, if not attainable, argue an apparent Impossibility of Transmutation of Metals. Nor indeed can I see how any one can propose to increase the Relative, or Specifick Gravity of any Body whatsoever by a certain and determinate Way; and till this is done, all other Pretences are vain; for let it look how it will, if it have less Specifick Gravity than 18 and a half to 1, it cannot be true Gold; and therefore must either be a mixture of some Gold and other Metals together; or else some of them under the Disguise of Gold.

The trick of turning Cinnabar into Silver, is pretty enough, and ought to be known.

They bruise the Cinnabar grossly, and then *stratise* it in a Crucible with granulated Silver: The Crucible is placed in a great Fire, and after due time for its Calcination, they take it off; and pouring the Matter out, they shew the Cinnabar turn'd into real Silver, tho' the Silver Grains appear in the Number and Form they were put into the Crucible. But the Mischief of all is, when you come to handle the Grains of Silver, you find them nothing but light fraible Bladders which will crumble to pieces between your Fingers: The Silver is almost of it got in and incorporated with the Cinnabar, and the whole weighs no more, nor indeed so much, as it did when it was first put into the Crucible.

But to give you something on the behalf of *Transmutation*, Mr. *Boyle* talks of his own separating from common Mercury; near a fourth part of its weight in clear Liquor, *Sep. Chym. Pag. 134.* and tells us also, that two Friends of his did, by pressing Mercury in a skilfully managed Fire, turn it almost Weight for Weight into Water; but they tell us not in either Experiment, the Specifick Gravity of the produced Water, nor of the remaining untransmuted Mass of Mercury; which unless one knew, there is no judging of the Reality of the *Transmutation*.

In his *Second Essay on the succeeding Experiments* he tells us, that Dr. K. a Person far both from the Temptation and Custom of Lying, assured him he did once light on a kind of *Aqua fortis* with which he did divers times draw a *Volatile Tincture*, which could and did turn Silver into Gold; and that out of an Ounce of Gold he drew as much of this Tincture, as did Transmute an Ounce and a half

half Silver into that Noble Metal: But withal, that designing afterwards to prosecute this surprising Experiment further, he could never again make such an *Aqua fortis* as would draw any such Tincture from Gold. Tho' Mr. Boyle seems inclined to believe the Thing possible, because he himself more than once was able to deprive Gold of its yellow Colour, and to communicate it to a *Menstruum*.

He tells us also in his Origin of Forms, P. 235, That by putting to a Calx of Gold, a good Portion of his *Menstruum Peracutum*, with a little Spirit of Salt, it did slowly, and quietly dissolve it, only at the bottom remained a white Powder which the *Menstruum* would not touch, and which was Indissoluble in *Aqua Regalis*. This white Powder being with Borax, or some such flux Powder melted into a Metal, was found to be white like Silver, yielding to the Hammer, Dissoluble in *Aqua fortis*, or Spirit of Nitre; and would there leave a true Silver Calx, odiously Bitter. This is a strange Experiment, which had Mr. Boyle made any more than once, as I cannot find that he had; and had he tried the Specific Gravity of this apparent Silver, and found it to be less than that of Gold, it had been no small Proof of the Possibility of a Transmutation of Metal.

But what that noble Author relates in another Place of the same Book, about the Transmutation of Water into Earth; I judge the more considerable, because he made use of Hydrostaticks, to examine his Transmuted Matter, viz.

That rain Water being distilled, or re-distilled (by a Friend of his) many times over again (near 200 Times) did after each Distillation, leave at the Bottom of the Glass Body, a *white Earth* in a considerable Quantity; and this was afforded (saith Mr. Boyle) more plentifully in the latter Distillation, than in the first.

This he believed to be a certain Quantity of Water, actually turned into Earth, and it was above twice as heavy (specifically) as common Water, and was of so fixt a Nature, that it lay in a red hot Crucible for a considerable Time, without being diminished in Weight, or emitting any manner of Smoak.

He takes notice also, that an Ounce of Water yielded fix Drams of Powder, a considerable Quantity of Water still remaining behind; and that the Glass in which it was distilled, was not in the least sensibly Damaged thereby. Yet this great Chymist was not without some Scruples about the Experiment. For,

First, He was not satisfied that the remaining Water, was not Lighter than before the Distillation.

Secondly, He was not assured that no Parts of the Glass Vessel were Dissolved, or incorporated with it.

Thirdly, Nor whether Water be truly an Homogeneous Body; for if it be, he thinks it Difficult, if not impossible to conceive that it can be Transmuted: For how can (saith he) the bare Convention of the Parts of a Fluid into a Concrete, alter the Specific Gravity.

TRANSNOMINATIO. See *Metonymia*.

TRANSOM, is the Term which some give to

the Vane of a *Cross-staff*, which is made to slide along upon the *Cross-staff*, by means of a Square Socket; and may be set to any of the Graduations on the Staff, in an Observation.

TRANSOM of a Ship, is that main Piece of Timber which lieth across her Stern at her Burtock, directly under the Gun-room Port; as when a Ship is built broad or narrow at her Transom, she is said to have a broad or narrow Burtock.

TRANSPARENT, or Diaphanous Bodies are such whose Pores probably are all right and nearly Perpendicular to the Plain of their Surface, and so consequently do let the Rays of Light pass freely thro' them, without being refracted: Whereas the Pores of *Opacous Bodies* are in crooked oblique Position, by which means the Beams of Light cannot pass freely thro' them, but are variously refracted and lost.

TRANSPARATION, a Breathing through, as of Vapours through the Pores of the Skin. *Blanchard*.

TRANSPPOSITION of Equations. See *Equation*.

TRANSVERSALIS *Colli*, is a Muscle of the Neck, which ariseth fleshy from all the Transverse Processes of the *Vertebrae* of the Neck, except the first and second, and is inserted after an oblique ascending Progress to their Superior Spines; it being a Continuation of the same Series of Muscular *Fibres* that compose the *Sacer* and *Semispinatus*: If either of those Muscles act, the *Vertebrae* of the Neck are moved obliquely backwards, as when we look over one Shoulder.

TRANSVERSALIS *Musculus*, one of the Muscles of the Abdomen, so called, because its Fibres run across the Belly: Its use is to compress the Abdomen exactly inwards, in *Expiration*.

TRANSVERSALIS *Pedis*, is a Muscle of the Foot so called from its Transverse situation; it ariseth Tendinous from the Internal *Os Sesamoides* of the Great Toe, and becoming a fleshy Belly in its Progress over the first internodes of the two next Toes, it is lessened at its Insertion to the Inferior part of that *Metatarsal* Bone, which supports that Toe next the lesser. Its use is to bring the lesser Toe towards the greater.

TRANSVERSALIS *Penis* is a Pair of Muscles arising near the *Erectores Penis*, and thence pass transversely to their Insertions at the upper part of the Bulb of the Cavernous Body of the *Urethra*: They have this Name for their Situation. They are mentioned by *Lindanus* after *Aguapendens*, as *Bartholin* observes, *Lib. 1. cap. 24*.

TRANSVERSALIS *Sutura*, is a Suture which runs across the Face; it passes from one Temple to another transversely, over the Root of the Nose, joining the *Os Frontis*, and the *Synicrut*: 'Tis the first of the true Sutures, and is usually called, *Coronalis*.

TRANSVERSE *Axis*, or *Diameter*. See *Latus Transversum*.

TRAPEZIUM, see under *Quadrilateral Figures*. For its Superficial Content. See *Area*.

TRAPEZIUM, is a Muscle of the Shoulder-blade, which serves to move it upwards, backwards, and downwards.

TRAPEZOID, is a solid irregular Figure, having four Sides not parallel to one another.

TRAVAILING-BAROSCOPE, the same with *Portable Barometer*.

TRAVERSE,

TRAVERSE, a Term in *Gunnery*, signifying to turn a Piece of *Ordnance* which way one pleases upon her *Platform*.

TRAVERSE, a Sea Word used in these Senses; they call the Way of a Ship when she makes Angles in and out, and cannot keep directly to her true Course, a *Traverse*.

Also the laying and removing a Piece of Ordnance, or great Gun, in order to bring it to bear, or lie level with the Mark, is called *Traversing* the Piece.

TRAVERSE, in Navigation, is the Variation or Alteration of the Ship's Course, upon the shifting of Winds, &c.

Note, That in Sailing in respect of the Wind, is either *before a Wind*, *by a Wind*, or *Largely*.

If a Ship Sail by or against a Wind, there ought to be an allowance for her Lee-way, and that more or less, according to the Growth, and Suage of the Sea, Mould of the Ship, and Sail she bears, &c.

E X A M P L E.

Of a Traverse.

A Ship from Latitude 47 Degrees, 00 Minutes N. Sails S. E. by S. 23 Miles, and then Sails S. W. by W. 31 Miles, and afterwards W. N. W. 40 Miles; lastly, N. 28 Miles.

I demand the Course and Distance failed from the first Place of Departure, and the Latitude she is now in.

Geometrically.

First, Draw the Meridian Ab , with 60 Degrees from the Chords, describe the Arch bc ; which make equal to 33 Degrees 45 Minutes = 3 Points; draw Ac , and make Ad , or Ac equal to 23 Miles.

Secondly, Draw de parallel to Ab ; from d , with 60 Degrees of the Chords, describe ef , which make equal to 5 Points, draw gf , for 31 Miles from d to g .

Thirdly, Draw gh parallel to Ab ; with 60 Degrees of the Chords describe hi , which make equal to 6 Points; draw gi , for 40 Miles from g to k .

Fourthly, Draw kl parallel to Ab , make kl equal to 28 Miles; draw lA , that measured on the *Equal Parts*, gives 50, 4 Miles, and the Angle Alk measured on the Chords, gives 82 Degrees, or $7\frac{1}{2}$ Points from the *Meridian*; so that if she had sail'd on a straight Line, and single Course from A to l , that Course had been W. by N. $\frac{1}{4}$ Westerly, and the Distance 50, 4 Miles.

By the Logarithms.

As the Radius ————— 10,00000
Is to the Dist. of the first Course 23 Mil. 1,36172
So is the S. Compl. of the Co. S. $56^{\circ} 15' - 9,91984$

To the Diff. Lat. in the first Cou. 19, 1 M. 1,28156
Then, as the Radius ————— 10,00000

Is to the Distance Ad 23 Miles ————— 1,36172
So is the S. $33^{\circ} 45' = \sqrt{d} A b$ the first C. 9,74473

To the Departure in the first Course 12, 8, 1, 10646

Thus proceeding with the several Courses, and Distances given, find the Departures, and Difference of Latitude to them all.

If the Course be between the North and East, then the Difference of Latitude is called Nothing, and the Departure Easting; if the Course be in the North-west Quarter, then the Difference of Latitude is called Nothing, and Departure Westing. If the Course be between the South, and East, the Difference of Latitude is called Southing, and the Departure Easting, &c.

Now place all the said Differences of Latitude, and Departures in a Table, the Northings all under one another, under the Title *Northing*, and the Southings, under the *Southing*; the Eastings in the East Column, and the Westings in the West Column.

Then add up all the Northings, as likewise the Southings, and so the Eastings, and also the Westings: Lastly, Take the Sum of the Northings, from that of the Southings, if the Southings make most; or the Sum of the Southings from the Northings, that you may have their Third Difference, which is the Difference of Latitude; as also, the Difference of the Totals, of Easting, and Westing for the Departure; by which Difference of Latitude, and Departure, according to *Case 5* of Right-angled Triangles, you will find the Direct Course and Distance.

Course.

Courfe.	Points.	Distance.	North.	South.	East.	West.
S E by S	3	23		19,12	12,78	
S W by W	5	31		17,22		25,78
W N W	6	40	15,31			36,96
North.	0	28	28,00			
From Sum take			43,31 36,34	36,43	12,78	62,74 12,78
Refts.			6,57			49 96 Dep. West

Departed }
 Difference of } Latitude { $47^{\circ} 00'$ North.
 Present } $00^{\circ} 07'$
 { $47^{\circ} 07'$ North.

As the Difference of Latitude 7 Miles—0,845098

Is to the Radius ————— 10,000000

So is the Departure 49,9 ————— 1,698100

To the Tan. of the Course 82,1 ————— 10,853002

And,

As the S. of the Course $82^{\circ} 1'$ ————— 9,995770

Is to the Departure 49,9 Miles ————— 1,698100

So is the Radius ————— 10,000000

To the Distance 50,4 Miles ————— 1,702330

Example 2.

A Ship being bound to the Eastward, and finding the Wind variable, a small Gale, and smooth Water, plies upon these several Courses, with the Distances on each Course; as followeth.

The Lar-board Tack on Board, Wind from S S W to S, and so to S S E and E.

	Miles
South-East by East half Easterly	5
East South-East	4
East by South	7
East half Northerly	3

The Star-board Tack on Board, the Wind S E, E S E, E, &c.

South South-West	5
South by West	6
South	4
South South-East	7
South-East by South	3

The Direct Course and Distance from the first place of Departure is requir'd.

The Work by the Traverse Table.

Courfe.	Points	Dist.	North.	South.	East.	West.
S E by E $\frac{1}{2}$ Ely	$5\frac{1}{2}$	5		2 36	4 41	
E S E	6	4		1 53	3 70	
E by S	7	7		1 37	6 86	
E $\frac{1}{2}$ Nly	$7\frac{1}{2}$	3	0 29		2 98	
S S W	2	5		4 62		1 91
S by W	1	6		5 88		1 17
South	0	4		4 00		0 00
S S E	2	7		6 47	2 08	
S E by S	3	3		2 49	1 67	
Sum			0 29	28 72 0 29	21 70 3 08	
				28 43	18 62	

Having set down the several Courses, and Distances, then in the *Traverse Table* find the Course on the Head of the Table, if under four Points, but at the bottom, if above four Points; and look the Distance in the Left Hand Column, and in the

Square meeting will be the difference of Latitude and Departure under the respective Titles.

Thus, above $5\frac{1}{2}$ Points, and right against 5 m, I find over Title Diff. Lat. 2 36 m, the Difference of Latitude, and over Dep. 4. 14, the Departure, in the

the first Course, which being placed in their proper Columns, according as they are Northing or Southing, &c. Proceed in like manner with all the other Courses or Distances entering and corresponding Differences of Latitude and Departures in their Columns: Then add up the Columns of Diff. of Lat. and Departure, Subtracting the lesser Difference of Latitude from the greater, and the lesser Departure from the greater, and the Remainders are the whole Difference of Latitude and Departure she hath made from the Place of her Departure; so in this Example, she's 28, 43 *m* to the South of the Place of her Departure; and 18, 62 *m* East, with which by Case 5th I find her Course S E by S 2 Southerly, and Distance 34 5 *m*.

TRAVERSE. There is also a Partition of an Escutcheon us'd in Heraldry of this Figure, which they call *Parted per Pale Traverse*.

Argent and Gules.

TRAVERSE, is also a Word much used in Answer to Bills in *Chancery*; or it is that which the Defendant pleadeth or saith in Bar, to avoid the Plaintiff's Bill, either by confessing or avoiding, or by denying and *traversing* the material parts thereof.

To *traverse* an Office, is nothing else but to prove, That an Inquisition made of Lands or Goods by the Escheator, is defective, and untruly made. And to *traverse* an Indictment, is to take Issue upon the chief Matter, and to contradict or deny some Point of it.

TRAVERSE, in Fortification, is a little Trench bordered with two Parapets, viz. One on the right Side, and another on the left, which the Besiegers make quite thwart the Mouth of the Place, to pass secure from Flank-shot, and to bring the Miners to the Bastions.

This *Traverse* is usually covered on top with Hurdles or Bains laden with Earth, for Security from the Fire-works, and differs from a Coffre only in this respect, That it is made by the Besiegers, and the other by the Besieged.

This Word is now often us'd for any Retrenchment or Line Fortify'd with Fascines, Gabions Barrels, Bags of Earth, &c.

TRAVERSE-Board, is a little round Board hanging up in the Steerage of a Ship, and bored full of Holes upon Lines showing the Points of the Compass; upon it, by moving of a little Peg from Hole to Hole, the Steers-man keeps an account how many Glasses (that is, half Hours) the Ship Steers upon any Point.

TRAUMATICKS, are those things which being taking in Decoctions and Potions, fetch the ferrous and sharp Humours out of the Body, and so attenuate the Blood, that it may be conveniently driven to the wounded, broken, or bruised Parts. *Blanchard.*

TREASON, is of two sorts, viz. *High* and *Petty Treason*. *High Treason* is defined to be an Offence committed against the Security of the King or Kingdom, whether it be by Imagination, Word or Deed; as to compass or imagine the Death of the King, Queen, or Prince; or to De-flower the King's Wife, or his eldest Daughter un-

married, or his eldest Son's Wife; or levy War against the King in his Realm, adhere to his Enemies, counterfeit his Great Seal, Privy Seal, or Money: To Kill the King's Chancellor, Treasurer, Justices of either Bench, Justices in Eyre, of Assize, or of Oyer and Terminer, being in their Place, doing their Office; diminishing or impairing current Money, and many others, as may be seen in divers Statutes particularly express'd. In case of this *Treason*, a Man shall be Hang'd, Drawn and Quartered, and forfeit his Lands and Goods to the King. It is sometime called *Treason Paramount*, *Petty Treason*. See the Word it self in its proper place.

There is also mention of *Accumulative Treason*, and *Constructive Treason*, in the Statute 14 Car. 2. cap. 29. And here Note, That in *Majori prodicione omnes sunt principales*, there are no Accessaries in *Treason*, all are Principals. And *Voluntas non reputabitur pro facto nisi in causa Prodicionis*, for *Petty Treason*.

TREASURE-TROVE, is when any Money, Gold, Silver, Plate, or Bullion is found in any Place, and none knows to whom it belongs; then the Property thereof belongs to the King, but the Civil Law gives it to the Finder, according to the Law of Nature. The Punishment for concealing *Treasure found*, is Imprisonment and Fine. But if any Mine or Metal be found in any Ground, that always pertains to the Lord of the Soil, except it be a Mine of Gold or Silver, which used to be always to the King, in whose Ground soever it be found; But by a late Act of Parliament, the King hath only the *Preemption*.

TREBLE, is the last or highest of the four Parts in *Musical Proportion*.

TREENELS, in a Ship, are long Pins or Nails of Wood, whence they are called *Tree-nells*, or *Tree-nails*, made out of the Heart of Oak, to fasten the Planks to the Timber; and these have always Oakum, driven into them to prevent any Leak.

TREES and *Shrubs*, of our Native Growth in *England*, are thus distinguished by our most judicious Botanist, Mr. *John Ray*.

I. Such as have their Flower disjoined and remote from the Fruit; and these are.

1. *Nuciferous ones*, or such as bear Nuts, as the Walnut Tree, the Hazel Nut-tree, the Beach, the Chestnut, and the common Oak.

2. *Coniferous ones*, or such as bear a squamose or scaly Fruit, of a kind of Conical Figure, and of a woody or hard Substance, in which are many Seeds, which when they are Ripe, the Cone opens or gapes, in all its several Cells and Partitions, and so they drop out. Of this kind are the *Scotch Firs*, Male and Female; the Pine, which in our Gardens is called the *Scotch Fir*; the common Alder Tree, and the Birch Tree.

3. *Bacciferous ones*, or such as bear Berries; as Juniper, and the Yew Tree.

4. *Lanigerous ones*, or such as bear a woolly downy Substance; as the black, white, and trembling Poplar, Willows, and Osiers of all kinds.

5. Such as bear their Seeds (having an imperfect Flower) in Leafy Membranes or Cafes; as the *Horn-beam* of *Hardbeam*, called in some places the *Hornbeech*.

II. Such as have their Fruits and Flowers Contiguous; and these are either with the Flower placed on the Top of the Fruit, or else have it adhering to the Base or Bottom of the Fruit.

1. Trees and Shrubs with the Flower placed on the Top or Upper-part of the Fruit: Of these, some are *Pomiferous*, as Apples and Pears; and some *Bacciferous*, as the Sorb or Service Tree; the White or Haw Thorn, the wild Rose, Sweet-brier, Currants, the great Bilberry Bush, Honey Suckle, Ivy, &c.

2. Trees whose Flower adheres to the Base or Bottom of the Fruit, are either such as have their Fruit moist and soft when Ripe, as

1. *Pruniferous ones*, whose Fruit is pretty large and soft, with a Stone in the middle; as the black Thorn or Slow-Tree, the black and white Bullace Tree, the common wild Cherry-Tree, the Black Cherry, &c.

2. *Bacciferous ones*; as the Strawberry Tree, in the West of Ireland, Mistletoe, Water Elder, the Dwarf or large Lawrel, the Viburnum or way-faring Tree, the Dog-berry Tree, the Sea black Thorn, the Berry-bearing Elder, the Privet Barberry, common Elder, the Holly, the Buck Thorn, the Berry-bearing Heath, the Bramble and the Spindle Tree, or Prickwood.

Such as have their Fruit dry when 'tis Ripe; as, the Bladder Nut-Tree, the Box-Tree, the common Elm and Ash, the Maple, the *Gaule* or *Sweet-Willow*, common Heath, Broom, Diers Weed, Furze or Gorse, the Lime-Tree, &c.

TREMOR, is a voluntary Motion depraved, by which the Member is sometimes raised up, and sometimes depressed through the mutual Contraction between the Faculty and the Part affected.

TRENCHES, in Fortification, are certain Moats or Ditches, which the Besiegers cut to approach more securely to the Place Attack'd, and are of several sorts, according to the different nature of the Soil; for if the adjacent Territory be Rocky, the Trench is only an Elevation of *Bavins*, *Gabions*, *Wool-packs*, or Shouldrings of Earth cast up round about the Place: But where the Ground may be easily open'd, the Trench is dug therein, and border'd with a Parapet on the Side of the Besieged. The Breadth of it ought to be from 8 to 10 Foot, and the Depth from 6 to 7.

These Trenches are to be carried on with winding Lines, in some manner parallel to the Works of the Fortrefs, so as not to be in view of the Enemy, nor to expose its Length to their Shot, which they call *Enfilading*; for then it will be in danger of being *Enfiladed*, or scoured by the Enemies Cannon: And this carrying of the Trenches obliquely, they call, carrying the Trenches by *Coudees* or *Traverses*.

They call it *Opening the Trenches*, when the Be-

siegers begin to Work upon the Line of Approaches, and this is usually done in the Night, and sometimes within Musket-shot, and sometimes within half or whole Cannon-shot of the Place, if there be no rising Ground about it, the Garrison Strong, and their Cannon well served. The Workmen that open the Trenches, are always Supported by Bodies of Men against the Sallys of the Besieged; and sometimes those bodies lie between them and the Place, as also on their Right and Left. The Pioneers sometimes Work on their Knees, and the Men that are to support them, lie flat on their Faces, in order to avoid the Enemies shot: And the Pioneers are also usually covered with *Mantelets* or *Saucissons*. They also say, *Mount the Trenches*; that is, go upon Duty in them: And to *Relieve the Trenches*, is to Relieve such as have been upon Duty there. To *Carry on the Trenches*, is to advance them towards any Place.

TREPANUM, the same with *Mediolus*; which see.

TRESPASS, signifies any Transgression of the Law under Treason, Felony, or Imprison of either; for a Lord of the Parliament to depart from thence without the King's Licence, is neither Treason nor Felony, but *Trespafs*.

But this Word is most commonly used for that Wrong or Damage which is done either to the King in his Forest, or by one private Man to another; and according to this Signification, it is of two sorts; *Trespafs General*, otherwise called *Trespafs vi & armis*; and *Trespafs Special*, otherwise called *Trespafs upon the Case*; and this seemeth to be without Force, howbeit they are sometimes confounded. How to distinguish the Forms of these Writs or Actions, see F. N. B. Fol. 86, 87. In an Action of *Trespafs*, the Plaintiff always Sues for Damages, or the Value of the Hurt done him by the Defendant. There is also *Trespafs local*, and *Trespafs transitory*. *Trespafs local*, is that which is so annexed to the Place certain, that if the Defendant joyn issue upon a Place, and traverse the Place only by saying *absque hoc*, That he did the *Trespafs* in the Place mentioned in the Declaration, and aver it, it is enough to defeat the Action. *Trespafs Transitory*, is that which cannot be defeated by the Defendant's traverse of the Peace, because the Place is not material: But the Action of *Trespafs quare clausum fregit*, ought to be *Local*.

TRESSSEL-TREES, in a Ship, are those Timbers of the Cross Trees that stand along Ships, or Fore and aft at the tops of the Masts. See *Cross Trees*.

TRESSURE, a term in Heraldry for an Orle when it is flowered; and if there be two of them, it is called a double Tressure. See *Orle*.

TRIA *Primæ*, are Salt, Sulphur, and Mercury, the Three Hypothetical Principles of the Chymists, out of which they pretend that all mix'd Bodies are compounded, and into which they are ultimately resolvable by Fire; but the latter is false, and the first impossible to be proved.

TRIAL, in Law, is used for the Examination of all Causes, Civil and Criminal, according to the Laws of the Realm, before a proper Judge: Of which there are divers kinds; as Matters of Fact shall be tried by the Jurors; Matters of Law, by the Justices; Matters of Record, by the Record it self. A Lord of Parliament, upon an Indictment of Treason or Felony, shall be Tried without any Oath by his Peers, upon their Ho-

nours and Allegiance; but in Appeal at the Suit of any Subject, they shall be Tried *per bonos & legales homines*. If ancient Demefine be pleaded of a Mannor, and denied, this shall be Tried by the Record of *Doomsday*. Bastardy, *Excommenement*, Lawfulness of Marriage, and other Ecclesiastical Matters shall be Tried by the Bishop's Certificate.

TRIANGLE, is a Figure having three Angles and three Sides only, and is either *Spherical*, (which see) or *Plane*; whose Sides are Right Lines. Every *Plane Triangle* may be consider'd with relation either to its Angles, or its Sides. As to its Angles 'tis either,

1. *Right Angled Triangle*, is that which hath one *Right Angle*, as A.

2. *Obtuse Angled Triangle*, is such as hath one *Obtuse Angle*, as B.

3. *Acute Angled Triangle*, is that which hath all its Angles *Acute*, as C.

N. B. Any Triangle that is not Right Angled is called *Oblique Angled*, or *Amblygonial*.

A Triangle, as to its Sides, is either,

1. *Equilateral Triangle*, is that which hath all its Sides equal to one another, as E.

2. *Isosceles*, or an *Equilegg'd Triangle*, is that which hath only two Sides equal, as I.

3. *Scalenous Triangle*, is that which has no two Sides equal, as S.

To find the *Area* of all Triangles, see *Area*.
Of the *Properties of Plane Triangles*.

PROPOSITION I

In every Triangle, the sum of all the three Angles is equal to two Right ones; and the external Angle made by any Side produced, is equal to the sum of the internal and its opposite.

I say, 1. $a + b + c = 2 \text{ } \checkmark$
2. $f = b + a$

Draw the prick'd Line through the Vertex parallel to the Base: Then will the Angles d and e be severally equal to the alternate ones b and c . (29 *é*. 1. *Eucl.*) But $d + a + e = 180$ (by *Cor.* 2. 13 *é*. 1. *Eucl.*) Wherefore $b + a + c = 180$. Q. E. D.

And since $c + f$ are also equal to 2 180 (13. *é*. 1. *Eucl.*) if c be taken from both, there must remain $f = b + a$. Q. E. D.

COROLLARY I.

Hence no Δ can have 2 obtuse or 2 180 .

COROL. II.

In a Right-angled Δ , the 2 oblique Angles must make a right one between them.

COROL. III.

If 2 Angles in one Δ be $=$ to 2 in another, the remaining Angles must also be equal.

PROP. II.

In the same Triangle, equal Sides subtend, and are subtended by equal Angles.

I say, if $a = b$, then $a c = c b$.

Because

Because the Angles a and b are equal, the Lines $a c$ and $c b$ must be equally inclined to the Base $a b$; and consequently, be so at the Point c where they meet, and therefore c must be equidistant from a and b ; for if c be nearer to, or farther from b than a , it must be because the Angle a is less or greater than b , which is contrary to the Supposition.

And on the other hand, if the sides are equal, the Angles must; for being equal, they must needs be equally inclined to the Base $a b$, in the Point c , where they meet.

PROP. III.

In two Triangles $A B C$, and $a b c$, if all the three Sides, or two Sides and one Angle, or two Angles and one Side be respectively equal one to another, the whole Triangles are equal.

For being laid one on another, they will concur.

PROP. IV.

Triangles on the same Base, and having the same Height, (that is, being between the same parallel Lines) are equal.

I say the Triangles $a b c$, and $e b c$, having the same Base $b c$, and between the same parallel Lines $a p$ and $b c$, are equal.

Draw $d c$ and $e f$ parallel to $a b$.

1. The Triangles $d c e$ and $e c f$ are equal, because each equal to half the Parallelogram $d f$.

2. The Triangles $a b c$ and $e b c$ are also equal, being each equal to half the Parallelogram $a f$.

3. But $\triangle a b c + \triangle e c f =$ half the $\square a f$.

4. And $\triangle e b c + \triangle e c f =$ half the $\square a f$.

Therefore, if the $\triangle e c f$ be taken away from both Sides, the $\triangle e b c$ must remain $=$ to the Triangles $a b c$. Q. E. D.

PROP. V.

Triangles on equal Bases, and between the same Parallel Lines, are equal.

I say $\triangle Z = \triangle X$.

Draw $b c$ parallel to $a g$ join $d a$, $d b$, and $b e$.

1. $\triangle Z = e b d$ (per preced.) $= a b d$, because 'tis half the $\square a b e d$.

2. $\triangle a b d = a b c$ (per preced.) $= \triangle X$, because 'tis half the $\square a b c g$.

Wherefore $\triangle Z$ must be equal to $\triangle X$. Q. E. D.

COROL.

Hence follows, that if two Lines have between them equal Triangles on the same or equal Bases; these Lines must be Parallel to each other.

PROP. VI.

I say the Square of the Hypotenuse ($e d$) of a Rect^d angled \triangle ($e a d$) is equal to both the Squares of the 2 other Sides ($a e$) and ($a d$).

That is,

$$\square O q_3 = Z = q_3 + X q_3$$

$\square O q_3$

$$1. Oq; = \square kf + \square kb.$$

2. $\frac{1}{2} \square kf = \triangle fae$, and $\frac{1}{2} \square kb = \triangle adb$; because \square s on the same Bases, are double to \triangle s that have the same perpendicular height, or are between the same parallel Lines.

3. But $\triangle fae = \triangle bed$, and the $\triangle bda = \triangle ecd$, as having severally two Sides and one Angle in one equal to those in the other. The two equal Sides, are the Sides of the Square, and the obtuse Angle $bed = ecd$.

4. Now $\frac{1}{2} Xq; = \triangle bed$, and $\frac{1}{2} Zq; = \triangle dce$, (by the Proof in the Second Step.)

5. Therefore $\frac{1}{2} Xq; = \frac{1}{2} \square kf$, and $\frac{1}{2} Zq; = \frac{1}{2} \square kb$ (by comparing together the 2d, 3d and 4th Steps.)

6. And consequently, $Xq; = \square kf$, and $Zq; = \square kb$, (for if the halves are equal, the wholes must.)

Wherefore $Xq; + Zq; = Oq;$ (by the first Step.) Q. E. D.

The Second way.

I say the Square of $df =$ Sum of the Squares of do and of

$$1. \square df = \square ae + \square ec.$$

2. The $\triangle aod = \frac{1}{2} \square dg$, and also $= \frac{1}{2} \square ae$, because on the same Base, and between the same Parallels with both.

$$\text{Wherefore } \square dg = \square ae.$$

3. The $\triangle cof = \frac{1}{2} \square X$, and also $= \frac{1}{2} \square ec$ for the reason given in the 2d Step.

$$\text{Wherefore } \square X = \square ec.$$

4. And consequently, $\square dg + \square X$ is equal to $\square df$, (by Step 1.) Q. E. D.

The Third way.

$$\text{I say, } acq; = abq; + bcq;$$

Make $bk = to ab$, and compleat all the Squares.

Then will,

$$\begin{aligned} \square ac &= D + X + Z + T, \\ \square ab &= X + R + O, \\ \square bc &= Z + H. \end{aligned}$$

Wherefore taking away what is common, Remains $D + T = R + H + O$. But then,

$R = T$, bec. $ac = de$, $df = ab$, and $\angle f = \angle b$.

Remains to be proved, that

$D = H + O$. Which it is, because $D = R$ (as having 2 Sides and one \angle) and R was proved $= T$, and $T = O + H$, because $ac = ce$, the Angle at $b = k$, and the Angle $acb = eck$ (because each with bce makes a \angle .)

Wherefore, the Square of $ac = abq; + bcq;$ Q. E. D.

PROP. VII.

In an Obtuse-angled Triangle, the Square of the Side subtending the Obtuse Angle, exceeds the Sum of the Squares of the other two Sides by the double Rectangle, ($2ba$) under the Base, and the part added to it.

Let fall the Perpendicular p , and produce b , till it meet with it.

Demonstration.

$$1. bb = bb + 2ba + aa + pp.$$

$$2. \text{ And } oo = pp + aa.$$

$$3. \text{ But } bb + oo = bb + aa + pp.$$

Wherefore bb exceeds the last Step by $2ba$.

Q. E. D.

PROP. VIII.

In an Acute-angled Triangle, the Square of the Side (h) subtending an Acute, is less than the Sum of the Squares of the other two Sides, by double the Rectangle under the whole Base, ($b + a$) and the Segment of the Base (a) which is next to the Acute-angle.

Let fall the Perpendicular p .

Demonstration.

$$1. bb = bb + pp.$$

$$2. oo = pp + aa.$$

$$3. \text{ Q. } b + a = bb + 2ba + aa.$$

4. $bb + pp + 2aa + 2ab$, is the Sum of the Squares of the Legs.

Wherefore bb is less than that by $2aa + 2ab$, which is plainly equal to the Double Rectangle under the whole Base, and the part a .

PROP. IX.

The Side abc of an Equilateral Triangle, abc , inscribed in a Circle, is in Power Triple of the Radius; or its Square is equal to thrice the Square of the Radius, a d .

Let the Radius be called R , and consequently its Square RR .

I say, then $de = \frac{1}{3}R$, for the two Triangles fea , and ead , are equal, as having two Angles and one Side Equal, in both. Wherefore the Square of $ed = \frac{1}{3}RR$; which being subtracted from RR , leaves $PP = \frac{2}{3}RR$. Wherefore $P = \sqrt{\frac{2}{3}RR}$; and consequently its double $ab = 2\sqrt{\frac{2}{3}RR}$; i.e. to the $\sqrt{\frac{4}{3}}\sqrt{RR}$, or to $\sqrt{3}RR$. Wherefore $3RR = \square$ of ab ; or $abp = 3RR$. Q. E. D.

N. B. Herein is founded Euclid's way of generating a Tetrahedrum, and inscribing it in a given Sphere. See Prop. 13 ϵ 13.

PROP. X.

The Sides of a Triangle are cut Proportionably by a Line drawn Parallel to the Base.

That is, it makes, $ab : bc :: ad : de$.

Draw the Lines be and cd .

Demonstration.

1. The Triangles bdc , and bde , are equal, because on the same Base, and between the same Parallels. Therefore the Triangle abd , will have the same Proportion to them both, i.e. $abd : bdc :: abd : bde$. But the Triangle abd , having the same height with the two equal Triangles bdc , and bde , will be to them as its two Sides ab and ad , are to their Bases bc and de .

Therefore $ab : bc :: ad : de$.

Which Proportionals, may be considered and varied according to the several Species of Proportion.

As by Inversion, $cb : ab :: dc : de$: the Parts of the Legs below the Parallel, are Proportional to those above it.

Also Alternately, $ab : ad :: eb : de$. The Part of one Leg above the Parallel, is to the Part of the other Leg above the Parallel, as the Parts below are to one another.

The same thing may be done by Composition and Division, &c.

PROP.

PROP. XI.

In a Triangle, a Parallel to the Base, is to the Base, as the Parts above the Parallel are to the whole Legs.

That is, $de : cb :: ad : ac :: ae : ab$.

Draw df parallel to eb .

Then will $fb = de$: Therefore 'twill be $bf : fc :: da : dc$: And by Inversion, $fc : bf :: dc : da$. And then by Composition, $fc + bf (i.e. bc) : bf (i.e. de) :: dc + da (i.e. ac) : da$; or as $cb : de :: ac : da$.

Which Inverted, gives $de : cb :: da : ac$. Q. E. D.

PROP. XII.

In a Right-angled Triangle (abc) a Line (ad) drawn from the Right-angle at the Top, Perpendicular to the Hypotenuse (bc) divides the Triangle (abc) into two other Right-angled Triangles, which are similar to the first Triangle, and to one another.

1. For all three Triangles have one Right-angle. And the Triangles abc , and abd , have the Angle b (common to both) and consequently the third Angle $b a d$, must be equal to c . Wherefore these two Triangles are similar.

2. The Case is the same, as to the Triangles abc and adc : But the Triangles abd and adc , being similar to the great one abc , must be also similar to one another. Q. E. D.

From the Similarity of which three Triangles, it will follow, that the Sides about the Equal Angles are proportional (by 4. 6. Eucl.) and thence arises the Proof of the next Famous Proposition; by this means proved a fourth way.

PROP. XIII.

In every Right-angled Triangle, the Square of the Hypotenuse is equal to the Sum of the Squares of the other two Sides.

I say, $\square bc = \square ba + \square ac$.

Demonstration.

1. For the Square bg is made up of the two Rectangles bf and dg .

But $\square bf = \square ba$, for $cb : ba :: ba : bd$. That is, $\square ba = cb \times bd = \square bf$. And $\square dg = \square ac$, for $bc : ac :: ac : cd$. That is, $\square ac = bc \times cd = \square dg$. Wherefore $\square bc (= \square bf + \square dg) = \square ba + \square ac$. Q. E. D.

COROLLARY.

Hence 'tis plain, That any Figure made on the Hypotenuse of any Right-angled Triangle, shall be equal to two other similar Figures made on the Sides. Because all such Figures are to one another, as the Squares of their Homologous Sides.

You have above three other ways of demonstrating this admirable Proposition, without the Doctrine of Proportion being first learnt.

P R O P. XIV.

If any Angle of a Triangle be bisected, the Bisecting Line will divide the opposite Side in the same Proportion as the Legs of the Angle are to one another.

Let the Sides of the Triangle be a , b , and $c + d$, and the Bisecting Line s ,

I say, $a : b :: c : d$.

Produce the Leg b , till $f = a$ the other Leg of the Angle, and draw the Line e . Then will the Triangle ef be an *Isoceles*; and consequently the Angles at the Base e , will be equal: And therefore each will be equal to half the bisected Angle, (because that is external and equal to them both:) Therefore in the first Triangle, the Bisecting Line s is parallel to the Base e ; and consequently, $f : b :: c : d$.

That is, $a : b :: c : d$? Q. E. D.

TRIANGULAR Compasses, are such as have three Legs or Feet to take off any Triangle at once; they are used in Maps, Globes, &c.

TRIANGULAR Quadrant, is a Sector, with a loose Piece to make it an *Equilateral Triangle*; the Calendar is graduated on it, with the Sun's Place, Declination, and many other useful Lines, and by the help of a String and a Plummer, and the Divisions graduated on the loose Piece, it may be made to serve for a Quadrant.

TRIANGULARE Ossiculum, the Triangular little Bone, is that which is placed betwixt the Lambdoidal Suture of the Scull, and the *Sagittalis*. Blanchard.

TRIANGULARIS, a Muscle of the *Thorax*, which with its Partner, lies on each Side the *Cartilago Eniformis*, within the Cavity of the *Thorax*, under the *Sternum*; sometimes this appears to be three, at other times four distinct Muscles on each Side. It arises from the inferior Part of the *Os Peitoris*, whence its upper Part ascends, and lower descends to its Implantations at the Bony Endings of the fourth, fifth, sixth, and sometimes seventh and eighth Ribs, near their Junction with their Cartilages. Its reputed Use by most (if not all) Anatomists, is to contract the Breast.

TRIANGULUS Septentrionalis, or *Deltozon*, the Triangle, a Northern Constellation consisting of 6 Stars.

TRIBRACHYS, is the Foot of a *Latin Verse*, consisting of three Syllables, and those all short, as *Priamus*.

TRIBRACHUS, the same with *Tribrachys*.

TRICEPS, is a Muscle of the Thigh, so called from its three Heads or Beginnings, the first and largest of which, ariseth broad and fleshy from the Inferior Edges, and External Parts of the *Os Ischium*, and *Pubis*, where they are joined to each other lying between the *Semi-tendinosus*, and *Semi-membranosus*, and that of the *Gracilis*, and descending with an Oblique Order of fleshy Fibres, is inserted partly Tendinous and Fleshy, near an Hand's Length in Breadth to the *Linea Aspera*, of the Thigh-bone, that is immediately below the Insertion of the *Quadratus Femoris*; its inferior Part making a strong round Tendon, inserted into the superior Part of the Internal and Lower *Appendix* of the Thigh-bone.

The second Head, or Beginning of this Muscle, ariseth Tendinous from the *Os Pubis*, but in its descent soon becomes Fleshy, and joins with the former, near to its Insertion to the middle Part of the *Linea Aspera* of the Thigh-bone.

The third and last Beginning of this Muscle, springeth from the inferior Part of the *Os Pubis*, between the Origination of its last described Head, and that of the *Pectineus*; and descending obliquely, joins with the First near its Insertion to the *Linea Aspera* of the Thigh-bone, immediately above the Termination of the second Head of this Muscle. This moves the Thigh variously according to the Diversity of its Beginnings; so the first described Part pulls the Thigh-bone upwards, inwards, and somewhat backwards: The second and third Beginnings of it, pull it more inwards, and turn it somewhat outwards, as when we put our Legs across each other.

TRICUSPIDES are three Valves of a Triangular Form, placed at the Mouth of the Right Ventricle of the Heart; they are made of a thin Membrane, and their Bases are fixed to the Mouth of the said Ventricle, and their Points tied by small Fibres to the Fleshy Productions; so that when the Heart contracts, its Point approaches its Basis, and the Fleshy Productions move upwards; therefore the Fibres of these Valves are relaxed, and the Valves lifted up by the Blood which gets underneath them, because the Furrows and Fleshy Productions keeping the Valves at a little Distance from the Sides of the Ventricle, give way to the Blood to pass under them, and so to thrust up the Valves, which shut so closely the Entry into the Ventricle, that the Blood cannot return the Way it came in, but when the Ventricle is dilated, the Fibres are pulled down, and the Passage made open for the Blood to enter.

TRIE, a Sea Term: See *Try*.

TRIEMIMERIS, is a Branch of the *Cesura* of a *Latin Verse*, when after the first Foot of the Verse there remains an odd Syllable, which helps to make the next Foot; as in this Verse.

Ille Latus Niveum molli fultus Hyacintho.

TRIGEMINUM: See *Complexus*.

TRIGILD: See *Argild*.

TRIGLYPH, in Architecture, is a Member of the Frieze of the *Doric Order*, set directly over every Pillar, and in certain Spaces in the Inter-columniations. By their Triangular Gutters (for they

Hence 'tis plain,

1. That as the Co-Sine Is to the Sine :: So is the Radius To the Tangent. That is, $CR : RO :: CS : CT : TS$.

2. As Radius Is to the Sine :: So is the Secant To the Tangent. That is, $CO : OR :: CS : ST$.

3. As the Sine Is to the Radius :: So is the Radius To the Co-Secant. That is, $OR : OC :: FC : CN$.

4. As the Tangent Is to the Radius :: So is Radius To the Co-Tangent; As $ST : TC :: FN$.

Therefore the Rectangle between the Tangent and Co-Tangent of any Ark is equal to the Square of the Radius.

11. Every Triangle has six Parts, of which three are Sides, and three Angles; and of these if we have three given, we can find the rest, (except in the Case where the three Angles only of a plain Triangle are given.)

For from thence the Sides cannot be found, because two Triangles may be Equiangular, and yet have the Sides by no means of the same length. We can find the rest, I say, if supposing the Radius divided into any Number of equal Parts, we can but discover how many of such parts any Sine, Tangent, or Secant of any Ark or Angle doth contain. Now this is ready done to our Hands, in the Table of Sines, Tangents, and Secants, which we have, with prodigious Industry, in Books ready calculated for this purpose.

12. When therefore any Triangle is given to be resolved, the first thing we have to do, is to confi-

der, That there is in the Table of Logarithms, Sines, Tangents, and Secants, a Triangle exactly similar, and equal to that which we are required to solve, and whose Sides are to one another in the very same Proportion of those of the Triangles proposed.

12. We must understand whatever *Ratio* one Side of the Triangle given, hath to the other Side about the same Angle, considered as Lengths estimated or numbered by any known Measure, as suppose Inches, Yards, Miles, Leagues, &c. the very same hath the two Sides about the same Angle in the Triangles in the Tables, or in the Tabular Parts: Which two things well understood, do lead us into the whole Mystery of Trigonometrical Calculations.

13. *Trigonometry*, is either *Plain* or *Spherical*; and both may be resolved by the means of four *Propositions*, which because of their excellent Use, are called *Axioms*.

14. The first of which relates to *Right-angle Plain Triangles*; and is this:

AXIOM I.

In a Right-angle Triangle, if either of the Legs be supposed to be the Radius of a Circle, the other Leg will be the Tangent of the opposite Angle, or of the Angle at the Centre; and the Hypotenuse will be the Secant of that Angle: But if you imagine the Hypotenuse to be the Radius of a Circle, then each Leg will be the Sine of its opposite Angle, or of the Angle at the Centre; as is plain from the adjoining Figures.

In the first of which, B (the Base) being made the Radius, P (the Perpendicular) is the Tangent of the Angle at a, the Centre of the Circle, which is opposite to P, and the Hypotenuse is the Secant of the same Angle.

In the second Figure, where P is made the Radius, B is the Tangent of the opposite Angle at the Centre c:

In the third Figure, where H the Hypotenuse is made the Radius, P is the right Sine of the opposite Angle at the Centre. And,

In the fourth Figure, H being also made Radius, but C the Centre of the Circle, B will be the Sine of its opposite Angle o.

The Seven Cases of Plain Triangles.

	Given	Re- qui- red.	Proportions.	Given	Re- qui- red.
1	B, a, b	P	R : B :: Tan. b : P	c : √	c
2	B, a, b	H	S, a, B :: R : H	c : √	b
3	B, H	√	H : R :: B : S, a	c : √	b : √
4	B, H	P	H : R :: B : S, a Then R : T :: b : P Or R : B :: T : b : P	which finds the √ a,	
5	B : P	√	B : R :: P : T : b	c : √	√
6	B : P	H	B : R :: P : T : b Then S : b P :: R : H	c : √	h
7	H : √	B	R : H :: S, a : B	b : √	c : √

The Calculation of the Seven Cases of Right-angle Plain Triangles.

CASE I.

Given B, a, b. Required P?

Canon $R : B :: T : b : P?$

$R = 10.$

$B = 2.8833612 = 768$

$T, b = 9.6197205 = 22^\circ 37'$

$P = 2.5050817 = 320 = P?$

The General Rule for all Operations in Trigonometry, is, to write down the Numbers found in the Tables according to the Order of the Canon: And then adding together the second and third Numbers, from their Sum subtract the First, the Remainder is the Logarithm of the Term sought.

By Gunter's Line.

Extend the Compasses from 45 Degrees on the Tangents, to 22 Degrees 37 Minutes, the same Extent will reach in the Line of Numbers from 768, backward to 320.

CASE II.

Given B, a, b. Required H?

$S, a : B :: R : H?$

$S, a = 9.9652480 = 67^\circ 23'$

$B = 2.8833612 = 768$

$R = 10.$

$H = 2.9201132 = 832 = H.$

By Gunter's Scale.

Extend the Compasses from 67 Degrees 23 Minutes to 90 Degrees on the Line of Sines; the same Extent will reach from 768, to 832 on the Line of Numbers.

The general Method to state any Case, or to form the Canon.

1. Consider that the Thing sought must always stand in the fourth or last Place: And therefore in *Cas.* 1. since P, a Length is sought, that must be the last of the Four Terms; place it therefore last with an Interrogation-point after it, to shew that it is required or sought.

2. In the Golden-Rule the second and fourth Terms being always of the same Nature or Kind, and P being a Length sought, and B the only Length given; B is necessarily determined to be in the second Place: Write it down therefore in that Place with four Points after it thus :: to shew that the Proportion disjoins or breaks off there.

3. Consider that the Hypotenuse not being either given or sought, the first Axiom determines you to work by Tangents: And the Side given B being supposed Radius, the Proportion must be; As B consider'd as Radius, Is to its self consider'd as a Length given :: So will P consider'd as the Tangent of the Angle b, be To its self consider'd as a Length sought. That is,

$R : B :: T, b : P?$

If the Angle b had been sought, that must have been placed last, and it would have stood thus; as in *Case* the Fifth.

$$B : R :: P : T, b?$$

But if the Hypotenuse had been in the Question, either given or required, you must have worked by Sines, and the Hypotenuse will be always Radius; as in *Case* 2. where H is sought.

For H being required, it must stand in the last Place; and since B a Length is given of the same Nature with H , that must be in the second Place: And then say by *Axiom* 1, As B considered as the Sine of the given Angle a , Is to its self considered as a Length :: So is H considered as Radius, To its self as a Length sought: That is,

$$S, a : B :: R : H?$$

And to shew the extensive Use of this Doctrine of *Plain Trigonometry*, the General Triangle above described and numbered, may either first relate to the Sea, and then these 7 Cases will be all the Cases of *Plain Sailing*; and also of Mr. *Wright's*, or, as 'tis commonly, tho' falsely call'd, *Mercator's* too; Regard being fit had to the Way of Working by Meridional Parts, &c.

For, in this Triangle the Angle a , is the Angle of the Rhumb, or the Angle which the Line of the Ship's Course makes with the Meridian, and therefore usually by the Sailors called, *The Course*; and the Side P represents the Meridian of any Place, across which the Ship is supposed to sail; and consequently on it must be accounted the Difference of Latitude between the two Places a and b . The Angle b is the Complement of the Course, or what that Angle wants of 90 Degrees, and consequently known when the Course is so. The Base represents the Difference of Longitude, or the Departure West, or the Westing of the Ship in Comparison of the Place at a that she is supposed to have parted from: And the Hypotenuse H , represents the Distance sailed, or *run* (as the Seamen call it) or how many Leagues or Miles the Ship hath sailed from the Place a to the Place b .

This being understood, if this first Case be made a Case of *Plain Sailing*, there will be given Course and Departure; required Difference of Latitude, and the Canon is;

As Radius is to the Departure in Miles :: So is the Co-Tangent of the Course, To the Difference of Latitude in Miles.

N.B. Here the Ship being at a , is supposed to sail South Westward (or to speak exactly, W. S. W.) and therefore her Difference of Latitude is reckoned to the South, and her Departure to the West: But by inverting the same Triangle, you may suppose the Difference of Latitude North, and the Departure East; for the North is accounted to lie right before you, and consequently the East to the Right hand, and the West to the Left; wherefore the Course now is E. N. E.

2. If you would apply the Doctrine of *Trigonometry*, to the Calculation of Heights, Depths, Distances, the same Triangle and Numbers will do; regard being had to the Nature of the Terms required and sought.

For the Perpendicular P , will represent any Altitude; and B will represent a Distance from the Foot of it measured on the Ground: The Angle at b is found by the Quadrant, or some such Instrument; and consequently you may find P by *Case* 1. For,

As Radius is to the Distance, from the Foot of the Object :: So is the Tangent of the Angle of Altitude, To the Height of the Place, *i. e.*

$$R : B :: T, b : P?$$

Or, suppose the Distance B were required from above, by taking the Angle a , and finding the Length of P , by a String and Plummer. Then will

$$R : P :: T, b : P?$$

This being premised as to the general Use of *Trigonometry*, let us proceed to

TRI

CASE III.

Given B, H. Required the Angles a, b ,

$$H : R :: B : S, a?$$

$$H = \frac{2.9201233}{10.0000000} = 832$$

$$R = 10.0000000$$

$$B = \frac{2.8853612}{9.9652379} = 768$$

$$S, a = \frac{9.9652379}{9.9652379} = 67^{\circ} 23' = \text{Angle } a$$

Which Subtracted from 90 Degrees, gives the Angle $b = 22$ Degrees, 37 Minutes.

By Gunter's Scale.

The Extent from 832, back to 768, in the Line of Numbers will reach from 90 Degrees to 67 Degrees 30 Minutes in the Line of the Sines.

CASE IV.

Given B, H. Required P?

Having found a by the foregoing Case, this will be the Theorem :

$$R : B :: T : b : P?$$

Or,

$$R : T, b :: B : P?$$

$$R = 10.$$

$$T, b = \frac{9.6197205}{2.8853612} = 22^{\circ} 37'$$

$$B = \frac{2.8853612}{2.5050817} = 768$$

$$P = \frac{2.5050817}{2.5050817} = 320.$$

By Gunter's Scale.

The Extent from 45 Degrees in the Tangent-line, back to 22 Degrees 37 Minutes, will reach in the Line of Numbers from 768, back to 320.

TRI

CASE V.

Given B, P. Required $\sqrt{a} \sqrt{b}$

$$B : R :: P : T, b?$$

$$B = \frac{2.8853612}{10.0000000} = 768$$

$$R = 10.$$

$$P = \frac{2.5051500}{9.6197888} = 320$$

$$T, b = \frac{9.6197888}{9.6197888} = 22^{\circ} 37' = b.$$

Which 22 Degrees 37 Minutes subtracted from 90 Degrees, leaves $a = 67$ Degrees 23 Minutes.

By Gunter's Scale.

The Extent from 768 back to 320, in the Line, will reach from 45 back to 22 Degrees 37 Minutes in the Tangents.

CASE VI.

Given B, P. Required H?

Having found b by the foregoing Case, this will be the Theorem :

$$S, b : P :: R : H?$$

$$S, b = \frac{9.5849685}{2.5051500} = 22^{\circ} 37'$$

$$P = \frac{2.5051500}{10.0000000} = 320$$

$$R = 10.$$

$$H = \frac{2.9201815}{2.9201815} = 832 = H?$$

By Gunter's Scale.

The Extent from 22 Degrees 37 Minutes, forwards, to 90 Degrees in the Line of Sines, will reach from 320, to 832 in the Line of Numbers.

CASE VII.

Given H and $\sqrt{a} \sqrt{b}$. Required H?

$$R : H :: S, a : B?$$

$$R = 10.$$

$$H = \frac{2.9201233}{9.9652480} = 832$$

$$S, a = \frac{9.9652480}{2.8853719} = 67^{\circ} 23'$$

$$B = \frac{2.8853719}{2.8853719} = 768 = B.$$

By Gunter's Scale.

The Extent from 90 Degrees in Line of Sines back to 67 Degrees 23 Minutes, will reach in the Line of Numbers from 832 backwards to 768.

The

The Resolution of Oblique Plain Triangles.

AXIOM II.

In every Triangle, a, b, c , the Sides are in Proportion to one another, as the Sines of their opposite Angles.

Let fall from the Angle b , a Perpendicular to the Base ac : For then the whole will be resolved into 2 Right-angle Triangles, and consequently by Axiom the First $ab : R :: bd : S, a$; also $bc : R :: bd : S, c$; wherefore $ab : bc :: S, c : S, a$: by Reciprocity of Proportion.

Otherwise thus:

Draw a Circle about the Triangle, from whose Centre O , let the Perpendiculars Oe, Ok , and Ot , be let fall to the three Sides of the Triangle, and the Lines oa, ob , and oc , be drawn to the three Angles.

The Sides of the Triangle will be bisected by the Perpendiculars, and consequently ae will be $= eb, bk = kc$ and $ct = ta$; wherefore as the whole Line ab , Is to $bc ::$ So will the half Side ae be, To the half kc ; but ae and kc , are the Sines of the Angles at the Centre aoc and koc , which Angles at the Centre are severally equal to the Angles of the Triangle c and a , because they stand on half the Arcs that the Angles of the Triangle do; wherefore $ab : bc :: S, c : S, a$.

Let H, B , and O , be the Sides of an Oblique Plain Triangle; a, b and c , its three Angles; here because there is no Right-angle, three Things must be always given, that is, either two Sides and one Angle, one Side and two Angles, or else all the three Sides.

From whence will arise the three former of the six following Cases.

Given. [Requir'd.]		Proportions.
1	H. O. c	b . $O, S, c :: H : S, b$. Note, that the Angle b is ambiguous, and you must collect from the Circumstances of the Triangle, whether it be Obtuse or Acute.
2	H. O. c.	B. Here first find the Angle b by Case 1. thence a will be known by taking the Sum of $b + c$ from 180° . Then $S, c : O :: S, a : B$. Or $S, b : H :: S, a : B$.
3	c. b, O.	H. $S, c : O :: S, b : H$.
4	H. a. O	c, b. $A + O : H - O :: T \frac{1}{2} Z$ of the opposite Angles, To $T \frac{1}{2} X$ of the opposite Angles, and $\frac{1}{2} Z + \frac{1}{2} X = b$, and $\frac{1}{2} Z - \frac{1}{2} X = c$.
5	H. a, O.	B. Find the Angles by the former Case, and then $S, b : H :: S, a : B$; or $S, c : O :: S, a : b$.
6	H. O. B 3 Sides.	3 Angl. $B, H + O :: H - O : X$. And then $\frac{1}{2} B + \frac{1}{2} X = C$ and $\frac{1}{2} B - \frac{1}{2} X = Bb$. Then will $H : R :: C B : Co-sine Angle C$; and $O : R :: b B : Co-sine Angle b$; Axiom 1.

And the three last are solved by the Help of the two following Axioms.

AXIOM III.

As the Sum of the Legs about the Angle given, Is to their Difference :: So is the Tangent of half the Sum of the other two Angles, To the Tangent of half their Difference.

Now the Sum of the other two Angles is known, being what the given Angle wants of 180 Degrees, and their Difference is now found; add therefore their half Sum, and half Difference together, and it gives you the greater of the two Angles sought; and half the Difference subtracted from the half Sum, leaves the lesser Angle sought. And thus having found the Angles; if the Side opposite to the former given Angle be sought, it will be found easily by *Pardie's Axiom*, That the Sides are as the Sines of the Angles.

The Demonstration of the Third Axiom, is briefly thus.

Demonstration.

I say the Sum of the Legs of any Angle a , Is to their Difference :: As the Tangent of half the Sum of their opposite Angles, Is to the Tangent of half their Difference.

Produce

Produce O , one of the given Legs of the Angle given, till $a f$ become equal to H or $C a$, and then bisect $b f$ in e , join $c f$, and bisect it also in d : Draw $a d$, which will be perpendicular to $c f$ (2. 16.) and draw $d e$, which will be parallel to $c b$. (6. 92.) Then will the Angle $c a d = d a f$; i. e. to the half of $c a f$, which external Angle $c a f = c + b$: That is, to the Sum of the opposite Angles required.

Draw then $g a$ parallel to $c b$; so will the Angle $g a c$, be equal to the alternate one c . And if from half the Sum of the opposite Angles, you take the lesser Angle; i. e. If from $c a d$, you take $g a c$, there will remain the Angle $g a d$, equal to half the Difference of the opposite Angles.

And so also, if from $b e$, half the Sum of the Legs, you take O the lesser Leg, there will remain $a e$ equal to half the Difference of the Legs. And then since the Triangle $c a d$ is Right-angled, if $a d$ be made Radius, $c d$ will be the Tangent of the Angle $c a d$; (i. e. the Tangent of half the Sum of opposite Angles;) and in the little Triangle $g a d$, $g d$ will be the Tangent of the Angle $g a d$; (i. e. the Tangent of half the Difference of opposite Angles.) But the Segments of the Legs of any Triangle cut by Lines parallel to the Base, being proportionable, $e b : e a :: c d : d g$; That is, in Words, *Half the Sum of the Legs, Is to half their Difference :: As the Tangent of half the Sum of the opposite Angle, Is to the Tangent of half their Difference*; but Wholes are as their Halves: Wherefore the Sum of the Legs, Is to their Difference :: As the Tangent of half the Sum of the opposite Angles, Is to the Tangent of half their Difference. Q. E. D.

Whence the two following Cases will easily be solved.

CASE I.

Given H , O and a . Required c, b ?

For $H + O : H - O ::$ as T , half Z opposite Angles, Is to T , half X opposite Angles; and then half $Z +$ half $X = b$, and half $Z -$ half $X = c$.

CASE II.

Given $H O$, and a . Required B ?

First find the Angles by the former Case, and then $S, b : H :: S, a : B$; or $S, c : O :: S, a : B$; by the Second Axiom.

AXIOM IV.

The Base, Is to the Sum of the Legs :: As the Difference of the Legs, Is to the Difference of the Segments of the Base made by a Perpendicular let fall from the Angle opposite to the Base.

For there is also another Case, in plain Oblique-Triangles, which requires a particular Axiom to solve it; and that is, Where all three Sides are given to find the Angles. Here let fall a Perpendicular from any Angle to its opposite Side as $a p$;

and then say, As the Side $d c$, Is to $d a + a c$, the Sum of the other two Sides :: So is the Difference of those two Sides $d a - a c$, To a fourth Number. Half of which added to half $d c$, gives you the Segment of the Base $d p$; and if subtracted from half $d c$, it will leave the other Segment $p c$. And when those Segments are thus found, the Angles are easily had thus; $d a : Radius :: d p : Co-sine$ of the Angle d , And $a c : Radius :: p c : Co-sine$ of the Angle c .

The Demonstration of which last Axiom, is thus.

Demonstration.

On the Centre a , with the Distance $a c$, describe a Circle, which will intersect both the other Sides of the Triangle, and then $x d$ will represent the Sum of the Legs $d a$ and $a c$; $d e$ will represent their Difference, and $d f$ will represent the Difference of the Segments of the Base made by the Fall of the Perpendicular $a p$.

Then I say, $d c : d x :: d e : d f$; That is, *The Base, Is to the Sum of the Legs :: As the Difference between the two Sides, Is to the Difference of Segments of the Base*; as is apparent from Prop. 67. of Pardie's Sixth Book, after drawing the prick'd Lines $e c$ and $f x$.

And then the Case will stand thus.

CASE III.

Given H, O, B , all three Sides. Required the Angles? See the Figures before.

I say, by this Axiom, $B : H + O :: H - O : X$, which expresses the Difference of the Segments of the Base, $= e f$ in the Figure.

And

TRI

And then having found X ; half $B + \text{half } X = dp$ the greater Segment, and half $B - \text{half } X = pc$, the lesser, by which means the two Right-angled Triangles adp , and apc , will be solved easily: For $da : \text{Radius} :: dp : \text{Co-sine of the Angle } d$; And $ac : \text{Radius} :: pc : \text{To the Co-sine of the Angle } c$.

The Operation of the Six Cases of Oblique-angled Triangles.

CASE I.

Given H, O, c . Required b ?

$$O : S, c :: H : S, b$$

The Numbers of the Triangles, are as follows

$$\begin{aligned}\sqrt{c} &= 22^\circ 37' \\ \sqrt{b} &= 53^\circ 08' \\ \sqrt{a} &= 104^\circ 15' \text{ Or, its Suppl.} = 75^\circ 45'\end{aligned}$$

$$\begin{aligned}H &= 780 \\ O &= 374.9 \\ B &= 945 \\ O &= 2.5739154 = 347.9\end{aligned}$$

$$\begin{aligned}S, c &= 9.5849685 = 22^\circ 37' \\ H &= 2.8920946 = 780\end{aligned}$$

$$\text{Sum} = 12.4770631$$

$$S, b = 9.9031477 = 53^\circ 8'$$

CASE II.

Find first the Angle b , by *Case I.* then will a be known.

Given H, O, c . Required B ?

$$S, c : O :: S, a : B$$

$$S, c = 9.5849685 = 22^\circ 37'$$

$$O = 2.5739154 = 374.9$$

$$S, a = 9.9864273 = 104^\circ 15'$$

$$\text{Sum} = 12.5603427$$

$$B = 2.9753742 = 945$$

TRI

CASE III.

Given c, b, O . Required H ?

$$S, c = 9.5849685 = 22^\circ 37'$$

$$O = 2.5739154 = 374.9$$

$$S, b = 9.9031084 = 53^\circ 8'$$

$$\text{Sum} = 12.4770238$$

$$H = 2.8920553 = 780$$

CASE IV.

Given H, a, O . Required b, c ?

$$H + O : H - O :: T, \frac{1}{2} Z, \text{op.} \sqrt{\sqrt{T, \frac{1}{2} X, \text{op.} \sqrt{\sqrt{H + O}}}} : T, \frac{1}{2} X, \text{op.} \sqrt{\sqrt{H - O}}$$

$$H + O = 11540.9$$

$$H - O = 405.1$$

$$\text{Half } Z \text{ opposite Angles} = 37^\circ 52'$$

$$H + O = 3.0625820 = 1154.9$$

$$H - O = 2.6074550 = 405.1$$

$$T \text{ half } Z = 9.8907254 = 37^\circ 52'$$

$$\text{Sum} = 12.4981804$$

$$T, \text{ half } X. 9.4355984 = 15^\circ 15'$$

Then will half $Z + \text{half } X = 53^\circ$ Degrees 7 Minutes $= b$; And half $Z - \text{half } X = 22^\circ$ Degrees 37 Minutes $= c$.

TRI

CASE V.

Given H, a O. Required B ?

Find the Angles b and c , by Case 4, then,

$$[S, b : H :: S, a : B ?]$$

$$S, b = 9.9031084 = 53^{\circ} 8'$$

$$H = 2.8920946 = 780$$

$$S, a = 9.9864273 = 104^{\circ} 15'$$

$$\text{Sum} = 12.8785219$$

$$B = 2.9754135 = 945$$

* This is the Sine of 74.45 , the Supplement of 104.15 , to a Semi-circle.

CASE VI.

Given H, O, B. Required Three Angles ?

$$\begin{aligned} B : H + O :: H - O : X. \\ \frac{1}{2} B + \frac{1}{2} X = C B \text{ and } \frac{1}{2} B - \frac{1}{2} X = B b. \\ H : R :: B c : \Sigma c; \text{ and } O : R :: B b : \Sigma b. \end{aligned}$$

$$B = 2.9754318 = 945$$

$$H + O = 3.0622058 = 1154.9$$

$$H - O = 2.6074540 = 405.1$$

$$\frac{1}{2} B = 472 \frac{1}{2} \quad 5.6696058 =$$

$$\frac{1}{2} X = 247 \frac{1}{2} \quad 2.6942280 = 495$$

$$H = 2.8920453 = 780'$$

$$\frac{1}{2} B + \frac{1}{2} X = 750$$

$$\frac{1}{2} X - \frac{1}{2} B = 225 \quad R = 10.$$

$$B C = 2.8573225 = 720$$

$$\Sigma c = 9.9652672 = 23^{\circ} 37'$$

$$O = 2.5739154$$

$$R = 10.$$

$$B b = 2.3521825$$

$$\Sigma b = 9.7782671 = 53^{\circ} 08'$$

And when thus the Nature, Reason, and Method of Operation in the Calculating of the Sides and Angles of Oblique Triangles, is fully under-

TRI

stood; its Application, Use, and Practice, will be very easie and plain, tho' its Extent be very large and ample. For,

First, If you have a Mind to apply it to what they call *Oblique Sailing*, or the Doctrine of *Oblique Plain Trigonometry*, applied to *Sailing*; your former Triangle and Cases will reach all that you can desire.

As suppose a Ship Coasting along by the Shore from the Place b , lets an Head Land by her Compaſs, (as c) and finds it to bear from her S. S. W. then she fails on, W. S. W. 51. 5 Miles or Minutes to a ; and then finds that the Head Land bears from her full S. E.

'Tis required to determine her Distance from this Head Land when she was at b , and now she is at a .

First, To Plot the Triangle.

Draw a streight Line, as B, representing the first bearing of the Head Land, which was S. S. W. Then from 6 Points take 2, and there remains 4 = 45°; because the Ship sailed West South West, make the Angle b equal to 45°, and so will the Line O represent the Distance sailed, and b will be the Course. Prick off the Distance run, viz. 51. 5 Miles from b to a . Then because the Ship sailed W. S. W. the contrary Rhumb from a to b , must be E. N. E. And since the South-East Rhumb makes with that an Angle of $67^{\circ} 30'$, you must make the Angle at a , just $67^{\circ} 30'$. So with the Line H, when drawn, intersect the Line B in the Point of the Situation of the Head Land c ; and by that means will the Triangle be completed.

This being done, if you please, (tho' Plotting the Triangle is not of absolute Necessity, but very useful and instructive) then consider, that it must be a Case of *Oblique Plain Triangles*, where is given the Angle a and b , and the Side O. Required H and B ?

To find H, say, (because c is also known if a and b are)

$$[S, c : O :: S, b : H ?]$$

Operation.

Operation.

$$\begin{aligned} S, c &= 9.9656153 = 67^{\circ} 30' \\ O &= 1.7118072 = 51.5 \text{ Miles.} \\ S, b &= 9.8494850 = 45^{\circ}. \\ \text{Sum} &= 11.5612922 \\ H &= 1.5956769 = 39.4 \text{ Miles.} \end{aligned}$$

And to find B, you may say,

$$\text{As } S, b : H :: S, a : B?$$

Or,

$$\text{As } S, c : O :: S, a : B?$$

I shall give but one Instance more in this Matter, which is this.

Suppose a Ship sail S. S. W. 50 Leagues, and then W. by N. 64 Leagues : What was her direct Course, and what is her Distance from the Place she went from ?

To Plot the Cafe.

Let b be the Place from whence the Ship sailed, and let B represent the S. S. W. Rhumb, and the Distance thereon run = 50 Leagues, from b to a .

Then, since the first Course was two Points, and the Second seven Points from the Meridian, make an obtuse Angle at b , equal to 9 Points, $101^{\circ} 15'$: And on the Leg H. set 64 Leagues, then drawing the Side $a c$, the Triangle will be formed.

In which you have two Legs, H and B forming the Angle a , and that Angle given. And this is *Cafe 4. of Plain Oblique Triangles.*

Secondly, If you would apply this Part of Trigonometry to the Measuring of inaccessible Distances, Heights, &c. at Land; the Practice will be very easie.

Suppose a Tower, Steeple, &c. as $a G$, whose Height you would take, but can measure no nearer than from c to b , but know the Length B, is = 100 Yards.

Here you can take the Angle $a b G$, with your Quadrant, and consequently the Obtuse Contiguous one, $c b a$, is known.

The Angle c is known after the same way by the Instrument : Wherefore having in the Obtuse Angled Triangle $H O B$, the Base B, and the Angles c and b , you must find O by *Cafe 3. of Oblique Plain Triangles* : For since c and b are known their Sum subtracted from 180, will leave $c a b$, known. Therefore say,

$$\boxed{\text{As } S, a : B :: S, c : O?}$$

And when it is thus known or found, having in the Right-angled Triangle, $b a, G$, the Hypotenuse O, and the Angle b .

By *Cafe* the 7th of Right-angled Triangles.

$$\text{As } R : O :: S, b : a G?$$

The Altitude of the Tower sought.

Thirdly, Suppose an inaccessible Distance, as B D, which imagine to be the Distance between two Forts, Bastions, &c. on the Wall or Line of an Enemies City or Camp; and that because of the Cannon, &c. you can go no nearer than the Line G C, but can measure from G to C, and at each Station take Angles with an Instrument.

Having taken then by the Theodolite, &c. the Angles G C D, and C G D, and measured G C : And also having taken the Angles C G D, and B C G. This premised, which is easily done by the Instrument.

You have in the Triangle C B G, the Side C G, and the two Angles G, and G C B : Wherefore, also the Angle C B G. Say therefore,

$$\text{As, } B : G C :: S, C : G B ?$$

And consequently $G B$ is found.

Again, in the Triangle CDG , the Angles GCD , CGD , and the Side CG being given, the Side, GD , will be found by this Proportion.

$$\text{As } S, D : CG :: S, C : GD ?$$

And consequently GD also is found.

And now having in the Triangle GBD , the two Sides GB and GD , and the included Angle G ; you can first find the remaining Angles severally by *Axiom 3*, and then the Side BD by *Axiom 2*.

Or, If not being able to get nearer than the Point a , you could not measure sideways as before, but only backward to b , or forward from b to a : You may then easily gain the Length from D to C .

For placing the Instrument at a , you can take the two Angles baD and baC , and take also CaD ; measure then from a to b , and at b take also the two Angles abD , and abC . Then can you easily gain the Sides aC , and aD , in the two Triangles baC , and baD ; and having before taken by the Instrument the Angle CaD , you may find the Side CD in that last Triangle aCD , by the second and third *Axioms* of *Plain Oblique Trigonometry*. Also,

Fourthly, On the Application of this Part of *Trigonometry*, to the Doctrine of *Astronomy*, depends the Method for finding the Parallax and Distance of a Planet, or Star.

Let c be the Centre of our Earth, and b a Point on its Surface; at which, an Observer at b takes with an Instrument the Angle $\angle bz$, or the Distance of the Meridian Moon C , from her Zenith at z .

Her true Distance from the Zenith, is known by the Astronomical Tables; which is the Angle $\angle cz$: But the observed Angle $\angle bz$, being external to the Triangle, $\angle bz$, will be \equiv to $\angle + c$.

Where take c from it, and the Remainder is the Angle $b \angle c \equiv$ to the Moon's Parallax, whose Subtense is $bc \equiv$ to the Earth's Semidiameter.

Suppose that bc be 4000 Miles; then in the Triangle $\angle bc$, there are all the Angles, and the Side bc known.

Wherefore,

$$\text{As } S, \angle : bc :: S, b : \angle c ?$$

Which is the Moon's Distance from the Centre of our Globe.

And also, as

$$S, \angle : bc :: S, c : \angle b ?$$

The Moon's Distance from the Place of Observation.

TRIGONOMETRY Spherical.

Definition 1.

A *Spherical Triangle* is made by, or contained under the Arks of three great Circles of the Sphere.

Definition 2.

A *Spherical Angle*, is the mutual Inclination or Aperture of the Planes of two great Circles.

Properties of Spherick Triangles.

1. When one Circumference of a Circle cuts, crosses, or falls on another, the Sum of the Angle made thereby is equal to two right ones.
2. When two Circumferences of Circles cross each other, tho' opposite or vertical Angles are always equal.
3. In every *Spherical Triangle*, the greater Angle is opposite to the greater Side.
4. An *Isoceles Spherical Triangle*, hath its Angles at the Base equal to each other; the *Converse* of which also is true, That if the Angles at the Base are equal, the Triangle is an *Isoceles*.
5. If two *Spherical Triangles* are mutually *Equilateral*, they are also *Equiangular* and *Similar* one to another.
6. If two *Spherick Triangles* have in each one Angle and two Sides including it; or if they have one Side and two Angles adjacent respectively equal, the whole Triangles are equal.
7. Any two Sides of a *Spherick Triangle*, are longer than the Third; because the Ark of a great Circle is the nearest Distance between any two Points on the Sphere.

8. All

8. All great Circles must cut each other into two equal Parts, because their common Intersection is a Diameter of the Sphere; and consequently, the two Points of Intersection are at the Distance of a Semicircle from each other.

COROLLARY.

Hence 'tis plain, That every Side of a Spherick Triangle must be less than a Semicircle.

9. The opposite Angles at the Intersection of two Circles are always equal, because the same Planes constitute both Angles; that is, the Angle a is equal to the Angle b : See Figure below.

10. In a Spherical Triangle, if the Sum of the Legs of any Angle be greater, equal, or less than a Semicircle; the internal Angle at the Base is accordingly greater, equal, or less than the outward and opposite one; and consequently, the Sum of the two internal Angles at the Base is greater, equal or less than two Right Angles.

DEMONSTRATION.

If $ac + cd$ be greater than ab , dc must be longer than cb , and consequently, the Angle b ($= a$) will be bigger than the Angle cdb . Property 3. But if $ac + cd$ be equal to a Semicircle, then dc will be equal to cb , and the Angle $b =$ Angle cdb . And in the Triangle $dc b$, because $dc + cd$ is less than ab ; therefore ac is greater than cd , and consequently the external Angle adc is greater than the Angle a ; that is, than the Angle b , the internal Angle at the Base.

Also, since the Angle $adc +$ the Angle $cdb =$ two Right Angles, therefore the Angle $adc +$ the Angle a is great than two Right Angles, &c.

11. In an Isosceles Sph. Triangle, if one of the equal Legs is greater, equal, or less than a Quadrant, the Angle is accordingly greater, equal, or less than a Right one.

12. The Sum of the three Sides of every Sph. Triangle, is less than a Circle.

For cd is less than $cb + bd$, wherefore $ac + dc + da$, must be less than the Sides $acb + adb$: See the Figure above.

13. The Measure of any Spherick Angle, is an Ark of a great Circle described from the Angular Point, and precisely 90 Deg. distant from it; that is, making the Angular Point the Pole of that Circle.

14. The Poles of the Sides of any Triangle GHD, do on the Surface of the Globe, constitute another Triangle nxm , which may be called Supplemental to the Triangle GHD; for the Supplements of the Angles and Sides of the Triangle nxm , are equal to the Sides and Angles of the Triangle GDH.

DEMONSTRATION.

From the Points GHD, as Poles describe three great Circles $x Ay$, $RT mn$, $x B n z$, then is $ym =$ Quadrant $= Ax$; because m is the Pole of $HG y$, and x or E the Pole of GA , therefore $mx = Ay =$ Supplement of $CA =$ Angle HGD , and zn is Quadrant $= Bx$, therefore $nx = Bx =$ Supplement of Angle GHD , and $nt =$ Quadrant $= mR$, therefore $nm = TR =$ Supplement of the Angle DHG .

Note, That the Triangle nEm constituted between the three next Poles, has its three Sides and Angles equal to the Angles and Sides of the Triangle GHD, save that the greatest Side nm is the Supplement of the greatest Angle H , and the Angle E the Supplement of the Side GD .

15. Any Angle of a Triangle, with the Difference of the other two, is less than two Right Angles. For, xn is less than $xm + mn$:

That is,

$$2 \angle - D < 2 \angle - G + 2 \angle - H.$$

Therefore,

$$G + H - D < 2 \angle.$$

For since $2 \angle - D < 2 \angle - G + 2 \angle - H$:

That is,

$$2 \angle - D < 4 \angle - G - H,$$

By transferring D, G , and H , 'twill be $2 \angle + G + H < 4 \angle + D$; then by taking away $2 \angle$ from both Sides, and transferring D , you'll have $G + H - D < 2 \angle$. Q. E. D.

16. If two Triangles are mutually Equiangular, they are also mutually Equilateral; for because they are Equiangular, their Supplemental Triangles are Equilateral, (by 14th) and therefore Equiangular (by 15th) and therefore the proposed Triangles are Equilateral (by 14th.)

17. First, The 3 Angles of every Triangle are greater than 2 Right Angles, and less than 6 Right ones.

For $nx + mx + mn < 4L$ (by 12.)

That is,

$$6L - D - G - H < 4L; \\ i.e. 2L < D + G + H.$$

2dly, The Sum of the internal Angles, is less than the Sum of the Internal and External, both which, in all, make but six Right Angles.

18. Of several Arks of great Circles falling from the same Point of the Sphere's Surface on another Circle, the greatest is that which passes through the Pole of the Circle, and the next to this, is greater than that which is farther off.

For suppose P the Pole of the Circle $C \odot D$, and \odot the Pole of DPC ; then is $AD > AB > AE > AC$; and the Arch $B \odot C > BP > BD$.

19. A great Circle passing through the Poles of another great Circle, cuts it at Right-angles; and on the contrary, if it cuts it at Right-angles, it passes through its Poles. Thus the Angle $PBD = L = PGD = PDB$, also $= \odot AC$.

20. In an oblique angled Triangle, if the Angles at the Base are like, or of the same kind, i.e. both Acute, or both Obtuse; the Perpendicular falls within the Triangle, and the Quadrantal Ark without: But if they be unlike, the Perpendicular falls without, and the Quadrant within. For the Triangle EAF has the Angles E and F Acute, and the Perpendicular AC falls within, and the Quadrant $A \odot$ without. Also the Triangle BAG hath B and G obtuse; and the Perpendicular AD within, and the Quadrant $A \odot$ without: But the Triangle BAE has the Angle B, E of different kinds, and the Perpendicular AC without, and the Quadrant $A \odot$ within.

Also, by the same Figure is manifest, how the Ambiguities of Right-angled Triangles may be solved, viz.

SOLUTIONS.

1. The Legs of the Right-angle are of the same kind with the opposite Angles. So in the Triangle BDA , because DA is greater than a Quadrant DP , the Angle DBA is greater than the Right-angle DBP : And in the Triangle BCA , because AC is less than the Quadrant PC , the Angle CBA is less than the Right-angle CBP .

2. If the Legs (and consequently the Angles) are of the same or different kinds; the Hypotenuse is accordingly less or greater than a Quadrant: So in the Triangles EDA , ECA , the Hypotenuse EA is less than a Quadrant; but in the Triangle BDA , the Hypotenuse AB , is greater than the Quadrant BP .

3. If the Hypotenuse is less or greater than a Quadrant, either Leg, with its adjacent Angle, is accordingly of the same or different kind, as follows from the two last.

For the viewing the Sines, Co-sines, and other Right-Lines of Arks, which are not visible in a common Sphere; Let the Arks of three great Circles of Card Paste-board be put together, as in an Armillar Sphere.

As suppose the two Arks BP , BA , and that BPH , the Plane of the greater Ark were turn'd round BH , till that a Right-Line falling from P perpendicular to the Plane BAH , may fall on the same Point of the Line CA , suppose on D ; for in that Position PAB will be a Spherick Triangle Right-angled at A , and BP the Hypotenuse, BA the Base, PA the perpendicular Arch.

And suppose PA (in the next Figure) be equal PA of the Triangle, and fitted according to its Letters therein, and draw AE , PF Perpendicular to BC ; so AE , PE , PD , will be Sines of the Arks BA , BP , PA , and their Co-sines will be EC , FC , DC .

These

TRI

These things being done and conceived, the two first Axioms of *Spherick Trigonometry* will presently appear, and also the Demonstration of the 16 Cases of Right-angled Triangles, without any other Figure or Production of Sides, as is usual.

To that End, let the Ark $\propto \alpha$ (Fig. 3.) be also fitted in the Solid, according to its Letters; (*as you will find it very well done in Mr. Heynes's Trigonom.*) Then in the two Right-angled Spherick Triangles. PBA, $\propto \beta \alpha$, having the same Acute Angle B, at the Base.

TRI

AXIOM I.

The Sines of the Hypothenuses are proportional to the Sines of the Prependiculars.

P F : P D :: $\text{C} : \text{C} \sharp$.

AXIOM II.

The Sines of the Bases are proportional to the Tangents of the Perpendiculars.

$$AE:AG::\alpha C,\alpha\gamma.$$

For the two Right-angled Triangles FPD , $C\pi\delta$, are similar; as also EAG , and $C\alpha\gamma$.

And for the Solution of the following Cases, I suppose BAP (in this Figure) a Right-angled Triangle, and its Sides produced to Quadrants BN, BM, AD.

Suppose also, P E, P F, N G, and E G, Quadrants. Then is N E equal to B P, and the Complement of B A equal to A M, equal to *b* A D M, and F E equal to Angle F P E, equal to Angle B P A, and G D equal to N M, equal to Angle B, and the Angles at A, M, N, E, and F, right.

N. B. The Reason of producing the Sides of the Triangle B A P to Quadrants, is, because by this Means the Angles may be turned into Sides, and the Hypothenuses into Sides and Perpendiculars & *contra*: And from hence it comes to pass, that the Parts of the Triangle given, do sometimes fall in Co-fines and Co-Tangents, instead of Sines and Tangents.

Here follow the Proportions for Right-angled Triangles.

The Propositions for the Solution of the Sixteen Cases of Right-angled Spherick Triangles, with their Solutions of the Ambiguities.

Given.	Req.			Given.	Req.

N. B. If you Project the given Triangle within a Primitive Circle, according to the Doctrine of the Sphere, as was shewed under Spherick Geometry, all Ambiguities will vanish; and if the Triangle be Oblique, the Perpendicular will be drawn also: And this is a very good Way to gain a clear Notion of Spherical Trigonometry; which cannot be understood thoroughly, without the Doctrine of the Sphere, and its several Projections be first learn'd.

Examples,

Examples of the Sixteen Cases of Right-angled Spherical Triangles.

For the Sun's Declination.

C A S E I.

Given the Complement of the Sun's Amplitude B A, and the Latitude P A: Required the Sun's Distance from the Pole P B, which is the Complement of his Declination?

$$R : \Sigma BA :: \Sigma PA : \Sigma BP?$$

$$R. = 10.0000000$$

$$\Sigma BA = 9.8508702 = 44^\circ 49'$$

$$\Sigma PA = 9.6149441 = 65^\circ 40'$$

$$\Sigma PB = 9.4658143 = 73$$

Wherefore the Sun's Declination is 77 Degrees, = \odot B.

C A S E II.

Given as before B A and P A. Required B, the Angle of the Sun's Position?

$$S, BA : R :: T, PA : T, BP?$$

$$S, BA = 9.8480909$$

$$\text{Radius} = 10.$$

$$T, PA = 10.3446523$$

$$T, B = 10.4965614 = 72^\circ 20'$$

C A S E III.

Given B P, equal to the Sun's Distance from the Pole, and P the Sun's Hour from Midnight. Required B, the Angle of the Sun's Position?

$$R : \text{Cof. } BP :: T, P : \epsilon, B?$$

$$\text{Radius} = 10.$$

$$\Sigma BP = 9.4659353$$

$$T, P = 10.0376939$$

$$\epsilon, B = 72^\circ 20' = 9.5036292$$

C A S E IV.

For the Latitude.

Given B P equal to the Sun's Distance from the Pole, and P the Hour from Midnight. Required P A the Latitude?

$$R : \Sigma P :: T, BP : T, PA?$$

$$\text{Radius} = 10.$$

$$\Sigma P = 9.8298212$$

$$T, BP = 10.5146610$$

$$T, PA = 10.3444822 = 65^\circ 40'$$

C A S E V.

For the Sun's Amplitude.

Given as before B P and P. Required B A, equal to the Sun's Amplitude?

$$R : S, BP :: S, P : S, BA?$$

$$\text{Radius} = 10.$$

$$S, BP = 9.9805963$$

$$S, P = 9.8675151$$

$$S, BA = 9.8481114 = \text{Co-Amplitude}$$

Wherefore, the Sun's Amplitude will be $45^\circ 11'$.

C A S E VI.

For the Sun's Declination.

Given P A equal to the Latitude, and P the Hour from Midnight. Required B P equal to the Distance from the Pole, or the Sun's Co-Declination?

$$\Sigma B : R :: T, PA : T, BP?$$

$$\Sigma P = 9.8298212$$

$$\text{Radius} = 10.$$

$$T, PA = 10.3446523$$

$$T, BP = 10.5148311 = 73^\circ$$

C A S E VII.

For the Angle of the Sun's Position.

Given as before PA, and P. Required B?

$$R. \Sigma PA :: S, P :: \Sigma, B?$$

$$R. = 10.$$

$$\Sigma PA = 9.6149441$$

$$S, P = 9.8675151$$

$$\Sigma B = 9.4824592 = 72^{\circ} 20'$$

C A S E VIII.

For the Latitude.

Given BA equal to the Sun's Amplitude, B equal to the Sun's Position. Required PA the Latitude?

$$R : S, BA :: T, B : T, PA?$$

$$\text{Radius} = 10.$$

$$S, BA = 9.8480909$$

$$T, B = 10.4968908$$

$$T, PA = 10.3449817 = 65^{\circ} 40'$$

C A S E IX.

Given PA equal to the Latitude, and B the Angle of Position. Required BA equal to the Amplitude?

$$T, B : R :: T, PA : S, BA?$$

$$T, B = 10.4968908$$

$$\text{Radius} = 10.$$

$$T, PA = 10.3446523$$

$$S, BA = 9.8477615 = 40^{\circ} 49'$$

C A S E X.

For the Sun's Distance from the Pole.

Given PA and B, as before. Required BP, the Sun's Distance from the Pole?

$$S, B : R :: S, PA : S, BP?$$

$$S, B = 9.9790192$$

$$\text{Radius} = 10.$$

$$S, PA = 9.9595964$$

$$S, BP = 73^{\circ} 0' = 9.9805772 = \text{Co-Decl.}$$

Wherefore the Declination is 17 Degrees.

C A S E XI.

For the Hour from Midnight.

Given, as before, PA and B. Required P, the Hour from Midnight?

$$\Sigma PP : R :: \Sigma B : SP?$$

$$\Sigma PA = 9.6149441$$

$$\text{Radius} = 10.$$

$$\Sigma B = 9.4821283$$

$$S, P = 9.8671842 = 47^{\circ} 29'$$

C A S E XII.

For the Hour.

Given PA, equal to the Latitude BP, equal to the Sun's Amplitude. Required P = Sun's Hour from Midnight?

$$T, BP : R :: T, PA : \Sigma P?$$

$$T, BP = 10.5146610$$

$$\text{Radius} = 10.$$

$$T, PA = 10.3446523$$

$$\Sigma P = 9.8299913 = 47^{\circ} 21'$$

The Hour from Midnight $47^{\circ} 29' = 3 \text{ H. } 10'.$

C A S E XIII.

For the Angle of Position.

Given, as before, PA : PB. Required B, and the Angle of the Sun's Position?

$$S, BP : R :: S, PA : S, B?$$

$$S, BP = 9.9805963$$

$$\text{Radius} = 10.$$

$$S, PA = 9.9595964$$

$$S, B = 9.9790001 = 72^{\circ} 20'$$

C A S E XIV.

Given Latitude and Declination. Required the Sun's Amplitude?

Given, as before, PA and P B. Required BA = Sun's Amplitude?

$$PA : R :: \Sigma BP : \Sigma BA.$$

$$\Sigma PA = 9.6149441$$

$$\text{Radius} = 10.$$

$$\Sigma BP = 9.4659353$$

$$\Sigma BA = 9.8509912 = 44^{\circ} 49'$$

Equal to the Co-Amplitude, wherefore the Sun's Amplitude = $45^{\circ} 11'.$

C A S E

CASE XV.

Given B the Angle of the Sun's Position, and P the Hour from Midnight. Required B P the Sun's Distance from the Pole?

$$T, P : R :: \angle B : \angle B P ?$$

$$T, P = 10.0376939$$

$$\text{Radius} = 10.$$

$$\angle B = 9.5031092$$

$$\angle B P = 9.4654053 = 73^\circ$$

CASE XVI.

Given as before B, the Angle of Position, and P the Hour from Midnight. Required P A the Latitude of any Place?

$$S, P : R :: \angle B : \angle P A ?$$

$$S, P = 9.8675151$$

$$\text{Radius} 10.$$

$$\angle B = 9.4821283 = 72^\circ 20'$$

$$\angle P A = 9.6146132 = 24^\circ 19'$$

Oblique Spherical Triangles, may be reduced to two Right-angled Spherical ones, by letting fall a Perpendicular, which either divides the Oblique Triangle proposed into two Right ones, or makes two Right ones, by adding a Right-angle Triangle to it.

In *Oblique Triangles* there are 12 Cases, 10 of which (by this Preparation) may be solved by the two first *Axioms*, or by Rules deduced from them.

RULE I.

The Co-sines of the Angles at the Base, are proportional to the Sines of the Angles at the Vertex. For by Case 7. of *Right-angled Spherical Triangles*.

$$R : \cos PA :: \sin BPA : \cos BP ?$$

$$R : \cos PA :: \sin DPA :: \cos DP ?$$

$$\text{Therefore } \cos B : \sin BPA :: \cos D : \sin DPA ?$$

RULE II.

The Co-sine of the Sides are proportional to the Co-sines of the Bases. For by Case 1. of *Right-angled Spherical Triangles*.

$$R : \cos PA :: \cos BA : \cos BP ?$$

$$R : \cos PA :: \cos CA : \cos DP ?$$

$$\text{Therefore } \cos BA : \cos BP :: \cos DA : \cos DP ?$$

RULE III.

The Sines of the Bases are reciprocally proportional to the Tangents of the Angles at the Bases. For by *Axiom 2*.

$$S, BA : R :: T, PA : T, BP ?$$

$$S, DA : R :: T, PA : T, DP ?$$

$$\text{Therefore } S, BA \times T, B = R \times T, A = S, DA \times T, D ?$$

$$\text{Consequently } S, BA : S, DA :: T, D : T, B ?$$

RULE IV.

The Tangent of the Sides, are reciprocally proportional to the Co-sines of the Angles at the Vertex. For by Case 4.

$$T, BP : R :: T, PA : \cos DPA ?$$

$$T, DP : R :: T, PA : \cos DPA ?$$

$$\text{Therefore } T, BP : T, DP :: \cos DPA : \cos BPA ?$$

AXIOM III.

In any Triangle the Sines of the Sides are proportional to the Sines of the opposite Angles. For by *Axiom 1*.

$$S, BP : R :: S, PA : S, B ?$$

$$S, DP : R :: S, PA : S, D ?$$

$$\text{Therefore } S, BP : S, DP :: S, D : S, B ?$$

In letting fall your Perpendicular, observe this Rule.

Let it fall from the End of a given Side, and opposite to a given Angle.

For by so doing, you have enough given in one of the Right-angled Triangles to determine any of its unknown Parts.

The two first Cases are solved each by one Operation by the third Axiom; the other eight Cases are solved each by two Operations.

Observe also, the Addition or Subtraction both of the Segments of the Base, and Angles at the Vertex, according as the Perpendicular falls within or without the Triangle.

Proportions for the Solving the first Ten Cases of Oblique Spherick Triangles.

Cafe.	Given.	Req.	Proportion.
1	BP, PD, B.	D.	$S, PD : S, B :: S, BP : S, D$. <i>Ambiguous.</i>
2	B P, E, D.	PD.	$S, D : S, BP : S, B : S, PD$. <i>Ambiguous.</i>
3	B P, P D B.	BD	$R : cs, B :: T, BP : T, BA$, by <i>Cafe 4th</i> of Right-angled Spherick Triangles. Then $cs, BP : cs, BA :: cs, DP : cs, DA$, by <i>Rule 2d</i> . Then $BA \pm DA = BD$, according as the Perpendicular falls within or without the Triangles; which is doubtful, unless the Kind of the Angle D is known.
4	B P, P D, B.	P.	$R : cs, BP :: TB : ct, BPA$, by <i>Cafe 3d</i> . And then, $T, DP : T, BP :: cs, BPA : cs, DPA$, by <i>Rule 4th</i> . Then $BPA \pm DPA = PBD$. Here also, the falling of PA is doubtful, unless you know the Kind of the Angle D.
5	B P, B, D.	P.	$cs, BP : R :: ct, B : T, BPA$, by <i>Cafe 3d</i> . Then, $cs, B : S, BPA :: cs, D : S, DPA$, by <i>Rule 1</i> . then, if B and D are $\begin{cases} \text{alike} \\ \text{unlike} \end{cases}$ $BA \pm DPA = BD$.
6	B P, B, D.	BD	$cs, B : R :: ct, BP : ct, BA$, by <i>Cafe 4th</i> . Then $T, D : T, B :: S, BA : S, DA$, by <i>Rule 3d</i> . And then, if B and D are $\begin{cases} \text{alike} \\ \text{unlike} \end{cases}$ $BPA \pm DA = BPD$.
7	B, P, B P.	D.	$cs, BP : R :: ct, B : T, BPA$, by <i>Cafe 3d</i> . Then $s, BPA : s, DPA :: cs, B : cs, D$, by <i>Rule 1</i> . If $BPA > BPD$, and B $\begin{cases} \text{acute} \\ \text{obtuse} \end{cases}$, D is $\begin{cases} \text{obtuse} \\ \text{acute} \end{cases}$. But if $BPA > BPD$, and B $\begin{cases} \text{acute} \\ \text{obtuse} \end{cases}$, D is $\begin{cases} \text{acute} \\ \text{obtuse} \end{cases}$.
8	B, P, B P.	D P.	$cs, BP : R :: ct, B : T, BPA$, by <i>Cafe 3d</i> . Then $cs, DPA : cs, BPA :: T, BP : DP$, by <i>Rule 4th</i> . Then, if DPA is $\begin{cases} \text{like to} \\ \text{unlike} \end{cases}$ B, DP is $\begin{cases} < \\ > \end{cases}$ than a Quadrant.
9	B P, B D, B.	DP.	$cs, B : R :: T, BP : T, BA$, by <i>Cafe 4th</i> . Then $cs, BA : cs, BP :: cs, DA : cs, DP$, by <i>Rule 2d</i> . Then, if DA is $\begin{cases} \text{like} \\ \text{unlike} \end{cases}$ (PA) $> B, BD$ is $\begin{cases} < \\ > \end{cases}$ than a Quadrant.
10	B P, B D, B.	D.	$cs, B : R :: T, BP : T, BA$, by <i>Cafe 4th</i> . Then $S, DA : S, BA :: T, B : T, D$, by <i>Rule 3d</i> . Then if BA is $\begin{cases} < \\ > \end{cases}$ BD, D is $\begin{cases} \text{like} \\ \text{unlike} \end{cases}$ B.

LEMMA.

The Difference of the versed Sines of two Arks multiplied by half the Radius, is equal to the Sine of half the Sum of those Arks multiplied by the Sine of half the Difference of the Arks.

Suppose, AF, AB , the two Arks; the Difference of the versed Sines is $AG - AH = GH = BF$, and the Sine of half the Sum of the Arks is AD , for $EP = FA$, the Sine of half the Difference of the Arks is FO . Now the Triangles ACD, EFB , are Similar, (for the Triangles ACG, EOA are Similar, therefore the Angle C equal to the Angle E) therefore, as $AC : AD :: FE : FB$, or $\frac{1}{2} AC : AD :: \frac{1}{2} FE (i. e. FO) : FB$; therefore $\frac{1}{2} AC \times FB = FO \times AD$. For since $AC : AD :: FE : FB$; therefore $AC \times FB = AD \times FE$; and consequently $\frac{1}{2} AC \times FB = \frac{1}{2} AD \times FE$: that is $= AD \times \frac{1}{2} EF = AD \times OF$. $Q. E. D.$

AXIOM IV.

The Rectangle, or Product of the Sines of the Legs, Is to the Square of the Radius :: As the Difference of the versed Sines of the Base, and of the Difference of the Legs, To the versed Sine of the Vertical Angle.

Demonstration.

Resume the foreaid Circles of Pastboard, and suppose there B the Angle required, BA, BP , (equal BM) its Legs, PA the Base to be any way oblique to the Plane BA , and not perpendicular as before. Then will BPA be an oblique Triangle.

Let fall PB perpendicular to Bm , and $\pi\gamma$ perpendicular to $C\alpha$, and Bb to bA , and mL perpendicular to cA ; therefore Bb is perpendicular to cA , and bL equal $bA - LA$ equal to the versed Sine of the Base, less the versed Sine of the Difference of the Legs.

But $AE : AC :: bL : Bm$

And $mF : a c :: Bm : \gamma a$.

Therefore multiplying the Correspondent Terms of both Proportions,

$$AE \times mF : AC \times a c :: (bL \times Bm : Bm \times \gamma a) \\ bL : \gamma a.$$

CASE XI.

The Three Sides of any Spherick Triangle being given, to find an Angle.

The Rectangle of the Sines of the Legs, Is to the Square of the Radius :: As the Sine of $\frac{1}{2}$ Base more $\frac{1}{2}$ diff. of the Legs multiplied by the Sine of $\frac{1}{2}$ Base less $\frac{1}{2}$ diff. of the Legs, Is to the Square of the Sine of $\frac{1}{2}$ the Angle required.

Demonstration.

$AE \times mF : Rq ::$ (by Ax. 4. $bL : \gamma a$) $bL \times \frac{1}{2} R : \gamma R \times \frac{1}{2} R$; (i. e. by the foregoing Lemma, and the first in Mr. Caswell's Trigonometry.)

$AE \times mF : Rq :: S, \frac{1}{2} \text{Base} \times \frac{1}{2} \text{diff. } cr \times S, \frac{1}{2} \text{Base} - \frac{1}{2} \text{diff. } cr \text{ to } Sq \frac{1}{2} \text{Angle.}$

Example in Numbers.

Suppose BP equal $60^\circ. 10'$, DP equal $46^\circ. 42'$, BD equal $87^\circ. 30'$ were given, and the Angle P required?

$\frac{1}{2}$ the Base is	$43^\circ. 45'$
$\frac{1}{2}$ the Diff. of the Sides is	$6. 44$
$\frac{1}{2}$ the Base $+$ $\frac{1}{2}$ Diff. of the Sides is	$50. 29$
$\frac{1}{2}$ the Base $-$ $\frac{1}{2}$ Diff. of the Sides is	$37. 01$
Rad. Sq.	20.0000000
$S, \frac{1}{2} \text{Base} + \frac{1}{2} \text{diff. } cr \times S, \frac{1}{2} \text{Base} - \frac{1}{2} \text{diff.}$	19.6669325

Sum	39.6669325
Subtract the \square of the Sine of the Legs	19.8002534

Remainder $= Sq.$ of the Sine of $\frac{1}{2} < P$ 19.8666791
 The $\frac{1}{2}$ of which is the Sine of $59^\circ. 03'$ 9.9333395
 That is $\frac{1}{2}$ the Angle required.
 Therefore being doubled is $118^\circ. 06' = P.$

If these Data's were projected by the Directions given in *Spherical Geometry*; the Angles may be likewise found, without Calculation, and 'twill stand thus. The Triangle will be $\odot Z D$, where

$$\begin{aligned} Z &= P \\ P &= D \\ \odot &= B \\ BD &= \odot P \\ PD &= Z P \\ PB &= Z \odot \end{aligned}$$

CASE XII.

The three Angles being given, to find a Side.

The Angles adjacent to the Side requir'd, call Legs; and the Angle opposite, call Base: Then work as in the 11th Case.

For, such is the Operation in the Supplemental Triangle, whose Angles and Sides are equal to the Supplements of the Sides and Angles of the Triangle propos'd: But Arks and their Supplements, have the same Sines and Tangents.

Example in Numbers.

In the Triangle B D P, there is given the

$$\text{Angle} \begin{cases} P = 143.0, \text{ the Sun's Azimuth from the North.} \\ B = 15.04, \text{ the Angle of the Sun's Position.} \\ D = 30.00, \text{ the Hour from Noon.} \end{cases}$$

Required the Side P D, which is the Complement of the Latitude?

$$\begin{aligned} \text{Com. Angle } P &= 37^{\circ} 00' \} \text{ Ar. co. of } \S 0.220537 \\ \text{Angle } D &= 30^{\circ} 00' \} \text{ the Sines. } \S 0.301030 \\ \text{Angle } B &= 15^{\circ} 04' \} \text{ Angle op.} \end{aligned}$$

$$\begin{aligned} \text{Sum} &= 82^{\circ} 04' \\ \frac{1}{2} \text{ Sum} &= 41^{\circ} 02' \\ \frac{1}{2} \text{ Sum} - \text{Angle op. } 25^{\circ} 58' \} \text{ Sines } \S 9.817233 \\ & \qquad \qquad \qquad \S 9.641323 \end{aligned}$$

$$\text{The Sum of the 4 Logarithms equal } 19.980113$$

$$\text{Its half is the Co-sine of } 12^{\circ} 13' \quad 9.990056$$

Which doubled, gives $24^{\circ} 26'$ equal P D equal Complement of Latitude: Wherefore the Latitude must be $65^{\circ}.34'$.

In a Spherick Triangle, that is Right-angled or Quadrantal, the two Parts which are adjacent to the Right-angle or Quadrant, together with the Complements of the other three, are called, by my Lord Napier, *The Five Circular Parts*. And if the three Parts which enter the Question, (viz. 2 given, and 1 required) have no Interruption, (now tho' a Right-angle or Quadrant come between, 'tis not counted an Interruption) that Part which is between the other two, is called *The middle Part*, and then the other two are called *Extreams adjacent*, or *conjunct*. But if there be an Interruption, that Part which is separated from the other two, is called *The middle Part*, and the other two, are *Extreams opposite*, or *disjunct*. This being premised, Napier, after a diligent View of the Solutions of all the Cases of Right-angled and Quadrantal Triangles, has observed, That they all agree in one or two Propositions, viz. That the Radius multiplied by the Sine of the middle Part, is equal to the Rectangle or Product made of the Tangents of the Extreams conjunct, or to the Rectangle of the Co-sines of the Extreams disjunct.

This Proposition was invented by the Lord Napier, purely for Ease of Memory, and has been applied in all its Cases by most Authors; as particularly, by Sir Isaac Newton, Norwood, Sir J. Moor, Ward, &c.

Some more Examples of Oblique Spherick Triangles in Numbers.

In the Oblique Triangle B P D, (See the Figure following.)

Suppose there be given the Sides.

$$PD = 24^{\circ}.20', \text{ } \left\{ \begin{array}{l} \text{the Complement of the Sun's} \\ \text{Latitude.} \end{array} \right.$$

$$BD = 73^{\circ}.00', \text{ } \left\{ \begin{array}{l} \text{the Complement of the Sun's De-} \\ \text{clination, or his Distance from} \\ \text{the North Pole.} \end{array} \right.$$

$$PB = 52^{\circ}.34', \text{ } \left\{ \begin{array}{l} \text{the Complement of the Sun's} \\ \text{Altitude.} \end{array} \right.$$

'Tis required to find the Angle.

$$BPD, \left\{ \begin{array}{l} \text{the Sun's Azimuth from the North Part of} \\ \text{the Meridian.} \end{array} \right.$$

$\frac{1}{2}$ the

the Base is 36° 30'
 the Diff. of the Side is 14 07
 the Base + $\frac{1}{2}$ the Diff. of the Sides is $\left\{ \begin{array}{l} 50 \\ 22 \end{array} \right. 37$
 23

The Radius Square. 24 000000
 $S, \frac{1}{2}$ Base + $\frac{1}{2}$ Diff. cr $\times S, \frac{1}{2}$ base - $\left\{ \begin{array}{l} 19 \\ 469525 \end{array} \right.$

Sum 39 469525
 From which Subtr. the \square of the $\left\{ \begin{array}{l} 19 \\ 514701 \end{array} \right.$
 Sines of the Legs.

Rem. = Sq. of the Sine of $\frac{1}{2}$ the Angle P. 19 954824
 Its $\frac{1}{2}$ is the Sine of 71° 40' = $\frac{1}{2}$ the Angle required $\left\{ \begin{array}{l} 9 \\ 977412 \end{array} \right.$

Therefore being doubled, is 143° 20' = Angle P.

For practical Operations in this Case, nothing is more easy and expeditious than the following Method, of which I shall give two useful Examples: One for the *Azimuth*, as above; the other for the *Hour of the Day*.

1. In the Triangle DPB, let the same things be given, and the Angle P, or *Azimuth* requir'd.

PD = 24° 20' $\left\{ \begin{array}{l} \text{Ar. co. of the} \\ \text{Sines,} \end{array} \right. \left\{ \begin{array}{l} 0 \\ 385056 \end{array} \right.$
 BP = 52 04 $\left\{ \begin{array}{l} 0 \\ 103146 \end{array} \right.$
 BD = 73 00 = Base.

Sum = 149 54.

Sum = 74 57 $\left\{ \begin{array}{l} \text{their Sines} \end{array} \right. \left\{ \begin{array}{l} 8 \\ 984842 \end{array} \right.$
 $\frac{1}{2}$ S - Base = 1 57 $\left\{ \begin{array}{l} 9 \\ 531822 \end{array} \right.$

Sum = 19 001872
 Its half is the Co-sine of 71° 32' 9 500936

Which being doublet, gives 143° 04' for the Angle P, or the *Azimuth* from the North.

2. In the Triangle DPB, the Sides being given, and the Angle D, which is the Hour from Noon requir'd.

PD = 24° 20' $\left\{ \begin{array}{l} \text{Ar. co. of} \\ \text{the Sines} \end{array} \right. \left\{ \begin{array}{l} 0 \\ 385056 \end{array} \right.$
 BD = 73 00 $\left\{ \begin{array}{l} 0 \\ 019404 \end{array} \right.$
 BP = 52 34 Base.

Sum = 149 55

$\frac{1}{2}$ Sum = 74 57 $\left\{ \begin{array}{l} \text{their Sines} \end{array} \right. \left\{ \begin{array}{l} 9 \\ 984842 \end{array} \right.$
 $\frac{1}{2}$ Sum - Base = 22 23 $\left\{ \begin{array}{l} 9 \\ 580698 \end{array} \right.$

The Sum of the four Logarithms = 19 970000

Its half is the Co-sine of 14° 58' 9 985000

Which doubled, is 29° 56' = Angle D; and being reduced into Time, gives 1 Hour and above 59 Minutes from Noon, which was requir'd.

TRILATERAL, in Geometry, is the same with a three-sided Figure.

TRIMM of a Ship, is her best Posture, Proportion of Ballast, and hanging of her Masts, &c. for sailing; and therefore, to find the best way of making any Ship to sail swiftly, is called finding her *Trimm*. And this depends very much on Experience and Judgment, and several Trials and Observations which the Commander may make Aboard.

TRINE, is an Aspect of the Planets, when at the Distance of 120 Degrees or 4 Signs from each other, and noted thus Δ .

TRINGLE, in Architecture, is a little Member fix'd exactly upon every *Triplyb*, under the Plar-band of the Architrave, from whence hang down the *Gutts* or Pendant-Drops in the *Doric* Order.

TRINOMIAL-Root, in Mathematicks, is a Root consisting of three Parts connected together by the Sign +; as $a + b + c$: See *Binomial*.

TRIP: The Seamen say a Ship goes with her *Top sails a-Trip*, when she carries them hoisted up to the highest, and when the Wind blows not too hard, but a gentle, or *Loom-gale*.

TRIPARTITION, is Division by 3, or a taking the third Part of any Number or Quantity.

TRIPPLICATE Ratio, must be well distinguish'd from *Triple*, and is the Ratio of Cubes one to another.

Thus in these Geometrical Proportionals 2, 4, 8, 16, 32, as the Ratio of the first Term (2) is to the third (8) Duplicate of the first to the second, or as 4 the Square of 2, to 16 the Square of 4; so the Ratio of 2 to 16 the fourth Term, is *TriPLICATE*; or as 8 which is the Cube of 2, to 64 the Cube of 4. And this *TriPLICATE Ratio* is compounded of all the preceding Ratio's.

TRIPPING; a Term in Heraldry: See *Passant*.

TRIPTOTES, in Grammar, are such defective Nouns as have but three Cases, as *Sordem, Sordis, Sorde*, and *Tantundem*. &c.

TRIS-DIAPASON, or *Triple-diapason*, a Chord in Musick, otherwise called a Triple, Eighth, or Fifteenth.

TRISE; the Sea Word for hailing up any thing by a dead Rope, or one that doth not run in a Block, but 'tis done by Hand or by main Strength: Thus if any Cask, Chest, or other Goods hath only a Rope fastned to it, and so without a Tackle is pulled up into the Ship by Hand, they say it is *Trised up*.

TRISMUS, is the grinding of the Teeth, or a Convulsion of the Muscles of the Temples, whereby the Teeth gnash whether one will or no. *Blanchard*.

TRISYLLABLE, is a Word consisting of but three Syllables.

TRITÆOPHYES, is an Ague that comes every third Day. *Blanchard*.

TRITEUS, is the same with *Febris Tertiana intermittens*. *Blanchard*.

TRITONE, a Term in Musick, which signifies a greater Fourth.

TRITURATION, is a pounding in a Mortar, &c. whereby Medicines are reduced to Powder, that they may be the better mixed.

TROCANTER, the same that *Rotator*.

TROCHILE, in Architecture, is that hollow Ring or Cavity which runs round a Column next to the *Tore*; vulgarly 'tis call'd the *Casement*: 'Tis frequently bordered or rather shut in with *Lists*. 'Tis often called *Scotia*, from its shady dark Appearance.

TROCHISCI, *Trochisks*, are round or other figur'd Medicinal things, made of Powders, mix'd with viscus Extracts, and made up into Paste, and then into round, triangular, &c. little Bodies, which are to be dried up in the Shade. They are much the same with Tablets and Lozenges.

TROCHLEA, a Term in Anatomy, the same with *Bathmū*.

TROCHLEA

TROCHLEA, is also one of the Mechanick Powers, and is what we usually call the *Pulley*.

TROCHLEARIS, is the upper or greater oblique Muscle of the Eye: See *Obliquus Superior*.

TROCHOID, the same with *Cycloid*; which see.

TROCHOLICKS, is by some taken for that Part of the Mechanicks which shews the Properties of all circular Motions.

TROMA, is a Wound from an external Cause.

TROMBOSIS, is a Trembling, or a Depravation of the voluntary Motion of the Members.

Blanchard.

TROPEs, are, when Words are changed from their proper Signification, and applied to other things than what they naturally mean.

TROPICAL Year: See *Year*.

TROPHY, in Architecture, is an Ornament which represents the Trunk of a Tree charged or encompassed all round about with Arms or Military Weapons, both *Offensive* and *Defensive*.

TROPICKS, are Circles supposed to be drawn parallel to the *Equinoctial* at $23^{\circ} 30'$ distance from it, one towards the North, called the *Tropick of Cancer*; and the other towards the South, call'd the *Tropick of Capricorn*, because they lie under these Signs.

Mr. *Halley*, in *Philos. Trans.* N^o 215, by three subsequent Observations made near the Tropick at proper Intervals of Time, shews a Method to find the Moment of the Sun's Ingress into the Tropical Signs, capable of all the Exactness the most Accurate can desire; and that without any Consideration of the Parallax of the Sun, of the Refractions of the Air, of the greatest Obliquity of the Ecliptick, or Latitude of the Place, premising the following *Lemma*, viz.

1. That the Motion of the Sun in the Ecliptick, about the time of the Tropicks, is so nearly equal, that the Difference from Equality is not sensible, from five Days before the Tropicks, to five Days after; and the Difference arising from the little Inequality that there is, never amounts to above $\frac{1}{4}$ of a single Second in the Declination, and this by reason of the Nearness of the *Apogæon* of the Sun to the *Tropick of Cancer*.

2. That for five Degrees before and after the Tropicks, the Differences whereby the Sun falls short of the Tropicks, are as the versed Sines of the Sun's Distance in Longitude from the Tropicks; which versed Sines in Arches under five Degrees, are beyond the utmost Nicety of Sense, as the Squares of those Arches. From these two follows,

3. That for five Days before and after the Tropicks, the Declination of the Sun falls short of the utmost Tropical Declination, by Spaces which are in duplicate Proportion, or as the Squares of the Times by which the Sun is wanting of, or past the Moment of the Tropick.

Hence 'tis evident, that if the Shadows of the Sun, either in the Meridian, or any other Azimuth, be carefully observed about the time of the Tropick, the Spaces whereby the Tropical Shade falls short of, or exceeds those at other times, are always proportionable to the Squares of the Intervals of Time between those Observations and the true time of the Tropick; and consequently, if the

Line, on which the Limits of the Shade is taken, be made the Axis, and the correspondent Times from the Tropick, expounded by Lines, be erected on their respective Points in the Axis as Ordinates, the Extremities of those Lines shall touch the Curve of a Parabola, as in the following Figure, where a, b, c, e , being supposed Points observed, the Lines aB, bC, cA, eF , are respectively proportional to the times of each Observation, before or after the Tropical Moment in *Cancer*.

This being premised, the true time of the Tropick by three Observations, is found from this Geometrical Problem.

Having three Points in a Parabola, A, B, C , or A, F, C , given, together with the Direction of the Axis, To find the Distance of those Points from the Axis.

Of this there are two Cases; the one when the time of the second Observation B is precisely in the Middle-time between A and C : In this case, putting t for the whole time between A and C , then A or the Interval of the remotest Observation A from the Tropick is found by the following Analogy:

$$2ac - bc : 2ac - \frac{1}{2}bc :: \frac{1}{2}t \text{ (or } AE) : A$$

the time of the remotest Observation A from the Tropick.

But the other Case, when the middle Observation is not exactly in the Middle between the other two times, as at F , is something more operose, and the whole Time from A to C being put $= t$, and from A to $F = S$, $ce = c$, and $bc = b$, the

Theorem will stand thus $\frac{t^2 c - b S S}{2 t c - 2 b S} = A$, the

Time sought.

To illustrate this Method of Calculation, he gives the two following Examples.

Anno 1500, Bernard Walther, in the Month of June, at Nuremberg, observed the Chord of the Distance of the Sun from the Zenith, by a large Parallacltick Instrument of *Ptolemy*, as follows.

$$\text{June } \left\{ \begin{array}{l} 2. 45467 \\ 9. 44934 \\ 16. 44990 \end{array} \right\} \text{ and June } \left\{ \begin{array}{l} 8. 44975 \\ 12. 44883 \\ 16. 44990 \end{array} \right.$$

In both which Cases, the middle Time is exactly in the Middle between the Extremes, and therefore in the former three, $ac = 533$, $bc = 477$ and t , the Time between being 14 Days; by the first Rule, the Time of the Tropick will be found by this Proportion.

As

As 589 : 827 $\frac{1}{2}$:: $\frac{1}{2}$ t (or 7 Days) : 9 d. 2 h. 2'. Whence the Tropick Anno 1500, is concluded to have fallen June 11 d. 20 h. 2'.

In the latter three, a equal 107, b equal 15, and the whole Interval of Time is 8 Days equal t ; whence,

As 199 : 206 $\frac{1}{2}$:: 4 Days : 4 d. 3 h. 37', which taken from the 16 Day at Noon, leaves 11 d. 20 h. 23' for the Time of the Tropick agreeing with the former to the third Part of an Hour.

Anno 1636, Gassendus at Marseilles observed the Summer Solstice by a Gnomon of 55 Foot high, in order to determine the Proportion of the Gnomon to the Solstitial Shade; and he left these Observations, serving for the second Rule.

June 19 } { 31766 }
 June 20 } Shadow { 31753 } Parts whereof the
 June 21 } (Sh. N. { 31751 } Gnomon was 89428.
 June 21 } { 31759 }

These being divided into two Sets of three Observations each, viz. The 19th, 20th, and 22d; and the 19th, 21st, and 22d, there will be in the first three, c equal 13, b equal 7, t equal 3 Days, S equal 1; and in the second, c equal 15, b equal 7, t equal 3, and S equal 2. Whence, according to the Rule, the 19th Day at Noon, the Sun wanted of the Tropick a Time proportionate to one Day, as t to c — S S b to 2 c —2 b S ; that is, as 110 to 64 in the first Set, or 107 to 62 in the second Set, that is, 1 d. 17 h. 15' in the first, or 1 d. 17 h. 25' in the second Set; whence it may be concluded, that the Moment of the Tropick was on June 10 d. 17 h. 20' in the Meridian of Marseilles.

The great Advantage of this Method is, That any very high Buildings serves for an Instrument, or the top of a high Tower or Steeple, or even any high Wall whatsoever, that may be sufficient to intercept the Sun, and cast a true Shade. Nor is the Position of the Plane on which you take the Shade, or that of the Line thereon, on which you measure the Recels of the Sun from the Tropick, very material; but in what way soever you discover it, the said Recels will be always in the same Proportion, by reason of the smallness of the Angle, which is not 6 Minutes in the first five Days: Nor need you enquire the Height or Distance of your Building, provided it be very great, so as to make the Spaces you measure, large and fair. But it is convenient, that the Plane on which you take the Shade, be not far from perpendicular to the Sun, at least not very oblique; and that the Wall which casts the Shade, be strait and smooth at top, and its Direction nearly East and West. And it will be requisite to take the Extream greatest or least Deviation of the Shadow of the Wall, because the Shade continues for a good time at a stand without Alteration, which will give the Observer leisure to be assured of what he does, and not be surprized by the quick transient Motion of the Shade of a single Point at such a Distance.

The principal Objection is, That the Penumbra or Parrile Shade of the Sun, is in its Extreame very difficult to distinguish from the true Shade, which will render this Observation hard to determine nicely.

But if the Sun be transmitted through a Telescope, after the manner used to take his Species in a Solar Eclipse, and the upper half of the Object-glass be cut off by a Paper pasted thereon, and the exact

upper Limb of the Sun be seen just emerging out of, or rather contiguing the Species of the Wall, (the Position of the Telescope being regulated by a fine Hair extended in the Focus of the Eye-glass) then by this Means the Limit of the Shade may be obtained to the utmost Exactness.

TROVER, in Law, is an Action which a Man hath against one, that having found any of his Goods, refuses to deliver them upon Demand. Of late, Actions of Detinue are much turn'd into Actions upon the Case, *Sur Trover & Conversion*.

TROUGH of the Sea, is the Hollow or Cavity made between any two Waves or Billows in a rowling Sea; and when a Ship lies down there, they say, *She lies in the Trough of the Sea*.

TRUCKS, belonging to the Carriage of a Piece of Ordnance, are the Wheels which are on the Axletree to move the Piece.

TRUE Conjunction: See *Conjunction True*.

TRUE Place of a Planet or Star, is a Point of the Heavens shewn by a right Line drawn from the Centre of the Earth through the Centre of the Planet or Star; whereas its apparent Place, is that which is found by a right Line drawn from the Observer's Eye through the Centre of the Planet or Star. And this Point in the Heavens is referred to the Ecliptick or Zodiack, by the Planet or Star's Circle of Longitude.

TRUNCATED Pyramid or Cone, is one whose Top is cut off by a Plane parallel to its Base; and therefore the Figure of the truncated Top must always be similar to the Base.

How to find its Solidity, see in the Word *Frustrum*.

A Truncated Cone, or the *Frustrum* of that Body, is called sometimes a *Curri-Cone*.

TRUNK Roots of a Plant, are little Roots which break or grow out of the Trunks of Plants; and are of two kinds.

1st, Such as Vegetate by a direct Descent, the Place of their Eruption being sometimes all along the Trunk, as in *Mints*, &c. and sometimes only in the utmost Point, as in *Brambles*.

2^{dly}, Such as neither ascend nor descend, but shoot forth at Right-angles with the Trunk; which therefore, tho' as to their Office they are true Roots, yet as to their Nature they are a middle Thing between a Trunk and a Root. Dr. Grew *Anat. of Plants*, p. 27.

TRUNNIONS of a Piece of Ordnance, are those Nobs or Bunches of the Guns Metal which bear her up upon the Cheeks of the Carriages.

TRUSSES, are Ropes fastned to the Parrels of a Yard in a Ship, serving either to bind fast the Yards to the Masts, when the Ship rowls, lying either a *Hull*, or an Anchor; or to hale down the Yards in a Storm or Gust of Wind: They belong to the Main-yard, Fore-yard, and Miffen, and are all brought to upon occasion.

TRY; a Ship is said to Try, when she hath no more Sails abroad but her Main-sail: When her Tacks are close aboard, the *Bowlings* set up, and the *Sheets* haled close aft; when also the Helm is tied close down to the Board, and so she is let lie in the Sea. And sometimes when it blows so hard, that they cannot maintain the Main-sail, as they say; that is, cannot bear it out, they make her lie a Try under a *Miffen-sail* only.

TUBÆ Fallopiane, are two slender Passages, proceeding from the Womb, which when they are a little removed from it, grow gradually wider : They have large Holes or Orifices, which almost lie shut, the extream Edges falling flat ; yet if they be diligently opened and dilated, they represent the extream Orifice of a Trumpet. Their Use is to receive the Eggs from the Testicles, and carry them into the Womb, according to the Excellent *R. de Graef* ; the Truth whereof is evident from the Inspection of Rabbits dissected.

TUBER, properly, is a subterraneous Mushroom, or a *Truffle* ; but by Botanick Writers, is often used to signify the round turgid Roots of some Plants : Which therefore they call *Turberefe Roots*, or *Knobby Roots*, as *Mr. Ray* Englishes it.

TUBEROUS : See *Tuber*.

TUBULI Lactiferi, certain Lactiferous or Milk-carrying Pipes, which are as it were the Store-house wherein the Milk is kept, and thro' which, as by Conduits, it flows to the Nipples of the Breasts of Females when they give Suck.

TUBULI Vermiculares, are certain small winding Cavities formed on the outsides of the Shells of Marine Shell-Fishes, in which some small Worms inhabit and breed.

These are very frequently found on such *Fossil Shells* as are dug up almost every where out of the Earth ; and therefore help to demonstrate, that they are real Shells, and not *formed Stones*, as some will have it.

TUCK of a Ship, is the trussing or gathering up of her Quarter under Water ; which if she lie deep, makes her have a Broad, or as they call it, *Fat Quarter*, and hinders her Steering, by keeping the Water from passing swiftly to her Rudder ; and if this Trussing lie too high above the Water, she will want bearing for her Works behind, unless her Quarter be very well laid out.

TUMOR ; by this Word, which in general signifies any Swelling, the Chirurgeons understand a *Disease* or morbid Affection, incident most usually to the Organical Parts of the Body, increasing their Quantity preternaturally by Means of some superfluous Humours coming thither from other Parts.

TUNICLE, in Anatomy, signifies a Membranous Coat.

TUNNAGE : See *Tonnage*.

TURBITH Mineral, or Yellow Precipitate of Mercury, is thus made. Put any Quantity of good Quicksilver into a Glass Retort, and pour on it four times its Weight of Oil of Vitriol. Set the Retort in Sand, and when the Mercury is dissolv'd, which 'twill hardly be in ten Hours time, distil off the Humidity gently at first, but make a strong Fire at last, to drive out all the Spirits. When you break the Retort, you will find in it a white Mass, which powder in a Glass Mortar, and then pouring warm Water upon it, it will presently turn *Yellow* ; it must be washed several times, and dried in the Shade, and then 'twill Vomit and Purge strongly.

TURIONES ; amongst Botanick Writers, are the first young tender Shoots or Tops which any Plants do annually put forth of the Ground.

TURN, a Term belonging to the Movement of a Watch, and signifies the entire Revolution of any Wheel or Pinion.

The number of *Turns*, which the *Pinion* hath in one *Turn* of the *Wheel*, is commonly set down as a

Quotient in common Arithmetick, thus, 5) 60 (12 where the *Pinion* 5 playing in a *Wheel* of 60, moveth round 12 times in one *Turn* of the *Wheel*.

Now, by knowing the Number of *Turns*, which any *Pinion* hath in one *Turn* of the *Wheel* it worketh in, you may also find how many *Turns* a *Wheel* or *Pinion* hath, at a greater Distance : as the *Contrate-wheel*, *Crown-wheel*, &c.

For, 'tis but Multiplying together the *Quotients*, and the Number produced, is the Number of *Turns*, as in this Example.

$$\begin{array}{r} 5) 55 (11 \\ 5) 45 (9 \\ 5) 40 (8 \end{array}$$

The first of these three Numbers hath 11 *Turns*, the next 9, and the last 8. If you multiply 11 by 9, it produceth 99 ; that is, in one *Turn* of the *Wheel* 55, there are 99 *Turns* of the second *Pinion* 5, or the *Wheel* 40, which runs concentrical, or on the same Arbor with the second *Pinion* 5. If you multiply 99 by the last Quotient 8, it produces 792, which is the Number of *Turns* the third *Pinion* 5 hath.

TURN, is the Sheriff's Court, kept twice every Year, viz. within a Month after *Easter*, and within a Month after *Michaelmas*. *Magna Charta*, cap. 35. From this Court are exempted only Archbishops, Bishops, Earls, Barons, all religious Men and Women, and all such as have Hundreds of their own to be kept. It is a Court of Record, in all things that pertain to it : It is also the King's Leet through all the Country, and the Sheriff's Judge ; and this Court is incident to his Office.

TURN-Pikes, in the Art of War, are Spars of Wood of 12 or 14 Foot long, and about 6 Inches Diameter in a sexangular Form : They are bored with Holes, one right under another, about an Inch Diameter ; the Axis of each Hole must be six Inches one from another, but to go by *Turns* from each side, the Pickets that are driven into the Hole, are 6 or 5 Foot long, pointed with Iron, and with Wedges or Nails fasten'd hard into the Holes.

Two of these fasten'd together with an Iron Chain and Staple, some 6 Inches long, will be of great Use to stop the Enemies in the Breaches, or elsewhere. But those that are intended to be thrown in Breaches, must be made of Oak, and need not be so big, or the Pickets so long.

TURNO Vicecomitum, is a Writ that lies for those that are called to the Sheriff's *Turn* out of their own Hundred.

TUSCAN Order of Architecture ; so called, because invented in *Tuscany*, an eminent Part of *Italy*. 'Tis the most plain of all the 5, and is seldom us'd but in some Country Building, where there is no need of any Order but one ; or else in some very great Building, such as an *Amphitheatre*, or the like, where all the Orders are design'd to be used.

The Columns here, together with Base and Capital, are to be 7 Modules in Length, and to have their Thickness diminish'd by degrees to a quarter Part. When these Columns stand alone, the Spaces between them, or the *Inter-columns*, ought to be very large.

Their Pedestals ought to be one Module high ; and the Base of the Column ought to be of the Height of half its Thickness ; and that Height divided into two equal Parts, makes the *Orle* or *Plinth*,

Plinth, which is made with a kind of Compals; the other is divided into 4 Parts, of which, one is for the *Lift*, the other for the *Tore*, or thick round Circle of the Pillar.

The *Base* hath a *Saille* or Bearing out, which is the 16th Part of the Diameter of the Column.

The *Capital* is an Height half the Thickness of the Column at the *Base*; and is divided into three equal Parts (according to *Ozanam*), of which, one is for the *Abacus*, the other for the *Oeuf*, as they call it in *French*, i. e. the *Ornament*; and the third Part being divided into 7 Divisions, the first makes the *Lift* under the *Ornament*; and the other six serve for the *Gorgerin Collier*, or *Frise*. The *Astragal* is the Height of the *Lift* below the *Ornament*.

TUSCAN Work, in Architecture, is the most simple and rude of the Five ancient Orders of Pillars: See *Column* and *Order*.

TWIGILD: See *Angild*.

TWILIGHT, is that dubious half Light which we perceive before the Sun-rising, and after Sun-setting. 'Tis occasion'd by the Earth's Atmosphere and the Splendor of the *Aether* which environs the Sun. The *Ethereal* accended Atmosphere of the Sun, not setting so soon as, and rising before the Sun; and the Sun's Rays also illuminating the Earth's Atmosphere, before the Body of the Sun itself can appear, occasions a Light always preceding at the Rise, and subsequent to the Setting of that Planet. Which, tho' because of many accidental Variations in both the Sun's and Earth's Atmosphere, it cannot be always of the same Degree of Duration or Brightness; yet it usually holds in the Evenings, till the Sun is about 18 Degr. below the Horizon, and appears so long before his Rise in the Morning: And therefore will be least under the Equator, where the Sun rises and sets at Right-Angles to the Horizon; and so will increase more and more, according as the Position of the Sphere grows more oblique: For, in our Latitude, for a good Part of the Year, the Sun is never above 18 Degrees below the Earth; and consequently, all that Time we have no Night, but continual Twilight.

TYMPAN, in Architecture, is that Part of the Bottom of the *Fronçons*, which is enclosed between the *Cornices*, and answers the Naked of the *Frise*.

TYMPAN of an Arch, is a Triangular Table placed in its Corners.

The most simple of these *Tympans* have only a Table hollow'd, sometimes with the Branches of Lawrel, Olive-Tree, or Oak, or with Trophies, and are conformable to the *Doric* and *Ionick* Orders. But the richest are adorn'd with flying Figures, as *Fame*; or sitting Figures, as those of the *Cardinal Virtues*, and are proper for the *Corinthian* and *Composite* Orders.

Tympan, is also attributed to the Pannels of Doors in Joiners Work, and to the *Dye* or Square of Pedestals.

TYMPANITES, *Tympantias*; the Disease call'd the *Tympany* is a fix'd, constant, equal, hard, resisting Tumour of the *Abdomen*, which being beat

or struck, yields a Sound. It proceeds from a stretching Inflation of the Parts, and of the Membranaceous Bowels, whose Fibres are too much swoln with Animal Spirits, and hindered from receding by the Nervous Juice, which obstructs the Passage; to which Distemper there is consequently added, as the Complement of all, an abundance of stantent Matter in the Places that are empty. *Blanchard*.

TYMPANUM, or rather *Tympani Membrana*, the Drum, or the Skin of the Drum of the Ear, is a small, thin, orbicular, transparent, nervous and dry Membrane, of most exquisite Sense, stretched over the Cavity of the inner Part of the Ear, and dividing between the inward and outward Ear. Some will have it spring from the *Pericranium*, others from the *Dura-mater*, others from the *Pia-mater*, and others from the softer Process of the auditory Nerve there expanded; and there are some Anatomists, which believe it hath a Substance proper to its self, made in the first Formation of the Parts, and springing from nothing else. It is very dry, that it may give the better Sound; and strong to bear external Injuries the better. It is enshased in a Channel made in the circumference of the outer End of the Bone that joins to the Cartilage which forms the largest Part of the *Meatus Auditorius*; and it hath a Cord which runs a-cross it behind, which some take for a Ligament to strengthen it; but *Verney* saith, 'tis a Branch of the 7th Pair of Nerves which supplies Twigs to the Muscles that move the *Tympanium*, which are two in Number. When this *Membrana Tympani* is taken away, there appears a Cavity on the inside of it, which is properly the *Tympanium*; but *Verney* will call it the *Barrel*. It's about a Quarter of an Inch long, and half an Inch wide; 'tis compass'd round with Bone, and clad within with a Membrane, which is interwoven with a great Number of Vessels. How Sounds are distinguish'd by means of this *Membrana Tympani*, and the four Bones, *Malleolus*, *Incus*, *Stapes*, and the *Oss. Orbiculare*, you will find at large under the Word *Ear*.

TYMPANUM, in Mechanics, is a Cylinder, but larger and shorter than the common Axis or Cylinder, which is the *Axis in Peritrochio*, and 'tis usually placed upon that Axis, and is much the same with the *Peritrochium*, which is a kind of Wheel placed on the Axis, in whose Circumference are Staves or Levers to turn the Axis easily about, in order to raise the Weight required.

TYPHODES, is a Symptomatical, continued burning Fever; as it were from the Inflammation of the Bowels. *Blanchard*.

TYPHOMANIA, is a *Delirium* with a Phrensy and a Lethargy. *Blanchard*.

TYPUS, or *Periodus* and *Circuitus*, is the Order that intermitting Fevers observe, consisting of Intension and Remission, of Encreasing and Decreasing, according to some kind of Regularity; and accordingly denominating the kind of the Fever by its Type. *Blanchard*.

TYROSIS, is when Milk which is eaten, curdles in the Stomach into a Substance like Cheese. *Blanchard*.

V A C

VACATION, by the Lawyers, is all the respective Time betwixt the End of one Term, and the Beginning of another.

It signifies also the time from the Death of a Bishop, or other Spiritual Person, 'till the Bishoprick, or other Dignity, be supplied with another.

VACUUM, is by Physiologists, supposed to be a Space devoid of all Body: And this they distinguish into a *Vacuum Diffeminatum*, or *Interpersum*; i. e. small void Spaces interpersed about between the Particles of Bodies:

Or, a *Vacuum Coacervatum*, which is a larger void Space made by the meeting together of the several Interpersed or Diffeminate Vacuities before mentioned.

That there is a *Vacuum*, at least a *Diffeminate* one, seems clear from the following Arguments.

1. That without supposing some Interpersed Vacuities among Bodies, 'tis very hard to account for Motion: For, if there be an absolute *Plenum*, the least Body in Nature cannot move, but all Bodies that are, must move with it; and yet into what Places they should move, when all Things are already full, is as hard to conceive, as the former.

2. Without allowing a *Vacuum*, how can there be any such thing as either *Rarefaction*, or *Condensation*? For, if all Space is adequately full of Body, nothing can possibly ever take up a greater or lesser Room than it had at first; and yet we find by evident Experience, that Air is capable of a very great Degree of Compression, and that Water can be rarified into Air, or Vapour, and then take up vastly larger Room, than it did before.

3. Sir Isaac Newton found, that the Weight of Bodies doth by no means depend on their Forms or Textures, but that all Bodies at equal Distances from the Earth, do equally gravitate towards it in Proportion to the Quantity of Matter in them, which is every where as their Weight: Wherefore, *there must of Necessity be a Vacuum*: For, if all Places were full, there could be no Difference in the Specifick Gravity of Bodies, but Air would be intensively as heavy as Gold; and so Gold could not descend in Air, and much less any lighter Body than it, which would contradict all the received Laws of Hydrostaticks, though confirm'd by Ten thousand Experiments.

In *VADO* *exponere*, is to Pawn, or leave any equivalent as a Pledge, or Surety of returning Money borrowed or owing.

VADIUM Mortuum, a Term in Law, signifying a Mortgage, Lands or immoveable Goods so pawn'd, or engaged to the Creditor, that he has a Right to the mean Profits for the Use of his Loan or Debt.

Per VADIUM ponere, in Law, signifies to take Security, Bail, or Pledges, for the Appearance of a Delinquent in some Court of Justice.

VAGINALIS Gula, the perforated Muscle of

V A L

the *Gula*, as *Willis* calls it; who says, The whole *Oesophagus* seems to consist of two Muscles; which make four Parallelograms with their opposite Fibres decussating each other: But in Men it is far otherwise; in whom the Fibres of this Muscle are Longitudinal, and Oblique; the former seem to take their Original at the Arytenoidal Cartilages, and passing somewhat Obliquely to the back Part of the *Oesophagus*, descend to the Stomach: The latter seems to be a Continuation of the *Pterigopharyngeus*, and the *Oesophagus*, descending obliquely in a Spiral manner, not unlike those of the Intestines described by the learned Dr. Cole.

VAGINALIS Tunica: See *Elythroides*.

VAIRY, or **VERRY**, is when the Field of a Coat of Arms is chequered into 2 Colours by the Figures of little Bells; and if these Colours are Argent and Azure, 'tis *Vairy Proper*, and you need say no more but *Vairy*: But if the Colours are any other, they must be expressly named in Blazoning the Coat: See the Form of it under *Verry*.

VAIRY Coppy, or **Potent Counter-Potent**, is a Bearing in Heraldry of this Figure, and in Blazon, the Colours must be expressed; as *Azure and Argent*, &c.

VALORE Maritagii, is a Writ: See *Value of Marriage*.

VALUE of Marriages, or **Valore Maritagii**, is a Writ that lies for the Lord, having proffered covenantable *Marriage* to the Infant, without Disparagement, if he refuse to take the Lord's Offer, to recover the *Value* of the *Marriage*: See *Stat. 12 Car. 2. cap. 24*.

VALVULA Major, is the upper Part or Cover of the *Isthmus*, which is betwixt the *Testes*, and the foremost Vermicular Process of the *Cerebellum*, to which two it is tied at its two Ends, and to the Processes that come from the *Cerebellum* to the *Testes*, at its Sides. 'Tis of a Medullary Substance; its Use is to keep the *Lympha* from falling out above the Nerves in the Basis of the Skull.

VALVES, are little thin Membranes in Vessels, or Fibres, like Folding-doors as it were; they have received different Names, according to the Diversity of their Figuration, as *Sigmoides*, like the Greek Letter *Sigma*; *Semilunares*, like an Half-Moon, &c. They are found in Veins, Arteries, and in the Lymphatick and Lacteal Vessels; nay, as some say, even in the Musculous Fibres. There are

VALVES also found in the Intestines, in the small and great Guts, especially in the *Jejunum*, and about the Beginning of the *Ilium*, which are called Semi-circular from their Figure. These Valves, or Folds, grow more and more Oblique, by little and little, the nearer you come to the *Ilium*, and at the Beginning of the *Ilium*, they are less Oblique than further on.

In like manner, near the End of the *Jejunum*, they are gradually more and more distant from one another, and so in the *Ilium* too.

At the Beginning, and in the Middle of the *Jejunum*, they are scarce distant half a Thumb's breadth; in the *Ilium* a whole Thumb's breadth, and more.

They yield a little if thrust with your Finger, and move here and there: At the Beginning of the *Colon* there is a Flethy and Circular Valve, besides several others in that Gut.

The Use of them is to stop the Meat a little, that it may be the better fermented, the Chyle distributed, adjacent Parts be cherish'd with Heat; and lastly, That it ascends or returns not again.

VALVULÆ *Conniventes*: See *Conniventes*.

VANE. Those *Sights* which are made to move and slide upon *Cross-staves*, *Forestaves*, *Davis's Quadrants*, &c. the Seamen call *Vanes*.

VAN-GUARD, a Military Term, signifying the first Line of an Army drawn up in *Battalia*. This is the same with the Front of an Army, and gives the first Charge upon the Enemy.

VAPORARIUM, is when the Patient sits so as that he receives the Vapours through an Hole, under which there is placed a Pot full of opposite and boiling hot Ingredients, which cooling, fresh Matter is added.

VAPOROSUM *Balneum*: See *Balneum Vaporis*.

VAPOURS, in a Medical Sense, is now a-days used for the Disease called otherwise *Hysterick*, or *Hypocondriack Fits*, or *Melancholy*: But the most common Sense of the Word, is for Warry Exhalations raised up either by the Heat of the Sun, the Subterranean, or any other accidental Heat, Fire, &c.

Mr. Halley, in *Philosophical Transactions*, N^o 189. gives an Estimate of the Quantity of Vapours raised out of the Sea, by the Warmth of the Sun, by an Experiment as follows.

We took a Pan (saith he) about 4 Inches deep, and 7 or 9 Inches in Diameter, in which we placed a Thermometer, and by means of a Pan of Coals, we brought the Water to the same Degree of Heat which is observed to be that of our Air in the hottest Summers; the Thermometer nicely shewing it.

Then we affixed the Pan of Water with the Thermometer in it, to one end of the Beam of the Scales, and exactly counterpoised it with Weights in the other Scale: And by the Application or Removal of the Pan of Coals, we found it very easy to maintain the Water in the same precise Degree of Heat.

Doing thus, we found the Weight of the Water sensibly to decrease; and at the end of 2 Hours we observed, That there wanted half an Ounce of Troy, all but 7 Grains, or 233 Grains of Water, which in that Time had gone off in Vapour, tho' one could hardly perceive it to smok, and the Water was not sensibly warm.

This Quantity in so short a Time, seemed very considerable, being little less than 6 Ounces in 24 Hours, from so small a Surface as a Circle of 8 Inches Diameter.

To reduce therefore this Experiment to an exact *Calculus*, and to determine the Thickness of that Skin of Water, which had so evaporated, I assume the Experiment alledged by Dr. Edward Bernard, to have been made in the *Oxford Society*, viz. That a Cube-Foot (English) of Water, weighs

exactly 76 Pounds Troy. This divided by 1728 the Number of Inches in a Foot, will give $253\frac{1}{3}$ Grains, or half an Ounce, $13\frac{1}{3}$ Grains for the Weight of a Cube-Inch of Water; wherefore the Weight of 233 Grains is $\frac{233}{13\frac{1}{3}}$, or 35 Parts of 38 of a Cube-Inch of Water.

Now the Area of the Circle, whose Diameter is 72 Inches, is 49 Square Inches; by which dividing the Quantity of Water evaporated, viz. $\frac{233}{13\frac{1}{3}}$ of an Inch, the Quote $\frac{35}{1728}$, or $\frac{1}{48}$, shews, that the Thickness of the Water evaporated, was the Fifty-third Part of an Inch; but we will suppose it only the Sixtieth Part, for the Facility of Calculation.

If therefore Water as warm as the Air in Summer, exhales the Thickness of a sixtieth Part of an Inch in two Hours, from its whole Surface, in 12 Hours it will exhale the $\frac{1}{5}$ of an Inch; which Quantity will be found abundantly sufficient to serve for all the Rains, Springs and Dews, and account for the *Caspian Seas* being always at a stand, neither wasting nor overflowing; as likewise for the Current laid to set always in at the Straights of *Gibraltar*, though those *Mediterranean Seas* receive so many, and so considerable Rivers.

To estimate the Quantity of Water arising in Vapour out of the Sea, I think I ought to consider it only for the Time the Sun is up; for that the Dews return in the Night, as much if not more Vapours than are then emitted; and in Summer, the Days being longer than twelve Hours, this Excess is ballanced by the weaker Action of the Sun, especially, when arising before the Water be warmed: So that if I allow $\frac{1}{10}$ of an Inch of the Surface of the Sea, to be raised *per Diem* in Vapours, it may not be an improbable Conjecture.

Upon this Supposition, every ten Square Inches of the Surface of the Water, yields in Vapour *per Diem*, a Cube-Inch of Water; and each Square Foot half a Wine-pint; every Space of four Foot Square, a Gallon; a Mile Square, 6914 Tons; a Square Degree, suppos'd of 69 English Miles, will evaporate 33 Millions of Tons: And if the *Mediterranean* be estimated at 40 Degrees long, and four broad, Allowances being made for the Places where it is broader, by those where it is narrower, (and I am sure, I guess at the least) there will be 160 Square Degrees at Sea; and consequently the whole *Mediterranean* must lose in Vapour, in a Summer's Day at least 5280 Millions of Tons, and this Quantity of Vapour, though very great, is as little as the Remains of another Cause, which cannot be reduced to Rule, I mean the Winds, whereby the Surface of the Water is lick'd up sometimes faster than it exhales by the Heat of the Sun; as is well known to those that have considered those Drying Winds which blow sometimes.

To estimate the Quantity of Water the *Mediterranean Sea* receives from the Rivers that fall into it, is a very hard Task, unless one had the Opportunity to measure their Channels and Velocity; and therefore we can only do it by allowing more than enough: That is, by presuming these Rivers greater than in all Probability they be, and then comparing the Quantity of Water voided by the *Thames*, with that of those Rivers whose Waters we desire to compute.

The

The *Mediterranean* receives these considerable Rivers ; The *Iberus*, the *Rhone*, the *Tiber*, the *Po*, the *Danube*, the *Neister*, the *Boryphenes*, the *Tanais* and the *Nile* ; all the rest being of no great Note, and their Quantity of Water inconsiderable.

These nine Rivers, we will suppose each of them to bring down ten times as much Water as the River of *Thames* ; nor that any of them are so great in Reality, but to comprehend with them all the small Rivulets that fall into the Sea, which otherwise I know not how to allow for.

To calculate the Water of the *Thames*, I assume that at *Kingston-Bridge*, where the Flood never reaches, and the Water always runs down, the Breadth of the Channel is 100 Yards, and its Depth three, it being reduced to an Equality ; (in in both which Suppositions I am sure I take with the most.)

Hence the Profile of the Water in this Place, is 300 Square Yards : This multiplied by 48 Miles, (which I allow the Water to run in 24 Hours, at two Miles an Hour) or 84480 Yards, gives 25344000 Cubick-Yards of Water to be evacuated every Day : That is 20300000 Tons *per Diem* : And I doubt not but in the Excess of my Measures of the Channel of the River, I have made more than sufficient Allowance for the Waters of the *Brent*, the *Wandel*, the *Lea*, and *Darwent*, which are all worth Notice, that fall into the *Thames* below *Kingston*.

Now, if each of the aforesaid nine Rivers yield ten Times as much Water as the *Thames* doth, 'twill follow, that each of them yield but 203 Millions of Tons *per Diem*, and the whole nine but 1827 Millions of Tons in a Day ; which is but little more than one third of what is proved to be raised in Vapour out of the *Mediterranean* in Twelve Hours Time.

Now what becomes of this Vapour when rais'd, and how it comes to pass that the Current always sets in at the Mouth of the Streights of *Gibraltar*, is intended, with Leave, for a farther Entertainment of this Honourable Company.

In the mean Time, it is needful to advertise the Reader, That in making the Experiment herein mentioned, the Water used, had been salted to the same Degree, as is the common Sea-Water, by the Solution of about a fortieth Part of Salt.

The Quantity of Vapours drawn by any determinate Heat from any Quantity of Water in a determinate Time is always proportionable to the Surface of that Water : So that from a double Surface there will be raised a double Quantity of Vapour, from a triple Surface, a triple Quantity, &c.

For the Manner how, and the Reason why Vapours are raised by Heat, Mr. *Halley* gives the following Account.

He hath shewed, That if an Atom of Water be expanded into a Shell or Bubble, whose Diameter shall be Ten times as great as before, such an Atom will be specifically lighter than Air, and will rise so long as that Flatus or warm Spirit which first separated it from the Mass of Water, shall continue to distend it to the same Degree : But then that Warmth declining, and the Air growing cooler, and with all specifically lighter, these Vapours will stop at a certain Region of the Air, or else descend.

If therefore it should be supposed, That the whole Earth were covered with Water, and that the Sun as now should make his Diurnal Course round it, this Learned Person thinks, That the Air would be impregnated with a certain Quantity of Aqueous Vapours, which it would retain it in like Salts dissolved in Water ; and that the Sun in the Day time warming this Air, that part of the Atmosphere would sustain a greater Proportion of Vapours ; (as warm Water will hold more Salt dissolved in it than cold ;) which on the Absence of the Vapours at Night, would be discharged in Dews.

And in this Case he concludes, there could be no Diversity of Weather, other than Periodically every Year alike, the Mixture of all Terrestrial, Saline, and Heterogeneous Vapours being here excluded ; which he judges to be when variously compounded and driven by Winds, the Causes of those various Seasons and Changes of Weather which we now find.

But if instead of an Earth covered all over with Water, you suppose the Sea interspersed about wide and spacious Tracts of Land, and also divided by high Ridges of Mountains, such as the *Pyrenean*, the *Alps*, and the *Appenine* in Europe : *Taurus*, *Caucasus*, *Imaus*, &c. in Asia ; Mount *Atlas*, and the Mountains of the Moon in Africa : And the *Andes* and *Apalatean* Mountains in America ; each of which far surpass the usual Height to which the Aqueous Vapours of themselves ascend, and on the Tops of which, the Air is so cold, and rarified, as to retain but a small Part of those Vapours which are brought thither by the Winds.

The Vapours therefore thus rais'd from the Sea, and by the Winds carried over the Low-Lands to those Ridges of Mountains, are there compelled by the Stream of the Air, to mount with it up to their Tops, where the Water presently precipitates, gleeting down by the Crannies of the Stones ; and part of the Vapour entering into the Caverns of the Hills, the Water thereof gathers as in an Alembick in the Basons of Stone which it finds ; and these being once full, the Overplus of the Water runs down at the lowest Place of the Bason, and breaking out by the Sides of the Hills, forms *Single Springs* :

Many of which running down by the Valleys, or Guts, between the Ridges of the Hills, and after uniting, form little Rivulets, or Brooks ; and many of these meeting again in a common Channel from large Rivers.

And in this Theory, the Author saith, he was confirmed by Experience at *St. Helena* ; where residing to make Celestial Observations, the Place being about 800 Yards above the Surface of the Sea, there was every Night such a Condensation, or rather Precipitation of the Vapours, as that, tho' the Sky was clear, they would cover every half Quarter of an Hour the Object-Glasses of his Telescopes, and wet his Paper to that it would hardly bear Ink to write his Observations. *Philosophical Transactions*, N^o 192.

The Learned Dr. *Woodward* supposes the great Abyfs of Water in the Bowels of the Earth to be the Promptuary from whence the Water of Springs and Rivers is chiefly deduced : See *Springs*.

Mr. *Homberg*,

Mr. *Homborg*, in some Experiments which he hath published in the *Memoires de Mathematique & de Physique*, for the Month of *May*, 1693. says, That the most probable Cause of the Elevation of Vapors in general, is that the Fiery or Æthereal Matter first puts the small Particles of the Water into an Agitation, and then mingles it self with it; which Mixture is what we call *Vapors*; this being specifically lighter than Air, will rise in it, 'till it come to such an height, as that the Air is there of the same relative Gravity with it self, and there it will swim about, 'till by the Motion of Winds, or other Causes, its Constitution is broken, and so the watry Parts uniting together in greater Drops, it descends in Dew, or Rain: Which Notion differs very little from Mr. *Halley's*. Only *Homborg*, by an Experiment which he made of Evaporation in *Vacuo*, concludes, That Air is not necessary to the first rising of Vapors, but only to the making of them mount up on high, after they once are brought or raised into it.

VARIATION is, according to *Tycho*, the third Inequality in the Motion of the Moon; and arises from her *Apogæum*, being changed as her System is carried round the Sun by the Earth. *Bullialdus* calls this the Moon's *Reflexion*, expressing it, That her *Apogæon* reflects backwards contrary to the Order or Succession of the Signs, by reason of which the Angle of her *Evection* is sometimes more, and sometimes less, than it would appear to be, by considering only the two other Inequalities. But *Tycho* asserts this *Variation* to be never less than 40 Minutes, 30 Seconds.

Sir *Isaac Newton* thinks the *Variation* is caused partly by the Elliptick Form of the Moon's Orbit, and partly by the Inequality of the Moments of the Area which the Moon describes by a Radius drawn to the Earth. This, *Prop. 29. Book 3.* of his *Principia*, he shews how to find; and sets

it at a middle Rate, to be 35 Minutes, 9 Seconds.

VARIATION of the Needle, or Compass, is the Deviation, or Turning of the Magnetical Needle in the *Mariners Compass*, from the true North-point; which happens more or less in most Places; and is commonly called by Sea-men the North-Easting, or North-Westing of the Needle.

To find the Variation at Sea.

About three Hours before or after Noon, having the *Sun's Declination*, his *Altitude*, and the Latitude of the Place, find his true *Azimuth*, (as is directed under that Word) observe also the *Sun's Magnetical Azimuth*, and then the Differences of those two Distances from the *Meridian*, is the *Variation of the Compass*.

The same is also found by having the *Sun's True and Magnetical Amplitude*.

For if the Amplitudes be of one kind; that is, both North, or both South, their Difference is the *Variation*: But if of different kinds; that is, one North, the other South, their Sum is the *Variation*.

In the Practice of observing the *Variation*, it is usual to take it by the Amplitude of the Rising and Setting of the Sun, when his Centre appears in the *Visible Horizon*; whereas he ought to be observed when his under Limb is still above the *Horizon* about two Thirds of his Diameter, or 20 Minutes, because of the Refraction, and the Height of the Observer's Eye above the Surface of the Water; or else to work the Amplitudes, as the Azimuths, by reckoning the Sun's Distance from the Zenith, 90 Degrees 36 Minutes. This, tho' it be of little Consequence near the Equinoctial, will make a great Error in high Latitudes, where the Sun Rises and Sets Obliquely.

A Table of the Variation of the Compass, as it hath been observed in divers Places, and at divers Times.

From the foregoing Table 'tis observ'd by the Learned Capt. Halley.

1. That in all Europe, the Variation at this Time is *West*, and more in the Eastern Parts thereof than the Western, increasing that way.

2. That on the Coast of America, about Virginia, New England, and Newfoundland, the Variation is *Westerly*, increasing all the way as you go Northerly along the Coast, so as to be above 20 Degrees at Newfoundland, nearly 30 Degrees in Hudson's Streights, and not less than 37 Degrees in Bassin's Bay: And that as you sail Eastward from this Coast, the Variation diminishes.

Whence it is, That somewhere between Europe and the North part of America, there must be an Easterly Variation, or at least no Variation.

3. That on the Coast of Brazil, there is East Variation, increasing as you go to the Southward, so as to be 12 Degrees at Cape Frio, and 20 Degr. and half over-against R. Plata; and thence sailing South-westerly, to the Streights of Magellan, it decreases 17 Degrees, and at the West Entrance about 14 Degrees.

4. That the Eastward of Brazil, this Easterly Variation decreases, so as to be very little at St. Helena and Ascension, and to be quite gone, and the Compass Point true about 18 Degrees of Longitude West from the Cape of Good Hope.

5. That to the Eastward of the aforesaid Places, a Westward Variation begins, and governs in all the Indian Sea, arising to 18 Degrees under the Equator, about the Meridian of the Northern part of Madagascar; and 27 Degrees and a half in 39 Degrees South Latitude, near the same Meridian: Easterly from thence, the West Variation decreases, so as to be not much above 8 Degrees at Cape Comorin, and about 3 Degrees upon the Coast of Java; and about the Molucca Islands to be quite gone; as also a little to the Westward of Van Diemen's Land.

6. That to the Eastward of the Molucca's and Van Diemen's Land, in South Latitude, there arises another Easterly Variation, which seems not so great as the former, nor of so large Extent; for that at the Island Rotterdam, it is sensibly less than upon the East Coast of New Guinea; and at the rate it decreases, it may well be supposed, that about 20 Degrees further Eastward, or 225 Degrees East Longitude from London, in the Latitude of 20 Degrees South, a Westery Variation begins.

7. That the Variation taken at Baldivia, and at the West Entrance of the Streights of Megellan, shews, That the East Variation noted in the third Observation, is decreasing apace; and that it cannot well extend many Degrees into the South Sea, from the Coast of Peru and Chili, leaving room for a small Westery Variation in that Tract of the unknown World that lies in the mid-way between Chili and New Zealand, and between Hounds Island and Peru.

8. That in sailing North-west from St. Helena, by Ascension, as far as the Equator, the Variation

continues very small East, and as it were, constantly the same; so that in this part of the World, the Course, wherein there is no Variation, is evidently no Meridian, but rather North-west.

9. That the Entrance of Hudson's Streights, and the Mouth of R. Plata, being nearly under the same Meridian, at the one place the Needle varies 29 Degrees and a half West; at the other 20 Degrees and a half East.

Whence 'tis concluded,

That the whole Globe of the Earth is one great Magnet, having four Magnetical Poles, or Points of Attraction, near each Pole of the Equator two; and that in those Parts of the World which lie near adjacent to any one of those Magnetical Poles, the Needle is govern'd thereby, the nearest Pole being always predominant over the more remote.

And he conjectures, That the Pole, which is at present nearest to us, lies in or near the Meridian of the Lands-End of England, and not above 7 Degrees from the Arctic Pole; by this Pole the Variation in all Europe and Tarrary, and the North Sea, are principally govern'd; tho' with regard to the other Northern Poles, whose Situation is in the Meridian passing about the middle of California, and about 15 Degrees from the North Pole of the World; to this the Needle has chiefly respect in all the North America, and in the two Oceans on either side thereof, from the Azores Westwards to Japan, and farther.

The two Southern Poles are rather farther distant from the South Pole of the World: The one about 16 Degrees therefrom, in a Meridian some 20 Degr. to the Westward of Magellan's Streights, or 95 Degrees West from London; this commands the Needle in all South America, in the Pacifick Sea, and the greatest Part of the Ethiopick Ocean.

The fourth and last Pole seems to have the greatest Power, and largest Dominions of all, as it is the most remote from the Pole of the World, being little less than 20 Degrees distant therefrom, in the Meridian which passes through New Holland and the Island Celebes about 120 Degrees East from London; this Pole is predominant in the South part of Africa, in Arabia, and the Red Sea, in Persia, India, and its Islands; and all over the Indian Sea, from the Cape of Good Hope Eastwards, to the middle of the great South Sea that divides Asia from America.

This seems to be the present Disposition of the Magnetical Vertue throughout the whole Globe of the Earth: It remains to shew how this Hypothesis makes out all the Variations that have been observ'd of late; and how it answers to the several Remarks drawn from the Table.

And first, it is plain, that (our European North Pole being in the Meridian of the Lands-end of England) all places more Easterly than that, will have it on the West side of their Meridian; and consequently the Needle respecting it with its Northern Point, will have a Westery Variation, which will still be greater as you go to the Eastwards, till you come to some Meridian of Russia, where 'twill be greatest, and from thence decrease again. Thus at Brest the Variation being but 1 Degree and

3 Quarters at *London* 4 Degrees and a half; but at *Dantzick* 7 Degrees West. To the Westward of the Meridian of the *Lands-End* the Needle ought to have an Easterly Variation; were it not that (by approaching the *American Northern Pole*, which lies on the West side of the Meridian, and seems to be of greater force than this other) the Needle is drawn thereby Westward, so as to counter-balance the Direction given by the *European Pole*, and to make a small West Variation in the Meridian of the *Lands-End* it self. Yet about the Meridian of the *Ile Tercera*, 'tis supposed our nearest Pole may so far prevail, as to give the Needle a little Turn to the East; tho' but for a very little space; the Counter-balance of those two Poles permitting no considerable Variation in all the Eastern part of the *Atlantick Ocean*; nor upon the West Coast of *England* and *Ireland*, *France*, *Spain*, and *Barbary*: But to the Westward of the *Azores*, the Power of the *American Pole*, overcoming that of the *European*, the Needle has chiefly respect thereto; and turns still more and more towards it, as you approach it. Whence it comes to pass, that on the Coast of *Virginia*, *New-England*, *Newfoundland*, and in *Hudson's-Streights*, the Variation is Westward; that it increases as you go from thence towards *Europe*, and that it is less in *Virginia* and *New-England*, than in *Newfoundland* and *Hudson's-Streights*.

This Westerly Variation again decreases, as you pass over the *North America*, and about the Meridian of the middle of *California*, the Needle again points due North; and from thence Westwards to *Tedzo* and *Japan*, 'tis supposed the Variation is Easterly; and half Sea over, not less than 15 Degrees: And that this East Variation extends over *Japan*, *Tedzo*, *East-Tartary*, and part of *China*, till it meet with the Westerly, which is govern'd by the *European North Pole*, and which is the greatest somewhere in *Russia*.

Towards the South Pole the Effect is much the same, only that here the South Point of the Needle is attracted.

Hence it will follow, That the Variation on the Coast of *Brazil*, at the River of *Plate*, and so on to the *Streights of Magellan*, should be Easterly, if we suppose a Magnetical Pole situated about 20 Degrees more Westerly than the *Streights of Magellan*. And this Easterly Variation doth extend Eastward over the greatest part of the *Ethiopic Sea*, till it be counterpoiz'd by the Virtue of the other Southern Pole; as it is about mid-way between the *Cape of Good Hope*, and the *Isles of Tristan d'Acuntia*.

From thence Eastwards the *Asian South Pole* becoming prevalent, and the South Point of the Needle being attracted thereby, there arises a West Variation very great in Quantity and Extent, because of the great Distance of this Magnetical Pole of the World.

Hence it is, That all the *Indian Sea*, as far as *Hollandia Nova*, and farther, there is constantly West Variation; and that under the Equator it self, it arises to no less than 18 Degrees, where 'tis most.

About the Meridian of the Island of *Celebes*, being likewise that of this Pole, this Westerly Variation ceases, and an Easterly begins, which reaches to the middle of the South Sea, between the middle of *Zelandia Nova* and *Chili*, leaving room for a

small West Variation govern'd by the *American South Pole*.

From all this it appears, That the Direction of the Needle in the Temperate and Frigid Zone, depends chiefly upon the Counterpoise of the Forces of two Magnetical Poles of the same Nature: As also how it is, that under the same Meridian, the Variation should be in one place 29 Degrees and a half West, and in another 20 Degrees and a half East.

In the *Torrid Zone*, and particularly under the Equinoctial, respect must be had to all four Poles, and their Positions well consider'd; otherwise it will not be easie to determine what Variations shall be; the nearest Pole being always strongest; yet not so, as not to be counter-balance'd sometimes by the united Forces of two more remote; as is noted in the Eighth Observation, that in sailing from *St. Helena*, by the *Ile of Ascension*, to the Equator, on the North-west Course, the Variation is very little Easterly, and in that whole Tract unalterable, because that the *South American Pole* (which is considerably the nearest in the aforesaid Places) requiring a great Easterly Variation, is counterpoiz'd by the contrary Attraction of the *North American*, and the *Asian South Pole*; each whereof singly are, in these Parts, weaker than the *American South Pole*; and upon the North-west Course, the Distance from this latter is very little varied; and as you recede from the *Asian South Pole*, the Balance is still preserv'd by access towards the *North American Pole*. In this Case no notice is taken of the *European North Pole*; its Meridian being little remov'd from those of these Places, and of it self requiring the same Variations we here find.

After the same manner you may proceed to determine the Variations in other places, under and near the Equator.

All this seems very much to confirm the aforesaid Hypothesis, That there are in the Earth four such Magnetical Points, or Poles, which occasion the great Variety, and seeming Irregularity, which is observed in the Variation of the Compass.

But to calculate exactly what it is, in any Place assign'd, is not as yet done, nor is it determin'd in what Proportion the attractive Power decreases, as you remove from the Pole of the Magnet; as also the Change of the Variation, and at what rate, is not yet perfectly discovered.

From the foregoing Table, it should seem, that all the Magnetical Poles had a Motion Westward; but if it be so, 'tis evident, That it is not a Rotation about the Axis of the Earth; for then the Variations would continue the same, in the same Parallel of Latitude (the Longitude only changed) as much as the Motion of the Magnetical Poles: But the contrary is found by Experience; for there is no where in the Latitude of 51 and an half North, between *England* and *America*, a Variation of 11 Degrees East, at this time; as it was once here at *London*. Wherefore it seems that our *European Pole* is grown nearer the Pole *Arctic* than it was heretofore; or else that it has lost part of its Virtue.

But whether these Magnetick Poles move altogether with one Motion, or with several, whether equally, or unequally; whether circular, or libratory: If circular, about what Centre; if libratory, after what manner, things yet unknown.

In

In *Philos. Transl.* N. 195. Capt. *Halley* brings the following *Hypothesis*, accounting for this *Variation*, and solving all its *Phenomena's*; which is thus:

He reckons the external Parts of the Globe as the Shell, and the internal as a *Nucleus*, or inner Globe, included within ours, with a fluid Medium between, which having the same common Centre and Axis of Diurnal Rotation, may turn about with our Earth each 24 Hours; only this outer Sphere having its turbinating Motion, (some small matter either swifter or slower than the internal Ball. And a very minute Difference in Length of Time, by many Repetitions, becomes sensible; the internal Parts will by degrees recede from the external; and not keeping pace with one another, will appear gradually to move, either Eastward or Westward, by the Difference of their Motions.

Now supposing such an internal Sphere having such a Motion, the two great Difficulties in the former Hypothesis is easily solv'd: For if this exterior Shell of Earth be a Magnet, having its Poles at a distance from the Poles of Diurnal Rotation; and if the internal *Nucleus* be likewise a Magnet, having its Poles in two other places distant also from the Axis; and these latter, by a gradual and slow Motion, change their Place in respect of the External: We may then give a reasonable Account of the four Magnetical Poles aforementioned, as likewise of the Changes of the Needle's Variations.

The Period of this Motion being wonderful great, and there being hardly an hundred Years since these Variations have been duly observ'd, it will be very hard to bring this *Hypothesis* to a *Calculation*, especially since, tho' the Variations do increase and decrease regularly in the same place, yet in differing places, at no great distance, there are found such casual Changes thereof, as can no ways be accounted for by a regular Hypothesis, as depending upon the unequal and irregular Distribution of the Magnetical Matter within the Substance of the external Shell or Coat of the Earth, which deflect the Needle from the Position it would acquire from the Effect of the general Magnetism of the whole.

Of this, the *Variations* at *London* and *Paris* give a notable Instance; for the Needle has been constantly about $1\frac{1}{2}$ more Easterly at *Paris* than at *London*: Tho' it be certain, that according to the general Effect, the Difference ought to be contrary way; notwithstanding which, the Variations in both places do change alike.

Hence, and from some other things of like nature, it seems plain, that the two Poles of the external Globe are fix'd in the Earth, and that if the Needle were wholly govern'd by them, the *Variations* thereof would be always the same, with some Irregularities upon the Account but just now mention'd. But the internal Sphere having such a gradual Translation of its Poles, does influence the Needle, and direct it variously, according to the Result of the attractive or directive Power of each Pole; and consequently, there must be a Period of the Revolution of this internal Ball; after which, the Variations will return again, as before. But if it shall in future Ages be observed otherwise, we must then conclude, that there are more of these internal Spheres, and more Magnetical Poles

than Four, which, at present, we have not a sufficient number of Observations to determine, and particularly in that vast *Mer. del Sur*, which occupies so great a part of the whole Surface of the Earth.

If then, two of the Poles be fix'd, and two moveable, it remains to ascertain, which they are that keep their Place. And it were to be wish'd we had the Experience of another Century of Years to found our Conclusions upon: Yet he thinks it may be safely determined, that our *European North Pole* (which is supposed to be near the Meridian of the *Lands-End* of *England*, and about 7 Deg. therefrom) is that that is moveable of the two Northern Poles, and that that has chiefly influenced the Variations in these Parts of the World: For in *Hudson's Bay*, which is under the Direction of the *American Pole*, the Change is not observ'd to be near so fast, as in these Parts of *Europe*, tho' that Pole be much farther removed from the Axis.

As to the *South Poles*, he takes the *Asian Pole* which he places about the Meridian of the Island *Celebes* to be fixed, and consequently the *American Pole* to move, from the like Observation of the slow decrease of the Variation on the Coast of *Java*, and near the Meridian of the *Asian Pole*; tho' he owns to have no Account of the Effects of the other beyond *Magellan Straights*.

This being granted, 'tis plain, That the fixed Poles, are the Poles of this external Shell or *Cortex* of the Earth; and the other two, the Poles of the Magnetical *Nucleus*, included and moveable within the other. It likewise follows, that this Motion is Westwards; and, by consequence, that the aforesaid *Nucleus* has not precisely attain'd the same Degree of Velocity with the exterior Parts in their diurnal Revolutions; but so very nearly equals it, that in 365 Revolves, the Difference is scarce sensible.

This is supposed to arise from the Impulse whereby this diurnal Motion was impress'd on the Earth, being given to the external Parts, and from thence, in time, communicated to the internal; but not so, as perfectly to equal the Velocity of the first Motion impress'd on, and still conserv'd by the superficial Parts of the Globe.

As to the Quantity of this Motion, it is impossible to define it, both from the Nature of this kind of Observation, which cannot be very accurately perform'd; as also, from the small Time these Variations have been observ'd, and their Change discover'd. It appears by all Circumstances, that its Period is of many Centuries of Years, and as far as may be, collected from the Change of the Place, where there was no Variation by reason of the *Equilibrium* of the two Southern Magnetical Poles, viz. from *Cape d'Agulhas*, to the Meridian of *St. Helena* (which is about 23 Deg. in about 90 Years) and of the Place where the Westerly Variation is in its greatest Deflection, being about half so much, viz. from the Isle of *Diego Roiz*, to the South-west Parts of *Madagascar*; we may with some reason conjecture, that the *American Pole* has moved Westward 46 Degr. in that Time, and that the whole Period thereof is perform'd in 700 Years, or thereabouts: So that, the nice Determination of this, and of several other Particulars in the Magnetick System, is reserv'd for Posterity; all that we can hope to do, is to leave behind us Observations that may be confided in, and to propose Hy-

potheses

potheses which after Ages may examine, amend, and refute.

Thus, in order to explain the Change of the *Variations*, we have adventured to make the Earth hollow, and to place another Globe within it; not but that there may be several Objections against it; as,

That there is no Instance in Nature of the like thing.

That, if there was such a middle Globe, it would not keep its Place in the Centre, but be apt to deviate therefrom, and might possibly chock against the concave Shell, to the Ruin, or at least Endamaging thereof.

That the Water of the Sea would perpetually leak through, unless we suppose the Cavity to be full of Water.

That were it possible, yet it does not appear what Use such an inward Sphere can be of, being shut up in eternal Darknels, and therefore unfit for the Production of Animals, or Plants; with many more Objections, according to the Fate of all such new Propositions.

To these it may be briefly answer'd, That the Ring environing of the Globe of *Saturn*, is a notable Instance of this kind, as having the same common Centre, and moving along with the Planet, without sensibly approaching him on one side more than on the other. And if this Ring were turned on one of its Diameters, it would then describe such a concave Sphere as this external one is supposed to be. And since the Ring in any Position given, would in the same manner keep the Centre of *Saturn* in its own, it follows, That such a concave Sphere may move with another included in it, having the same common Centre: Nor can it well be supposed otherwise, considering the Nature of Gravity; for should these Globes be adjusted once to the same common Centre, the Gravity of the Parts of the Concave, would press equally towards the Centre of the inner Ball; which Equality must necessarily continue till some external Force disturb it, which is not easie to imagine in this Case. And, perhaps, this might be more intelligibly express'd, by saying, That the inner Globe being posited in the Centre of the Exterior, must necessarily ascend which way soever it moves; that is, it must overcome the Force of Gravity pressing towards the common Centre, by an Impulse it must receive from some outward Agent. But all outward Efforts being insufficiently fenced against, by the Shell that surrounds it, it follows, That this *Nucleus* being once fix'd in the common Centre, must always there remain.

As to the Leaking of the Water through this Shell, when once a Passage shall be found for it to run through, is confes'd to be an Objection seemingly of weight; but by considering how rightly great Beds of Chalk or Clay, and much more Stone, do hold Water, and even Caves arch'd with Sand, no Man can doubt but the Wisdom of the Creator has provided for the Microcosm, by many more Ways than can be either imagin'd or express'd; especially since we see the admirable and innumerable Contrivances wherewith each worthless Individual is furnish'd, both to defend it self, and pro-

pagate its Species: What Curiosity in the Structure; what Accuracy in the Mixture and Composition of the Parts ought not we to expect in the Fabrick of this Globe, made to be the lasting Habitation of so many various Species of Animals, in each of which, there want not many Instances that manifest the boundless Power and Goodness of their Divine Author; and can we then think it a hard Supposition, that the internal Parts of this Bubble of Earth should be replere with such *Saline* and *Vitriclick* Particles, as may contribute to Petrefaction, and dispose the transuding Water to shoot and coagulate into Stone, so as continually to fortify, and, if need were, to consolidate any Breach or Flaw in the concave Surface of the Shell.

And perhaps this may not without reason be supposed to be the final Cause of the Admixture of the magnetical Matter in the Mass of the terrestrial Parts of our Globe, viz. To make good and maintain the concave Arch of this Shell: For, by what the Excellent Sir *Is. Newton* has shewn in his *Principia Philosophiæ*, it will follow, that according to the general Principle of Gravity, visible throughout the whole Universe, of those Particles that by Length of Time, or otherwise, shall moulder away, or become loose on the concave Surface of the external Sphere, would fall in, and with great Force descend on the internal, unless those Particles were of another sort of Matter, capable by their stronger Tendency to each other, to suspend the Force of Gravity; but no other Substance is known capable of supporting each other by their mutual Attraction, but the Magnetical; and these we see miraculously to perform that Office, even where the Power of Gravity has its full Effect; much more within the Globe, where it is weaker. Why then may we not suppose these said Arches to be lined throughout with a magnetical Matter, or rather, to be one great concave Magnet, whose two Poles are the Poles we have before observ'd to be fix'd in the Surface of our Globe.

Another Argument favouring this Hypothesis, is drawn from a Proposition of the same Sir *Isaac Newton*, where he determines the Force wherewith the Moon moves the Sea in producing the Tides; his Words are, *Densitas Lunæ est ad densitatem Terræ ut 680 ad 387, seu 9 ad 5 quom proxime. Est igitur corpus Lunæ densius ac magis terrestre quam Terra nostra*, p. 466.

Now if the Moon be more solid than the Earth, as 9 to 5, why may we not reasonably suppose the Moon, being a small Body, and a secondary Planet, to be solid Earth, Water and Stone, and this Globe to consist of the same Materials, only $\frac{2}{3}$ thereof to be Cavity, within and between the internal Spheres; which might be rendred not improbable.

And one of the Uses of the Cavity of the Earth seems to be, To diminish the Specifick Gravity thereof, in respect of the Moon; for it may be demonstrated, that the Opposition of the *Ether* to the Motions of the Planets, in a long time, becomes sensible; and consequently, the greater Bodies must receive a less Opposition than the smaller, unless the Specifick Gravity of the smaller do proportionably exceed that of the greater, in which Case only they can move together; so that the Cavity assign'd in the Earth, may serve well to adjust its Weight to that of the Moon: For otherwise, the Earth would leave the Moon behind it, and the become another primary Planet.

VARICOSUM Corpus, is that Contexture of Spermatick Vessels, which enters the Testicles.

VARIOLÆ, the Small-Pox, consists in a contagious Disorder of the Blood, contracted from the Air or otherwise; accompanied with a continued wandering Fever, which sometimes increaseth, sometimes decreases, with a Pain in the Head and Loins, Anxiety and Inquietude, and with a breaking forth of Pimples and Wheals, which swell and suppurate. The Famous *Willis* attributes the Cause of this Distemper to some filthy and fermentative Matter, which is communicated to the *Fætus*, together with the Nourishment from the Womb; but how this can hold in adult Persons, whose Blood has undergone so many Alterations, I could never yet understand from his Writings. It seems rather to consist in a depraved Temperature of Air, with a peculiar Disposition of the Blood and the nervous Juice towards this Distemper. This poisonous Quality of the Air, first infects the nervous Juice, (whence proceeds the Pain of the Head and Loins) wherewith the Blood boils and ferments, and parts into little Pieces or Clots, which in the Course of Circulation, stick to the outward Parts, and to the inner *Viscera* too; after a while they grow ripe, and suppurate. *Blanchard*.

VARIX: See *Cirsus*.

VASA brevia: See *Breve vas*.

VASA, the Vessels in an Animal, are Cavities through which the Liquors of the Body pass, as a Vein, an Artery, Lymphatick Vessels, the *Ductus* that conveys the Chyle, and those of the Spittle.

VASA deferentia, are those Vessels wherein the Seed is convey'd from the Testicles to the *Vesicula Seminales*.

VASA Lactea, the Milky Vessels in the Mesentery: They which reach from the Guts to the Glandules in the Mesentery, are said to be of the first sort; and they which reach from those Glandules to the Bag that carries the Chyle, are of the second sort.

Their Use is to convey the Chyle from the Guts to the little Bag which holds the Chyle, and thence to the *Ductus*, which conveys it to the *Thorax*. *Asellius* was the first who discovered them, and the dexterous *F. Ruyschius* afterwards discover'd Valves in them. *Blanchard*.

VASA Lymphaticæ: See *Vena Lymphatica*.

VASCULIFEROUS Planets, are, according to the Botanists, such as have besides the common Calyx or Flower-Cup, a peculiar Vessel or Case to contain their Seed, one belonging to each Flower, but sometimes divided into distinct Cells. These have always a monopetalous Flower, either uniform or difform.

The former of these have their Seeds all divided.

1. Into two Partitions; as the *Hyoscyamus*, *Nicotiana*, *Priapeia*, and the *Gentiana*.

2. Into three Partitions; as the *Convolvulus*, *Speculum Veneris*, *Trachelium*, *Repunculus*, *Campanula*, *Repunculus Corniculatus*, &c.

3. Into four Partitions; as the *Stramonium*.

Those of the latter Kind, or which have a difform monopetalous Flower, as the *Linaria*, *Pinguicula*, *Antirrhinum*, *Aristolochia*, *Scrophularia*, *Digitalis*, *Pedicularis*, *Melampyrum* and *Euphrasia*, &c.

VASTI Musculi, are certain Muscles that contribute to the extending of the Leg, and are of two sorts, viz. *External* and *Internal*.

VASTO, is a Writ that lies for the Heir against the Tenant for Term of Life, or of Years, for making Waste, or for him in the Reversion or Remainder.

VASTUM, is a Waste or Common, lying open to the Cattle of all Tenants, who have a Right of Commoning.

VASTUS Externus, is a Muscle of the Leg, so called, from its Magnitude and Situation. It arises outwardly tendinous, inwardly fleshy from the external Part of the great *Trochanter*, and *Linea Aspera* of the Thigh-bone, from whence its Fibres descend obliquely forwards; and on the contrary, become outwardly fleshy, and tendinous internally; and so soon as they meet with the Tendon of the *Rectus Femoris*, grow perfectly tendinous. It helps to extend the *Tibia*.

VASTUS Internus, is a Muscle of the Leg, which hath its Denomination from its Situation and Magnitude. Its Beginning is large, partly tendinous, and partly fleshy; its being continued from the *Linea Aspera*, on the Back-part of the Thigh-bone, from immediately below the lesser *Trochanter*, till within three Fingers breadth above the inferior *Appendix* of the said Bone internally and laterally; from hence its fleshy Fibres descend obliquely outwards, and an almost semicircular manner, and on a sudden ceasing to be fleshy, its Tendon is united with that of the *Rectus*, together with the *Vastus Internus* and *Crureus*, and is inserted with them. It helps to extend the *Tibia*.

VECTIS, or the *Lever*, is the first of the Mechanick Powers, as they are usually call'd. This Dr. *Wallis*, in his *Mechanicks*, rightly considers as a *Right Line* perfectly inflexible, of no weight it self, or at least, of an equable one throughout, accommodated to the raising or sustaining of heavy Bodies. This *Vectis* is always supported by a *Fulcrum*, on which it moves as on an immoveable Centre.

VECTOR, a Line suppos'd to be drawn from any Planet moving round a Centre, as the Focus of an Ellipsis, to that Centre or Focus, is by some Writers of the New Astronomy, call'd the *Vector*; because 'tis that Line by which the Planet seems to be carried round its Centre, and with which it describes proportional Area's in proportional Time.

VEDETTE, a Military Term, signifying a Centinel on Horse-back detach'd from the Main Body of the Army, to discover and give notice of the Enemies Designs.

VEER: The Seamen call *Veering* out a Rope, letting it go by Hand, or letting it run out of it self. Thus they say, *Veer more Cable*; that is, let more Cable run out. But they don't use this Word for the letting out of any running Rope, except the *Sheat*, but of that, they say, *Veer more Sheat*; that is, let more of it run out.

The Word *Veer* is also used in reference to the Wind; for when it changeth often and suddenly, they say, the Wind *veereth*; also when a Ship being under Sail, hath her *Sheat* veered out, they say, she goes *Veering*; that is, at large; neither by a Wind, nor directly before it, but between both, which they call also *Quartering*.

VEGETABLES, are such Natural Bodies as grow and increase from Parts organically form'd, but have no proper Life nor Sensation.

VEGE-

VEGETATION, is the Way of Growth or Increase of Bulk, Parts and Dimensions, proper to all Trees, Shrubs, Plants, and Herbs.

It hath been a general Opinion amongst almost all the Modern Naturalists; That the Vegetation of Plants and even Minerals too, was chiefly owing to Water; and that not only as a Vehicle, to convey to them the fine rich Earth, &c. proper for their Nourishment; but that the Water was transmuted into the very Body of the Plant, and afforded the greatest part of it, if not all the Matter with which they are nourish'd, and by which they grow and increase in Bigness. This Opinion countenanced by very great Names, that Learned and Ingenious Naturalist Dr. John Woodward, Author of the *Natural History of the Earth*, thought very well worth taking into serious Examination.

And in the first place, he carefully examined all sorts of Water, and found, that the clearest, finest Spring-water, which he could any where meet with, exhibited even to the naked Eye, great Numbers of exceeding small terrestrial Particles, and that all other Crasser Waters had these in yet much greater Quantity; and also, that they were of a much larger Bulk.

He found this Terrestrial Matter, contain'd in all Water, to be of two kinds: The one properly a *Vegetable Matter*, but consisting of very different Particles; some of which are proper for the Nourishment of some kinds of Plants; others for different sorts, &c. The other kind of Earthy Matter, he found to be purely of a Mineral Nature; and this also was of very various and different kinds.

The former sort of Vegetable Earthy Matter, abounds plentifully in all Waters; but for the Mineral, 'tis found mostly in Spring-water, next to that, in River-water, and least of all in Rain-water; tho' even there it is also to be found plentifully.

This Fact (he saith) any one may discover, by only keeping Water for a competent Time without stirring it, in a clear Glass Viol, close stopp'd, to keep out Dust, &c. For then he will observe, that these very small Terrestrial Particles, which before were scarcely visible singly, will now combine together into larger and more conspicuous Masses, which, by Degrees, will join together, and form Clouds as it were in the Water, which will grow daily more and more opacous and thick, by the continual Accession of new Matter. And if the Earthy Matter in the Water be chiefly of the *Vegetable* kind, it will turn the Water green, the usual Colour of Vegetables; and this will grow deeper and deeper colour'd, but will not precipitate to the Bottom of the Glass, as the *Mineral* Matter will, if there be any considerable Quantity, by reason of its much greater Specifick Gravity. On the whole therefore he concludes, very justly, That there is in all Water a considerable Quantity

of Earthy Matter. And in order to determine whether the Vegetation of Plants was chiefly owing to bare Water, or not rather to the *Terrestrial Matter* therein contain'd, he made, with very great Accuracy and Care, the following Experiments, as you will find in a Discourse of his, read before the Royal Society, and publish'd in their *Transactions*, N. 253.

Which *Experiments*, because they are done with an uncommon Care and Exactness, are a sufficient number of them, and are follow'd by very ingenious *Reflections*, serving to explicate many Difficulties in Philosophy, and to set the whole Affair of Vegetation in a very good Light; I shall give the Reader as followeth.

A. D. 1691, I chose (saith he) several *Glass Viols*, that were all, as near as possible, of the same shape and bigness. After I had put what Water I thought fit into every one of them, and taken an Account of the *Weight* of it, I strain'd and ry'd over the Orifice of each Viol, a piece of Parchment, having an Hole in the Middle of it, large enough to admit the *Stem* of the *Plant* I design'd to set in the Viol, without confining or straitning it, so as to impede its *Growth*. My Intention in this, was to prevent the enclosed Water from evaporating or ascending any other way, than only through the Plant to be set therein.

Then I made choice of several Sprigs of *Mint*, and other *Plants* that were, as near as I could possibly judge, alike fresh, sound and lively. Having taken the *Weight* of each, I plac'd it in a Viol order'd as above; and as the Plant imbibed and drew off the Water, I took care to add more of the same from time to time, keeping an Account of the *Weight* of all I added. Each of the Glasses were for better Distinction, and the more easy keeping a Register of all the Circumstances, noted with a different Mark or Letter, A, B, C, &c. and all set in a row in the same Window, in such manner, that all might partake alike of *Air*, *Light*, and *Sun*. Thus they continued from *July* the 20th to *October* the 5th, which was just 77 Days. Then I took them out, weigh'd the Water in each Viol, and the Plant likewise, adding to its *Weight* that of all the Leaves that had fallen off during the Time it stood thus. And lastly, I computed how much each Plant had gain'd, and how much Water was spent upon it. The Particulars are as follows.

A: *Common Spear-Mint*, set in *Spring-water*.

The Plant weigh'd, when put in *July* 20, just 27 Grains; when taken out *October* 5. 42 Gr. So that in this Space of 77 Days; it had gain'd in *Weight* 15 Grains.

The whole Quantity of Water expended during the 77 Days, amounts to 2558 Gr. Consequently, the *Weight* of the Water taken up, was $170\frac{4}{17}$ times as much as the Plant had got in *Weight*.

A. Common Spear-Mint : Spring-Water.

Weight of the Plant when first put in Water.	Weight of the Plant when taken out of the Water.	Weight gained by the Plant during the 77 Days.	Weight of the Water expended upon the Plant.	Proportion of the Increase of the Plant to the Expence of the Water.
27 Grains.	42 Grains.	15 Grains.	2558 Grains.	As 1 to $170\frac{2}{3}$.

B. Common Spear-Mint : Rain-Water.

28 $\frac{1}{2}$ Gr.	45 $\frac{3}{4}$ Gr.	17 $\frac{1}{2}$ Gr.	3004 Gr.	As 1 to $171\frac{2}{3}$.
----------------------	----------------------	----------------------	----------	----------------------------

C. Common Spear-Mint : Thames-Water.

28 Gr.	54 Gr.	26 Gr.	2493 Gr.	As 1 to $95\frac{2}{3}$.
--------	--------	--------	----------	---------------------------

D. Common Solanum, or Night-Shade : Spring-Water.

49 Gr.	106 Gr.	57 Gr.	3708 Gr.	As 1 to $65\frac{3}{4}$.
--------	---------	--------	----------	---------------------------

E. Lathyrus seu Cataputia Gерб. Spring-Water.

98 Gr.	101 $\frac{1}{2}$ Gr.	3 $\frac{1}{2}$ Gr.	2501 Gr.	As 1 to $714\frac{4}{7}$.
--------	-----------------------	---------------------	----------	----------------------------

The Specimen D had several Buds upon it when first set in Water ; these in some Days became fair Flowers, which were at length succeeded by Berries. Several other Plants were try'd, that did not thrive in Water, or succeed any better than the Cataputia foregoing.

The Viols F and G were filled, the former with Rain, and the other with Spring-Water, -at the same time as those above-mention'd were, and stood as long as they did ; but they had neither of them any Plant ; my Design in these being only to inform my self, whether any Water exhaled out of the Glasses, otherwise than through the Bodies of the Plants. The Orifices of these two Glasses were cover'd with Parchment ; each piece of it being perforated with an Hole of the same bigness with those of the Viols above : In this I suspended a bit of Stick about the thickness of the Stem of one of the aforefaid Plants, but not reaching down to the Surface of the included Water ; I put them in thus, that the Water in these might not have more scope to evaporate than that in the other Viols.

Thus they stood the whole 77 Days in the same Window with the rest ; when, upon Examination, I found none of the Water in these wasted or gone off : Though I observed, both in these, and the rest, especially after hot Weather, small Drops of Water, not unlike Dew, adhering to the insides of the Glasses ; that part of them I mean, that was above the Surface of the enclosed Waters.

The Water in these two Glasses that had no Plants in them, at the End of the Experiment, exhibited a larger Quantity of Terrestrial Matter than that in any of those that had the Plants in them did. The Sediment in the Bottom of the Viols was greater, and the Nubecula diffused thro' the Body of the Water thicker. And of that which was in the others, some of it proceeded from certain small Leaves that had fallen from that part of the Stems of the Plants that was within the Water, wherein they rotted and dissolved. The Terrestrial Matter in the Rain-Water, was finer than that in the Spring-Water.

Experiments, Anno 1692.

The Glasses made use of in this, were of the same sort with those of the former Experiment; and cover'd over with Parchment in like manner.

The Plants here were all *Spear-Mint*; the most kindly, fresh, sprightly Shoots I could chuse. The Water and the Plants were weigh'd as above, and the Viols set in a Line, in a *South Window*, where they stood from *June* the 2d, to *July* the 28th; which was just 56 Days.

H. Hyde-Park Conduit Water, alone.				
The Weight of the Plant when first set in Water.	Weight of the Plant when taken out of the Water.	What gain'd by the Plant during the 56 Days.	What of the Water is expended upon the Plant.	Proportion of the Increase of the Plant to the Expence of the Water.
127 Grains.	255 Grains.	128 Grains.	14190 Grains.	As 1 to 110 $\frac{71}{12}$.
I. The same Water, alone.				
110 Gr.	249 Gr.	139 Gr.	13140 Gr.	As 1 to 94 $\frac{74}{133}$.
K. The same Water, with an Ounce and an half of common Garden Earth dissolved in it.				
76 Gr.	244 Gr.	168 Gr.	10731 Gr.	As 1 to 63 $\frac{147}{106}$.
L. Hyde-Park Water, with the same Quantity of Garden Mould as the former.				
92 Gr.	376 Gr.	284 Gr.	14950 Gr.	As 1 to 52 $\frac{182}{284}$.
M. Hyde-Park Water, distilled with a gentle Still.				
114 Gr.	155 Gr.	41 Gr.	8803 Gr.	As 1 to 21 $\frac{439}{21}$.
N. The Residue of the Water which remain'd in the Still after that in M was distill'd off.				
81 Gr.	176 Gr.	94 Gr.	4344 Gr.	As 1 to 46 $\frac{20}{94}$.

H, was all along a very kindly Plant, and had run up above two Foot in height. It had shot but one considerable collateral Branch; but had sent forth many and long Roots; from which sprung very numerous, tho' small and short lesser Fibrils. These lesser Roots came out of the larger on two opposite sides, for the most part; so that each Root, with its Fibrilla, appeareth not unlike a small Feather. To these Fibrillæ adhered pretty much Terrestrial Matter. In the Water which was at the last thick and turbid, was a green Substance, resembling a fine thin *Conserva*.

The Plant I, was as kindly as the former, but had shot no collateral Branches: Its Roots, the Waters, and the green Substance, all much as in the former.

The Plant K, tho' it had the Misfortune to be annoy'd with very small Insects that happen'd to fix upon it, yet had shot very considerable collateral Branches; and at least as many Roots, as either in H or I, which had a much greater Quantity of Terrestrial Matter adhering to the Extremities of them. The same green Substance here that was in the two preceding.

The Plant L, was far more flourishing than any of the precedent; had several considerable collateral Branches, and very numerous Roots, to which Terrestrial Matter adhered very copiously.

The Earth in both these Glasses was very sensibly and considerably wasted, and less than when first put in. The same sort of green Substance here, as in those above.

The Plant M, was pretty kindly; had two small collateral Branches, and several Roots, tho' not so many as that in H or I; but as much Terrestrial Matter adhering to them, as those had. The Water was pretty thick; having very numerous small Terrestrial Particles swimming in it, and some Sediment at the bottom of the Glass. This Glass had none of the green Matter above-mentioned in it.

The Plant N, was very lively, and had sent out six collateral Branches, and several Roots.

The Glass O, had also Hyde Park Conduit Water, in which was dissolv'd a Dram of Nitre. The Mint set in this, suddenly began to wither and decay, and died in a few days, as likewise did two more Sprigs that were set in it successively. In another Glass I dissolv'd an Ounce of good Garden Mould, and a Dram of Nitre; and in a third, half an Ounce of Wood-ashes, and a Dram of Nitre; but the Plants in these succeeded no better than in the former. In other Glasses I dissolv'd several other sorts of Earth, Clay, Marls, and variety of Manures, &c. I set Mint in distilled Mint-Water; and other Experiments I made of several

several Kinds, in order to get Light and Information what hastned or retarded, promoted or impeded *Vegetation*.

The *Glass P, Hyde-Park Conduit Water*: In this I fixed a *Glass-Tube* of ten Inches long, the Bore about one sixth of an Inch in Diameter, filled with very fine and white Sand, which I kept from falling down out of the Tube into the Viol, by tying a thin Piece of Silk over that end of the Tube that was downwards. Upon Immersion of the lower End of it into the Water; this by little and little ascended quite to the upper Orifice of the Tube; and yet in all the 56 Days which it stood thus, a very inconsiderable Quantity of Water had gone off, viz, scarcely 20 Grains, tho' the Sand continued moist up to the top, 'till the very last. The Water had imparted a green Tincture to the Sand, quite to the very top of the Tube: And in the Viol, it hath precipitated a greenish Sediment, mix'd with Black. To the Bottom and Sides of the Tube, as far as 'twas immersed in the Water, adhered pretty much of the green Substance described above. Other-like Tubes I filled with *Cotton, Lint, Pith of Elder*, and several other porous *Vegetable Substances*; setting some of them in clear Water, others in Water tinged with *Saffron, Cochinele, &c.* And several other Trials were made, in order to give a Mechanical Representation of the Motion and Distribution of the Juices in Plants; and of some other *Phænomena* observable in *Vegetation*.

Several *Plants* being also set in the Vials *Q, R, S, &c.* ordered in like manner as those above, in *October*, and the following colder Months; these thrived not near so much, nor did the Water ascend in nigh the Quantity it did in the hotter Seasons, in which the before cited Trials were made.

Some Reflections upon the foregoing Experiments.

1. In the *Plants* of the same kind, the less they are in Bulk, the smaller Quantity of the Fluid Mass in which they are set, is drawn off; the Dispensium of it where the Mass is of equal Thickness, being pretty nearly proportion'd to the Bulk of the Plant.

Thus, that in the Glass mark'd A, which weigh'd only 27 Gr. drew off but 2538 Gr. of the Fluid: And that in B, which weigh'd only 28 $\frac{1}{4}$ took up but 3004 Gr. Whereas that in H, which weigh'd 127 Gr. spent 14190 Gr. of the *Liquid Mass*.

The Water seems to ascend up the Vessels of Plants, in much the same manner as up a *Filter*; and 'tis no great Wonder, that the larger *Filter* should draw off more Water, than the lesser; or that a Plant that has more and larger Vessels, should take up a greater share of the Fluid in which it is set, than one that has fewer and smaller ones can. Nor do I note this as a Thing very considerable in it self, but chiefly in regard to what I am about next to offer: And that it may be seen, that in my other Collations of Things, I made due Allowance for this Difference.

2. The much greater part of the Fluid Mass that is thus drawn off, and convey'd into the Plant, does not settle or abide there; but passes through the Pores of them, and exhales up into the Atmosphere.

That the Water in these Experiments ascended only through the Vessels of these Plants, is certain.

The *Glasses F and G*, that had no Plants in them, tho' disposed in like manner as the rest, remain'd at the end of the Experiment, as at first, and none of the Water was gone off: And that the greatest part of it flies off from the Plant into the Atmosphere, is as certain.

The least Proportion of the Water expended, was to the Augment of the Plant, as 46 or 50 to 1. And in some, the Weight of the Water drawn off was 100, 200, nay, in one above 700 times as much as the Plant had received of Addition.

This so continual an Emission and Detachment of Water, in so great Plenty, from the Parts of the Plants, affords us a manifest Reason, why Countries that abound with Trees, and the larger Vegetables especially, should be very obnoxious to *Damps*, great Humidity in the Air, and more frequent Rains, than others that are more open and free. The great Moisture in the Air, was a mighty Inconvenience and Annoyance to those who first settled in *America*, which at that Time was much overgrown with Woods and Groves. But as these were burnt and destroy'd, to make way for Habitations and Culture of the Earth, the Air mended and cleared up apace, changing into a Temper much more serene and dry than before. Nor does this Humidity go off pure and alone, but usually bears forth with it many Parts of the same Nature with those whereof the Plant, through which it passes, consists. The *Craffer* indeed are not so easily born up into the Atmosphere; but are usually deposited on the Surface of *Leaves, Flowers*, and other Parts of the Plants. Hence come our *Manna's*, our *Honies*, and other Gummy Exudations of Vegetables.

But the finer and lighter Parts are with greater ease sent up into the Atmosphere.

Thence they are convey'd to our Organs of Smell, by the Air we draw in *Respiration*, and are pleasant or offensive, beneficent or injurious to us, according to the Nature of the Plants from whence they arise.

And since these owe their Rise to the Water that ascends out of the Earth through the Bodies of Plants, we cannot be far to seek for the Cause why they are more numerous in the Air, and we find a greater Quantity of Odours exhaling from Vegetables, in warm, humid Seasons, than in any others whatsoever.

3. A great part of the Terrestrial Matter that is mix'd with Water, ascends up into the Plant, as well as the Water.

There was much more Terrestrial Matter at the end of the Experiment in the Water of the *Glasses F and G*, that had no Plants in them, than in those that had Plants.

The Garden Mould dissolved in the *Glasses K and L*, was considerably diminished, and carried off; nay, the Terrestrial and Vegetable Matter

was born up in the Tubes fill'd with Sand, Cotton, &c. in that Quantity, as to be evident even to Sense. And the Bodies in the Cavities of the other Tubes, that had their lower Ends immers'd in Water, wherein *Saffron*, *Cochineel*, &c. had been infused, were tinged with Yellow, Purple, &c.

If I may be permitted to look abroad a while, towards our *Shores* and *Parts* within the *Verge* of the *Sea*, these will present us with a large Scene of *Plants*, that along with the *Vegetable*, take up into them meer *Mineral Matter* also in great abundance: Such are our *Sea Purslain*, the several sorts of *Alga's*, of *Samphires*, and other *Marine Plants*. Those contain common *Sea Salts*, which is all one with the *Fossil*, in such Plenty, as not only to be plainly distinguish'd on the *Palate*, but may be drawn forth of them in considerable Quantity; nay, there want not those, who affirm, There are *Plants* found that will yield *Nitre*, and other *Mineral Salts*; of which, indeed, I am not so far satisfied, that I can depend on the thing, and therefore give this only as an *Hint* for Enquiry.

To go on with the *Vegetable Matter*, how apt, and how much dispos'd this, being so very fine and light, is to attend Water in all its *Motions*, and follow it into each of its *Recesses*, its manifest, not only from the Instances above alledged, but many others. *Percolate* it with all the Care imaginable, *Filter* it with never so many *Filtrations*, yet some *Terrestrial Matter* will remain. 'Tis true, the Fluid will be thinner every time than other, and more disengaged of the said Matter; but never wholly free and clear. I have filter'd Water thro' several Sheets of thick Paper, and after that thro' very close fine Cloth twelve times doubled; nay, have done this over and over, and yet a considerable Quantity of this Matter discovered it self in the Water after all. Now, if it thus passes *Interstices* that are so very small and fine along with the Water, 'tis the less strange it should attend it in its Passage through the *Ducts* and *Vessels* of *Plants*. 'Tis true, filtering and distilling of Water, intercepts and makes it quit some of the Earthy Matter it was before impregnated withal; but then, that which continues with the Water after this, is fine and light, and such consequently as is in a peculiar manner fit for the Growth and Nourishment of *Vegetables*. And this is the case of *Rain-water*. The Quantity of *Terrestrial Matter* it bears up into the *Atmosphere* is not great: But that which it does bear up, is mainly of that light kind or *Vegetable Matter*, and that too perfectly dissolved, and reduced to single *Corpuscles*, all fit to enter the *Tubules* and *Vessels* of *Plants*. On which account 'tis, that this Water is so very *Fertile* and *Profitick*.

The Reason why in this *Proposition* I say only a great Part of the *Terrestrial Matter* that is mix'd with the Water, ascends up with it into the Plant is, because all of it cannot. The *Mineral Matter* is a great deal of it, not only gross and ponderous, but scabrous and inflexible; and so not disposed to enter the *Pores* of the *Roots*. And a great many of the simple *Vegetable Particles* by Degrees unite, and form some of them small *Clods* or *Molecules*; such as those mention'd in H, K, and L, sticking to the Extremities of the *Roots* of those *Plants*. Others of 'em intangled in a looser manner, and form the *Nubecula*, and green Bodies so commonly

observed in stagnant Water. These, when thus conjoin'd, are too big to enter the *Pores*, or ascend up the *Vessels* of *Plants*, which singly they might have done.

They who are conversant in *Agriculture*, will easily subscribe to this. They are well aware, that be their *Earth* never so rich, so good, and so fit for the Production of *Corn* or other *Vegetables*, little will come of it, unless the *Parts* of it be separated and loose. 'Tis on this account they bestow the Pains they do in *Culture* of it; in *Digging*, *Plowing*, *Harrowing*, and breaking of the clodded *Lumps* of *Earth*. 'Tis the same way that *Sea Salt*, *Nitre*, and other *Salts* promote *Vegetation*.

I am sorry I cannot subscribe to the Opinion of those *Learned Gentlemen*, who imagine *Nitre* too essential to *Plants*; and that nothing in the *Vegetable Kingdom* is transacted without it. By all the *Trials* I have been able to make, the thing is quite otherwise; and when contiguous to the Plant, it rather destroys, than nourishes it. But this *Nitre* and other *Salts* certainly do; they loosen the *Earth* and separate the concreted *Parts* of it, by that means fitting and disposing them to be assumed by the Water, and carried up into *Seed* or *Plant*, for its *Formation* and *Augment*.

There is no Man but must observe, how apt all sorts of *Salts* are to be wrought upon by *Moissture*; how easily they lique and run with it; and when these are drawn off, and have deserted the *Lumps* wherewith they were incorporated, those must moulder immediately, and fall asunder of course. The hardest *Stone* we meet with, if it happen, as frequently it does, to have any sort of *Salt* intermix'd with the *Sand*, of which it consists, upon being expos'd to an humid *Air*, in a short time dissolves and crumbles all to Pieces, and much more will clodded *Earth* or *Clay*, which is not of near so compact and so solid a Constitution as *Stone* is. The same way likewise is *Lime* serviceable in this Affair. The *Husbandman* says of it, That it does not fatten, but only mellows *Ground*. By which they mean, That it does not contain any thing in it self that is of the same Nature with the *Vegetable Mould*, or afford any Matter fit for the Formation of *Plants*, but merely softens and relaxes the *Earth*, by that means rendering it more capable of entering the *Seeds* and *Vegetables* set in it, in order to their Nourishment, than otherwise it would have been. The Properties of *Lime* are well known, and how apt 'tis to be put into *Ferment* and *Commotion* by *Water*: Nor can such *Commotion* ever happen when *Lime* is mixed with *Earth*, however hard or clodded that may be, without opening and loosening of it.

4. The Plant is more or less nourished and augmented in Proportion, as the Water in which it stands contains a greater or smaller Quantity of proper *Terrestrial Matter* in it.

The Truth of this *Proposition* is so evidently discernable through the whole Process of these *Trials*, that I think no doubt can be made of it.

The *Mint* in the *Gla's C*, was of much the same Bulk and Weight with those in A and B: But the Water in which that was, being *River Water*, which was apparently stored more copiously with *Terrestrial Matter*, than the *Spring* or *Rain Water* wherein they stood, were; it had thriven at almost

almost double the Bulk that either of them had, and with a less Expence of Water too. So likewise, the *Mint* in L, in whose Water was dissolved a small Quantity of good Garden Mould, tho' it had the Disadvantage to be less when first set, than either of the *Mints* in H or I, whose Water was the very same with that in L, but had none of that Earth mixed with it, yet in a short time, the Plant not only overtook, but much outstript those; and at the end of the Experiment, was very considerably bigger and heavier than either of them.

In like manner, the *Mint* in N, tho' less in the beginning than that in M, being set in that *thick, turbid, ferulent Water* that remained behind, after that wherein M was placed was stilled off, had in fine more than double its original Weight and Bulk; and received above twice the additional Encrease that that in M, which stood in thinner distilled Water, had done: And which is not less considerable, had not drawn off half the Quantity of Water that that had.

Why, in the beginning of this Article, I limit the Proportion of the Augment of the *Plant*, to the Quantity of the proper Terrestrial Matter in the Water, is, Because all, even the *Vegetable Matter*, to say nothing of the *Mineral*, is not proper for the Nourishment of every *Plant*.

There may be, and doubtless are, some Parts in different Species of *Plants*, that may be much alike, and so owe their Supply to the same common Matter: But 'tis plain, all cannot. And there are other Parts so differing, that 'tis no ways credible they should be formed all out of the same sort of *Corpuscles*: So far from it, that there want not good Indications, as we shall see by and by, That every kind of *Vegetable* requires a peculiar and specific Matter for its Formation and Nourishment; yea, each part of the same *Vegetable* does so; and there are very many and different Ingredients go to the Composition of the same individual Plant.

If therefore the Soil, wherein any *Vegetable* or Seed is planted, contains all or most of these Ingredients, and those in due Quantity, 'twill grow and thrive there; otherwise 'twill not. If there be not as many sort of *Corpuscles*, as are requisite for the Constitution of the main and more essential Parts of the Plant, 'twill not prosper at all. If there be these, and not in sufficient Plenty, 'twill starve, and never arrive to its natural Stature. Or if there be any the less necessary and essential *Corpuscles* wanting, there will be some Failure in the Plant; 'twill be defective in Taste, in Smell, in Colour, or some other way.

But tho' the Tract of Land may happen not to contain proper Nourishment for the Constitution of some one peculiar kind of *Plant*; yet it may for several others, and those much differing amongst themselves.

The *Vegetable Particles* are commixt and blended in the Earth, with all the Diversity and Variety, as well as all the Uncertainty conceivable. (I have given some Intimations of this in *Nat. Hist. of the Earth*, Page 268, &c. and shall not repeat them here.)

It is not impossible to imagine, how, one, uniform, homogeneous Matter, having its Principles or original Parts all of the same Substance, Constitution, Magnitude, Figure, and Gravity, should ever constitute Bodies so egregiously unlike, in all those respects, as *Vegetables* of different kinds are; nay, even as

the different Parts of the same *Vegetable*: That one should carry a *Resinous*, another a *Milky*; a third a *Yellow*, a fourth a *Red Juice* in its Veins; one afford a *fragrant*, another an *offensive Smell*; one be *sweet* to the Taste, another *bitter*, *acid*, *acerb*, *austere*, &c. That one should be *nourishing*, another *poisonous*, one *purging*, another *astringent*, That there should be that vast difference in them; in their several *Constitutions*, *Makes*, *Properties*, and *Effects*, and yet all arise from the very same sort of *Matter*, would be very strange. And, to Note that by the Bye, this Argument makes equally strong against those who suppose mere *Water* the *Matter* out of which all *Bodies* are formed.

The *Cataputia*, in the Glas E received but very little Encrease, only three Grains and an half all the while it stood, tho' 2501 Gr. of *Water* were spent upon it. I will not say the reason was, Because the *Water* did not contain in it *Matter* fit and proper for the Nourishment of that peculiar and remarkable *Plant*. No, it may be, the *Water* was not a proper *Medium* for it to grow in: And we know, there are very many *Plants* that will not thrive in it.

Too much of that *Liquor*, in some *Plants*, may probably hurry the Terrestrial Matter thro' their Vessels too fast for them to arrest and lay hold of it. Be that as it will, 'tis most certain, There are peculiar Soils that suit particular *Plants*.

In *England*, *Cherries* are observ'd to succeed best in *Kent*; *Apples* in *Heresfordshire*; *Saffron* in *Cambridgeshire*; *Wood* in two or three of our *Midland Counties*; and *Teazles* in *Somerseeshire*. This is an Observation that hath held in all *Parts*, and indeed in all *Ages* of the *World*. The most ancient Writers of *Husbandry* took Notice of it; and are not wanting in their *Rules*, for making choice of *Soils* suited to the *Nature* of each kind of *Vegetable* they thought valuable or worth Propagating.

But, which is a further Proof of what I am here endeavouring to advance, That Soil that is once proper and fit for Production of some one sort of *Vegetable*, does not ever continue to be so. No, in Tract of Time, it loses that Property; but sooner in some *Lands*, and later in Others. This is what all, who are conversant in these Things, know very well.

If *Wheat*, for Example, be sown upon a Tract of Land that is proper for that *Grain*, the first Crop will succeed very well, and perhaps the second, and the third, as long as the Ground is in *Heart*, as the *Farmers* speak: But in a few Years 'twill produce no more, if sowed with that *Corn*. Some other *Grain* indeed it may, as *Barley*. And after this has been sown so often, that the *Land* can bring forth no more of the same, it may afterwards yield some good *Oats*, and perhaps *Pease* after them: At length it will become barren; the *Vegetative Matter* that at first it abounded withal, being reduced forth of it by those successive Crops, and most of it born off. Each sort of *Grain* takes forth that peculiar *Matter* that is proper for its own Nourishment. First the *Wheat* draws off those Particles that suit the Body of that *Plant*, the rest lying all quiet and undisturb'd the while. And when the *Earth* has yielded up all them, those that are proper for *Barley*, a different *Grain*, remain still behind, 'till the successive Crops of that *Corn* fetch them forth too: And so the *Oats* and *Pease* in their Turn, 'till in fine all is carried off, and the

Earth in a great Measure drained of that sort of Matter.

After all which, that very Tract of Land may be brought to produce another *Series* of the same *Vegetables*, but never till 'tis supplied with a new *Fund* of Matter of the like sort with that it at first contained. This Supply is made several ways: By the Ground's lying Fallow for some time, till the Rain has poured down a fresh Stock upon it: Or by the Tiller's Care, in Manuring of it. And for further Evidence that this Supply is in reality of like sort, we need only reflect a while upon those *Manures* that are found by constant Experience best to promote *Vegetation*, and the *Fruitfulness* of the Earth. These are chiefly either *Parts* of *Vegetables*, or of *Animals*, which indeed either derive their own Nourishment immediately from *Vegetable* Bodies, or from other *Animals* that do so. In particular, the *Blood*, *Urine*, and *Excrements* of *Animals*; *Shaving* of *Horns*, and of *Hoofs*; *Hair*, *Wool*, *Feathers*, *calcined Shells*, *Lees* of *Wine*, and of *Beer*, *Ashes* of all sorts of *Vegetable Bodies*, *Leaves*, *Straw*, *Roots*, and *Stubble* turned into *Earth*, by plowing or otherwise, to rot and dissolve there. These, I say, are our best *Manures*; and being *Vegetable* Substances when refunded back again into the Earth, serve for the Formation of other like Bodies.

Nor wholly to confine our Thoughts to the *Fields*, let us look a while into our *Gardens*, where we shall meet with still further Confirmations of the same thing. The *Trees*, *Shrubs*, and *Herbs*, Cultivated in these, after they are continued in one *Station*, till they have derived thence the greater Part of the Matter fit for their *Augment*, will decay and degenerate, unless either fresh Earth, or some fit *Manure*, be applied unto them. 'Tis true, they may maintain themselves there for some time, by sending forth *Roots* further and further, to a great Extent all round, to fetch in more remote Provision: But at last, all will fail; and they must either have a fresh Supply brought to them, or they themselves be removed and transplanted to some Place better furnished with Matter for their Subsistence. And accordingly, *Gardeners* observe, That *Plants* that have stood a great while in a Place, have longer *Roots* than usual; part of which they cut off when they transplant to a fresh Soil, as now not of any further use to them.

All these Instances, to pass over a great many others that might be alledged, point forth a particular *Terrestrial Matter*, and not *Water*, for the Subject, to which *Plants* owe their Increase: Were it *Water* only, there would be no need of *Manures*, or of Transplanting them from place to place. The *Rain* falls in all places alike, in this *Field* and in that indifferently, in one side of an *Orchard* or *Garden* as well as another. Nor could there be any reason, why a Tract of Land should yield *Wheat* one Year, and not the next, since the *Rain* showers down alike in each. But I am sensible I have carried this Article to too great a length, which yet on so ample and extensive a Subject, 'twas not easie to avoid.

5. *Vegetables* are not formed of *Water*, but of a certain peculiar *Terrestrial Matter*.

It hath been shewn, That there is a considerable Quantity of this Matter contained both in *Rain*, *Spring*, and *River-water*; that the much greatest

part of the *Fluid Mass* that ascends up into *Plants*, does not settle or abide there, but passes through the *Pores* of them, and *Exhales* up into the *Atmosphere*; that a great part of the *Terrestrial Matter* mixed with the *Water*, passes up into the *Plant* along with it, and that the *Plant* is more or less augmented in proportion, as the *Water* contains a greater or smaller Quantity of that Matter. From all which we may very reasonably infer, That *Earth*, and not *Water*, is the Matter that constitutes *Vegetables*.

The *Plant* in *E* drew up into it 2501 Grains of the *Fluid Mass*, and yet had received but $3\frac{1}{2}$ Gr. of Encrease from all that.

The *Mint* in *L*, tho' it had at first the Disadvantage to be much less than that in *I*, yet being set in *Water*, wherewith *Earth* was plentifully mixed, and that in *I* only in *Water*, without any such additional *Earth*, it had vastly outgrown the other, weighing at last 145 Gr. more than that did, and so having gain'd above twice as much as the other had.

In like manner, that in *K*, tho' 'twas a great deal less when put in than that in *I*, and was also impair'd and offended by *Insects*, yet being planted in *Water* wherein *Earth* was dissolved, whereas the *Water* in which (*I*) stood, had none, it not only overtook, but considerably surpassed the other, weighing at last 29 Gr. more than that in *I*, and yet had not expended so much *Water* as that by above 2400 Gr.

The *Plant* in *N*, tho' at first a great deal less than that in *M*, yet being set in the foul crass *Water* that was left in the *Sill*, after that in which *M* was set, was drawn off, in conclusion, had gain'd in Weight above double what that in the finer and thinner *Water* had.

The Proportion of the Augment of that *Plant* that throve most, was to the *Fluid Mass* spent upon it, but as 1 to 46; in others, 'twas as 1 to 60, 100 to 200; nay, in the *Cataputia*, 'twas but as 1 to 714.

The *Mint* in *B* took up 39 Gr. of *Water* a day, one day with another; which was much more than the whole Weight of the *Plant* originally; and yet withal this, it gained not $\frac{1}{2}$ of a Grain a day, in Weight.

Nay, that in *H*, took up 253 Gr. a day of the *Fluid*, which was near twice as much as its original Weight, it weighing, when first set in the *Water*, but 127 Gr. And after all, the daily Encrease of the *Plant* was no more than $2\frac{1}{2}$ Gr.

6. *Spring* and *Rain-water* contain pretty near an equal Charge of *Vegetable Matter*; *River-water* more than either of them.

The *Plants* in the *Glasses* *A*, *B*, and *C*, were at first of much the same Size and Weight. At the end of the Experiment, the *Mint* in *A* had gain'd 15 Gr. out of 2558 Gr. of *Spring-water*: That in *B*, $17\frac{1}{2}$ Gr. out of 3004 Gr. of *Rain-water*; but that in *C* had got 26 Gr. out of only 2493 Gr. of *River-water*.

I do not found this Proposition solely upon those Trials, having made some more, which I do not relate here, that agree well enough with these: So that the Proportions here delivered, will hold for the main; but a strict and just Comparison is hardly to be expected; so far from it, that I make no doubt, but the *Water* that falls in *Rain*, at sometimes,

times, contains a greater Share of *Terrestrial Matter*, than that which falls at others. A more powerful and intense Heat must needs hurry up a larger Quantity of that Matter along with the humid Vapours, that form Rain, than one more feeble and remiss ever possibly can. The Water of one Spring may flow forth with an higher Charge of this Matter, than that of another; this depending partly upon the quickness of the *Ebullition* of the Water; and partly, upon the quantity of that Matter latent in the *Strata* through which the Fluid passes, and the greater or less Laxity of those *Strata*. For the same Reason, the Water of one River may abound with it more than that of another; nay, the same River, when much agitated and in *Commotion*, must bear up more of it, than when it moves with less *Rapidity* and *Violence*.

That there is a great quantity of this Matter in Rivers; and that it contributes vastly to the ordinary Fertility of the Earth, we have an illustrious Instance in the Nile, the Ganges, and other Rivers, that yearly overflow the neighbouring Plains. Their Banks shew the fairest and largest Crops of any in the whole World: They are even loaded with the multitude of their Productions; and those who have not seen them, will hardly be induced to believe the mighty Returns those *Tracts* make, in comparison of others, that have not the Benefit of like *Inundations*.

7. *Water serves only for a Vehicle to the Terrestrial Matter which forms Vegetables, and does not itself make any Addition unto them.*

Where the proper *Terrestrial Matter* is wanting, the Plant is not augmented, tho' never so much Water ascend into it.

The *Cataputia* in B, took up more Water than the *Mint* in C, and yet had grown but very little, having received only $3\frac{1}{2}$ Gr. of additional Weight, whereas the other had received no less than 26 Grains.

The *Mint* in I, was planted in the same sort of Water as that in K was; only the latter had Earth dissolved in Water, and yet that drew off 13140 Gr. of Water, gaining it self no more than 139 Gr. in Weight; whereas the other took up but 10731 Gr. of Water, and was augmented 168 Gr. in Weight; consequently, that spent 2409 Gr. more of the Water than this in K did, and yet was not so much encreased in Weight as this, by 29 Grains.

The *Mint* in M stood in the very same kind of Water, as that in N did. But the Water in M having much less *Terrestrial Matter* in it than that in N had, the Plant bore up 8803 Gr. of it, gaining it self only 41 Gr. the while; whereas that in N drew off no more than 4344 Gr. and yet was augmented 94 Gr. So that it spent 4459 Gr. of Water more than that did; and yet was not it self so much encreased in Weight as that was by 53 Gr.

This is both a very fair and a very conclusive Instance; on which account 'tis that I make often use of it. Indeed they are all so; and to add any thing further on this Head, will not be needful.

'Tis evident therefore, Water is not the Matter that composes Vegetable Bodies; 'tis only the Agent that conveys that Matter to them, that introduces and distributes it to their several Parts for their Nourishment. That Matter is sluggish and

inactive, and would lie eternally confined to its Beds of Earth, without ever advancing up into Plants, did not Water, or some like Instrument, fetch it forth, and carry it unto them.

That therefore there is that plentiful Provision and vast Abundance of it supplied to all Parts of the Earth, is a Mark of a *Natural Providence* Super-intending over the Globe we Inhabit, and Ordaining a due Dispensation of that Fluid, without the Ministry of which the noble Succession of Bodies we behold in *Animals*, *Vegetables*, and *Minerals*, should be all at a stand. But to keep to Plants; 'tis manifest, Water, as well upon this, as upon the other Hypothesis, is absolutely necessary in the Affair of *Vegetation*; and it will not succeed without it: Which indeed, gave occasion to the Opinion, That *Water* it self nourished, and was changed into Vegetable Bodies. They saw, That tho' these were planted in a Soil never so Rich, so Happy, so Advantageous, nothing came of it, unless there was *Water* too in considerable Quantity.

And it must be allow'd, *Vegetables* will not come on or prosper, where that is wanting. But yet what these Gentlemen inferred thence, was not, we see, well grounded.

This Fluid, is capacitated for the Office here assigned it, several ways. By the Figure of its Parts, which, as appears from many Experiments, is Exactly and Mathematically Spherical; their Surfaces being perfectly Polite, and without any the least Inequalities. 'Tis evident, Corpuscles of such a Figure are easily susceptible of Motion, yea, far above any others whatsoever; and consequently, the most capable of moving and conveying other Matter that is not so active and voluble. Then the Intervals of Bodies of that Figure are, with respect to their Bulk, of all others, the largest, and so the most fitting to receive and entertain foreign Matter in them. Besides, as far as the Trials hitherto made inform us, the constituent Corpuscles of Water, are each singly considered absolutely solid, and do not yield to the greatest external Force. This secures their Figure against any Alteration; and the Intervals of the Corpuscles must be always alike.

By the latter, 'twill be ever disposed to receive Matter into it: And by the former, when once received, to bear it along with it.

Water is further capacitated to be a Vehicle to this Matter, by the Tenuity and Fineness of the Corpuscles of which it consists. We hardly know any Fluid in all Nature, except Fire, whose Constituent Parts are so exceeding subtil and small, as those of Water are. They'll pass Pores and Interstices, that neither Air nor any other Fluid will. This enables them to enter the finest Tubes and Vessels of Plants, and to introduce the *Terrestrial Matter*, conveying it to all Parts of them; whilst each, by means of Organs 'tis endow'd with for the Purpose, intercepts and assumes into it self such Particles as are suitable to its own Nature, letting the rest pass on through the common Ducts: Nay, we have almost every where Mechanical Instances of much the same Tenor.

'Tis obvious to every one, how easily and suddenly Humidity, or the Corpuscles of Water sustained in the Air, pervade and insinuate themselves into Cords, however tightly twisted into Leather, Parchment, Vegetable Bodies, Wood, and the like.

This

This it is that fits them for Hygrometers, and to measure and determine the different Quantities of Moisture in the Air, in different Places and Seasons.

How freely Water passes and carries with it Terrestrial Matter through Filices, Colatures, Distillations, &c. hath been intimated already.

8. *Water is not capable of performing this Office to Plants, unless assisted by a due Quantity of Heat; and this must concur, or Vegetation will not succeed.*

The Plants that were set in the Glasses Q, R, S, &c. in *October*, and in the following colder Months, had not near the Quantity of Water sent up into them, or so great an additional Encrease by much as those that were set in *June, July*, and the hotter Months. 'Tis plain, Water has no power of moving it self, or rising to the vast Height it does in the more tall and lofty Plants; so far from this, that it does not appear from any Discovery yet made, that even its own Fluidity consists in the intestine Motion of its Parts; whatever some otherwise very learned and knowing Persons may have thought. There is no need of any thing more for solving all the Phenomena of *Fluidity*, than such a Figure and Disposition of Parts, as Water has. Corpuscles of that make, and that are all absolutely *Spherical*, must stand so very ticklish and nicely upon each other, as to be susceptible of every Impression, and tho' not perpetually in Motion, yet must be always ready and liable to be put into it, by any the slightest Force imaginable. It is true, the Parts of Fire or Heat are not capable of moving themselves any more than those of Water; but they are more subtil, light, and active than those are, and so more easily put into Motion.

In fine, 'tis confident, and Matter of Fact, That Heat does operate upon, and move the Water, in order to its carrying on the Work of *Vegetation*; but how 'tis agitated it self, and when the Motion first begins, this is no fit Place to enquire.

That the Concourse of Heat in this Work, is really necessary, appears not only from the Experiments before us, but from all Nature: From our Fields and Forests, our Gardens and our Orchards, we see in *Autumn*, as the Sun's Power grows gradually less and less, so its effects on Plants is remitted, and their *Vegetation* slackens by little and little.

Its Failure is first discernible in Trees; these are raised highest above the Earth, and require a more intense Heat to elevate the Water charged with its Nourishment, to the Tops and Extremities of them; so that for want of fresh Support and Nutriment, they shed their Leaves, unless secured by a very firm and hardy Constitution indeed, as our *Evergreens* are; next the Shrubs part with theirs, and then the Herbs and lower Tribes; the Heat being at length not sufficient to supply even these, tho' so near the Earth, the Fund of their Nourishment. As the Heat returns the succeeding Spring, they all recruit again, and are furnished with fresh Supplies and Verdure; But first those which are lowest and nearest the Earth, Herbs, and they that require a lesser Degree of Heat to raise the Water with its Earthy Charge, into them. Then the Shrubs and higher Vegetables in their Turns; and lastly, the Trees. As the Heat encreases, it grows too powerful, and hurries the Matter with too great Rapidity thro' finer, and more tender Plants. These therefore go off and decay; and others that are more hardy and vigorous, and require a greater

degree of Heat, succeed in their Order. By which Mechanism, provident Nature furnishes us with a very various and differing Entertainment; and what is best suited to each Season, all the Year round.

As the Heat of the several Seasons affords us a different Face of Things, so the several distant Climates shew different Scenes of Nature, and Productions of the Earth.

The hotter Countries, yield ordinarily the largest and tallest Trees, and those too in a much greater Variety than the colder ever do. Even those Plants which are common to both, attain to a much greater Bulk in the Southern, than in the Northern Climes; nay, there are some Regions so Bleak and Chill, that they raise no *Vegetables* at all, to any considerable Size. This we learn from *Greenland*, from *Ireland*, and other Places of like cold Site and Condition. In these no Tree ever appears, and the very Shrubs they afford, are few, little, and low.

Again, In the warmer Climates, and such as do furnish forth Trees, and the larger *Vegetables*, if there happen a Remission, or Diminution of the usual Heat, their Productions will be impeded or diminished in Proportion.

Our late colder Summers have given us Proof enough of this. For tho' the Heat we have had, was sufficient to raise the *Vegetative Matter* into the lower Plants, into our Corns, our Wheat, Barley, Pease, and the like; and we have had Plenty of Strawberries, Raspberries, Currants, Gooseberries, and the Fruits of such other *Vegetables*, as are low and near the Earth: Yea, and a moderate store of Cherries, Mulberries, Plumbs, Filberts, and some others that grow at a somewhat greater height; yet our Apples, our Pears, Walnuts, and the Productions of the taller Trees have been fewer, and those not so kindly, so thoroughly ripen'd, and brought to that Perfection they were in the former more benign and warm Seasons. The Dwarf-apple and Pear-trees have succeeded better; and indeed in Trees of the same kind, those that keep closest to the Earth, always produce the most and best Fruit. For which reason it is that the Gardiners check and restrain the Growth of their better Fruit-Trees, and prevent their running up too great a Height: Now, even the lower Fruits and Greens have had some share in the common Calamity, and fallen short both in Number and Goodness of what the hotter and kinder Seasons were wont to shew us.

As to our Grapes, Abricots, Peaches, Nectarins, and Figs, being transplanted hither out of hotter Climes, 'tis the less wonder we have of late had so general a Failure of them.

Nor is it the Sun, or the ordinary Emission of the Subterranean Heat only, that promotes *Vegetation*; but any other indifferently, according to its Power and Degree.

This we are taught by our Stoves, Hot-beds, and the like. All Heat is of like kind; and where-ever is the same Cause, there will be constantly the same Effect.

There's a Procedure in every part of Nature, that is perfect Regularly, and Geometrical, if we can but find it out; and the farther our Searches carry us, the more shall we have Occasion to admire this, and the better 'twill compensate our Industry.

VEHICLE, in the General, is that which carries or bears any thing along; as the *Serum*, or watery Humour, they say is the Vehicle which serves to convey the Blood Particles, and to disperse them

all over the Body: And in Pharmacy, that Liquid in which any Powder, or such like Medicine, is taken, they call a proper Vehicle for it.

VEJOURS, are such as are sent by the Court to take View of any Place in Question, for the better Decision of the Right. It signifies also such as are sent to view those that Eskin themselves *de malo Leſſi*, whether they be in Truth so sick as they cannot appear, or whether they counterfeit. This Word is also used for those that are appointed to view an Offence, as a Man murdered, &c. See *View*.

VEIN, is a Vessel in an Animal Body, made to receive and bring the Blood back again from the Arteries.

The Veins consist of four Tunicks, a Nervous, a Glandulous, a Muscular, and a Membranaceous one. The Branches of the *Vena Cava*, above the Heart, are called *Jugular Veins*, which go towards the Head; they which go towards the Arms, are called *Axillary*; that about the Heart *Coronary*; in the Lungs *Pulmonary*; in the Liver *Hepatic*, or *Liver Vein*; in the *Diaphragma*, *Pheonica*; in the Thighs *Cruial*; in the Reins *Emulgentis*; and so from its various Ramification, it is variously denominated. *Blanchard*.

VENA Cava: See *Cava Vena*.

VENA Porta, is a notable Vein, so called from the two Eminences, called by *Hippocrates πυλαί*, between which it enters the Liver. The

VENA Porta, as it enters into the Liver, is invested with another Coat, which some call *Vagina Porta*, its Sheath, others *Capſula* or *involucrum*, its Case, or Cover, and *Capſula communis*, because the *Porumbilarius* is involved in it as well as the *Porta*.

This outer Coat it has immediately from the Membrane that cloaths the Liver; that is, it is continued from it, though it be of a clear other Substance, namely more dense and carnos; it is invested with it in all its Ramifications, and so having a double Coat, is in that respect an Artery; as also in that it brings Blood to its Liver for its Nourishment, as well as for other Uses; and lastly, into the *Capſula*, it has an obscure Pulsation (according to Dr. *Gliffon*.)

When it is enter'd about half an Inch into the Liver, it is carried partly to the Right Hand, partly to the Left, and so is shap'd into a *Sinus* as it were, and thence is divided into five large Branches, four whereof are diffus'd all over the hollow Side of the Liver, but the fifth ascends streight to its upper Side, where it disperses it self. The said *Sinus* is more conspicuous in an *Embryo*, because the great Influx of nutritious Juice by the Umbilical Veins enlarge it much. Some make it a sort of a Heart, observing it in an obscurer kind of *Systole* and *Diastole*, whereby the Motion of the Blood in the Branches of the *Porta* within the Liver, is promoted in like manner, as it is in the *Arteria pulmonaris*, and *Aorta* by the Right and Left Ventricles of the Heart. Without which Pulsation, they think the Blood would hardly pass out of the larger Branches of the *Porta* into the narrower, and so on into the Roots of the *Cava*.

In an *Embryo* very observable is the *Tubulus*, or *Canalis Venosus*, which passes directly out of this *Sinus*, into the *Cava*, almost opposite to the Mouth of the Umbilical Vein that opens into the *Sinus*.

This *Canalis*, or Pipe, is of the same Substance and Tincture with a Vein, and enters into the *Cava* just as it penetrates the *Diaphragma*; and there

also two other great Branches out of the Liver are inserted into the *Cava*; and in the same Place this Pipe is also knit to the suspensory Ligament, as it is called, and after the Child is born, grows it self into a Ligament, being in a manner opposite to the Umbilical Ligament.

Its Use in the *Fœtus*, is for the freer and readier Motion of the Blood and Chyle out of the Umbilical Vein into the *Cava*, seeing the Current is hardly strong enough to pervade the *Parenchyma* of the Liver; nor indeed is there any Reason why the said Liquors should pass there-through, seeing there is either little or no Bile therein; or however, they are not yet in a Condition to have the same separated from them. But to return to the Divisions of the *Porta*.

The Ancients taught, that they were only spread in the sinous or hollow Part of the Liver; but Dr. *Gliffon*, in his Accurate Anatomy of it affirms the *Porta* to be dispersed very equally in all its Parts, upper as well as lower.

And whereas it has been a constant Doctrine, That the Branches of the *Porta* open by *Anastomoses*, into those of the *Cava*; the same learned Author, and many others since him, have observed, That there are no such *Anastomoses* at all, but that the Blood doth ouze through the glandulous *Parenchyma* of the Liver, out of the Capillary Veins of the *Porta*, into those of the *Cava*. He that would be fullier informed hereof, may consult his most accurate Book *de Hepate*: But we will now pass to the Branches of the *Porta*, when it is gone out of the Liver.

This Trunk having past a little from the Liver, before it be severed into Branches, puts forth two Twigs, out of its upper and fore-part, which are inserted into the *Cystis fellea*, or Gall-Bladder, (and are from thence called *Cystice gemelle*) about the Neck of it, and spread by enumerable Twigs through its external Coat.

A third Twig also arises single from it, which is larger than either of the former, and is inserted into the Bottom of the right side of the Stomach, from whence it ascends by its hinder side up to the *Pylorus*, which gives it the Name of *Pylorica*; it is otherwise called, *Gastrica dextra*.

Having sent forth these three Twigs, the Trunk passeth down, and bending a little towards the left side, it is parted into two remarkable Branches; whereof the upper is called *Sinister*, or the *Left*, and is the lesser; the lower *Dexter* or the *Right*, which is the larger. The *Left* is bestowed upon the Stomach, the *Omentum*, a Part of the *Colon*, and the Spleen; the *Right* is spread through the Guts and Mesentery; the *Left* is called, *Vena Splenica*; but the *Right*, *Vena Mesenterica*.

The *Vena Splenica*, runs across the Body towards the left side, being sustained by the hinder Leaf of the Cawl, and hath two Branches issuing out of it, before it comes to the Spleen, viz. the *Superior* and the *Inferior*.

The *Superior* is called *Gastrica*, or *Ventricularis*, because it is bestowed upon the Stomach; it ascends obliquely towards the left part of the Stomach, into the back side whereof it is inserted, and divides it self into three Sprigs, of which the two outmost are spent on the Body of the Stomach, but the middle ascends on its back-side up to its upper, or left Orifice, which it encompasses like a Garland, and is called *Coronaria*. From the *Inferior* Branch two Twigs spring; the one is small, and sends

Twigs

Twigs to the right Side of the inner Leaf of the *Omentum*, and to the *Colon* annexed to it. This is called *Epiplois*, or *Omentalis dextra*. The other is spent upon the same Leaf of the *Omentum*, with that part of the *Colon* which it ties to the Back, and is called, *Epiplois*, or *Omentalis postica*.

When the *Ramus Splenicus* hath just approached to the Spleen, it sends out two other Twigs, the upper and lower. The Upper is called, *Vas breve venosum*, and is implanted into the left Part of the Bottom of the Stomach. It is sometimes single, in which case it is properly called, *Vas breve* in the singular Number; but more often there are two, three, or more of them, and then these Vessels, be they one or more, do sometimes spring from the *Ramus Splenicus*, after it has entered the Spleen.

This *Vas breve*, was a Vessel much renowned by the Ancients, who believe it carried an acid Juice from the Spleen to the Stomach, to stir up Appetite, and to help the Fermentation of the Meat in it; but it is certain both by Ligature (whereby it filleth toward the Stomach, and emptieth toward the Spleen) and also by the general Nature of Veins, whose smaller Branches and Twigs still receive the superfluous Arterial Blood, from the part whereinto they are inserted, and conduct it by the larger Channels toward the heart: I say, it is certain from hence, that this same *Vas breve* carries nothing to the Stomach, but only brings from thence, into the *Ramus Splenicus*, the Remains of the Arterial Blood.

From the lower two Twigs issue.

The first is called, *Gastroepiplois sinistra*; this is bestowed upon the left Part of the Bottom of the Stomach, and the Fore-leaf of the *Omentum*, chiefly on its left Part.

The second springeth most commonly indeed from the *Ramus Splenicus*, but sometimes from the left *Mesenterick Vein*; and running along the *Intestinum Rectum*, is inserted into the *Anus*, by many Twigs. This is called, *Hemorrhoidalis interna*, as that which springeth from the *Vena Cava*, is called, *Hemorrhoidalis externa*.

Now followeth the *Vena Mesenterica*, or the right Branch of the *Vena Portæ*. Before it be divided into Branches, it sendeth forth two Twigs.

The first is called, *Gastroepiplois dextra*; this is bestowed upon the right Part of the Bottom of the Stomach, and the right Side of the upper Leaf of the Cawl.

The second is called, *Intestinalis*, or *Duodena*: It is inserted into the Middle of the *Duodenum*, and the Beginning of the *Jejunum*, and runneth lengthways of them; whence some Capillary Twigs go to the *Pancreas*, and the upper Part of the *Omentum*.

After these Twigs are past from it, it enters by one Trunk into the Mesentery, where presently it is divided into two Branches, to wit, *Mesenterica dextra*, and *sinistra*.

Mesenterica dextra (placed on the right Side) is double, and sendeth a great Number of Branches to the *Jejunum*, *Ilium*, *Cecum*, and the right part of the *Colon*, which ascendeth up by the right Kidney and runs under the Liver.

It hath fourteen remarkable, though nameless Branches; and these are afterwards divided into innumerable small Twigs. These are those Veins that are called the *Meseraicks*, whose Branches are supported by the Glandules of the Mesentery, but enter not into them; for the Glands open into the *Vena Laëæ*.

Mesenterica sinistra, passeth thro' the Middle of the Mesentery, to that Part of the *Colon* which descendeth from the left Part of the Stomach, and to the *Intestinum Rectum*.

The Use of the *Portæ*, before the Circulation of the Blood, and the *Vena Laëæ* were found out, was taught to be for the carrying of Nourishment to the Intestines and other Parts contained in the *Abdomen*, and also to bring back from the Guts the purer Part of the Chyle to the Liver to make Blood of, and a thicker feculent Part of it to the Spleen, to be excocted by it into an acid Juice, and then carried to the Stomach by the *Vas breve venosum*, for the exciting of Hunger.

As for this last Opinion, it appears by Ligature, That the *Vas breve* carries its Contents from the Stomach to the *Ramus Splenicus*, and it is nothing but the Blood remaining from the Nutrition of the Stomach, (that was brought thither by the Arteries) which is now a conveying back to the Liver, and so to the Heart again in its Circulation.

And as for the *Meseraicks* carrying Nourishment to the Guts, or bringing back Chyle, those Errors have been sufficiently laid open before now. But their true Use is only to bring back to the Liver from the Guts, Cawl, and other Entrails, that Blood which remains after their Nutrition, and which was carried to them by their respective Arteries.

VENÆ Laëæ, the *Laëæal Veins*, are so called, from the white Colour of the Chyle they carry. These were not discovered as such 'till about the Year 1622. When *Gaspar Afellius* found them out in dissecting a live Dog fed well. Since whom, many others have made more accurate Discoveries of them. They are slender pellucid Vessels, having but a single Coat, and are dispersed in great Numbers thro' the Mesentery, and appointed for carrying the Chyle. Their Rise is from the innermost Membrane of the Intestines, where their Mouths are hid under a kind of spongy Crust, or *Mucus*, thro' which, by the Pressure of the Guts the Chyle is strained, and received by the Mouths of those Vessels. From whence they proceed the nearest or readiest way to such Glandules of the Mesentery as are nearest them; but in their Passage many smaller ones uniting to another, do commonly grow into one large Trunk, and this a pretty way before they insinuate themselves into the Glands they are marching to. But then at their Entrance into the Gland, and sometimes a little before, this Trunk separates again into new Branches more and smaller than the other. And hitherto they bear the Name of *Radicales*, or *Venæ Laëæ primi generis*. After this, out of the Gland there spring again new Capillary ones, which by and by meeting together, make one Trunk again, as before, which keeping its Course towards the Centre of the Mesentery, enters as many Glands as lie in its way, being divided into new Branches just before its Entrance into each Gland, as before: But whilst all the Trunk bend one way, they also meeting with one another, do in Procelles several of them grow into one; and at length all the Trunks arrive at the great or middle Gland of the Mesentery (call'd improperly *Pancreas*) which most of them enter into, but some of them pass over its Surface, and by and by they all empty themselves into the great or common Recepracle of the Chyle that lies behind the said Gland; those that were inserted into it rising out of it in like manner, as they did before out of the lesser Glands. As they run from one Gland

to another, they are called *secundi generis*, or of the second Kind; and from their having pals'd all the Glands to their opening into the common Receptacle, &c. they are called *tercii generis*, or of the third Kind.

VENÆ Lymphaticæ, the *Lymphatick Veins*, receive the *Lympha* from the conglobated Glandules, and discharge themselves either into the Sanguinary Veins, or into the Receptacle of the Chyle.

VENÆ Preputii, are Veins arising from the Capillary Extremities of the Artery of the *Penis* called *Pudenda*, these uniting into larger Branches, pass into those Veins which arise from the *Corpora Caverosa Penis*, and passing under the common Integuments, do empty themselves into the upper Vein of that continued from the *Saphena Vein* of the Foot. *Cowper's Myst. Reformata in Append.*

VENÆ Sectio, is the same with *Phlebotomy*, or Blood-letting.

VENTICTIONI exponas, is a Writ Judicial, directed to the Under-Sheriff, commanding him to sell Goods which he hath formerly by Commandment taken into his Hands, for the satisfying a Judgment given in the King's Court.

VENIRE facias, is a Writ Judicial directed to the Under-Sheriff, and goeth out of the Record, and lies where two Parties plead and come to Issue, for then the Party, Plaintiff, or Defendant, shall have this Writ directed to the Sheriff to cause Twelve Men of the same Country to say the Truth upon the Issue taken. And if this Inquest come not at the Day of the Writ return'd, then shall go a *Habeas Corpora*, and after a Distress, until they come. And it is also a Process upon an *Audita Querela*, or upon an Indictment in the King's Bench, or *Venire facias ad computandum*, against a Tenant, by *Elegit*.

VENIRE facias tot Matronas: See *Ventre inspicendo*.

VENT, in Gunnery, signifies the Difference between the Diameter of a Bullet, and the Diameter of the Bore of the Piece; and is ought to be $\frac{1}{10}$ of the Diameter of the Bore: See *Ordnance*.

VENTER Infimus: See *Hypogastrium*.

VENTERS, according to the Definition of Anatomists, are the three principal Cavities, or hollow Parts of Animal Bodies, viz. those of the Belly, Chest and Head; or the *Abdomen*, the *Thorax*, and the *Caput*.

VENTOSE, a Cupping-Glass: See *Cucurbitula*. The Ingenious Mr. *Hawksbee* hath now found a way of applying Cupping-glasses without Fire, by means of a small Air-pump, which do mighty well, and put the Patient to no Pain or Fright.

VENTRE Inspeciendo, is a Writ for the Search of a Woman that saith she is with Child, and thereby with-holdeth Land from him that is next Heir at Law.

VENTRES: See *Cavities*.

VENTRICLE, the Stomach, is a Membranous Bowel in the *Abdomen*, under the *Diaphragma*, betwixt the Liver and the Spleen, consisting of four Tunicks; a Nervous, Fibrous, Glandulous, and Membranous one: It hath two Orifices, one on the Right Hand, called *Pylorus* and *Junitor*, whereat the Meat is sent out into the Guts: Another on the Left Hand, at which the Meat enters. Its Office is to concoct or ferment the Meat: It is also called *Stomachus* and *Aqualculus*.

VENTRICULI cerebri, the Ventricles of the Brain, are four; the Use of them is to receive the

Serous Humours, and to bring them by the *Pelvis* into the *Pituitary Glandule*, or into the *Processus Mamillares*, by the *Os Cribriforme* to the Nostrils. They are nothing but Complications of the Brain, which happen there as it were by Accident. *Blanchard*.

VENTRICULI Cordis, the Ventricles of the Heart, are two: The first, or Right Ventricle, receives the Blood from the *Vena Cava*, and sends it to the Lungs; the Left Ventricle receives the Blood from the Lungs, and sends it through the whole Body by the *Aorta*, or great Artery, and its Branches: In the *Systole*, or Contraction of the Ventricles, the Blood is sent out: In the *Diastole*, or Dilatation, it is let into the Heart.

VENUE, or *Venue*, or *Visme*, are Terms used in Law, signifying the Place next to that where any thing that comes to be tried happen'd to be done: And therefore for the better Discovery of the Truth of the Matter in Fact upon every Trial, some of the Jury must be of the same Hundred, or sometimes of the same Parish, or Neighbourhood, in which the thing is supposed to be done, who by Intendment may have the best Knowledge of the Matter.

VENUS. The time of the Periodical Revolution of this Planet round the Sun, is 224 Days and $\frac{1}{2}$ of a Day, or $7\frac{1}{2}$ of our Months.

According to Mr. *Cassini*, the greatest Distance of *Venus* from the *Earth* is 38,415, the mean Distance 22,000, and the least Distance 5585 Semidiameters of the *Earth*.

And the Diameter of *Venus* is equal to 7 Semidiameters of the *Earth*; therefore the Globe of *Venus* must be near 43 times greater than that of the *Earth*. But Dr. *Gregory* saith, That to an Eye placed in *Venus*, the Sun's Diameter would appear once and $\frac{1}{2}$ as big again as it doth to us, and therefore his Disk will be more than double of what it appears to us: And the *Light* and *Heat* in this Planet, and its Gravity towards the Sun, will be in the same Proportion in respect of ours.

The Length of the Day in *Venus*, is but 23 Hours.

The Eye here would behold 4 Planets above it, viz. our *Earth*, *Mars*, *Jupiter* and *Saturn*; and one below it, which is *Mercury*: And when our *Earth* is in Opposition to the Sun, it will appear then (in the Night) to shine with a full Orb, and be very bright. The Moon will appear always to accompany the *Earth*, and never to be seen from her above $\frac{1}{2}$ a Degree. *Mercury* will never appear to be above 38 Degrees distant from the Sun.

Kepler saith, The Inclination of the Orbit of *Venus*, is 3 Degrees and 22 Minutes.

October $\frac{1}{4}$ 1666, *Cassini* observed several Spots in the Body of this Planet, by whose Motion he judged (tho' he was not certain) That the moved either by a Circulation, or a kind of Libration round her Axis, in about 23 Hours:

A. D. 1672, and 1686, The same Astronomer, with a Telescope of 34 Foot, believes he saw a *Satellite* moving round this Planet, and distant from it about $\frac{1}{3}$ of *Venus*'s Diameter: It had the same Phasis with *Venus*, but was without any well defined Form, and its Diameter scarce exceeded $\frac{1}{4}$ of that of *Venus*.

Dr. *Gregory* thinks it more than probable, that this was a *Satellite*; and supposes the Reason why it is not usually seen, to be the Unfitness of its Surface to reflect the Rays of the Sun's Light; as is the case of the Spots in the Moon, of which if the whole Disk of the Moon were composed, he thinks that

the Planer could not be seen in *Venus*. *Astron. Phys. & Geom.* p. 472.

Herigone, *Kepler*, and *Rhetensis*, or *Schyrlaus de Rheinf.* conjecture that *Venus* moves round her Axis in about 14 Hours; as *Kircher* and *Schottus* pretend to have discovered, by Observation of certain Spots in her.

VERB, in Grammar, is a variable Part of Speech, expressing the Action of the Mind, which affirms that a Thing is so, or not so; And 'tis either *Personal*, which is conjugated or formed thro' all the Three Persons; or *Impersonal*, which is only found in the Third Person Singular.

VERDEGREASE, is the Rust of Copper gathered by stratifying Plates of Copper with the Husks of pressed Grapes, and then scraping off the Rust of the Plates contracted by lying in those Husks for some time. But the Painters call *Verdegreafe*, or *Verdeter*, a kind of Magistery of the common *Verdegreafe*; which is dissolved in distilled Vinegar, and then Crystaliz'd in a cool Place. These are called Crystals of *Venus*, made by Vinegar.

VERDEROR, is a Judicial Officer of the King's Forest, chosen by the King's Writ in the full County of the same Shire where the Forest is; and is sworn to maintain and keep the Affizes of the Forest; to view, receive and enrol the Attachments and Presentments of all manner of Trespassers of Vert and Venison in the Forest.

VERDICT, is the Answer of a Jury made upon any Cause, Civil or Criminal, committed by the Court to their Examination. And it is either *General*, or *Special*: A *General Verdict*, is that which is given or brought into the Court in like general Terms, to the *general Issue*, as in Action of *Diffesin*, the Defendant pleadeth, *No Wrong, no Diffesin*; then the Issue is *General*, whether the Fact be wrong, or not; which being committed to the Jury, they, upon Consideration of their Evidence, come in, and say, either for the Plaintiff, That it is a Wrong and *Diffesin*; or for the Defendant, That it is no Wrong, no *Diffesin*. A *Special Verdict* is, when they say at large, That such a Thing, and such a Thing, they found to be done by the Defendant or Tenant, do declaring the Course of the Fact, as in their Opinion it is proved; and as to the Law upon the Fact, they pray the Judgment of the Court. And this *Special Verdict*, if it contain any ample Declaration of the Cause from the Beginning to the End, is also called, *A Verdict at large*.

VERDOY; the Term in Heraldry for a Bordure of a Coat of Arms, being charged with any Kinds or Parts of Flowers, Fruits, Seeds, Plants, &c.

VERGE, is the Compass of the King's Court, which bounds the Jurisdiction of the Lord-Steward of the King's Household, and of the Coroner of the King's Houle; and that seems to have been twelve Miles round.

Verge, is also used for a Stick or Rod, by which One is admitted Tenant, and holding it in his Hand, takes the Oath of Fealty to the Lord of the Mannor, and for that cause is called *Tenant by the Verge*. Also, the Spindle of the Balance of a Watch is called the *Verge*.

VERMICULARES: See *Lumbricales*.

VERMICULATION, is an Infection of Plants by Worms.

VERMIFORMIS Proceffus, is the Prominence the *Cerebellum*, so called from its Shape.

VERMIVOROUS, are such Animals, as feed upon Worms.

VERRY, or *Vairy*, in Heraldry, is of two Sorts. If the Colours (which is a sort of Chequer-work, of the Shape of little Bells) be Argent and Azure, 'tis enough to say *Vairy* alone: But if the Colours are any other, they must be named expressly. They engrave it thus.

VERSED Sine of an Arch, is a Segment of the Diameter of a Circle, lying between the Foot of the Right Sine, and the lower Extremity of the Ark: See more under the Word *Trigonometry*.

Thus *S T* is the Versed Sine of the Ark *R T*; and *A S* the Versed Sine of the Ark *A R*, which is the Supplement of the former.

VERT; the Heralds Word for a Green Colour; and 'tis called Vert in the Blazon of the Coats of all under the Degree of Noble: But in Coats of Nobles 'tis called *Emerald*; and in those of King's 'tis called *Venus*. In Engraving 'tis expressed by Lines drawn athwart, beginning at the Sinister Corner of the Escutcheon, thus.

VERT, in the Forest-Law, signifies every thing that grows and bears a green Leaf within the Forest, that may cover a Deer. And 'tis either *Oververt* or *Nethervert*: *Oververt*, is the great Woods, and in Law Books are usually called *Hault-Bois*: *Nethervert* is the under Woods, otherwise call'd *South-Bois*. There is also a *Specialvert*; that is, all Trees that grows in the King's Woods within the Forest; and those that grow there in other Mens Woods, if they be such Trees as bear Fruit to feed the Deer.

VERTEBRÆ; the *Vertebres* or Joints of the Neck and Back-Bone of any Animal: In a Man they account seven in the Neck, 12 in the Back or *Dorsum*, 5 in the Loins, and 5 of the *Os Sacrum*.

VERTEBRALIS, or *Cervicalis*, is a Pair of Muscles, which extend all the *Vertebrae* of the Body.

VERTEX, is that Point in the Heaven just over our Heads, and the same with *Zenith*; which see.

The Point of any Angle is called also its *Vertex*; and that Point of the Curve of a Conick Section, where the Axis cuts it, is called also the *Vertex* of that Section.

VERTEX, in Anatomy, is also the Crown of the Head, or the middle Part of it, seated between the Bounds of the *Sinciput* and *Occiput*.

VERTEX of a Cone, Pyramid, Conick Section, &c. is the Point of the upper Extremity of the Axis, or

or the Top of the Figure. So the *Vertex* of an Angle, is the Angular Point; and those Angles which being opposite to one another, do touch only in the Angular Point, are called *Vertical Angles*.

VERTEX of a *Glass* (in Opticks) is the same with its Pole; which see.

VERTICAL Circles: See *Azimuths*.

VERTICAL Line: See *Line Vertical*.

VERTICAL opposite Angles: See *Angles*.

VERTICAL Plain in Perspective: See *Plain*.

VERTICAL Point, the same with *Vertex*: So that in Astronomy, a Star is said to be *Vertical*, when it happens to be in that Point which is just over any Place.

VERTICILLATE Plants, are by the Botanists said to be such as have their Flowers intermixed with small Leaves, growing in kinds of *Whirls* about the Joints of the Stalk, as *Penny-Royal*, *Hore-bound*, &c. See *Plants*.

The peculiar Characteristicks of this Genius of Plants, Mr. Ray saith, are, Their Leaves growing by Pairs, one just against another on the Stalk. The Flower *Monopetalous*, but usually hanging down with a kind of Lip, or turn'd something like the Form of an Helmet, four Seeds after each Flower, to which the *Perianthium* of the Flower serves instead of a *Capsula Seminalis*.

Mr. Ray makes two kinds of these *Verticillate Plants*.

I. The *Fruticose*, or such whose Superficies is Perennial; and these have either,

1. A plain Flower, as the *Chamaedrys vulgaris*, *Thoucium*, and the *Marum Syriacum*.
2. Such as have a Flower with a Lip, which they call a *Labiated Flower*, or one something in the Form of a Helmet, which they call *Galeated*; as the *Sacria Stechas*, *Hyssopus*, *Rosmarinus*, *Satureia*, *Marum vulgare*, *Thymum vulgare*, and the *Polium montanum*.

II. The *Verticillate Herbaceae*, or such whose Stalks are not Perennial; and these are the *Mentha*, *Verbena*, *Dittamnus Creticus*, *Origanum*, *Majorana*, *Ocimum*, *Horminum*, *Galeopsis*, *Nepeta*, *Betonica*, *Prunella*, *Stachys*, *Clinopodium vulgare*, *Laminium*, *Molucca Hedera terrestris*, *Galericulata*, *Calamintha*, *Melissa*, *Marrubium Commune*, *Nigrum*, and *Aquaticum*, *Chamaepitys*, *Scardonio*, *Scordium*, *Bugula*, *Sydeitis*, *Cardiaca*.

VERTICITY, the Property of the Loadstone, or a Touch'd-Needle to point North and South, or towards the Poles of the World: See *Magnet* and *Magnetism*.

VERTIGO: See *Scoromia*.

VERY LORD and *Very Tenant*, are Terms in Law, signifying those that be immediate Lord and Tenant one to another.

VESICA: So the Chymists call the large Copper Body Tinned within side, which is commonly used in Distillation of Ardent Spirits, because 'tis in Figure something like a blown Bladder. This is called also a *Cucurbit*, and commonly, a *Body*: See its Figure in *Cucurbit*.

VESICA Urinaria, the Bladder, is a Vessel ap-

pointed to receive the Urine separated in the Kidneys, and brought to it by the Ureters.

It is seated in the *Hypogastrium*, betwixt the two Coats of the *Peritonaeum*, in that Cavity that is formed of the *Os Sacrum*, *Coxae* and *Pubis*, and is called *Pelvis*. In Men, it lies upon the *Intestinum rectum*; in Women, it adheres to the Neck of the Womb, which is placed betwixt the Bladder and the straight Gut: In both, it is knit before to the *Ossa Pubis*. Moreover, it is knit to the Navel by the *Uracha*.

Its Substance is made up of three Membranes.

The first and outmost is borrowed from the *Peritonaeum*. *Riolanus* says, This Coat is a Duplication of the *Peritonaeum*, within which, the Bladder lies hid, suspended like a Bottle turned the Mouth downwards. On its outside, in Man, it is besmeared with Fat, but not in Beasts.

The second is thicker, and endowed with car-nous Fibres; yea, *Agapendens*, *Spigelius*, *Waleus*, and *Bartholin*, will have it to be a true Muscle, serving for the Compression of the Bladder, to squeeze out the Urine; as the Spincter serveth for Constriction to retain it.

The third and innermost, is white and bright, of exquisite Sense, as those know too well who are troubled with the Stone.

Within, it is covered with a slippery mucous Humour, such as the Gall-bladder has on its inside, and such as the Intestines abound with, which, without Doubt, must be sued out of some Glands in this inmost Coat, tho' they be hardly discernable. This doth defend it from the Acrimony of the Urine.

Its Membranes have all Sorts of Fibres. And when these Membranes and Fibres are too long or too far extended with Plenty of Urine, they lose the Power of contracting themselves, whence there issues a Stoppage of Urine.

It is perforated in three Parts, viz. in the Sides, where the Ureters are inserted, to let in the Urine; and before at its Neck, to let it out.

It hath two Parts, to wit, the Bottom, and the Neck.

The Bottom comprehends the upper, wider and more membranous Part of the Bladder, to which the *Urachus* being tied, reaches the Navel, which together with the bordering Umbelical Arteries, become a strong Ligament in the Adult, hindering the Bladder to press upon its Neck. But as for the Arteries, *Riolanus in Animadu. ad Bauch*, affirms, That they contribute nothing to the Suspension of the Bladder, neither reaching to the Navel in the Adult, nor touching the Body of the Bladder of the *Urachus*.

The Neck it lower than the Bottom, thicker and straiter. In Men, it is longer and narrower, and being carried to the Rife of the *Penis*, opens into the *Urethra*; in Women, it is shorter and wider, and is implanted into the upper Side of the *Vagina* of the Womb: In both, it is car-nous and muscular, woven of very many Fibres, especially Transverse or Orbicular, which lie hid within the straight Fibres that surround the whole Body of the

the Bladder, and these make the Sphincter, which constricts the Neck of the Bladder so, as no Urine can pass out against ones Will, unless when it is affected with the Palsy, Ulcer or other Malady, by which there sometimes happens an involuntary Pissing.

The Bladder is oblong and round, in Shape like unto a Pear.

Its Cavity is but one ordinarily, yet sometimes it has been found to have a membranous Partition, that divides it into two, which yet had a Hole in it for the Communication of one Cavity with the other. Such a Partition was observed in the Bladder of the Great Casaubon.

It hath Arteries and Veins from the *Hypogastricæ*, which are inserted into the Sides of its Neck, where they are immediately branched into two, whereof one is spent upon the Neck, and the other on the Bottom. Nerves it hath (according to Dr. Willis) from the lowest Plexus of the Intercostrals in the Abdomen, and from the Marrow of the Os Sacrum. For the said Plexus sending two Nerves into the Pelvis, they have each of them a vertebral Nerve joined to them, and so make two new Plexus, from one of which there passes a Nerve that being divided into many Branches, is on each Side distributed into the Bladder, and its Sphincter Muscle.

The Use of the Bladder is to receive the Urine from the Ureters; and to contain it, like a Chamber-pot, until the Time of Excretion, when it is squeezed out of it, by the help partly of its own carnosus Membrane, and partly of the Muscles of the Abdomen.

Bartholin quotes some Observations of Borrichius, concerning the Bladder, worthy to be noted, viz. "If it be boild in Acids, it turns into a Mucilage; "if it be in Salt Liquors, it is thickned; if in Oleous, or in the Liquor of the Alkali Salts of Tartar, or Herbs burnt to Ashes, it is neither thickned, nor turns into a Mucilage, but is burnt, as "if it were laid on burning Coals, and may almost be crumbled to Powder. By which (says he) it appears, with what great Danger to the Bladder, Men inject into it, either acid, salt, or oleous Liquor, for breaking the Stone.

VESICATORIA, are Medicines which act upon, and rarify the Spirits and ferous Particles, gather themselves betwixt the Skin and Cuticula, and consequently separate them, and raise little Blisters full of ferous Matter, which are called Blisters.

VESICULA Felli: See Folliculus Felli.

VESICULÆ Seminales, the Seed Bladders, are little Cells like those in a Pomgranate, or somewhat resembling a Bunch of Grapes. De Graef compares them to the Guts of a little Bird variously contorted.

They consist of one thin Membrane, through which some small Twigs of both Veins, Arteries, and Nerves run. They are about three Fingers-breadth long, and one broad; but in some Places broader, and some narrower, as they run in and out. They are two (one for each Vas deferens) divided from one another by a little Interstice; and they do severally, by a peculiar Passage, emit the Semen contained in them into the Uretbra.

They are very anfractuons and winding, and (as was said) consist of many little Cells, that they should not pour out all the Semen contain'd in them

in one Act of Copulation, but might retain it for several. They have no Communication one with another, nor even in their very opening into the Uretbra; but the Semen that is brought to the Vesiculæ Seminales on the right Side, by the right Vas deferens, issues by its proper Passage into the Uretbra, and that which is brought to the left likewise. So that, if by any Accident, the Vesicula on one Side be burst or cut (as in Cutting for the Stone they generally are) yet those on the other, being entire, may still suffice for Generation. Now when the Semen is emitted out of these Vesiculae in the Act of Generation, it passes out the same way it came in, which in this case may easily be, (tho' otherwise it be unusual there should be a contrary Motion of the same Vessel) for, as it comes in from the Vasa deferentia, it drills along gently, without any Force; but in Coitu, when the Muscles of the Penis, and all the bordering Parts, are much Tumified, it is expressed or squirted out of them with some Violence; and passing along, their Neck, (which is a Continuation of the Vasa deferentia) oozes through a Carbuncle (like Quicksilver thro' Leather) into the Uretbra, or the Duct of the Penis, that is common both to the Semen and Urine. I say, it oozes from the Necks of the Vesiculae thro' a Carbuncle into the Uretbra, for there is one placed as a Valve before the Orifice of each of them, partly to hinder the coming of the Urine into them, partly to hinder the involuntary Effusion of the Semen.

Now, though naturally the little Holes through which the Semen passes out of the Necks of the Vesiculae into the Uretbra, be almost imperceptible, yet if they be either eroded by the Acrimony of the Semen (such Acrimony as is contracted by impure Embraces, or in Claps, as we call them) or if of themselves they be debilitated, and so become more Lax (as sometimes happens) to old or impotent Men, that meddle too much) then there happens a Gonorrhæa or continual Efflux of Semen: And so Vasalius and Spigelius have observed them much dilated, in dissecting such as have died with a Gonorrhæa upon them.

VESPERTILIONUM ale, are two broad membranous Ligaments, on each Side one, where with the bottom of the Womb is loosely tied to the Bones of the Flank. Artæus likens them to Bats-wings, whence the Name. Blanchard.

VESPERTINE, in Astronomy, when a Planet sets after the Sun, it is said by some to be Vesperine.

VESSELS, in Architecture, are certain Ornaments, usually set over the Cornices, and so nam'd, because they represent divers sorts of Vessels, which were in use among the Ancients.

VESTIBULUM, is a Cavity in the Os Petrosum, behind the Fenestra Ovalis, it is covered with a fine Membrane; in it open the semicircular Pipes of the Labyrinth. The upper Turning of the Cochlea, and the Auditory Nerve pierce into it also.

VESTIGIA of Tendons are the little Hollows in the Shells of Fishes, which are formed on purpose for the fastening or rooting of the Tendons of their Muscles. These are plainly found on all the Fossile Shells; and this is a Demonstration, that once they really belonged to Fishes, and are not formed Stones.

VESTURE, in Law, signifies a Possession or an Admittance to a Possession or Seisin. Thus it is also taken by the Feudists, with whom Investitura signifies

fies a Delivery of Possession by a Spear or Staff, and *Vestura* Possession it self.

VETERNUS : See *Letbargus*.

VERU, a Comet, according to some Writers, resembling a Spit, being nearly the same kind, as the *Lancibites*, only its Head is rounder, and its Train longer and sharper pointed.

VETITUM *namium*. *Namium* is a Distress, and *Vetitum* forbidden : Thus when the Bailiff of a Lord distrains Beasts or Goods, and the Lord forbids his Bailiff to deliver them when the Sheriff comes to replevy them ; and to that end, drives them to Places unknown ; or when without any Words they are so cloined, as they cannot be replevied, divers Lords of Hundreds, and Courts-Barons, have Power to hold Plea *De vitito namio* : See *Naam*.

VI & *armis*, an Expression in a Charge or Indictment, to shew the forcible and violent Commission of any Crime.

VI *Laica amovenda*, when the Bishop of a Diocese has certified into the Court of Chancery, that the Rector or Vicar of any Church within his Jurisdiction, is kept out of his Manse, or Glebe, or Church, by any Lay-force or intruding Power ; then may a Writ be granted to the Sheriff, to remove all such Violence, and such Usurpation ; which Writ is therefore called, *De vi Laica amovenda*.

VI *Laica removenda*, is a Writ that lies where Debate is between two Parsons or Provisors for a Church, and one of them enters into it with a great Number of Lay-men, and holds the other out *Vi & Armis* ; he that is holden out, shall have this Writ directed to the Sheriff. That he remove the Force. And this Writ is returnable, and shall not be granted, until the Bishop of the Diocese, where such Church is, hath certified into the Chancery, such Resisting and Force.

VIA *Lactea* : See *Milky-way*.

VIBRATION, is the Swing or Motion of a Pendulum ; or of a Weight hung by a String on a Pin : See the Proportions of the Vibrations of Pendulums, under *Pendulum*.

VIBRISSÆ, are the Hairs which grow in the Nostrils : They, with the *Mucus*, which the Glands separate, stop any Filth from ascending too high up into the Nostrils.

VICARIO *deliberando occasione cujusdam Recognitionis*, &c. is a Writ that lies for a Spiritual Person imprisoned, upon Forfeiture of a Recognition, without the King's Writ.

VICENETUM : See *Venue*.

VICIS & *venellis Mundandis*, is a Writ that lies against a Mayor or Bailiff of a Town, &c. for the clear keeping of their Streets.

VISCOUNTIEL, in Law, signifies as much as belonging to the Sheriff ; as *Writs Viscountiel* are such Writs as are Triable in the County or Sheriff's Courts. *Viscountiel*, signifies also, certain Farms for which the Sheriff pays a Rent to the King, and makes what Profit he can of them.

VIEW, in Law, signifies the Act of Viewers ; for when an Action real or personal is brought, and the Tenant knows not well what Land it is that the Demandant asks, then he may pray the *View* ; which is, that he may see the Land which is claimed.

VIEW of *Frank-pledge*, is the Office which the Sheriff in his County-Court, or the Bailiff in his

Hundred, performs in looking to the King's Peace, and seeing that every Man be in some *Pledge*.

VILLAIN, is the same with Servant or Bondman ; and there were formerly in England two sorts of these Villains : *Villains in gross*, who were bound immediately to the Persons of their Lords, and to their Heirs ; and *Villains Regardent to a Mannor* ; these the Civilians call *Gleba Ascriptitius* ; and they were bound to their Lord as Members belonging to such a Mannor, of which he was Owner. This latter was a pure Villain, of whom the Lord took Redemption to marry his Daughter, and to make him Free ; and he might put him out of his Lands and Tenements at his Will ; might beat and chastize him, but not maim him. We have now no such Slaves as these.

VILLENAGE, signifies a servile kind of Tenure, anciently belonging to Lands or Tenements, whereby the Tenant was bound to do all such Services as the Lord commanded. Of this Villenage, there are several sorts, but the Slavery of such a Custom is now laid down in *favorem libertatis*, tho' the Statute concerning them be unrepealed.

VILLI, in Botany, are small Hairs like the Grain of *Plush* or *Shag*, with which, as with a kind of Excellence, some Trees do abound. Of this kind is the *Usnea Officinarum*.

VINDEMIATRIX, a Fixed Star of the third Magnitude, in the Constellation *Virgo*, whose Longitude is 185 degr. 23 min. Latitude 16 degr. 15 min.

VINUM *Hypocraticum*, is a Wine wherein Sugar and Spices have been infused, and is afterwards strained through a Bag, which they call *Manica Hippocratis* ; which see. *Blanchard*.

VIOL, a kind of Hawker (in a Ship) made use of to purchase in the Cable, when the Main-Capstan cannot do it, because the Ground in which the Anchor is let fall, is too stiff, or else the Sea runs too high, so that they cannot weigh it ; then for more help, they take a Hawker, and opening one Strand thereof, they put therein Nippers, (that is, small Ropes, with a little Truck at one end) and with these they bind fast this Hawker to the Cable, and then they bring it to the *Jeer-Capstan*, and so heave upon it : And this *Viol* will purchase far more than the Main-Capstan can. This *Viol* is fastned together with an Eye and a Wale-knot, or else with two Eyes seized together.

VIRGÆ, is a Meteor, representing a Bundle of Rods, and made by the Sun's-beams piercing the more lax and open Parts of a watry Cloud.

VIRGINS Milk, is made by dissolving *Saccbarum Saturni* in a great deal of Water : It will turn white as Milk ; whence the Name. If the Dissolution be left to settle, the white Matter will precipitate, and may be used as a *Magistery of Saturn*.

VIRGO, one of the 12 Signs of the Zodiac, being the 6th according to Order.

VIRGULA *Divinatoria*, is a Hazle Rod shaped into two Branches like a Y, which must be cut at the time of some certain Planetary Aspect, and by which (as some Writers pretend) you may easily find out a Vein of rich Metal or valuable Oar in the Earth.

Mr. Boyle tells us, That some Authors report the Fact : But I judge we may very reasonably suspect, if not deny the Truth of the Relation, for all this ; for he himself owns he could never find any thing

thing in it: And so saith Kircher, tho' a Person otherwise subject enough to tell strange Stories.

Some use, as is said above, a forked Rod, holding the two Ends in their Hands: Others tie a Hazle-Wand to another streight Stick, and holding it in their Hand, do so walk over the Hills and Places where they expect Metals. But they all own the Rod to be very cross-grain'd, and that it will work, as they call it, in some Mens Hands only, and at some certain Times, and not at others, in the Hands of the same Persons.

VRIDARIO eligenda, is a Writ that lies for the Choice of a *Verdoror* in the Forest.

VIRTUAL Focus, or *Point of Divergence* in a Concave-Glass, is the Point *e* in the following Figure.

Let the Concavity of the Glass be *abc*, and its Axis *de*: Let *fg* be a Ray of Light falling on the Glass, parallel to the Axis *de*; and let *d* be the Center of the Ark *abc*. This Ray *fg*, after it hath passed the Glass at its Emerſion at *g*, will not proceed directly to *b*, but be refracted from the Perpendicular *dg*, and will become the Ray *gk*. Draw then directly *gk*, so as that it may cross the Axis in *e*. The Point *e* so found, Mr. Molyneux calls the *Virtual Focus*, or *Point of Divergence*. P. 56. *Dioptr. Nov.*

VIS, or *Force*; as *vi & armis*, by Force of Arms. And this *Vis* is fivefold, *Vis impulsiva*, *ablative*, *expulsiva*, *turbativa*, and *inquietativa*. *Vis ablativa*, is the taking away of moveable Things: And hence accrues an Action, *Quare vi & armis*, &c. *Vis compulsiva* is, when any one is cast out of his Possession by Force and Arms. *Vis turbativa*, is when any one is disturbed in his Possession, as when two strive to possess the same Thing. *Vis inquietativa*, is when one Man will not suffer another quietly to enjoy his Right, or to do any thing in his own Bounds or Limits. And from all these some sort of Action will arise.

VIS Centrifuga, is the Force by which any Body revolving round another, endeavours to fly off from the Axis of the Motion, in a Tangent to that Curve.

The Centrifugal Force is always proportional to the Periphery which any Body describes in its Motion round the Axis of its Motion, by the first Theorem of Mr. Huguen's *de vi Centrifuga*.

VIS Centripeta, is that by which any Body (from what Cause soever) tends towards any Point as to its Center.

Of this kind is *Gravity*, by which Bodies tend towards the Center of the Earth: And such is the *Magnetical Force* by which Iron tends towards the Center of the Magnet: And of this kind is that Force or Power whatever it be, by which all the Planets are continually drawn from a Rectilineal Motion, and forced to revolve in Curves.

The Quantity of this Centripetal Force, is of three kinds; *Absoluta*, *Acceleratrix*, and *Motrix*.

The *Absolute Quantity* of it, is its Measure, greater or less, according to the Efficacy of the Cause that produces it; and which exerts it self on all Bodies in the Regions round about: As the *Magnetical Vertue* in some Magnets is greater than in others, tho' of the same Dimensions.

Vis Centripeta Quantitas Acceleratrix, is its Measure proportionable to the Velocity which it produces in a given Time. Thus the Power of a Loadstone is greater at a less, and lesser at a greater Distance from the Stone. Gravity is greater in Valleys, and less on the Tops of high Mountains, (as is plain from the Experiments of Pendulums) and is yet less at remoter Distances from the Earth: But at equal Distances, 'tis always the same, because all Bodies, heavy or light, great or small, abstracting from the Resistance of the Medium, are equally accelerated in their Descent.

Vñ Centripeta Quantitas Motrix, is its Measure proportionable to the Motion which it generates in a given time: As the Weight is greater in a greater Body, and less in a lesser; and in the same Body, it is greater near the Earth, and less in remote Regions. This Force is the *Gravity* or Tendency towards the Center of the whole Body, and is all one with its *Weight*, being always discoverable by some equal and contrary Force hindering the Descent of the heavy Body.

The *Vires Centripetae*, are always as the Squares of the Velocities divided by the Radii of the Circles described round the Center.

And also reciprocally, as the Squares of the Periodical Revolutions divided by the Radii.

Wherefore if the Periodical Times be equal, both the Centripetal Forces and Velocities, will be as the Radii; & *vice versâ*.

If the Squares of the Times of the Periodical Revolutions are as the Radii, the Centripetal Forces are equal; and the Velocities in half the Ratio of the Radii; & *vice versâ*.

If the Squares of the Periodical Times are as the Squares of the Radii, the Centripetal Forces are reciprocally as the Radii, and the Velocities equal, and *vice versâ*.

If the Squares of the Times of the Periodical Revolutions are as the Cubes of the Radii, or Distances from the Center, (which is the Case of all these Planets moving round the Sun, and of the Moon's or Secondary Planets moving round the Primary) then the Centripetal Forces (or Gravity of Bodies) are as the Squares of the Radii or Distances from the Center, (as we find it to be) and the Velocities are in half the Ratio of the Radii, and *vice versâ*: See Sir Isaac Newton's *Princip. Phil. Mathematic.* p. 39.

If the Centripetal Force of any Body moving round another, be as the Distance; that Body moves in an Ellipsis, having its Center in the Center of that Force; or perhaps in a Circle equal to that Ellipsis. *Idem*.

As to which, *Gallileus* hath this Theorem, That if such an Ellipsis, its Foci becoming infinitely distant, should change into a Parabola, the Body would move into the Curve of such a Parabola; and the *Vis Centripeta* respecting now a Center infinitely distant, would grow *Equable*. To which Sir Isaac Newton adds, That if a Parabolick Section of a Cone, by the Inclination of its Plane to the

Side of the Cone, should be turned into an Hyperbola, the Body would continue to move in its Perimeter; and its *Centripetal Force*, would be changed into a *Centrifugal* one.

If any Body freely revolve round a Center, as in the case of the Planets round the Sun, its *Centripetal* and *Centrifugal Forces* must be equal.

VIS Impressa, is an Impulse, Force, or Action, communicated to, and exercised upon any Body, in order to change its present State, either of Rest or Motion, uniformly forward in a right Line. *Newt. Princip. Mat.* This Force consists entirely in Action, and after that ceases, cannot remain in any Body: For the Body continues in its new State, whether of Motion or Rest, by the *vis Inertia* only.

VIS Infitae Materiae, is the bare Power of Resistance only, by which every Body, as much as it may, endeavours to continue in that State in which it is, either of Rest, or Motion, uniformly forward in a right Line. This is always proportionable to the Body or Mass which it is in, and differs nothing from the *Inactivity* of the Matter or Body, but only in the manner of Conceiving it: And therefore, this *Vis Infitae*, may most properly be call'd *Vis Inertia*. *Newt. Princip. Math.*

VIS Motrix, is the Power which produces the Motion of any Body from Place to Place: Thus Gravity is a *Vis Motrix* downwards, or towards the Center of the Earth.

VISCERA are the Bowels contained in the three great Cavities of the Body, as the Anatomists call them. They are called also *Extæ* and *Interranea*.

VISIBLE Horizon: See *Horizon*.

VISIBLE Place of a Star: See *Apparent Place*.

VISIBLE Species: See *Speciales Visibiles*.

VISION, is a Sensation in the Brain, proceeding from a due and various Motion of the Optick Nerve, produced in the Bottom of the Eye, by the Rays of Light coming from any Object; by which means the Soul perceives the illuminated Thing, together with its Quantity, Quality, and Modification.

Whether the Picture of the Object be made on the *Tunica Retina*, or on the *Choroides*, there is a great Dispute between Mr. *Pecquet* and Mr. *Mariotte*, in the *Philos. Trans.* N^o 59, &c.

As to the manner how this noble Sense of Seeing is produced, there were many Hypotheses among the Ancients.

1. The *Stoicks* imagined, That certain visual Rays went from the Brain through the Optick Nerve and Eye, and from thence to the Object; and there (just like a Blind Man's Staff) feel out the Figure, Colour, and Dimensions of the Object.

2. The *Pythagoreans* thought, That there went some visual Species out of the Eye to the Object, which were immediately reflected back again from thence to the Eye, and so produced *Vision*.

3. *Plato* supposed, That both from the Eye and the Object, there came substantial Effluvia, which meeting half way, and encountering the Ocular Effluvia, the latter were bear back again to the Eye, and there communicated the Impression they had received from those Effluvia which came from the Object; and so caused the Sense of Seeing.

4. *Aristotle* asserted, That the Colours of all Objects did move the transparent Medium, as that did the Eye, and thereby communicate their Images to the Brain, or *commune Sensorium*.

5. *Epicurus*, judiciously rejecting the Notion of an Emanation of visible Species from the Eye; and not thinking the Action of the intermediate Air or Medium sufficient to account for Vision, rightly concluded, That the Sense of Vision was produced by a substantial material Efflux from the Object to the Eye.

6. *Cartez* supposes Vision performed by bare Motion only, without any material Emanation from the Object; but only that the Light (which with him also is not a Body, but the Motion of the finer Parts of the Medium) moves the Eye just after the same manner as the Object is supposed to have determin'd it; which Motion is continued along the Optick Nerve, up into the Brain, where it moves the *Conarion*, or *Glandula Pinealis*, with him the Seat of the Soul; and, by that means produces internal Sensation, and enables the Soul to judge accordingly.

The Manner of the Vision with the naked Eye, according to Mr. *Molyneux* his Explication of it, in *Dioptr. Nov.* p. 103.

Suppose *a b c* an Object, *i k l e m* the Globe of the Eye, furnished with all its Coats and Humours; but here the *Crytalline Humour g o h* is only express'd, as being principally concern'd in forming the Image on the Fund of the Eye.

T. From

1. From each Point of the Object, we may conceive Rays flowing to the Papil of the Eye ik ; as here from the middle Point b , there proceed the Rays bg , bo , bb ; these by means of the Coats and Humours of the Eye, and especially by the Crystalline Humour gh , are refracted and brought together on the *Retina* or Fund of the Eye in the Point e , and there the Point b is represented. For we may conceive the Crystalline Humour gh , as it were a Convex-glass, in the Hole of a dark Chamber $ilmk$, and that def is the distinct Base of this Glass.

What is here said of the Point b , and its Representation at e , may be understood of all the other Points in the Object, as of a and c , and their Representations at f and d . For, according to Sir Isaac Newton's best Hypothesis of Light, each Ray has its innate Colour, and so will represent it where it falls.

2. As in a dark Chamber that has a Hole furnished with a Convex-glass, if the Paper that is to receive the Image in the distinct Base, be either nigher to, or farther from the Glass, than its due Distance, the Representation thereon is confus'd: For then the Radius Pencils do not exactly determine with their Appices on the Paper; but those from one Point are mix'd and confus'd with those from the adjacent Point: So in the Case of *Plain Vision*, 'tis requisite that the Pencils should exactly determine their Appices at def , on the *Retina*, or else Vision is not distinct.

Therefore, Nature has so contriv'd the Eye, That it should have a Power of adapting it self in some measure to nigh and distant Objects, for they require different Conformation of the Eye, because the Rays proceeding from the Luminous Points of nigh Objects, do more diverge than those from more remote Objects: But whether this Variety of Conformation consists in the Crystallines approaching nigher to, or removing farther from the *Retina*; or in the Crystallines assuming a different Convexity, sometimes greater, sometimes less, according as is requisite, is left to the Scrutiny of others; and particularly the Curious Anatomists. This only may be said, That either of these Methods will serve to explain the various *Phænomena* of the Eye: And that both these may attend each other, *viz.* a less Convex-Crystalline requires an Elongation of the Eye, and a more Convex-Crystalline requires a shortning thereof; as a more flat Convex Object-glass, or of a larger Sphere, requires a longer Tube; and one protuberant, bulging, or of a smaller Sphere, requires a shorter Tube.

3. By the former Figure we perceive the Rays from each Point of the Object are all confus'd together on the Pupil in gh , so that the Eye is placed in the Point of the greatest Confusion: But by means of the Humours and Coats thereof, each Cone of Rays is separated, and brought by it self to determine in its proper Point on the *Retina*, there painting distinctly the Vivid Representation of the Object, which Representation is there perceived by the *Sensitive Soul*.

4. We are likewise to observe, That the Representation of the Object abc , on the Fund of the

Eye fed is inverted: For so likewise it is on the Paper in a dark Room; there being no other way for the Radius Cones to enter the Eye, or the dark Chamber, but by their Axis ao , bo , co , crossing in the Pole o of the Crystalline, or Glass.

But how comes it to pass, that the Eye receiving the Representation of a part of an Object on that Part of its Fund which is lowermost, or nighest the Center of the Earth, perceives that Part of the Object as uppermost, or farthest from the Center of the Earth? In answer to this, let us imagine, that the Eye, in the Point f , receives an Impulse or Stroke by the Prorusion forwards of the Luminous Axis aof , from the Point of the Object a ; must not the visive Faculty be necessarily directed hereby to consider the Stroke, as coming from the Top a , rather than from the Bottom c , and consequently should be directed to conclude the Representation of the Top?

Therefore we may be satisfied by supposing a Man standing on his Head: For here, tho' the upper Parts of Objects are painted on the upper Parts of the Eye, yet the Objects are judged to be erect. And from this Posture of a Man, the Reason appears, why we have used the Words *farthest from*, and *nighest to the Center of the Earth*, rather than *upper* and *lower*: For in this Posture, because the upper Parts of the Objects are painted on that Part of the Eye nighest the Earth, (tho' really the upper Part of the Eye) they are judged to be farthest removed from the Earth.

What is said of *Erect* and *Reverse*, may be understood of *Sinister* and *Dexter*.

5. The Image of an *Erect* Object being represented on the Fund of the Eye *Inverted*, and yet the Sensitive Faculty judging the Object *Erect*, it follows, That when the Image of an *Erect* Object is painted on the Fund of the Eye *Erect*, the Sense judges that Object to be *Inverted*.

6. The Magnitude of an Object, is estimated by the Angle the Object subtends before the Eye. Thus, the Length of the Object ac , is estimated by the Angle aoc , fod , and this is called the *Optick Angle*.

Whence it follows, that if the Eye were placed instead of the Glass at d (Fig. 2.) and abc , or efg were Objects, the Eye would perceive them of equal Bigness.

The Point *o*, which is the Vertex of the Optick Angle, is variously assigned by various Authors; some placing it in the Centre of the Eye; others in the Vertex of the Crystalline; others in the Vertex of the outward Coat or Cerebra of the Eye; but 'tis a Matter of no great Consequence where-ever we place it; for according to the Bigness of this Angle *a o c*, the Image on the Fund of the Eye is bigger or less.

7. We perceive the Rays that flow from the Point *b*, do proceed to the Eye Diverging, as *bg, bo, bb*: And if the Object *a c* were infinitely distant from the Eye, or so distant from the Eye, that the Breadth of the Pupil *ik* were insensible in Comparison to this Distance; then the Rays *bg, bo, bb*, would proceed as it were parallel, and so fall on the Eye: In both which Cases, by means of the

Refractions of the Eye, they are brought together, and Point the Image of the Point *b*, on the Fund of the Eye at *e*.

But if the diverging Rays *bu, bx*, (Fig. 1.) that flow from the Point *b*, meet the Convex-glass *vx*, and are thereby made to converge, as *vi, xk*, and so fall on the Eye, and there passing through the Crystalline *gh*, are made to converge yet more, as *ie, ke*: Here they cross in the Point *e*, before they reach the Retina *rt*, and consequently do point thereon the Image of the Point *b* confusedly, for 'tis planted on the Space *rt*; whereas to cause distinct Vision, it should only be painted on a correspondent Point on the Retina.

And this is the Fault of their Eyes, who are called *Myopes*, *Purblind*, or *Short-sighted*: For in them the Crystalline is too Convex, (as in Fig. 3, both the Convex-glass and Crystalline joyn'd together, make too great a Convexity) uniting the Rays before they arrive at the Retina. And therefore they are help'd by Concave-glasses, which take off from the too great Convexity of their Crystalline, some part of its Refractive Power: Or rather these Concaves make the Rays diverge so, that their Crystalline shall be sufficient only to bring them again together, so that they be not touched, till they arrive at the Fund of the Eye.

Myopes are also help'd, by holding the Object very near; for then the Rays that fall on their Eye from any single Point, do more diverge, than when the Eye is farther from the Point, and consequently their too Convex Crystalline doth but suffice to bring them together on the Retina.

8. On the contrary, the Eyes of Old Men have their Crystalline too flat, (as Fig. 4) and cannot correct the Divergence of the Rays

bu, bk, to make them between the Retina *rt*, but beyond the Eye at *c*. Wherefore for their help 'tis requisite they add the adventitious Convexity of a Glass; that both it and the Crystalline together, may be sufficient to unite the Rays just at the Retina: And from hence it appears, that Spectacles help

Old Men, not by magnifying an Object, but by making its Appearance distinct; for Old Men cannot read the largest Print without Spectacles, and yet with Spectacles they read the smallest; tho' these with Spectacles do not appear so large, as those without Spectacles.

9. What is said of the confused or distinct Representation of a Point in the Object, may be understood of the confused or distinct Representation of the whole Object; at least, for those Parts that lie pretty nigh adjacent to that Point that is looked at. For here we do not see a Point, in the strict Sense of the Mathematicians, but in a Physical Sense, for the smallest part imaginable; and the whole Object consisting of such Points, what is shewn of one Point, may be understood of every Point in the Object.

Distinct Vision, is caused, when the Pencils of Rays from each Point of an Object, do accurately determine in correspondent Points of the Image on the *Retina*.

Confused Vision, is caused when these Pencils do intermix one with another.

Clear Vision, is caused by a great Quantity of Rays in the same Pencil illuminating the correspondent Points of the Image strongly and vigorously.

Faint Vision, is when a few Rays make up one Pencil: And tho' this may be *distinct*, yet 'tis dark and *obscure*; at least, not so *bright* and *strong*, as if more Rays concurred.

VISITATION, is that Office or Action that is perform'd by a Bishop in every Diocese once every three Years, or by the Arch-deacon once a Year, by visiting the Churches and their Rectors, &c.

VISNE: See *Venue*.

VISORIOUS: See *Optick Nerves*.

VISU Franci plegii, is a Writ to exempt him from coming to the *View of the Frank Pledge*, who is not Resident within the Hundred; for Men are bound to this *View*, by reason of their Habitation, and not of Lands held where they dwell not.

VISUAL Point in a Perspective, is a Point in the Horizontal Line, wherein all the Ocular

Rays unite; as if a Man stood in a long strait Gallery, wherein looking directly forward, the Sides, Floor, and Ceiling at last seem to be united, and to touch one another in a Point or common Centre.

VISUAL Rays: See *Rays*.

VITAL Faculty, is an Action whereby a Man lives, which is performed, whether we design it or no; such are the Motion of the Heart, Respiration, Nutrition, &c. It depends chiefly upon the *Cerebellum*. It is the same with Natural Faculty, tho' the Ancients distinguished them, placing the Natural in the Liver, and the Vital in the Heart.

Blanchard.

VITAL Flame: See *Flamma Vitalis*.

VITAL Indication, in the Art of Medicine, is such an one as requires the restoring and preserving of the natural Strength of the Body.

VITALIGO, a sort of Leprosie; there are three kinds of them.

Albus, where the Colour is White, something rough, and not continued, like so many Drops here and there; but sometimes it spreads broader, and with some Intermixions.

Melas differs in Colour, because it is Black, and like a Shade; in the rest they agree.

Leuce has something like *Albus*, but it is whiter, and descends deeper, and in it the Hairs are White, and like Down: All these spread, but in some quicker, in others slower.

VITRIFICATION, the turning of any Body into Glas by the Force of Fire: This (by the Chymists) is look'd upon as the Ultimate Action of Fire, and Bodies when once they have gain'd the Form of a Glas, do (generally speaking) continue in that Form, and are not capable of putting on any other Shape.

Most kinds of *Vitrifications* (as also *Calcinations*) are made by Salts uniting and incorporating with the Metalline Particles.

VITRIOL of Copper or Venus, is *Blue Chrystals* made by a Solution of Copper in Spirit of Nitre, Evaporation, and Chrytallization in a cool Place. These are used as Cauticks, but they will dissolve if expos'd to the Air.

There are other Chrystals of *Venus* made by distilled Vinegar, and they are what is called *Vergrease*; which see.

VITRIOL of Mars, or *Salt of Steel*, is made by dissolving Steel in some proper *Acid Menstruum*, then Evaporating and Chrytallizing to gain the as above in Copper.

VITRIOL of Silver, or of the Moon: See *Chrystals of Silver*.

VITRIOLATE Tartar: See *Tartar Vitriolate*.

VITRIOUS Humour, or *Glassie Humour of the Eye*, is the third Humour of the Eye, so called from its Resemblance of the melted Glas. 'Tis thicker than the *Aqueous*, but not so solid as the *Chrystalline*. 'Tis round or convex behind, and somewhat plain before, only hollowed a little in the Middle where it receives the *Chrystalline*. It exceeds both the other Humours in Quantity.

VITRIOUS Tunicle, a thin Film, or Coat, which is said to separate the *Glassie Humour* from the *Chrystalline*; tho' there are some who absolutely deny, That there is any such Coat in the Eye, before the Humours are taken out and expos'd to the Air.

VIVA VOCE : See *Depositions*.

VIVIPAROUS *Animals*, are such as bring forth their Young living and perfect ; by which they are distinguished from *Oviparous* ones, which lay Eggs, which after that, are hatched in living Creatures.

ULNA, or *Focile Majus*, is the greater Bone betwixt the Arm and the Wrist, which is jointed upward with the Shoulder by *Ginglymus* (which see;) and therefore it has there both *Processes* and *Cavities*; two oblong *Processes*, and as it were triangular, and rugged, that the Ligaments may knit it strongly. The foremost and uppermost is less, and goes into the Cavity of the Shoulder : The backward *Process* is thicker and larger, ends in an obtuse Angle, and enters the hinder Cavity of the Shoulder ; the *Latins* call it *Gibberus* : In the middle of these there's a great Cavity like a Semicircle.

It has yet another external lateral Cavity for the Head of the *Radius*, or lesser Bone of the *Cubitus* ; it is jointed at the lower End with the Wrist, both by a Cartilage in the Middle, and by an acute *Process*, and therefore called *Styloides*, (being like a sharp-pointed Pen used in *Writing-Tables*) whence there arises a Ligament, which fastens the *Cubitus*, and the *Joint* of the Wrist together.

UMBELICUS in an *Ellipsis*, &c. is that *Focus* about which the Motion of any Revolving Body is made, and which it respects as its Center : So that either *Focus* may be called by this Name.

UMBELLIFEROUS *Plants*, are by *Botanists* accounted, such as have their Tops branched and spread out like a *Ladies Umbrella* ; on each little Sub-division of which, there is a small Flower growing ; as *Fennel*, *Dill*, *Parsley*, &c.

This Flower is always *Pentapetalous*, and is succeeded by two naked Seeds lying joining together, which are the true Distinctions of these *Plants* from others.

The *Umbelliferous* are a very large Genus of *Plants*, and by our *Accurate Botanist*, Mr. Ray, are thus distinguished.

Umbelliferous Plants, are either,

I. Such as have a compounded Leaf, of a Triangular and *Pinnate* Form : And the Seeds of these are either,

1. Broad, flat, and plain, like Leaves almost ; as the *Spondylium*, *Pastinaca Latifolia*, *Panax Heracleum Tordylium*, *Orcofolium*, *Thyselinum*, *Apium Cicuta foliis*, *Daucus Alsaticus*, *Caroifolia*, *Anethum*, *Pucedanum*, *Thapsia*, *Ferula*, &c.

2. With a Seed more tumid, and less compressed and flat than the former : As the *Cachrys*, *Asperitium*, *Cicutaria vulgaris*, *Scandix*, *Cerrefolium*, *Myrrhis Sativa Angelica*, *Levisticum*, *Siler Montanum*, *Bulbocastanum*, *Sisyrinchium*, *Oenanthe*, *Sium*, *Pimpinella Apium*, *Cicuta*, *Vishnaga*, *Saxifraga*, *Critibum*, *Feniculum*, *Daucus Vulgaris*, *Anisum*, *Caucalcis*, *Coriandrum*, *Pastinaca Marina*, &c.

II. Such as have a simple, or an undivided Leaf, or at least one, only a little jagged : As the *Perfoliata*, *Buplerum*, *Astrantia Nigra*, *Sanicula*, and the *Seseli Ethiopicum*.

UMBELICAL *Region*, is that Part of the *Abdomen* lying round about the Navel.

UMBELICAL *Vessels*, are the *Veins*, *Arteries*, &c. that belong to the Navel, or rather are enwrapped in the *Navel-string*.

The *Navel-string* is membranous, wreathed, and unequal, arising out of the Middle of the *Abdomen*, (viz. the *Navel*) and reaching to the *Placenta Uterina* : 'Tis usually half an Ell in Length, and as thick as ones Finger. It was convenient to be so long and lax, that when the *Fetus* in the Womb grows strong, it might not break it by its sprawling and tumbling about ; and after it is born, the *Secundine*, or *After-birth*, might be drawn out the better by it.

The way that it passes from the Navel to the *Placenta*, is very unconstant ; for sometimes it goes upon the Right-hand to the Neck, which having encompassed, it defends to the *Placenta*, and sometimes it goes on the Left-hand up to the Neck, &c. Sometimes it comes not to the Neck at all, but goes first a little up towards its Breast, and then turns round its Back, and from thence passes to the *Placenta*.

The *Vessels* contain'd in this *String*, (and which are enwrapped to a common Coat, called *Funiculus*, or *Intestinulum*) are four, one *Vein*, two *Arteries*, and the *Urachus*. For as for the *Nerves* which *Verheyen* suspects to be contained in it, or the *Lacteal Vessels* which *Bidloo* thinks he has observed, I shall not reckon them among these *Vessels*, because these *Authors* speak but faintly of them.

The *Vein* is larger than the *Arteries*, and arises from the Liver of the *Fetus*, (viz. out of its *Fissure*) by the Trunk of the *Vena Porta* (of which it seems to be but a Branch) and from thence passing out of the Navel, it runs along the *Funiculus* to the *Placenta*, into which it is implanted by innumerable *Roots* ; but in its Passage it sends some little Twigs into the *Arteries*.

The *Ancients*, that thought the *Fœtus* was nourished by the *Mother's Blood* only, taught the sole Use of this *Vein* to be, to carry Blood from the *Placenta* to it : And since it has been found out, and believed that it is nourished also (if not only) by *Chyle*, or *Succus Nutritius*, some have continued the same Office to this *Vein*, and think that the *Chyle* is brought by *Lacteal Vessels* arising out of the *Placenta*, as (they say) it was brought thither by the *Mother's Lacteals*. And indeed if any certain Discovery had been made of these same *Lacteals*, we should have embraced this Opinion as the most probable. But we are not to form *Hypotheses* out of *Rational Notions* only, but much rather from what appears to the Eyes of the Dissector.

We do affirm therefore, That the *Umbelical Vein* serves for conveying to the *Fœtus* the *Nutritious Juice* separated in the *Placenta* from the *Mother's Arteries*. How this Separation is made, and how it is first of all turned into Blood, we shall consider by and by.

But together with this Juice there returns so much of the *Arterial Blood* (that comes from the *Fœtus*) as is not spent upon the Nourishment of the *Placenta*, or of the *Chorion* and *Amnios* : Which Liquors thus mixed, though by the *Umbelical Vein*, they are poured into the *Sinus* of the *Porta*, yet are they not distributed through the Liver by the usual Channels thereof only ; but by the *Venal Duct*, is the greatest Part thereof conveyed in a

direct Course and full Stream into the *Cava* about the Liver.

Besides this Vein, which is common to all Creatures, there have been observ'd in Whelps and Conies, (and may perhaps in others) two small Veins more, that arising from the fourth involving Membrane peculiar to them, pass directly from the *Umbilicus* to the Mesentery of the *Fœtus*, as the other great one does to its Liver; which may strengthen the Opinion, That the Chyle, or *Succus Nutritivus* is brought to the *Fœtus* by the *Umbilical Vein* (or *Veins*.) These Veins Dr. Needham calls *Omphalo-Mesenterice*.

In the *Funiculus* are included also two Arteries, which are not both of them together so big as the Vein: They spring out of the inner Iliacal Branches of the great Artery: (Dr. Needham judges them to be derived immediately from the Extremity of the *Aorta*, before its Division) and passing by the Sides of the Bladder, they rise up to the Navel, out of which they are conducted to the *Placenta*, in the same common Cover with the Vein and *Urachus*, with which they are twined and wreathed not unlike a Rope. I say, they are inserted into the *Placenta*, and with the Vein make a most admirable Neck-like Texture. But there is one Branch of each of them which is manifestly inserted into the *Amnios*. Dr. Harvey says, The Vein is conspicuous a pretty while before these Arteries appear.

In the Creatures mention'd in the foregoing Paragraph, there are besides these Arteries, others answering to, and accompanying the Veins called, *Omphalo-Mesenterice*, abovementioned.

Blood and Vital Spirit are not carried by them from the Mother to the *Fœtus*, as many from *Galen* have taught; but, on the contrary, Spirituous Blood is driven from the *Fœtus*, by the beating of its Heart, to the *Placenta* and the Membranes for their Refection and Nourishment; from which what Blood remains, circulates back again in the *Umbilical Vein*, together with the *Succus Nutritivus* afresh inhibited by its Capillaries dispersed in the *Placenta*. But besides Arterial Blood, there flows out of the Navel by them, part of the *Succus Nutritivus*, that was imported by the *Umbilical Vein*; namely, That of it which is more crass and cerrege, which by one Circulation through the Heart, (or it may be many) could not be changed into Blood: This Part, I say, flows out by these Arteries, which by their Branches that are dispersed through the *Amnios*, disimbugue it by their little Mouths into it: For what Use shall be declared presently.

But besides these Uses which are commonly ascribed to these *Umbilical Veins* and Arteries by Anatomists, *Verheyen* (with some Probability) assigns another.

Says he, "It is worth Inquiry, for what Purpose the Blood of the *Fœtus* is sent in such great Quantity out of its Body into the *Placenta*: Seeing, without doubt, a far less Quantity of Blood would suffice for its Nourishment: For no Part in the whole Body, if you except the Lungs and Liver, has such abundance of Blood-Vessels as the *Placenta*. This must needs be for a certain common Use, which we judge to be a-kin to the Use of the Lungs, in those who being born, enjoy a freer Air: Namely, That as these do by the Help of the Lungs plentifully draw in from the Air a certain Matter highly necessary for the feeding the Vital Flame; so in the *Fœtus*, where

"the Lungs lie idle, such like Matter being received into the Mother's Blood by her Respiration, is separated therefrom by help of the *Placenta*, and mixt with the Blood of the *Fœtus* (in the *Umbilical Vein*;) and as in the Lungs of Breathing Persons, some Heterogenous Matter is continually separated from the Blood; so in the *Placenta* certain Recrements of the Blood are deposited out of the *Umbilical Arteries* into the Veins of the Mother.

And here I shall transcribe a Material Objection, with the Answer to it, out of *Diemerbroeck*.

Objection.

How can these Vessels, (Vein and Arteries) when they have grown from the Belly of the Fœtus, to that Length as to reach the Membranes, penetrate and pass through them to the Placenta?

Answer.

This is done in the same manner as the Roots of Herbs, Shrubs and Trees penetrate into the hard Ground, yea, often into thick Plants, Walls and Stones, (which Water cannot enter) and root themselves firmly in them. For just to the first sharp-pointed and most fine ends of the *Umbilical Vessels*, insinuate themselves by little and little into the Pores of the Membranes (for the Figuration of those Pores are fitted for their Entrance) and pass through them, and yet the Liquors contained in these Membranes cannot flow out by them: And when those Vessels inhering in the Pores, grow more out into Length, by little and little, the said Pores are more and more widened, (according to the Increase of the Vessels) and are inseparably united unto, and grow in them.

The fourth *Umbilical Vessel*, is the *Urachus*, or *Urinary Vessel*. This is a small, membranous, round Pipe, endowed with a very strait Cavity arising from the bottom of the Bladder up to the Navel, out of which it passes along within the common Cover, and opens into the *Allantoides*.

It is more apparently pervious in many of the larger Brutes, than it is in Man; in whom some have denied it any Cavity; but that it is hollow in him, is confirmed by many Histories of Persons adult, who having the ordinary Urinary Passage along the *Penis* stopp'd, the Passage in this Vessel has been unlocked, and they have made Water by the Navel, which could not have been imagined to have happen'd, if it had been originally a Ligament without any *Meatus*.

Bartholin, and others have affirmed, That the *Urachus* in Men reaches no further than the Navel: How then comes that Humour into the *Allantoides*, that has perfectly the same Taste with the Urine in the Bladder? But their Error sprung from hence, That they thought a Humane *Fœtus* had no *Allantoides*; and that Humour that is found in it, they thought had been contained in the *Chorion*: But this is in short refuted above, but more fully and accurately by Dr. Needham, *Lib. de formato Fœtu*, cap. 3.

As to the Perviousness of the *Urachus*, I shall add this further, That in Abortions of five or six Months old, the Bladder of the *Embryo* is always full of Urine, out of which, if in the following Months it should not be emptied by the *Urachus*, the Bladder would soon burst, seeing there is daily some

some Serum separated from the Blood in the Kidneys, and sent to the Bladder; and the more the *Fetus* increaseth, the more must need be separated. Yea, Dr. Needham affirms, That one may either press the Liquor contained in the *Allantoides* by the *Urachus* into the Bladder, and with a Pipe blow Wind out of the Bladder by the same way into the *Allantoides*.

Its Use has been sufficiently declared in the preceding Paragraph; as also above, when we delivered the Use of the *Allantoides*, which we shall not repeat.

These four Vessels (as has been said above) have one common Cover, which also keeps each of them from touching the other: It is called *Intestinulum* and *Funiculus*, (by which it with its Vessels is sometimes understood.) It is membranous, round and hollow, indifferent thick, consisting of a double Coat, (the inner from the *Peritonæum*, and the outer from the *Panniculus carnosus*.) Sometimes it self only is wreathed about like a Rope, the Vessels included in it running streight along its Cavity; and sometimes they are wreathed together with it.

It hath several Knots upon it here and there, which Dr. Wharton thinks to be *Papillæ*, or little Glands through which the Lactal (or Nutritious Juice) distils out of the Cavity of the *Funiculus*, into the Cavity of the *Ammios*.

I cannot tell whether this be so, or no; but the Use that doting Midwives make of them to guess by their Number how many Children more the Mother shall have, and by their Colour, whether those Children shall be Male or Female, is more ridiculous than superstitious.

UMBILICK Points, in *Mathematicks*, are the same with *Focus's*; which see.

UMBILICUS, the Navel, is a Part in the Center of the *Abdomen*, to which the Navel-string in a *Fetus* is joined, which is cut off after the Delivery.

UNCIÆ, in *Algebra*, signifie those Numbers which are prefix'd before the Letters of the Members of any Power produced from a *Binomial*, *Residual*, or *Multinomial Root*.

This in the fourth Power of $a + b$; that is, $aaaa + 4 aaab + 6 aabb + 4 abbb + bbbb$, the *Unciæ* are 4, 6, 4.

The wonderful Sir Isaac Newton gives this Theorem for finding the *Unciæ* of any Power arising from a *Binomial Root*.

Let the Index of that Power be called m ; then will the *Unciæ* arise from such a continual Multiplication as this, viz.

$$1 \times \frac{m-0}{1} \times \frac{m-1}{2} \times \frac{m-2}{3} \times \frac{m-3}{4} \times \frac{m-4}{5} \times \dots, \text{ \&c.}$$

Thus if the *Unciæ* of the *Biquadræ*, or fourth Power were required; the Rule is,

$$1 \times \frac{4-0}{1} (=4) \times \frac{4-1}{2} (=6) \times \frac{4-2}{3} (=4) \times \frac{4-3}{4} (=1)$$

Which shews, that the *Unciæ* are 1, 4, 6, 4, 1.

UNCORE *Prise*, in Law, is a Plea for the Defendant, being sued for a Debt due at a Day past,

to save the Forfeiture of his Bond, saying, That he rendered the Debt at the Time and Place, and that there was none to receive, and that he is still ready to pay the same.

UNDIMIA, the same with *Oedema*.

UNGUIS, a Nail, is a simular, flexible, white, and hard Part, which defends the Fingers from external Injuries, and in some measure adorns them. The Root of it is joined to a certain Ligament, and by reason of the neighbouring Tendons it becomes sensible: They seem to be made of a Collection of very little Pipes, which adhere extremely thick to one another, and shoot out into length, Where they begin, there you find certain nervous Fibres like so many small Nipples lengthen'd, the lengthen'd Parts whereof, are seen as far as the Nail: If they be forcibly torn off, they leave divers Holes, so that the Horney Substance of the Nails looks like a Net. Under the Nails there's a pappy sort of Body, which has its Vessels of Excretion.

The *Apices*, or Tops of the Nails, are they which grow beyond the Flesh; the Parts which are out, are called the *Segmina*, the Paring of the Nails; the Parts under the Nails, are the *unguia*, the hidden Parts; the white Semi-lunar Part next the Root, is the Rife of the Nail; the very Beginnings that grow into the Skin, are call'd the Roots of the Nail; the Sides, the Clefts; the white Spots, *Nubeculae*, little Clouds, &c. *Blanchard*.

UNGUIS, the same with *Hypopyon*; which see.

UNGUIS Os, is a little thin Bone, which lies in the great Angle of the Orbit of the Eye, it has a Hole in which the Lachrymal Glands lies.

UNGULA, is a sort of hooked Instrument used by Surgeons, to draw a dead *Fetus* out of the Womb.

UNIFORM *Motions* are the same with equal, or rather *Equable ones*; which see.

UNIFORM *Flowers* of Plants, the Botanists call such as are all round of the same Figure; or whose fore and back Part, and whose right and left Parts are exactly alike; but when they are not so, they call them *Difform Flowers*.

UNION, (a Term among Painters) is the mutual Agreeableness and Sympathy of the Colours in a Piece of Painting.

UNION, Dr. Grew makes Union in a Physical Sense, to be one of the three Ways of Mixture; and he defines it to be, the Union of Atoms, or Particles which touch in a Plain; as in the Crystallization of Salts, and other like Bodies.

UNION, in Musick, is one of the same Sound, whether produced by one single Voice, or divers Voices sounding in the same Tone; so that an *Unison* in this Science, may be considered as an Unite in Arithmetick, or as a Point in Geometry, not divisible into any Parts, in regard that it is the first Term to any Interval. When the Ancients divided their *Monochord*, so that the Parts were as 1 to 1, they called them *Unisons*.

UNITE, is the same with the Figure 1, being one single individual Part of discreet Quantity. If a Number consist of 4 or 5 Places, that which is outermost towards the Right-hand, is called the Place of *Unites*.

Number in general, is by *Euclid* defined to be *univ. sive numeros*, a Multitude, or Aggregate of *Unites*; and in this Sense *Unity* is not a Number. But *Unity*, as it may be taken for an Individual

Unite,

Unite, is certainly as much a Number as 10, 20, 100, &c.

UNITY of *Possession*, in the Civil Law, is called, *Consolidatio fructus & proprietatis*, and signifies *Joint Possession* of two Rights by several Titles.

As for Example : If I take a Lease of Land from one upon a certain Rent, and afterwards I buy the Fee-simple, this is an *Unity of Possession*, by which the Lease is extinguished, by reason that I, which before had the Occupation only for my Rent, am become Lord of the same, and am to pay my Rent to none but my self.

UNIVERSAL Equinoctial Dial, is made of two Rings of Brass or Silver, that open and fold together, with a Bridge or Axis, and a Slider, and a little Ring to hang or hold it up by : It is divided on one side of the great Ring into 90 Degrees, and sometimes on the other into two Quadrants, or 180 Degrees, but one is enough : The innermost Ring is divided into 24 Hours, sub-divided on the Face, and on the outside of the Ring, into every five Minutes. The Axis has the Sun's Declination on one side, and the Days of the Month and the Sun's Place on the other.

To use it for the Hour, the Perpendicular Line or Stroke which is on the Slider, which moves on the outer Ring, must be set to the Latitude of the Place, and the Hole in the Slider on the Bridge either to the Sun's Place in the Ecliptick, the Day of the Month, or his Declination ; and then the Rings being opened, and set square to one another, move the Dial about two and fro, 'till the Sun shine through the Hole, and on the inner Edge of the innermost Ring, and there it will shew the true Hour.

UNIVOCAL Terms in Logick, are such whose Name and Nature is the same ; and 'tis used in Opposition to Equivocals, whose Names are the same, but their Natures very different ; for a Thing to be predicated *Univocally* of any others, is to be attributed to all of them alike, and in the same proper Sense.

UNLAWFUL *Assembly*, is the Meeting of three or more Persons together, by Force, to commit some unlawful Act, and so abiding together, tho' not endeavouring the Execution of it, as to assault, or beat any Person, to enter into his House, or Land, &c.

UNLIKE Quantities and Signs in *Algebra* : See like Signs and Quantities.

UNLIMITED Problem (*Inordonné*) according to Mr. *Ozanam*, is such a Problem in *Mathematicks*, as is capable of *Infinite Solutions* : As to di-

vide a Triangle given into two equal Parts, to make a Circle pass through two Points assigned, &c.

UNQUES *Prist*, in Law, is a Plea whereby a Man professeth himself *always* ready to do or perform that which the Defendant requires : As if a Woman sues the Tenant for her Dower, and he coming in at the Day offers to averr, That he was *always* ready, and still is to perform it In this Case, except the Demandant shall averr the contrary, he shall recover no Damages : When this Plea will serve to avoid Charges, and when not : See *Kitchin*, fol. 243.

VOCAL Nerves, the same with *Recurrent* ; which see.

VOID *Bastion* : See *Bastion*.

VOIDED, a Term in Heraldry, when there are Lines drawn within, and parallel to the Out-lines of any Ordinary : This expresses an Exemption of something of the Thing voidable, and makes the Field appear transparent thro' the Charge.

VOIDER, so the Heralds call one of the *Ordinaries*, whose Figure is much like that of the *Flasque* or *Flanch*, only it does not bend or bow in so much : This Armour they say, is the Reward of a Gentlewoman that has well served her Prince. They are always born by Pairs.

The Field is *Tenn*, two *Voids*, or.

VOIR *dire*, is when 'tis pray'd upon a Trial at Law, that a Witness may be sworn upon *Voir dire* ; the Meaning is, he shall upon his Oath speak or declare the Truth, whether he shall get or lose by the Matter in Controversie ; and if he be unconcern'd, his Testimony is allowed, otherwise not.

VOLATILE Salt of *Vegetables* is usually drawn into a Retort from the Fruits and Seeds fermented, and seems to be only the *Essential Salt* driven up higher, and Volatilized by the Spirits during the Fermentation and Distillation.

The *Volatile Salt* of *Animals*, is drawn much the same way as that of *Vegetables*.

VOLATILE Spirit of *Sal Armoniack*, is made either by mixing *Quick-lime*, or Salt of *Tartar*, with *Sal Armoniack*, and then pouring a sufficient Quantity of Water upon it, the Matter is distilled in a Retort when *Quick-lime* is used, otherwise in a Glass Body, or *Cucurbit* ; by this means the Lime or the Salt of *Tartar* doth destroy the Strength of the Acid Sea Salt, that held bound and fixt the *Volatile Salts* of *Urine* and *Soot* of which *Sal Armoniack* is made ; whereby they being at Liberty are driven out by the Fire, and dissolved in the Water that was poured on the Mixture, and so compose this *Volatile Salt*.

Spirit of *Sal Armoniack* made with *Quick-lime*, is an excellent Thing to make *Precipitations* with ; destroying all kinds of Acids almost, and is used to precipitate Solutions of Gold.

If you mix together equal Parts of this Spirit made with *Tartar*, and of Spirit of *Wine*, a *Coagulum* will arise on their being shaken together ; but not if you use the Spirit of *Sal Armoniack* made with *Quick-lime*.

If after either of these Mixtures to make Spirit of *Sal Armoniack* be put into the Body or Retort, Spirit of *Wine* be poured on, and then the Spirit drawn off ; this is called Spirit of *Sal Armoniack* dulcified.

VOLA-

VOLATILE Spirit, is a *Volatile Salt* dissolved in a sufficient Quantity of Phlegm or Water.

VOLATILES are (by some made) a Species of Animals which fly in the Air, as Birds do.

VOLATILITY, is the Property of such mixt Bodies, whose Corpuscles or Particles, of which they are composed, will rise up by that Degree of Heat, as is proper to sublime it.

Mr. Boyle, in his Notes about the Mechanical Production of this Quality of *Volatility*, supposes, or rather proves these four Attributes, or Qualifications, requisite to denominate a Body Volatile.

1. That its constituent Particles, or Corpuscles, be very small; for besides that such Minute Parts are more easily put into Motion by the Action of Fire and Heat, and consequently are more apt to be elevated, than other Parts which are more gross; these can continue their Motion upwards with less Resistance, and with a less Tendency, to descend down by their own Gravity. Wherefore,

2. 'Tis necessary that the Corpuscles of Volatile Bodies, should not only be very small, but they must also not be too solid and heavy; for the great Specifick Weight of such Bodies will hinder them from rising.

3. 'Tis necessary also, that they be conveniently *sloped* for Motion; for if they be of hooked, branched, or any other irregular and catching Figure, tho' they may be both very small and light, yet they will be apt to be entangled one in another, or to hang or stick to other Bodies; and this probably is the Reason why Water is more easily elevated by Heat, and brought to exhale than Oil, tho' it be specifically heavier than it, and its likely hath its Parts smaller too.

4. 'Tis necessary that the Parts do not too closely adhere to one another, so as on that account to be indisposed for the Separation by the Heat of an ordinary Degree of Fire.

And this Honourable Gentleman largely shews, that this Quality of *Volatility* is producible by such Mechanical Means as will produce some or all of the Qualifications above-mentioned.

VOLITION, is an Act of the Mind, knowingly exerting that Dominion it takes it self to have over any Part of the Man, by employing it in, or with-holding it from any particular Action.

VOLSELIA, or *Vulsella*, is an Instrument to pull up Hairs with by their Roots, the same with Tweezers, or a Chyrurgeon's little Tongs, which are of different Shape according to the Diversity of their Use.

VOLUMUS, is the first Word of a Clause in the King's Writs of Protection and Letters-Patents.

Of Protections, some are *Cum clausula Volumus*; and of these there are four Kinds, viz.

1. *Quia Profecturus.*
2. *Quia Moraturus.*
3. *Quia indebitatus nobis existit.*
5. When any one sent out into the King's Service beyond Sea in War, is imprisoned.

VOLUNT, a Law Term, is when the Tenant holds at the Will of the Lessor, or Lord, and that is in two ways.

First, When I make a Lease to a Man of Lands to hold at my *Will*, then I may put him out when I please; but if he sow the Ground, and I put him out, then he shall have his Corn with Egges and Regrets, 'till it be ripe to cut and carry it out of the Ground; and such Tenant at *Will*, is not bound to repair and sustain the House as Tenant for Years is: But if he make wilful Waste, the Lessor shall have against him an Action of *Trespasi*.

The other Tenant at *Will*, of the Lord, is by Copy of Court-Roll, according to the Custom of the Mannor; and such a Tenant may surrender the Land into the Hands of the Lord, according to the Custom, to the Use of another for Life, in Fee, or in Tail; and then he shall take the Land of the Lord, or his Steward, by Copy, and shall make Fine to the Lord.

VOLUTA, in Architecture, is that Part of the Capitals of the *Ionick*, *Corinthian*, and *Composite* Orders, which is supposed to represent the Bark of Trees twisted, and turned into Spiral Lines; or, as some say, the Head-dresses of Virgins in their long Hair. *Voluta's* are different in these three Orders: Those that appear above the Stems in the *Corinthian* Order (according to *Vitruvius*) are 16 in Number in every Capital, whereas there are only 4 in the *Ionick* Order, and 8 in the *Composite*. But these *Voluta's* are more especially remarkable in the *Ionick* Capital, representing a kind of Pillow or Cushion laid between the *Abacus* and the *Echinus*, as if it were to be fear'd lest the Weight of the *Abacus*, or of the *Entablature* above it, might break or deface the *Echinus*; whence the same Ancient Architect took Occasion to call the *Voluta*, *Pulvinus*, or Bolster.

VOLVULUS: See *Ileon* and *Chordapfus*.

VOMER, is a Bone situated in the Middle of the lower Part of the Nose. It has a Cleft in the upper Side, in which Cleft it receives the lower Edge of the *Septum Nasi*. In its further End it receives a small *Apophyse* of the *Sphenoides*, and its under Side joins the *Os Palari*.

VOMICA, is a Fault in the Lungs, from Heterogeneous Blood, which lodged perhaps in one of the little Bladders, or Cells there, occasions neither a Fever nor a Cough; but afterward, when it is encreased, it oppresses the neighbouring Sanguiferous Vessels, and impregnates the Blood as it passes along with its *Effluviuims*; whereupon there succeeds a small Fever, accompanied with Inquietude and Leannels; at last when it is full grown and concocted into Matter, it makes a Nest as it were, and lodges there. *Blanchard*.

VORTEX, according to the *Cartesian* Philosophy, is a System of Particles of Matter moving round like a Whirl-pool, and having no void Interstices, or Vacuities between the Particles. This Vortex thus moving round, will occasion any Bodies that swim in the System, to move round as that doth, and that swifter or slower, according as they are farther off, or nearer to the Centre.

By such *Vortices* as these, they endeavour to solve the Motion of the Heavenly Bodies round the Sun in the Centre of the Vortex. But the Excellent Sir *Isaac Newton* had demonstrated, That the Planets cannot be carried round their Centre by the Motion of any *Corporeal Vortex*: Because if they

they were, the Vortices themselves must be carried round after the same manner as Astronomers have discovered that the Planets perform their Revolutions; which is so, that their Periodical Times are always in a *Sesquialteral Ratio* of their Distances from their Centres; or that the *Squares* of the Times of their Periodical Revolutions are as the *Cubes* of their middle Distances from their Centres.

But he proves, That the Periodical Times of the Parts of the Vortex will always be only as the Squares of their Distances from the Centre of their Motion.

Besides, the Planets, according to the true *Copernican Hypothesis*, being carried about the Sun in Ellipses, and having the Sun in the *Umbilicus* of each Figure, by Lines drawn from themselves to the Sun, do always describe Areas proportional to the Times of their Revolutions, which he shews, the Parts of no Vortex can do: See *Scol. Prop. ult. Lib. 2. Princip.*

Again, as the Ingenious Mr. Keil observes in his Examination of *Dr. Burnet's Theory*: If the Earth were carried in a Vortex, it would move faster, in the Proportion of 3 to 2, when it is in *Virgo*, than when it is in *Pisces*, which all Experience proves to be false: See a large Refutation of all the *Cartesian* Doctrine of the Vortices in *Dr. Gregory's Astronom. Phys. & Geometr. Lib. 1. Sect. 10.*

VOUCHER, is a Term in Law, signifying when the Tenant calls another into the Court, that is Bound to him to Warranty: And 'tis either to defend the Right against the Demandant, or to yield him other Lands, &c. in Value, and extend to Lands or Tenements, of Freehold or Inheritance: And it seems in some measure to agree to the Contract in the Civil Law, whereby the Vendee bindeth the Vendor, sometimes in the simple Value of the Things bought, sometime in the double, to *Warrant* the secure enjoying the Thing bought; yet there is this Difference between the *Civil*, and the *Common Law*, that the *Civil Law* binds every Man to warrant the Security of that which he selleth, which the *Common Law* doth not, except it be specially covenanted.

The Process whereby the *Vouchee* is called, is a *Summons ad Warrantandum*: And if the Sheriff return upon that Writ, that the Party hath nothing whereby he may be summoned, then goes out another Writ called, *Sequentur sub suo periculo*

A Recovery with a *single Voucher*, is, when there is but one *Voucher*: And with a *double Voucher*, is, when the *Vouchee* voucheth over, and so a *treble Voucher*.

There is also a *Foreign Voucher*, when the Tenant being impleaded in a particular Jurisdiction of that Court, which might more aptly be called a *Voucher* of a Foreign.

Voucher signifies also a *Leiger-Book*, or Book of Accompt, wherein are entered the Acquittances or Warrants for the Accomptant's Discharge.

VOYDANCE, is a Want of an Incumbent upon a Benefice, and this double, either in Law, as when a Man hath more Benefices incompatible; or in *Deed*, as when the Incumbent is dead, or actually deprived.

UPRIGHT *South Dyals*: See *Prime Verticals*.

URACHUS, is one of the Umbilical Vessels, being a small Membranous round Pipe, with a very strait Cavity arising from the bottom of the Bladder up to the Navel, out of which it passes along with the common Cover, and opens into

the *Allantoides* of the *Fetus*: 'Tis more pervious in some of the larger Brutes than in Men, in whom some have denied it to be hollow; but that seems contradicted by the Instances we have had of Mens making Water by the Navel, when the Passage of the *Penis* hath been quite stopped. *Bartholin* and some others say, That the *Urachus* in Men reaches no farther than the Navel: But how then comes that Humour into the *Allantoides*, which has perfectly the same Taste with the Urine in the Bladder? The Mistake seems to arise from that wrong Notion, That a *Humane Fetus* hath no *Allantois*, which hath been by *Needham* and others sufficiently refuted.

The Use of the *Urachus* is to convey the Urine from the Bladder of the *Fetus* into the *Allantoides*, which is placed between the *Chorion* and the *Amnion*.

URETER, is a *Fistulous Membranaceous Vessel*, which proceeds from both Reins, and opens between the Membranes of the Bladder, by which the Urine passes from the Reins to the Bladder; *Celsus* calls it the *White Vein*.

URETHRA, or *Fistula*, is the Urinary Passage, whereby the Urine is discharged: It serves in Males also for the Ejection of the Semen. The Seminal little Bladders empty themselves into it by 2 Holes at the beginning of it, when there is occasion; which Bladders or Vessels are surrounded with Glandulous Prostates, perforated with several Holes, to which there is a little piece of Flesh affixed. *Blanchard*.

Mr. *Comper* observes, That the *Urethra* hath a *Corpus Cavernosum*, like to that of the *Penis*, which you will find described under the Words *Corpora Cavernosa*; but this of the *Urethra*, differs much in Figure from them: The superior Part of this *Corpus Cavernosum* lying between the two *Crura* of the former, he calls *Bulbus*, from its Figure; it is covered with the *Musculus Accelerator Urinae*; it possesseth all the lower Part of the *Urethra*, extending its self in the *Perineum*; it hath moreover, a *Septum Intermedium* (tho' not taken Notice of by Anatomists) dividing the right Side of the *Bulbus* from the left, which descending to the End of the *Bulbous Part*, is there obliterated.

The Use of this *Septum* is (as Mr. *Comper* thinks) to direct the *Refluent Blood* to the exporting Ducts, its two Veins that carry the *Blood back*.

As this *Corpus Cavernosum* descends on the inferior Part of the *Urethra*, it is lessened; but when it approaches the Extremities of the two other *Corpora Cavernosa* it again dilates it self and covers them, composing that Body which they call the *Glans* or *Balanus*.

URINOUS Salts, are that Tribe of Volatile Salts drawn from Animal, or other Substances that are contrary to Acids: And Mr. *Boyle* says, They are distinguishable from *Lixiviat Salts*, by this Test, That they will turn a Solution of Sublimate into a *White Colour*, whereas *Lixiviate Salts* turn it into a *Yellow one*.

URSA *Major*, a Northern Constellation, consisting of 27 Stars, and is otherwise called *Charles's Wain*, and the *Great Bear*.

USAGE: See *Prescription*.

USE, in Law, properly signifies the Profits or Benefits of Lands or Tenements: For every Deed consists of 2 principal Parts; namely, *The Premises*, and the *Consequents*.

The Premises, is the former Part thereof, being all that which precedeth the *Habendum*, or Limitation of the *Estate*, which are the Persons contracting, and the Thing contracted.

The Consequent is that which follows the *Premises*, and that is the *Habendum*, in which are two Limitations: The one of the *Estate* or Property, which the Party Passive shall receive by the Deed: The other of the *Use*; which is to express in the said *Habendum*, to or for what *Use* and Benefit he shall have the same *Estate*, and of the Limitation of such *Uses* many Precedents are set down in Law Books.

USER de Añion, a Term in Law, signifying the pursuing or bringing an *Añion*, which in what Place and Country it ought to be; See *Bro. tit. Lieu and Country*, Fol. 64.

USUCAPTION, in Law, signifies the enjoying a Thing by continuance of Time, or receiving the Profits, long Possession or Prescription.

USURY, is the Gain of any thing above the Principal, or that which was lent; exact only in Consideration of the Loan, whether it be Money, Corn, Apparel, Wares, or such like.

UTERUS, the Womb, an Organical Part, wherein Generation and Conception are made, being seated in the *Hypogastrium*.

UTLAGATIO Viri.

UTLAGATO *capiendo quando utlagatur in uno comitatu & postea fugis in alium*, is a Writ, the Nature whereof is sufficiently exprest by the Name.

UTLARY, or *Utlawry*, is a Punishment for such as being called into Law, and lawfully sought, do contemptuously refuse to appear after an *Original Writ*, with a *nihil habet*, three Writs of *Capias*, *Alias* & *Pluries*, returned by the Sheriff *non est inventus*, and an *Exigent* with a Proclamation, thereupon awarded. And *Bracton* says, he must be called at five Counties, a Month between every County; and if he appear not within that Time, he shall be pronounced out of the King's Protection, and deprived of the Benefit of the Law. The Effect of this is divers; for if he be *Outlawed* at the Suit of another in a civil Cause, he shall forfeit all his Goods and Chattels to the King. If upon Felony, then he shall forfeit all his Lands and Tenements which he hath in Fee, or for Life, and his Goods and Chattels. A Minor nor Woman cannot be *Outlawed*: For where a Man is said to be *Outlawed*, a Woman is termed *Waived*.

UTRUM: See *Affise*.

UTTER-BARRISTERS, are such, who for their long Study, and great Industry bestowed upon the Knowledge of the Common Law, are called from their Contemplation to Practice, and in the Face of the World, to take upon them the Protection and Defence of Clients; the Time before any ought to be called to the Bar, was formerly eight Years, but now reduced to seven; and the Exercises done by him (if he were not called, *Ex gratia*) was Twelve *Grand Moats* performed in the Inns of Chancery, in the Time of the Grand Readings, and Twenty four *Petty Moats*, at the Inns of Chancery, in the Term-times, before the Readers of the respective Inns of Chancery.

A *Barrister* newly called, is to attend the six next long Vacations, the Exercises of the House, *viz.* in *Lent* and *Summer*, and is therefore for those three Years called, a *Vacation-Barrister*.

And they are also called, *Utter-Barristers*, *i. e.* Pleaders without the Bar, to distinguish them from Benchers, or those that have been Readers, who are sometimes admitted to plead within the Bar, as the King's, Queen's, or Prince's Council are.

UVA, the same with *Cion*; which see.

UVEA Membrana sive Tunica, is the Fore-part of the *Choroides*; being almost altogether continuous on the Inside to the *Tunica Sclerotic*; it is perforated in the Fore-part, and leaves a Space for the Apple of the Eye, which may be contracted or dilated: Its exterior Surface is of various Colours, whence it is called *Iris*, and in this is the Difference of Mens Eyes as to Colour; as Black, Grey, &c. The Inside of this Uveous Tunick is cover'd with a Black Lining, that the Cavity of the Eye may be the darker.

UVIGENA, or *UVIGERA*, the same with *Cion*.

VULGAR Fractions: See *Fractions*.

VULTUR Volans: See *Aquila*.

UVULA, is a double Production of the Internal Membrane of the Mouth; its Substance is very lax, and it has a Number of small Glands as in the Palate: It is somewhat long and of a Conick Figure: It hangs from the Roof of the Mouth near the Passage which comes from the Nose, above the Seat of the Larynx between the Tonfils: It is moved by 2 Pair of Muscles, called *Pterigostaphilinus Externus* & *Internus*: Its Use is to hinder Drink, &c. from falling down into the *Aspera Arteria*.

W A K

WADHOOK, among the Gunners, is a Rod or great Wyre of Iron, turn'd in a Serpentine manner; and in its End, is put upon a Handle or Staff, to draw out *Wads* or *Okum*, that the Piece may be unloaded.

WAF: To waft a Ship, is to convey her safe, as Men of War do by Merchants Ships. But to *make a Waft*, is to hang out some Coat, Sea-gown, or the like, in the main Shrowds of the Ship, as a Sign for Men to come on Board, &c. And often such a *Waft*, is a Sign a Ship is in great Danger by a Leak, &c. and therefore wants Help from the Shore, or from some other Ship.

WAGONER: See *Charles Wayn*.

WAI*FE*, or *Weyfe*, is, when a Thief having feloniously stolen Goods, and being nearly followed with *Huy and Cry*, or else overcharged with the Burden or Trouble of the Goods; for his own Ease, and more speedy Flight, flies away and leaves the Goods behind him; then the King's Officer, or the Bailiff of the Lord of the Mannor, (within whose Jurisdiction they be left) who by Prescription or Grant from the King, hath the Franchise of *Waife*, may seize the Goods for waiv'd his Lord's Ufe, except the Owner come with fresh Suit after the Felon, and sue an Appeal within a Year and a Day, or give Evidence against him at his Arraignment, &c. In which Cases, the first Owner shall have Restitution of his Goods so stolen and *waived*. *Waifes* also signifie Things lost, and Estrays, which must by the Lord of the Franchise where they are found, be cauled to be Cried and Published in Markets and Churches near about, else the Year and Day does not run to the Prejudice of the Lifer.

WAI*VE*, is a Woman that is Outlaw'd; and she is called *Waive*, as forsaken of the Law, and not an *Outlaw*, as a Man is; for Women are not Sworn in Leets to the King, nor to the Law, as Men are, who therefore are within the Law; whereas Women are not, and for that Cause they cannot be *Outlawed*, since they never were within it.

WAKE of a Ship, is the smooth Water that runs from a Ship's Stern, when she is under Sail. This is also called her Wake; and by it a good Guess may be made of the *Speed* she makes. And particularly, they judge from this *Wake*, whether a Ship go *as she looks*, (as they expect it) *i. e.* whether she makes her Way right as her Head lies, as the doth, when her *Wake is right a Stern*: But if this *Wake* be a Point or two to Leeward, they judge that she slides and falls to the Leeward of her Course.

They say also, when a Ship *lays a Weather of Wake*; that is, when in her Slaying, she is so quick, that she don't fall to Leeward upon a Tack, but that when she is tack'd, her *Wake* is to Leeward; then 'tis a Sign that she feels her Helm very well, and is nimble of Steerage.

Also, when one Ship giving Chase to another, is got as far into the Wind as she, and sails directly after her, they say, *She is got into her Wake*.

WALE, or *Wail*; a Term at Sea for those utmost Timbers in Ship's Side, on which Men set

W A R

their Feet when they clamber up a Ship's Side. These are reckoned from the Water, and called her 1st, 2d, or 3d *Wale* or *Bend*.

WALE-Knot, is a round Knot or Knob made with three Strands of a Rope, so that it cannot slip, by which (in a Ship) the *Tacks*, *Top-sail Sheets*, and *Stoppers* are made fast: As also, some other Ropes.

WALE-Reared; so the Seamen call a Ship, when after she comes to her Bearing, she is not narrow in her upper Work, nor *bowed in*, as their Word is, but is built straight up. Which Way of Building, tho' it don't look well, nor is, as they say, *Ship-shaken*, yet it hath this Advantage, That a Ship is thereby more *Roomy* within-board; that is, she is larger within, and also becomes thereby a *Holsum Ship in the Sea*, especially if her Bearing be well laid out.

WALT; a Ship is *Walt*, when she hath not her due Ballast, *i. e.* not enough to enable her to bear her Sails.

WALVIARIA *Mulieris*, a Term in Law, signifying as much as *Ulagatio Viri*, or the Outlawing of a Man: See *Ulagation*.

WAPP, is that Rope in a Ship wherewith the Shrowds are set taught with *Wale-knots*; one End is made fast to the Shrowds, and to the other are brought the Laniards.

WARD, is a Word that has divers Significations; as a *Ward* in London, is a Portion of the City committed to the special Charge of one of the Aldermen of the City. Also, a Forest is divided into *Wards*. And a Prison is called a *Ward*. As also, the Heir of the King's Tenant, that held by Knight's Service, or in *Capite*, was called a *Ward* during his Nonage. But this last is taken away by the *Stat. 12. Car. 2. cap. 24*.

WARDEN, being the same with Guardian, but is commonly used for him that hath the Custody and Charge of any Person or Thing, by Office.

WARNING-Wheel, in a Clock, is the *Third* or *Fourth Wheel*, (according to its Distance from the *First Wheel*.)

WARP; to *warp* a Ship, is to hale her up by a Hawser, or any other Rope, (sufficient for that purpose) with an Anchor bent to it. It's used when a Wind is wanting to carry her into, or out of a Harbour; and this is termed *Warping*; and the Hawser, or any Rope sufficient, and used to hale her up, is called a *Warp*.

WARRANT of Attorney, is that whereby a Man appoints another to do something in his Name, and warranteth his Action. It seems to differ from a *Letter of Attorney*, which passeth usually under the Hand and Seal of him that makes it before any creditable Witnesses; whereas a *Warrant of Attorney*, in Personal, Mixt, and some Real Actions, is put in of course by the Attornies, for the Plaintiffs or Demandants, Tenants or Defendants. But a *Warrant of Attorney* to suffer a Common Recovery by the Tenant or Vouchee, is acknowledged before such Persons, as a Commission for the doing thereof directs.

WAR-

WARRANTIA Charta, is a Writ that lies for him, who being infeoff'd in Lands or Tenements with a Clause of Warranty, and is-impleaded in an *Affize*, or *Writ of Entry*, wherein he cannot Vouch or Call to *Warranty*: For in this Case his Remedy is to take out this Writ against the Feoffor or his Heirs.

WARRANTIA Diei, is a Writ lying in Case where a Man having a Day assign'd Personally to appear in Court to any Action wherein he is Sued, is in the mean Time, by Commandment, employ'd in the King's Service, so that he cannot come at the Day assign'd; this Writ is directed to the Justices, to the End that they may neither take, nor record him in Default for that Day.

WARRANTY, is a Promise or Covenant by Deed made by the Bargainer, for himself and his Heirs, to warrant or secure the Bargainee and his Heirs, against all Men, for the enjoying any thing agreed on between them, and this *Warranty* passeth from the Seller to the Buyer, from the Feoffor to the Feoffee, from him that releaseth, to him that is released from an Action real, and such like. *Warranty*, is either *real* or *personal*: *Real*, when it is annexed to Lands or Tenements granted for Life, &c. And this is either in *Deed*, or in *Law*: *Personal*, which either respects the Property of the Thing sold, or the Quality of it. *Real Warranty*, in respect of the Estate, is either *Lineal*, *Collateral*, or *commencing by Disseisin*; of which *Littleton* gives an Account in the last Chapter of his Tenure.

WASTE Boards, are Boards sometimes set upon the Sides of a Boat, to keep the Sea from breaking into her.

WASTE-Cloths, are Cloths hung up on the uppermost Work of a Ship's Hull, to shadow the Men from an Enemy in the Fight; and therefore by some they are called *Fights*.

WASTE-Trees, are those Timbers of a Ship which lie in the Waste.

WASTE of a Ship, is that Part of her between the two Masts, i. e. between the *Main-mast* and the *Fore-mast*.

WASTE, in Law, hath divers Significations.

First, It is a Spoil, made either in Houses, Woods, Lands, &c. by the Tenant for Life, or Years to the Prejudice of the Heir, or of him in Reversion or Remainder; whereupon the *Writ of Waste* is brought for the Recovery of the Thing wasted, and treble Damages.

Waste of the Forest, is most properly where a Man cuts down his own Woods within the Forest, without Licence of the King, or Lord-Chief-Justice in Eyre.

Secondly, *Waste* is taken for those Lands, which are not in any Man's Occupation, but lie common; which seem to be so called, because the Lord cannot make such Profit of them, as of his other Lands, by reason of that Use which others have of it, in passing to and fro: Upon this none may build, cut down Trees, dig, &c. without the Lord's Licence.

WATCH, at Sea, signifies the Space of 4 Hours, because half the Company or Crew watch and do Duty in their Turns, so long at a Time. All a Ship's Company is divided into two Parts, the *Larboard* and the *Starboard* Watch. The *Master* of the Ship Commands the latter, and the *Chief Mate* the former. Sometimes, when a Ship is in Harbour, they watch but a *Quarter-watch*, as they call it;

that is, but a quarter of the Company watch at a Time; because they have then but little to do, or look after.

WATCH-Glass, being four Hours, is used at Sea, to shift or change their Watches. There are also *Half-watches*, *Hour-glasses*, *Minute*, and *half Minute-glasses*; by which last, they count the Knots when they leave the Log, in order to find the Ship's Way.

WATCH-work, is the internal Parts of any Movement or Watch, which is designed to shew the Hour, or any other Division of Time without Striking; for whatever is contrived to produce that Effect, is called *Clock-work*; and that Part of the Movement is called the *Striking-part*.

The general Rules for the Calculation of *Watch-work*, are reducible to these Heads.

1. 'Tis certain that the same Motion may be perform'd either with one Wheel and one Pinion, or by many Wheels and many Pinions, provided that the Number of Turns of all those Wheels bear the Proportion to all those Pinions, which that one Wheel bears to its Pinion; or (which is the same thing) that the Number produced by multiplying all the Wheels together, be to the Number produced by multiplying all the Pinions together, as that one Wheel is to that one Pinion.

Thus, suppose you had Use for a Wheel of 1440 Teeth, with a Pinion of 28 Leaves, you may make it into three Wheels and Pinions, viz.

$$4) 36, 7) 8, 1) 5.$$

For if the three Wheels 36, 8 and 5, be multiply'd together, 'twill give 1440 for the Wheels, and if the 3 Pinions 4, 7 and 1, be also multiplied together, you'll have 28 for the Pinions.

It matters not in what Order the Wheels and Pinions are set, or which Pinion runs in which Wheel; only for Contrivance sake, the biggest Numbers are commonly set to drive the rest.

2. Two Wheels and Pinions of different Numbers may perform the same Motion. As a Wheel of 36 drives a Pinion of 4, all one as a Wheel of 45 drives a Pinion of 5; or a Wheel of 90 drives a Pinion of 10. The Turns of each are 9.

3. If in breaking your Train into Parcels, any of your Quotients should not please you; or if you would alter any other two Numbers which are to be multiplied together, you may vary them by this Rule. Divide your two Numbers by any two other Numbers which will measure them; then multiply the Quotients by the alternate Divisors; the Product of these two last Numbers found, shall be equal to the Product of the two Numbers first given.

Thus, if you would vary 36 times 8, divide these by any two Numbers that will evenly measure them; as 36 by 4, it gives 9; and 8 by 1, it gives 8; now (by the Rule) 9 times 1 is 9, and 8 times 4 is 32: (See the Operation.)

$$\begin{array}{r} 9 \quad 8 \\ 36 \times 8 \\ \hline 4 \quad 1 \\ 32 \times 9 \end{array}$$

So that for 36×8 , you have 32×9 , which is equal to it, and each equal to 288.

And if you Divide 36 by 6, and 8 by 2, then Multiply, as before is said, you'll have $24 \times 12 = 36 \times 8 = 288$.

$$\begin{array}{r} 6 \quad 4 \\ 36 \times 8 \\ \hline 6 \quad 2 \\ 24 \times 12 \end{array}$$

4. If it happens that you have a Wheel and Pinion fall out with cross Numbers, too big to be cut in Wheels, and yet not to be altered by the former Rules; then in seeking for your Pinion of Report, you may find out two Numbers of the same, or a near Proportion, by this Rule, viz. As either of the two given Numbers Is to the other :: So is 360 To a fourth. Divide that fourth Number, as also 360 by 4, 5, 6, 8, 9, 10, 12, 15, (each of which Numbers doth exactly measure 360) or by any one of those Numbers that bringeth a Quotient nearest to an Integer.

As suppose you had these two Numbers, 147 the Wheel, and 170 the Pinion, which are too great to be cut into small Wheels, and yet cannot be reduced into less, because they have no other common Measure, but Unity; Say therefore, As 170 : 147 :: 360 : 311. Or as 147 : 170 :: 360 : 416. Divide the 4th Number, and 360 by one of the foregoing Numbers;

- 6) 311 (52 as 311 and 360 by 6, it gives 52
360 (60 and 60; Divide them by 8, you
8) 311 (39 will have 39 and 45. Also, if you
360 (45 Divide 360 and 416 by 8, you'll
have 45 and 52 exactly. Where-

fore instead of the two Numbers 147 and 170, you may take 52 and 60, or 39 and 45, or 45 and 52, &c.

5. When you come to Practice in Calculating a Piece of Watch-work, the first thing you are to do, is, to pitch upon your Train or Beats of the Balance in an Hour; as whether a swift Train, of about 20000 Beats, (which is the usual Train of a common 30 Hour Pocket-watch) or a slower Train of about 16000, (the Train of the new Pendulum Pocket-watches) or any other Train.

Having chosen your Train, then resolve upon the Number of Turns you intend your Fusy shall have, and upon the Number of Hours you would have your Piece to go: As suppose 12 Turns, and to go 30 Hours, or 192 Hours (*i.e.* eight Days,) &c.

Then proceed to find out the Beats of the Balance or Pendulum in one Turn of the Fusy, by the Direction given under the Word Beat, thus in Numbers, 12 : 16 :: 20000 : 26666. Wherefore, 26666 are the Beats in one Turn of the Fusy or great Wheel, and are equal to the Quotients of all the Wheels unto the Balance multiplied together: But now this Number is to be broken

into a convenient Parcel of Quotients; which is to be done thus:

First, halve your Number of Beats, viz. 26666, and you'll have 13333; then pitch upon the Number of your Crown-wheel, as suppose 17. Divide 13333 by 17, and you'll have 784 for the Quotients (or Turns) of the rest of the Wheels and Pinions; which being too big for one or two Quotients, may be best broken into three; chuse therefore three Numbers, which when multiplied all together continually, will come nearest 784. As suppose 10, 9 and 9, multiplied continually, gives 810, which is somewhat too much; therefore try again other Numbers, 11, 9 and 8; these drawn one into another continually produce 792, which is as near as can be, and convenient Quotients.

Having thus contrived your Piece from the great Wheel to the Balance; but the Numbers not falling out exactly, according as you at first proposed, you must correct your Work thus:

First, (by the Direction given under the Word Beats) Multiply 792, (the Product of all the Quotients pitched upon) by 17, the Notches of the Crown-wheel, the Product is 13464, which is half the Number of Beats in one Turn of the Fusy; then (by a Rule given under the Word Beat) find the true Number of Beats in an Hour.

Thus, 16 : 12 :: 13464 : 10098, which is half the Beats in an Hour.

Then find what Quotient is to be laid upon the Pinion of Report (by the Rule given under that Word.)

Thus, 16 : 12 :: 12 : 9, the Quotient of the Pinion of Report.

Now having found your Quotients, 'tis easie to determine what Numbers your Pinions shall have; for chuse what Numbers your Wheels shall have, and multiply the Pinion by their Quotients, and that produceth the Number for your Wheels, as you see in the Margin.

4) 36 (9
5) 55 (11
5) 45 (9
5) 40 (8
17

Thus the Number of your Pinion of Report is 4, and its Quotient 9, therefore the Number for the Dial-wheel must be $4 \times 9 = 36$; so the next Pinion being 5, its Quotient 11, therefore the great Wheel must be $5 \times 11 = 55$, and so of the rest.

Thus you have the common and practical Method of Calculating the Numbers of a 16 Hour Watch.

And this Watch may be made to go a longer Time by lessening the Train, and altering the Pinion of Report.

As suppose you could conveniently slacken the Train to 16000, then by the Rule given under the Word Beat, say, As $\frac{1}{2}$ 16000, or 8000 : 13464 :: 12 : 20. So that this Watch will go 20 Hours.

Then for the Pinion of Report, say, (by the Rule given under that Word) As 20 : 12 :: 12 : 7. So that 7 is the Quotient of the Pinion of Report.

And as to the Numbers, the Operation is the same as before, only the Dial-wheel is but 28, for its Quotient is altered to 7.

But if you would give Numbers to a Watch of about 10000 Beats in an Hour, to have 12 Turns of the Fusy, to go 170 Hours, and 17 Notches in the Crown-wheel.

$$\begin{array}{r} 4) 28 (7 \\ 5) 55 (11 \\ 5) 45 (9 \\ 5) 48 (8 \end{array}$$

The Work is the same in a manner, as in the last Example, and consequently thus :

As 12 : 170 :: 10000 : 141666, which fourth Number are the Beats in one Turn of the Fusy ; Its half 70833 being divided by 17, gives 1467 for the Quotients. And because this Number is too big for three Quotients, therefore chuse four, as 10, 8, 6, whose Product into 17 maketh 71808, nearly equal to half the true Beats in one Turn of the Fusy.

Then say, as 170 : 12 :: 71808 : 5069, which is half the true Train of your Watch.

And say again, 170 : 12 :: 12 : $\frac{244}{17}$, (or 170) 144, which expresses the Pinion of Report, and the Number of the Dial-wheel.

But these Numbers being too big to be cut in small Wheels, therefore they must be varied by the fourth Rule of this, saying,

As 144 : 170 :: 360 : 425.
Or 170 : 144 :: 360 : 305.

Then dividing 360, and either of these two fourth Proportionals, (as directed by the Rule) suppose by 15, you'll have $\frac{24}{5}$ or $\frac{32}{5}$; then the Numbers of the whole Movement will stand thus :

24)	20	($\frac{24}{5}$)
6)	60	(10)
6)	48	(8)
5)	40	(8)
5)	33	($6\frac{2}{3}$)
	17	

Thus much may serve concerning the Calculation of ordinary Watches, to shew the Hour of the Day : But in such as shew Minutes and Seconds, the Process is thus :

First, having resolved upon your Beats in an Hour, then by dividing your designed Train by 60, find the Beats in a Minute ; and accordingly, find out such proper Numbers for your Crown-wheel and Quotients, as that the Minute-wheel shall go round once in an Hour, and the Second-wheel once a Minute.

As suppose you should chuse a Pendulum of six Inches to go 8 Days, with 16 Turns of the Fusy ; a Pendulum of 6 Inches (by Mr. Smith's Tables in *Horol. Diss.*) vibrates 9368 in an Hour ; and consequently, dividing it by 60, gives 156, the Beats in a Minute. Half these Sums are 4684 and 78. Now the first Work is to break this 78 into good Proportion ; which will fall into one Quotient, and the Crown-wheel. Let the Crown-wheel have 15 Notches ; then 78 divided by 15, gives 5 ; so

8) 40 (5
15

8) 64 (8
8) 60 (7
8) 40 (5

to shew Seconds. Next for a Hand to go round in an Hour, to shew Minutes. And because there are 60 Minutes in an Hour, 'tis but breaking 60 into good Quotients (as suppose 10 and 6, or 8 and 7, or &c.) and 'tis done.

Thus 4684 is broken, as near as can be, into proper Numbers.

But since it don't fall out exactly into the above-mentioned Numbers, you must correct (as you

were directed before) and find out the true Number of Beats in an Hour, by multiplying 15 by 5, which makes 75 ; and 75 by 60, makes 4500, which is the half of the true Train. Then find the Beats in one Turn of the Fusy, thus, 16 : 192 :: 4500 : 54000 ; which last are half the Beats in one Turn of the Fusy. This 54000 being divided by 4500, (which are the true Numbers already pitched upon) the Quotient will be 12, which being not too big for one single Quotient, needs not be divided into more, and the Work will stand thus :

As to the Hour-hand, the great
9) 108 (12 Wheel which performs only one
8) 64 (8 Révolution in 12 Turns of the Mi-
8) 60 (7 $\frac{1}{2}$ nute-wheel, will shew the Hour ;
8) 40 (5 or you may order it to be done by
15 the Minute-wheel.

For the Calculation of the Striking Part of any Clock, observe these Directions.

1. Consider that here you need have regard only to the *Count-wheel*, *Striking-wheel*, and *Detent-wheel*, which move round in this Proportion.

The *Count-wheel*, commonly goes round once in 12 or 24 Hours : The *Detent-wheel* moves round every Stroke the Clock striketh, or sometimes but once in two Strokes ; wherefore it follows, That,

2. As many Pins as are in the Pin-wheel, so many Turns hath the Detent-wheel in one Turn of the Pin-wheel ; or (which is the same) the Pins of the Pin-wheel, are the Quotient of that Wheel, divided by the Pinion of the Detent-wheel. But if the Detent-wheel moveth but once round in two Strokes of the Clock, then the said Quotient is but half the Number of Pins.

3. As many Turns of the Pin-wheel as are required to perform the Strokes of 12 Hours, (which are 78) so many Turns must the Pinion of Report have, to turn round the Count-wheel once : Or thus, the Quotient of 78 divided by the Number of Striking-pins, shall be the Quotient for the Pinion of Report, and the Count-wheel ; and this is in case the Pinion of Report be fixed to the Arbor of the Pin-wheel, as is commonly done. This Example will make all plain : The Locking-wheel being 48, the Pinion of Report 8, the Pin-wheel 78, the Striking-pins are 13, and so of the rest. Note also, That 78 divided by 13, gives 6, the Quotient of the Pinion of Report.

As for the *Warning-wheel* and *Flying-wheel*, it matters little what Number they have, their Use being only to bridle the Rapidity of the Motion of the other Wheels.

4. The following Rules will also be of great Use in this kind of Calculation ; and by their Help these Problems may readily be resolved.

1. To find how many Strokes the Clock striketh in one Turn of the Fusy or Barrel.

As the Number of Turns of the Great-wheel, or Fusy, is to the Days of the Clock's continuance : So is the Number of Strokes in 24 Hours, viz. 156, To

to the Strokes in one Turn of the Fusy or Great-wheel.

2. To find how many Days the Clock will go.

As the Number of Strokes in 24 Hours, viz. 156, Is to the Strokes in one Turn of the Fusy : : So is the Turns of the Fusy or Great-wheel, To the Days of the Clock's Continuance or Going.

3. To find the Number of Turns of the Fusy or Barrel.

As the Strokes in one Turn of the Fusy, Is to the Strokes in 24 Hours, viz. 156 : : So is the Clock's Continuance, To the Number of Turns of the Fusy or Great-wheel.

4. To fit the Pinion of Report on the Spindle of the Great-wheel.

As the Number of Strokes in the Clock's Continuance, or in all its Turns of the Fusy, to the Turns of the Fusy : : So are the Strokes in 12 Hours, which are 78, To the Quotient of the Pinion of Report, fixed upon the Arbor of the Great-wheel.

5. To fix the Pinion of Report to any Wheel.

Divide 78 by the Number of Strokes in one Turn of the Wheel you intend to fix your Pinion of Report upon, and your Quotient shall be that of the Pinion of Report.

6. To find the Strokes in the Clock's Continuance, viz.

As 12 : Is to 78 : : So are the Hours of the Clock's Continuance : To the Number of Strokes in that Time.

Or thus rather ; Multiply the Strokes in one Turn of the Great-wheel by the Number of Turns of the Fusy, the Product are the Strokes in the Clock's Continuance.

The Use of these Rules appears plain by the following Examples.

1. In small Pieces ; having pitched upon the Number of Turns, and the Continuance of your Clock, find (by Rule 6.) the Strokes in its Continuance ; then (if you make the Great-wheel the Pinion-wheel) divide these Strokes by the Number of Turns, and you have the Number of Striking-pins ; Or divide by the Number of Pins, and you have the Number of Turns.

Thus a Clock of 30 Hours, with 15 Turns of the Great-wheel, hath 195 Strokes.

For (by Rule 6.) $12 : 78 :: 30 : 195$.

Dividing by $\left\{ \begin{array}{l} 15 \\ 13 \end{array} \right\}$ 195 $\left\{ \begin{array}{l} 13 \\ 15 \end{array} \right\}$ the Striking-pin.
15, the Number of Turns.

2. In Calculating the Numbers of a Clock of much longer Continuance, you must make your Pin-wheel further distant from the Great-wheel : And having pitched upon your Turns, find out the Number of Strokes in one Turn of the Great-wheel or Fusy, (by Rule 1.) Thus in an 8 Day Piece of

16 Turns, As $16 : 8 :: 156 : 78$. Also, in a Piece of 32 Days and 16 Turns, $16 : 32 :: 156 : 312$.

These Strokes thus found, are the Number which is to be broken into a convenient Parcel of Quotients, thus :

First, resolve upon the Number of your Striking-pins, by which divide the last mentioned Number, the Quotient arising shall be one or more Quotients for the Wheels and Pinions. Thus in the Month-piece, if you take your Pins 8, divide 312 by it, the Quotient is 39 ; but that being too big for one must be cut into two Quotients for Wheels and Pinions, or as near as possible, which are either 7 and 5, or $6\frac{1}{2}$, and 6, which last is equal to 39, and therefore may stand, and 'twill be thus :

10) 65 ($6\frac{1}{2}$
8) 48 (6
6) 48 (8 Pins.

The Quotient being thus determined, and accordingly the Wheels and Pinions ; then find a Quotient for the Pinion of Report, to carry round the Count-wheel once in 12 Hours, or as you please. If you fix your Pinion of Report on the Great-wheel Arbor, you must work by the fourth Rule.

Thus in the last Example, the Strokes in the Continuance are 4992 (by Rule 6.) then (by Rule 4.) as $4992 : 16 :: 78 : \frac{4992}{16}$, or 4992) 1248, which is the Pinion and the Wheel.

But these Numbers being not the usual Numbers of a Month-piece, but only made use of here for Illustration sake ; and in Practice they commonly increase the Number of Strikings, and so make the Second-wheel the Striking-wheel. Suppose you take 24 Pins, divide 312 by it, and the Quotient is 13, which is little enough for one Quotient, and may therefore stand thus :

8) 104 (13
6) 72 (12, 24 Pins ;

Where the Quotient of the First-wheel is 13. In the Second-wheel of 72 Teeth, are the 24 Pins, altho' its Quotient is but 12, because the Hoop-wheel is double, and goes round but once in two Strokes of the Pin-wheel. In this the Pinion of Report is the same with the last, if fixed upon the Arbor of the Great-wheel. But if fixed on the Arbor of the Second or Pin-wheel, its Quotient is found by Rule 5, viz. 78 divided by 24, gives the Quotient of the Pinion of Report $3\frac{1}{2}$, thus 12) 39 ($3\frac{1}{2}$ The Pinion of Report being then 12, the Count-wheel will be 39.

The Calculation of a Year-piece is the same ; however, to perfect the Reader therein, we shall give this Example.

Suppose your Piece were to go 395 Days with 16 Turns, and 26 Striking-pins. There are 3851 Strokes in one Turn of the Great-wheel (by the Rule 1.) for $16 : 395 :: 156 : 3851$. And 3851 divided by 26, leaves 148 to be broken into Quotients, for Wheels and Pinions, which may be 12 and 12 ; for 12 into 12, gives 144, which is as near as it can well be to 148 ; then the Work stands thus :

10) 120 (12
8) 96 (12
78 (26 Pins.

In this Place, it would not be amiss for you to correct your Work, and see how near your Number comes to what you designed at first, because they did not fall out exact.

First, for the true Continuance of your Clock, Multiply the Quotients and Striking-pins together, and you'll have the true Number of Strokes in one Turn of the Great-wheel. So here, $12 \times 12 \times 26 = 3744$, which is the true Number of Strokes; then the true Continuance (by Rule 2) is 384, for

As 156 : 3744 :: 16 : 384

If this Continuance doth not please you, you may come nearer to your first proposed Number of 395 Days by a small Encrease of the Number of Turns, (by Rule 3) viz. making your Turns almost $16\frac{1}{2}$; for,

As 3744 : 156 :: 395 : $16\frac{1}{2}$ near.

But for the Pinion of Report, if you fix it on the Great-wheel, it will require an excessive Number; if you fix it upon the Pin-wheel, which is usual, then (by Rule 5) it will stand thus, 13) 39 (3 the Quotient is 3, the Pinion of Report 13, and the Count-wheel 39.

If to any Clock it be required to fit Quarters or Chimes, &c. you may proceed thus.

1. You are to consider, that Quarters are generally a distinct Part from the Clock-part, which striketh the Hour; and the Striking-wheel may be the First, Second-wheel, &c. according to your Clock's Continuance; unto which Wheel you may fix the Pinion of Report.

The Locking-wheel must be divided into 4, 8, or more unequal Parts, so as to strike the Quarter, and lock at the first Notch, or the Half Hour, and lock at the second Notch, &c. And in doing this you may make it to Chime the Quarters, or strike them upon two Bells, or more.

'Tis usual for the Pin-wheel or the Locking-wheel to unlock the Hour-part in these Clocks; which is easily done by some Jogg or Latch, at the End of the last Quarter, to lift up the Detents of the Hour-parts.

If you would have your Clock strike at the Half Hour, as well as whole Hour, you must make the Locking-wheel of the Hour-part double; that is, it must have two Notches of a sort, to strike 1, 2, 3, 4, &c. twice a-piece.

2. As for Chimes, I need say nothing of the Lifting-pieces and Detents, to lock and unlock; nor of the Wheels to bridle the Motion of the Barrel; only you are to observe, That the Barrel must be as long in turning round, as you are in Singing the Tune it is to Play.

As for the Chime-Barrel, it may be made up of certain Bars that run athwart it, with a convenient Number of Holes punched in them, to put in the Pins that are to draw each Hammer. By this means you may change the Tune, without changing the Barrel. Such is the Royal-Exchange Clock

in London, and others. In this Case, the Pins or Nut which draw the Hammers, must hang down from the Bar, some more, some less, and some standing upright in the Bar; the Reason whereof is, to play the Time of the Tune rightly.

For the Distance of each of these Bars may be a Semibrief, &c. of which hereafter.

But the usual way is, to have the Pins that draw the Hammers, fixed on the Barrel. For the placing of which Pins, you may proceed by the way of Changes on Bells, viz. 1, 2, 3, 4, &c. Or rather make use of the Musical Notes.

Where you must observe, what is the Compass of your Tune, or how many Notes or Bells there are from the highest to the lowest; and accordingly, the Barrel must be divided from End to End.

Thus, in the following Examples, each of those Tunes are 8 Notes in compass; and accordingly, the Barrel is divided into 8 Parts. These Divisions are struck round the Barrel, opposite to which are the Hammer-tails.

I speak here, as if there was only one Hammer to each Bell, that you may more clearly apprehend what I am explaining. But when two Notes of the same Sound come together in a Tune, there must be two Hammers to that Bell, to strike it. So that, if in all the Tunes you intend to Chime, of 8 Notes compass, there should happen to be such double Notes on every Bell, instead of 8 you must have 16 Hammers; and accordingly, you must divide your Barrel, and strike 16 Strokes round it, opposite to each Hammer-tail.

Then you are to divide it round about into as many Divisions, as there are Musical Bars, Semibriefs, Minums, &c. in your Tune.

Thus the 100th Psalm-tune hath 20 Semibriefs; and each Division of it is a Semibrief. The first Note of it also is a Semibrief and therefore on the Chime-Barrel must be a whole Division from 5 to 5, as you may understand plainly, if you conceive the Surface of a Chime-Barrel to be represented by the following Tables, as if the Cylindrical Superficies of the Barrel were stretch'd out at length or extended on a Plain. And then such a Table so dotted or divided, if it were to be wrapped round the Barrel, would shew the Places where all the Pins are to stand in the Barrel: For the Dots running about the Table, are the Places of the Pins that play the Tune.

The Notes of the 100 Psalm.

A Table

*A Table for Dividing the Chime-Barrel of the
100 Psalm.*

If you would have your Chimes compleat indeed, you ought to have a Set of Bells to the Gamut Notes; so as that each Bell having the true Sound of *Sol, La, Mi, Fa*, you may play any Tune with its Flats and Sharps; nay, you may by these means play both the Bass and Treble, with one Barrel.

And by setting the Names of your Bells at the Head of any Tune, you may easily transfer that Tune to your Chime-Barrel, without any Skill in Musick. But observe, That each Line in the Musick is three Notes distant; that is, there is a Note between each Line, as well as upon it.

To Calculate a Piece of Clock-work that shall represent any of the Celestial Motions.

To effect which, you may either make those Motions to depend on the Work already in the Movement, or else you may measure them by the Beats of a Balance or Pendulum.

If you would proceed the latter way, you must however contrive a Piece to go a certain Time, with a certain Number of Turns.

But to determine the Motion intended, you must proceed one of these two ways; either,

1. Find how many Beats are in the Revolution; divide these Beats by the Beats in one Turn of the Wheel or Pinion, which you intend shall drive the intended Revolution, and the Quotient shall be the Number to perform the same; which, if it be too big for one, may be broken into more Quotients. Thus, if you would represent the Synodical Revolution of the Moon, (which is 29 Days, 12 $\frac{1}{2}$ Hours) with a Pendulum that swings Seconds, the Movement to go 8 Days, with 16 Turns of the Fusy, and the Great-wheel to drive the Revolution, divide 2551500 (the Beats in 29 Days, 12 $\frac{1}{2}$ Hours) by 4200, (the Beats in one Turn of the Great-wheel) and you'll have 59 in the Quotient; which being too big for one, may be put into two Quotients.

Or,

2. You may proceed as directed before in Calculating a Piece of Watch-work, *viz.* Chuse your Train, Turns of the Fusy, Continuance, &c. And then, instead of finding a Quotient for the Pinion of Report, find a Number, (which is all one as a Pinion of Report) to Specificate your Revolution by this Rule following.

As the Beats in one Turn of the Great-wheel is to the Train; So are the Hours of the Revolution to the Quotient of the Revolution.

Thus, to perform the Revolution of *Saturn*, (which in 29 Years, 183 Days) with a 16 Hour Watch, of 26928 Beats in one Turn of the Fusy, and 20196 the Train; the Quotient of the Revolution will be 193824. For as 26928 : 20196 :: 258432 : (the Hours in 22 Years and 183 Days) To 193824.

Here Note, That the Great-wheel Pinion is to drive the Revolution-work.

But if you would have the Revolution to be driven by the Dyal-wheel, and the Work already in the Movement, then you must first know the Days of the Revolution. And because the Dyal-wheel commonly goeth round twice in a Day, therefore double the Number of the Days in the Revolution, and you have the Number of Turns of the Dyal-wheel in that Time. This Number of Turns, is what you are to break into a convenient Number of Quotients, for the Wheels and Pinions.

1. *A Motion to shew the Day of the Month.*

The Days in the largest Month are 31; those doubled are 62, which are the Turns of the Dyal-wheel, which may be broken into these two Quotients 15 $\frac{1}{2}$ and 4, whose Product is 62; therefore chusing your Wheels and Pinions (by the former Directions) your Work is done, and will stand thus:

$$\begin{array}{r} 4) 62 \text{ (} 15 \frac{1}{2} \\ 5) 20 \text{ (} 4 \end{array}$$

Or if a larger Pinion than one of 5 be necessary, by reason it is concentrick to a Wheel, you may take 10 for the Pinion, and 40 for the Wheel; then 'twill stand thus:

$$\begin{array}{r} 4) 62 \text{ (} 15 \\ 10) 40 \text{ (} 4 \end{array}$$

And the Work will lie thus in the Movement, *viz.* Fix your Pinion 10 concentrick to the Dyal-wheel (or to turn round with it upon the same Spindle) This Pinion 10 drives the Wheel 40; which Wheel has the Pinion 4 in its Center, which carrieth about a Ring of 62 Teeth, divided on the upper Side into 31 Parts or Days.

Or, without the Trouble of many Wheels you may effect this Motion, *viz.* By a Ring divided into 30 or 31 Days, and as many Fangs or Teeth, which are caught and pushed forward once in 24 Hours by a Pin in the Wheel, that goeth round in that Time. This is the usual way in Royal Pendulums, and many other Watches; and therefore being common, there needs no more be said of it.

2. *A Motion to shew the Age of the Moon.*

The Moon finisheth her Course in 29 Days and a little above an half. This 29 $\frac{1}{2}$ Days, (not regarding the small Excess) makes 59 twelve Hours or Turns of the Dyal-wheel, which is to be broken into convenient Quotients; which may be 5, 9, and 10, as here,

$$\begin{array}{r} 10 \div 59 \text{ (59 4) } 59 \text{ (14 } \frac{1}{4} \\ 4 \div 40 \text{ (10 10) } 40 \text{ (4} \end{array}$$

Or $14 \frac{1}{4}$ and 4; so that if you fix a Pinion of 10 concentricall. with your Dial-wheel, to drive a Wheel of 40, which drives a Pinion of 4, which carries about a Ring, or Wheel of 59 Teeth once in $29 \frac{1}{2}$ Days; which Ring may be also be divided into $29 \frac{1}{2}$ Parts; or carry an Index to point to a Circle so divided.

3: A Motion to shew the Day of the Year, the Sun's Place in the Ecliptick, Sun's Rising or Setting, or any other Annual Motion of 365 Days.

The Double of 365, is 730, the Turns of the Dial-wheel in one Year; which may be broken into these Quotients, viz. $18 \frac{1}{4}$ and 10 and 4, thus.

$$\begin{array}{r} 4 \div 73 \text{ (18 } \frac{1}{4} \\ 4 \div 40 \text{ (10} \\ 5 \div 20 \text{ (4} \end{array}$$

Or into $18 \frac{1}{4}$, 8 and 5, thus,

$$\begin{array}{r} 4 \div 73 \text{ (18 } \frac{1}{4} \\ 4 \div 32 \text{ (8} \\ 4 \div 20 \text{ (5} \end{array}$$

So that a Pinion of 5 is to lead a Wheel of 20, which again, by a Pinion of 40; and that by a Pinion of 4, carrieth about a Wheel or Ring of 73 divided into 12 Months, and their Days; or into the 12 Signs; and their Degrees, or into the Sun's Rising and Setting, &c. And for the setting on of this last, Mr. Oughbred has given a Table in his *Opuscula*.

4. To shew the Tides at any Port.

This is done without any other trouble, than the Moon's Ring (mentioned in the 2 of this) to move round by a fixed Circle, divided into twice 12 Hours, and numbred the contrary way to the Age of the Moon.

To set this to go right, you must find out at what Point of the Compass the Moon makes Full Sea, at the Place you would have your Watch serve to: Convert that Point into Hours, allowing for every Point North or South lost, 45 of an Hour.

Thus at *London-Bridge*, 'tis vulgarly thought to be High-water the Moon at North-East, and South-West, which are four Points from the North or South.

Or thus: By the Tide-Tables, learn how many Hours from the Moon's Southing, 'tis High-water.

Or thus: Find at what Hour it is High-water, at the Full and Change of the Moon; as at *London-Bridge*, the full Tide is reckoned to be three Hours from the Moon's Southing, or at 3 of the Clock at the Full and Change. The Day of Conjunction, or New-Moon, with a little Stud to point, being set to the Hour so found, will afterwards point to the Hour of the full Tide.

This is the common way: But this Ring being always in Motion, whereas the Tides are not, a better way perhaps may be found out; as suppose by causing a Wheel or Ring to be moved forward

only twice a Day, and to keep Time (as near as can be) with the Accurate Mr. Flamsteed's most correct Tables.

5. To calculate Numbers, to shew the Motion of the Planets, the slow Motion of the fixed Stars, the Sun's Apogæum, the Revolution of the Dragon's Head and Tail, whereby the Eclipses of the Sun and Moon are found, the Revolution of the several Orbs, according to the Ptolemaick System, or of the Celestial Bodies themselves, according to better Systems, &c.

Besides the Direction already given, there needs only thus much in general, i. e. Knowing the Years of any of these Revolutions, you may break that Number into Quotients, if you will make the Revolution depend upon the Year's Motion which is already in the Movement, and described in the 3d of this. Or if you would have it depend upon the Dial-wheel, or upon the Beats of a Pendulum, enough is said before to direct you in this Matter.

In all these slow Motions, you may somewhat shorten your Labour by endless Screws to serve for Pinions, which are but as a Pinion of one Tooth.

An Instance of this you have in the Account Sir Jonas Moore gives of his large Sphere-going Clock-work, in his *Math. Compendium*, p. 117. where a Motion of 17100 Years is performed by fix Wheels, being for the Sun's Apogæum. His Words are these.

"For the Great-wheel fixed is 96, a Spindle-wheel of 12 Bars turns round it 8 times in 24 Hours; that is, in 3 Hours; after these, there are four Wheels, 20, 73, 24, 75, wrought by endless Screws, that are in Value but one; wherefore 3, 20, 73, 24, and 75, multiplied together continually produceth 7884000 Hours, which divided by 24, gives 3285000 Days, equal to 900 Years. Now on the last Wheel, 75 is a Pinion of 6, turning a great Wheel that carrieth the Apogæum Number 114; and 114 divided by 6, gives 19 the Quotient; and 900 Times 19, is 17100 Years.

WATER, which the Chymists call *Pblegm*, is the 4th of the 5 Chymical Principles, and one of the Passive ones. 'Tis never drawn pure and unmix'd, which makes it a little more detestful than common Water.

This Principle, probably, contributes much to the Growth of Bodies, in that it both renders and keeps the Active Principles fluid. So that they are capable of being convey'd by Circulation into the Pores of the Mix'd; and also, because it tempers their exorbitant Motion, and keeps them together, so that they are not so easily and soon diffipated.

In all such Bodies, whose Active Substances are joined and united pretty closely together, as in common Salt, Tarter, all Plants that are not odoriferous, and in many Animal Bodies this Principle is the first that comes in Distillation. But when Water is mixed with volatile Salts, or with the Spirit of Wine, or is in any odoriferous Mixt, then the volatile Particles will rise and come away first.

WATER-Born, is when a Ship even and just with the Ground, first begins to float or swim, being born up by the Water.

WATER-Line of a Ship, is that which distinguisheth that Part of her which is under Water from that above, when she is duly laden.

WATER-Shot, is a fort of Riding at Anchor, when a Ship is *Moored* neither croses the Tide nor right up and down, but quartered betwixt both.

WATER-Way, in a Ship, is a small Piece of Timber lying fore and aft on her Deck, close by her Sides, to prevent the Waters running down there.

WATERY Humour of the Eye : See *Aqueous Humours*.

WATERY Meteors : See *Meteors*.

WAVED, or *Wavy*, a Term in Heraldry, when a Bordure, or any *Ordinary* or *Charge* in a Coat of Arms hath its Out-lines of this Shape

easily rising and falling like the Waves of the Sea.

WAVES of the Sea, or any Water. Sir Isaac Newton hath demonstrated, *Lib. 2. Prop. 45. Princip.* That their Velocity is always in half the Ratio of their Breadth; and their Breadth is estimated to be the Distance between the two Summits, or top Edges of any two Waves; or a right Line drawn from the middle of one Hollow, to the middle of the other.

Let there be a Pendulum, whose Length from the Point of Suspension to the Center of Oscillation shall be the Breadth of any two Waves; then while the Pendulum makes its Oscillations, the Waves will pass over a Distance equal to their Breadth.

Hence he concludes, That those Waves whose Latitude or Breadth is $3\frac{1}{3}$ Parisian Feet, will pass over a Distance equal to their Breadth in a Second of Time.

And in the Time of one Minute, these Waves will run $183\frac{1}{2}$ Feet, and in the Space of an Hour, 11000 such Feet nearly.

WAY of a Ship, is sometimes the same with the *Rake* or *Run* of her forward or aftward on: But 'tis mostly used as to her Sailing: For when she goes a-pace, they say, *She hath a good Way*, or makes a fresh Way. Also when they keep an Account how fast the sails by the Log; they call it *keeping an Account of her Way*: And because most Ships are apt to fall a little to Leeward of their true Course, they always in casting up the Log-board, allow something for her *Leeward Way*, or *Lee-way*; which is one Point or more according to her Way of Sailing.

WAY of the Rounds in Fortification, is a Space left for the Passage of the Rounds between the Rampart and the Wall of a Fortify'd Town. But it is not so much in use, because not having a Parapet above a Foot thick, it may be soon overthrown by the Enemies Cannon.

WAYWISER, the same with *Perambulator*; which see.

WEAPON-SALVE : See *Armarium*.

WEATHER-COYLE; when a Ship being a Hull, has her Head brought about, so as to lie that way which her Stern did before, without loosing of

any Sail, but only by the bearing up of the Helm, this is called *Weather-coying* of her.

WEATHER-GAGE, that Ship is said to have the *Weather-gage* of another, when she is to Windward of her.

WEIGHT of the Air : See *Air*. Mr. Boyle calculates, That when the Mercury in the common Barometer, stands at 30 Inches, the Weight of the whole Atmospheric Column of Air, incumbent on an Inch Square of Space, is 18 Pounds $\frac{1}{2}$ Troy, or 15 Pounds $\frac{2}{7}$ Averdupois.

WEIGHT of a Cubick-Inch of several Bodies.

Mr. Boyle found that the Weight of a Cubick-Inch.

Of Water was 256 Grains.
Of Quicksilver 3580 Grains.

Our Excellent Sir Isaac Newton saith, he found by most accurate Experiments on Pendulums, that

the Quantity of Matter in Bodies, is always proportionable to their *Weight*.

He saith also, That the *Attractiones Motrices*, or Weights of one Sphere, or Globe, to another at equal Distances from the Centers, are as the attracting and attracted Sphere multiplied into one another; or as the Product of those two Spheres. But at unequal Distances from the Centers, as those Products divided by the Squares of the Distances between the Centers, *Prop. 76. Corol. Lib. I.*

Averdupois Weight, is that by which all Physical Drugs, Grocery, Rosin, Wax, Pitch, Tar, Tallow, Soap, Hemp, and all things that have Waste; all base Metals and Minerals, as Iron, Steel, Lead, Tin, Copper, Alom, Coperas, &c. are weighed.

A Table of Averdupois Weight.

Foreign Weights.

Generally three sorts of *Weights* are used for Merchandize.

1. Weights of great Content; as Hundreds, Kintals, Centeners, Talents, Thousands, Weights, Skippounds, Charges, Lifpounds, Rooves, &c.

2. Weights of lesser Content; as Pounds, Mina's, Manchs' Rotuli, &c.

3. Small Weights as Ounces of 12, 14, 16, 18, 20, 30, &c. to the Pound, and the Subdivisions of the Ounce.

Talents of the Hebrews, Greeks, are seen before.

Cantars, Centeners, or Kintals, sometimes wrote Quintals, accounted by Merchants as Hundreds; are of 100, 112, 120, 125, 128, 132, and 140 Pounds.

Weights, or Weys, are commonly 165 Pound, or 180 Pound, or 200 Pound and $\frac{1}{2}$ for a Charge: Skippounds, used in many Places, *quasi* Skippound, or Skippound; for as in Italy, and other Countries, the *Carga*, *Cargo*, or *Charge*, is the Loading of an

Horse of 300 or 400 Pound: So is the Skippound taken for the Dividend of a Last of Corn laden in a Ship. Skippounds are of 300, 320, 340, and 400 Pound to the Skippound. Cargo is often taken for the whole Lading or Burthen of a Ship. Lifpounds, of 15, 16, and sometimes 20 Pound to the Lifpound.

Rooves, or Arrobas of 10, 20, 25, 30, and 40 Pound to the Roove.

Stone of 6, 8, 14, 16, 18, 20, 21, 24, 32, and 40 Pound to some Stones.

Poade of *Russia*, by *Heylin* is 40 Pound.

Mixias, is commonly understood to be 10000 Drachms, of 8 to an Ounce, and 12 Ounces to a Pound.

Seffertia's of *Cleopatra* in *Egypt*, and other Places in *Africa*, were two Pounds $\frac{1}{2}$, for 50 Seffertia's make 125 Pound, but in *Tbracia* it was but $2\frac{1}{2}$ of a Pound.

Pound is divided into more or less Ounces.

Mark Weight, commonly 8 Ounces.

Mark Pound 16 Ounces, that is 2 Marks.

Mina Ptolemaica, $1\frac{1}{2}$ *Rotuli*, or 18 Ounces, or 144 Drachms, and in lesser Divisions thus:

	<i>Rotuli.</i>	Ounces.	Drachms.	Scruples.	Oboli.	Lupines.	<i>Siliqua's</i> , or <i>Carrats.</i>	<i>Aereoli.</i>
<i>Mina.</i>	$1\frac{1}{2}$	18	144	432	864	1296	2592	6912
	<i>Rotulus.</i>	12	96	288	576	864	1728	4608
		Ounce.	8	24	48	72	144	384
			Drachm.	3	6	9	18	48
				Scruple.	2	3	6	16
					Obolus.	$1\frac{1}{2}$	3	8
						Lupine.	2	$5\frac{1}{2}$
							<i>Siliqua</i> , or <i>Carrat.</i>	$2\frac{1}{2}$

Mane, or Maneh, in *Arabia*, double one of 16 Ounces, and one of 20 Ounces.

That called *Alialica*, *Basaria*, *Alanthalica*, and *Egyptia*.

This *Romana*, and is indeed of *Alexandria*, the Pound there being 20 Ounces.

Rotulus in *Arabia*, *Syria*, *Asia Minor*, *Egypt*, and *Venice*, reckoned for a Pound, is thus divided,

	<i>Sachoff</i> , or Ounces.	<i>Sextaries</i> , or Cicles.	<i>Deniers</i> , or Aureos.	<i>Darching</i> , or Drachms.	<i>Scruples</i> , or Garma.	<i>Obolos</i> , or Orloffs.	<i>Danings</i> , or Lupines.	<i>Kirats</i> , or <i>Siliqua's</i> .	<i>Aereolas</i> , or <i>Keßuffs</i> .
<i>Rotulus</i> , or Pound.	12	24	84	96	288	576	864	1728	3456
	<i>Sachos</i> , <i>Sachos</i> , or Ounce,	2	7	8	24	48	72	144	288
		<i>Sextary</i> , or Cicle.	$3\frac{1}{2}$	4	12	24	36	72	144
			<i>Denier</i> , or Aureus,	$1\frac{1}{2}$	$3\frac{1}{2}$	$6\frac{6}{7}$	$10\frac{2}{7}$	$20\frac{4}{7}$	$41\frac{1}{7}$
			<i>Drachm</i> , or Aunius,	3	6	9	18	36	
			<i>Darch</i> , or Aundana-	Scruple,	2	3	6	12	
			<i>ing Alky</i> , or Oliginat,	Obolus,	$1\frac{1}{2}$	3	6		
				Kenmer.	Orloff,	or Daning,	2	4	
					Onoleffat,	or Onolum,	Danic	Carrat,	2
						Lupine,	Kirat,	or <i>Siliqua</i> .	

Some mention the Phyſick Pound at *Venice* to have but 7 Drachms in the Ounce.

The Lupines at *Venice*, called *Sextula's*, becauſe 1 Ounce hath 72, which is 6 times 12.

Every Keſtuff, or Aereolum (or Areolum) is the Weight of 2 Barly-Corns, ſo is there in the Rotulus 6912 Grains.

The *Alexandrian* Pound 20 Ounces, the Ounce 8 Scruples.

The *Italian* Pound generally is divided into 12 Ounces, 1 Ounce into 2 Staters, and 1 Stater into 4 Drachms; ſo hath 1 Pound 24 Staters, 96 Drachms.

But in Phyſick, there and in other Places, thus.

	Ounces.	Loots.	Sizaynes, or Siliquas.	Drams.	Scruples.	Obolos.	Siliqua's.	Grains.
Pound.	12	24	48	96	288	576	1728	5760

Pound Weights of France.

The Weight us'd by the Merchants for the most part, is of 16 Ounces, called *Livre d' Anvers*, tho' in some Places but 14, others 18 Ounces. *Cotgrave* writes the *Liure*, or *Bund de Lyon*, to be 15 Ounces, that *de Spaigne* but 14 Ounces, and divides the Pound of 16 Ounces, into 30 Halfs, 64 Sezaines, 128 Treseaux, 256 Gros, 512 Demi-gros. And the Pound us'd by the *Farriers*, consisting of 12 Ounces into 90 Drams, 270 Scruples, 540 Obols.

After *Malines*, the Ordinary, or Pound commonly us'd for Merchants, is parted thus.

In the Low-Countries they use Pounds of 12, 14, 15, &c. Ounces.

At *Bruges* in *Flanders*, they have 1 Pound of 14 Ounces, and 1 Pound of 16 Ounces; the 100 Pound of 16 Ounces makes 108 Pound of 14 Ounces; but the Ounces of 14 to the Pound are the heaviest, for 100 of these are 105 $\frac{1}{2}$ Ounces of 6 to the Pound; this Pound is thus divided.

Drachm or Quint.

At *Antwerp* they use to weigh by the Hundred Pounds even Weight, called *Sutle*, for which commonly at the Weigh-house, is allow'd 101 Pound. A Stone is 8 Pound. The Skippond 300 Pound. The Weigh 165 Pound. The Carga, or Charge, 400 Pound, which is two Bales of 203 Pound each, for an Horse to carry. The Pound there is 16 Ounces.

This 100 Pound of Anwerp, weigheth in the Places following.

- 1 3 *Abbeville*, 94 $\frac{3}{4}$ lb.
- 2 11 *Achri*, 17 $\frac{1}{4}$ Rotuli. The 100, a Cantar Tambaran.
 - 138 Ordinary Weight.
 - Alder, { 91 To weigh Steel, Tin, and Copper.
- 1 8 *Ailoft*, 108 lb.
- 3 1 *Alcario*, { 164 lb.
 - 78 Minas of 16 Oz. to the Mina.
 - 27 Rotuli, of 6 lb. to the Rotuli.
 - 1 Pefa is 1 $\frac{1}{2}$ Metallicum, or a Drachm.
 - 50 Metallici 1 Mark. Our Mark 42 Metallici.
- Musk and Amber sold by this Weight in *Egypt*.
- 2 11 *Allepo*, 22 Rotuli, of 100 to a Cantar.
 - 1 Rotulus is 60 Oz. or 480 Metecalos, or Drachms.
 - 1 Oz. is 8 Metecalos, or Drachms.
 - 1 Drachm, or Metecalo, is $\frac{1}{8}$ Pefa.
 - 10 Pefa's are 1 Onga, or Ongia, to weigh Civer.
- 2 1 *Alexandria*, { 108 Rotuli, of 190 to a Cantar.
 - 78 Mina's of 20 Oz.
- America Malica*, { 90 lb. of 12 Oz. to the lb.
 - 36 Mina's Sestertias of 30 Oz.
- 2 11 *Aman*, as *Aleppo*.
- 1 8 *Amsterdam*, 94 $\frac{3}{4}$ lb. And for Silks they use the Weight of *Antwerp*.
- 1 7 *Aquila*, 147 lb.
- 1 3 *Aquismort*, 102 lb.
 - 78 Rotuli.
 - 104 Maires, or Minas.
- 2 2 *Arabia*, { 148 Pound.
 - 936 Ounces, or Sachosi, 12 to 1 Rotulus.
- 3 1 *Arcadia*, 92 lb. and 83 lb. for *Mavigetto*.
- 1 5 *Archipelago*, 120 lb.
 - 105 lb. of Oz. to the lb.
- Armoria bona*, { 93 lb. of 18 Oz. used for Silk and Copper.
 - 54 lb. of 32 Oz. Fleth Weight.
- 2 3 *Armenia*, 130 lb.

- 1 14 *Arragon*, { 106 lb.
 - 96 lb. Great Weight for Wooll.
- 1 8 *Arshot*, 100 lb. all one with *Antwerp*.
- 1 8 *Audenarde*, or *Oudenard*, 110 lb.
- 1 3 *Avignon*, 111 lb. a Centener is two Frailes of 56 lb.
- 1 4 *Ausburgh*, 95 lb.
- 1 8 *Bergen Op Zome*, 98 lb.
- 1 14 *Barcellona*, { 96 lb. Wooll Weight.
 - 106 lb. Common Weight.
 - 131 lb. Saffron Weight.
- 1 4 *Basil*, 96 lb. They use Centeners of 100 lb. 120 lb. and 132 lb.
- 1 7 *Bergamo*, 137 lb. and 108 lb. by the two Quintals.
- 1 1 *Bergen*, 96 lb. but uncertain weighing with a Sling.
- 1 4 *Bibrach*, 92 lb. of 16 Oz. to 1 lb. as *Constance*.
- 2 11 *Barutti*, 21 Rotuli.
- 1 7 *Bologna*, 53 lb. of 30 Oz. to weigh Wax and Wooll by Rooves of 1 lb.
- 1 4 *Boigoigne*, as *Abbeville*.
- 1 4 *Botsen*, { 128 lb. Ordinary Weight.
 - 91 lb. To weigh Steel, Tin, and Copper.
- 1 3 *Bourdeaux*, as *Abbeville*.
 - 120 lb. by the Centerer of 24 lb. to one Stone, and five Stone to one Centener, and 5 $\frac{1}{2}$ Stone to the Centener of 132 lb. there also used.
- 1 7 *Brescia*, 184 lb. and for *Venice Gold* 136 lb. 100 lb.
 - 93 lb. for Butter and Cheese, the Stone 6 lb. and 20 Stone one Weigh; but Wooll Weight is 108 lb. weighed by Stones of 6 lb. called Nails, or Neils, 18 Neils to the Hundred, 45 Neils to the Weigh, 2 Weighs to one Pocket of Wooll. *Hunt* says, 18 Neils is 144 lb. of our Wooll Weight.
- 1 8 *Brussels*, as *Arshot*.
 - Bucca, 44 Ocha's.
- 1 14 *Burgos*, 93 Rotuli.
- 2 1 *Bursa*, 88 Rotuli.
- 3 4 *Cabo Verde*, 107 $\frac{1}{2}$ lb. or Rotuli, a Quintal is 121 of 4 Rooves of 32 lb.
- 1 7 *Calabria*, 147 lb.
- 1 3 *Calais*, { 111 lb. Ordinary Weight.
 - 92 lb. Merchants Weight.
 - 114 lb. English Wooll Weight.
- 2 6 *Calicut*, 80 Aracoles. *Malines*, p. 18, mentioning the Baccar, or Bahar at *Calicut*, to be at *Lisbon* 4 great Quintals of 112 lb. to the Quintal, and that 4 Quintals are 480 Aracoles, that is 120 Aracoles for 1 Quintal. And again, that the Bahar is 20 Faracoles, which is 5 Quintals at *Lisbon* of 32 lb. per Roove; which is not well to be understood, seeing the great Quintal at *Lisbon* is 128 lb. or 4 Rooves of 32 lb. per Roove: Whereas 4 Quintals of 112 lb. is but 448 lb. and 5 Quintals of 728 lb. is 640 lb. unless there be two sorts of Bahars at *Calicut*, one of 48 Aracoles, and

and another of 20 Paracoles. Or that the Bahar be 5 great Quintals at 129 lb. the Quintal; that is 645 lb. for so many Pounds, or Portuguese Rotuly, are in in 480 Aracoles, for 100 lb. of Antwerp, which answer to 107 $\frac{1}{2}$ lb. of Portugal Weight by his own Concession in the same Page a little before.

- 3 3 Canary-Islands, 107 lb. as Sevil.
 1 5 Candia, { 138 lb. for Gold-Thread.
 { 89 Rotuli, whereof a 100. is a Cantar, or Quintal.

Foreign Weights for Money.

In *Florence*, they use a Weight for Gold and Silver; and at *Geneva* for Silver, called a Pound. of 12 Oz. 1 Oz. is 24 Deniers, and 1 Denier is 24 Grains: So is there 6912 Grains in the Pound.

In *Naples*, their Pound is likewise divided into 12 Ounces, and every Ounce into 8 Octany, or Octavos.

The Mark Weight is used in many other Places, and at *Antwerp* containeth 8 Ounces, and is heavier than their ordinary Pound by 5 upon the Hundred, as *Malines* saith.

This Mark is divided in a double Manner.

	Ounces.	English.	Grains.
(1) Mark.	8	160	5120
	Ounce.	20	640
		English.	32

	Ounces.	Penny-weights.	Grains.
(2) Mark.	8	192	4608
	Ounce.	24	576
		Penny weight.	24

The Mark Weights of some other Places subdivided.

FRANCE.

	Ounces.	Gross.	Deniers.	Grains.	Primes, or Garobs.	Seconds.	Tercier, or Malloquen.
Mark.	8	64	192	4608	110592	2654208	63700992
	Ounce.	8	24	576	13824	331776	7962624
		Gross.	3	72	1728	41472	995328
			Denier.	24	576	13824	331776
				Grain.	24	576	13824
					Garob, or Prime.	24	576
						Second.	24

In *France*, that Ounce is also divided into 2 Carrats, and every Carrat into 12 Grains.

Dantzick in Poland.

	Ounces.	Pence.	Heller.
Mark.	8	256	512
	Ounce.	32	64
		Penny.	2

Geneva for Gold.

	Ounces.	Deniers.	Grains.

a. The Mina of 100 Drachms is called *Solon's Mina*, because thought to be continued by him sometime turned into *Latin* by *Mina*, often by *Libra*, tho' *Libra* be 4 Drachms lighter, the *Roman Libra* being but 96 *Attick* Drachms. The old *Mina* of 75 Drachms, now obsolete, for Memory sake, hath found Room in this Table.

aa. The Physicians, as by *Dioscorides* and *Galen* appears, used a *Mina*, or Pound of 16 Ounces, and a *Litra* or other Pound of 12 Ounces, conceived all one with the *Roman Libra*, consisting of 96 Drachms, as they did; and by Interpreters commonly rendred *Libra*, and seldom or never *Mina*; and *Mina*, and *Litra*, as also *Libra* commonly englished a Pound.

aaa. The Hippatrick had a *Mina* of 15 Ounces and a *Litra* of 12.

b. *Oungia*, in *Latin* *Uncia*, must not be taken for our Ounce, but for one of their Ounces, arising by the Division of their Pound into Drachms differently, according to the Quantity of Drachms in one Pound.

bb. Among the Hippatrick Weights there was a *Denarium* of 4 Scruples, 5 $\frac{1}{2}$ whereof made one of their Ounces.

c. *Drachme*, *Drachma*, and *Dragma*, in *Greek* and *Latin*, in *English* a *Dram*, is the 8th Part of their Ounce, whereby the Pound hath 12 or 16 Ounces therein. By *Asted* made to equal the *German Weight Quinclein*. Some call a *Dram Resolus* some *Holke*, from the *Greek ἀρχή*.

cc. The Ounce Hippatrick, that divided as well the *Mina* of 15 Ounces, as the *Litra* of 12 Ounces had but 7 $\frac{1}{2}$ Drams into it.

d. Drams of all sorts were parted into 3 Scruples. A Scruple in *Greek* sometime *Gramma*, sometimes *Grammata*; in *Latin* *Scriptulum*, *Scriptulum*, and *Scrupulum*.

e. *Obolus*, sometime a Weight, sometime a Piece of Money commonly rendred an Half Penny, because always was the half of a Scruple.

f. *Lupine*, in *Greek* *Therma's*, was a Weight equal in poise to the *Lupine*, which is a Seed grow-

ing in a Cod like to a Pease, and both Plant and Seed bear that Name. And seeing there are many sorts, as *Perkinson's Theater of Plants*, Page 1073, which sort of *Lupine* is meant, is uncertain; probably, the middle White, which are most in use, bigger than the Yellow, and not so big as the great Blue; and from the nearness in Weight thereto, if not exactness, might be so called.

g. gg. *Siliqua*, in *Greek* *Keration*, a Weight, a like heavy to the Carobseed or sweet Bean, common in many Countries subject to the *Grecian Empire*. Sometime called *Carat* or *Caract*, from whence the Word is still in use with us.

b. *Chalkos*, in *Latin* *Aerolis* and *Aerolum*. *Aerolis* was also a Piece of Brass Money current in ancient Times among those Countries of the *Grecian* Dominion.

i. *Sitar*, a Grain of Corn from *Σίτη* *Frumentum*, likely to have been the Original of their Weight, two whereof make one *Chalkos*.

k. *Lepton*, from *Leptos*, in *Latin* *Minutum*, and *Minutia*, supposed to be some small Scale of the Rhind or Bark of some Tree, 3 $\frac{1}{2}$ balanced the *Sitar*.

l. Besides these, in the Table of Physical Weights some Books mention the *Assarian*, allowed for two Drachms, which is $\frac{1}{2}$ part of an Ounce. Also, the *Exagion* wrote sometime *Stagion*, sometime *Agion* for Brevity, which was the *Roman Sextula*, the 6th part of their Ounce, whereof 12 make the *Litra*. Likewise *Orobis*, which was a Grain of a wild Vetch. And *Phaïke* a *Lentil*; but whether Weights or no, is not worth the Enquiry.

ll. As the other Weights are divided into lesser Divisions, than the *Obolus*, so no doubt but the *Hippatrick* also were, and may accordingly be done, when occasion serves. The *Obolus* of all sorts admitting the like smaller Denominations.

a. *Libra*, called also *As*, by Translators commonly rendred a Pound, was divided into 12 Ounces, and for every Number of Ounces under 12, a proper Name used, as,

Deunx, _____ 11
Dextans and Decunx, _____ 10
Dodrans, _____ 9

** *Bes*, *Bessis*, and of old, *Des*, _____ 8
Septunx, _____ 7
Semis, *Semissis*, *Semissius*, *Selibra*, and *Semibella*, _____ 6
Quincunx, _____ 5
Triens, _____ 4
Quadrans and Triunx, _____ 3
Sextans, _____ 2
Uncia, _____ 1

Ouncer.

Malines, p. 24. of his *Lex Mercatoria*, divides *Pondus*, which he calls the Old Pond of the Romans, into

84 Denario's.
129 Quinario's.
256 Sestertio's.
640 Asfes.
1280 Semilibella's.
2560 Teruncio's.

A Reason is wanting, why *Legat* makes the Roman *Libra* of 12 Oz. but $10\frac{1}{2}$ Oz. *Troy*, since if he reckon by the Number of Grains (the Original of Weights) at 5760 Grains of *Affize* in the Pound *Troy*, it can be but 10 Oz. just; for 10 times 6912, the Grains in a Roman Pound, and 12 times 5760 are equal: But if he count the Pound *Troy* at 7680 Grains, according to the Statute at 32 Grains of Wheat to a Penny-weight, the *Troy* Pound will be $13\frac{1}{3}$ Oz. Roman.

Pound, *Malines*, p. 24. afore said, makes the *Bes*, or old Mark of the Romans, to be divided into

16 Loor, or Tetrachms.
23 $\frac{1}{2}$ Tridrams.
32 Didrams.
64 Drachms.
96 Obolos, or Treobolos.
128 Triobolos.
384 Obolos.
768 Miobolos.
3840 Moments.

b *Semiuncia*, or the Half-Ounce, is sometimes called *Affarion*, and *Affarius*, and by *Alfred*, *Lotho*, answering to a German Weight of that Name.

c *Duella* being double to the Weight of the *Sextula*, sometimes called *Bina Sextule*.

d *Sicilicum*, or *Sicilicus*, and by Abbreviation, *Siclus*, is $\frac{1}{3}$ of an Ounce.

e *Sextula*, us'd promiscuously with *Sextans*, and understood by Import of the Name to be the sixth Part.

f *Denarius*,

** *Bes*, is the Mark Weight, two Thirds of the

f *Denarius*, a Penny-weight, the 7th Part of an Ounce, whether used to weigh any thing but Money, as other; the Divisions thereof, somewhat questionable, see among the Money. *Alsted* compares the *Drachmal Denarius* to the German Weight *Quintlein*.

g *Quinar*, was half the Penny-weight, and a Piece of Money set afterward among the Roman Coin.

h Between the *Quinar* and *Scruple* some mention a Weight called *Tremissis*, containing 32 Grains, being the 18th Part of an Ounce.

i *Quadrans*, here is $\frac{1}{4}$ of a Penny-weight, and so called *Quadrans Denarii*, to distinguish it from *Quadrans Librae*, which was 3 Oz.

k *Sextans*, called *Sextans Denarii*, to difference it from *Sextans Librae*, was the 6th Part of the Penny-weight, and sometime called *Sextula*.

l *Obolus*, or half a *Scruple*, called sometimes *Simplium*, weight 12 Grains. If there be another *Obolus*, as some say, which was the third Part of a *Quinar*, it seems to be a Piece of Coin, and must weigh $13\frac{1}{2}$ Grains, and so is all one with the *Sextans*, according to the *Tabular* Division; yet this sort of *Obolus*, they make to contain but 10 Grains.

Between the *Obolus* and the *Siliqua*, some mention a *Cerates*, which they say contains six Grains, and so is $\frac{1}{2}$ the *Obolus*, or $\frac{1}{3}$ of the *Scruple*.

A Table of the Scripture-Weights, from Bishop Cumberland.

1. A Shekel of Silver was just half the Roman Ounce, or our half Ounce *Averdupois*, and was equal to 219 Grains *Troy*; and its Value in our Money was 28 Pence, or 2 Shillings, 4 Pence, Farthing, and near $\frac{1}{2}$ Part of a Farthing; from whence 'tis easie to know the half and quarter Shekel.

2. The half Shekel was called *Bekob*.

3. Its 20th Part was called *Gerah*, *Agurah*, and *Keshibrah*, and is well translated by *Obolus Atticus*.

4. A Talent of Silver was 3000 Shekels, and in our Money its Value was 353 l. 11 s. 10 d. $\frac{1}{2}$.

5. A Talent of Gold was in Value of our Money 5076 l. 3 s. 10 d.

6. The *Maneh* was in Weight 100 Shekels, in Value or Coin 60 Shekels.

7. The Golden *Darios* or *Persian Drachmon*, was in Weight 12 *Gerahs*, in Value 1 l. 0 s. 4 d.

8. The Roman Silver *Denarius* was 7 d. 3 f. Gold Coins double in Weight.

9. The Roman Brazen or Copper *As*, was of $\frac{1}{2}$ an Ounce Weight; in Value 3 Farthings, and one Tenth of our Farthing.

10. *Affarium* was the Half of the *As*, viz. 1 f. 55 nearly.

11. The *Quadrans* was in Value about 3 quarters of a Farthing.

12. The *Mite* or *Λεπτον*, was the Half of the *Quadrans*, in Value about $\frac{1}{2}$ of our Farthing.

WENDING, is a Term for bringing a Ship's Head about, and seems only to be a Corruption from Winding. They say, *How Wends the Ship?* i. e. Which way does her Head lie?

WEST *Erect-Dials*: See *Direct Dials*.

WHEEL, or Way-wiser, an Instrument to measure Lengths upon the Ground: See *Perambulator*.

WHEEL-Barometer: See *Barometer*.

WHEEL-Fire, is the same with what the Chymists call *Ignis Rotæ*; that is, a Fire which covers the Crucible, Copple, or Melting-pot, entirely over; at Top, as well as round the Sides.

WHELPS; so the Seamen call those Brackets which are set up on the Capstan, close under the Bars, and they give the Sweep to it, and are so contrived, that the Cable winding about them, may not surge so much as it would do, if the Body of the Capstan were quite round and smooth.

WHIP, or *Whip-staff*, in a Ship, is a Piece of Wood fastned into the Helm, for him that steers to hold in his Hand, thereby to move the Helm, and steer the Ship. It goes through the Rowl, and is made fast to the Tiller with a Ring. But this is not used in great Ships.

WHITE-LEAD, how made: See *Ceruse*.

WHITENESS: This Colour, Mr. Boyle thinks, doth chiefly depend upon this, That the Surfaces of white Bodies are separated into innumerable small Planes or Superficies, which being of a Nature nearly specular, are also so placed, that some looking one way, and some another, do reflect the Rays of Light falling upon them, not towards one another, but outwards, towards the Spectator's Eye. But the Account of Whiteness, according to the *Newtonian* Hypothesis of Light and Colours, is, That 'tis the Result of the Mixture of all sorts of Rays of Light together: See *Colours and Light*.

WHOODINGS, in a Ship, are those Planks which are joined and fastned along the Ship's Side into the Stern.

WILL, or *Last Will*: See *Testament*.

WIND, at Sea, they call bringing a Ship's Head about, *Winding of her*; and when she comes to ride at Anchor, she is said to *Wind up*: Also when she is under Sail, they use to require, *How she Winds*, i. e. which way she lies with her Head? So, to *Wind the Boat*, is to turn her Head about.

WIND is defin'd to be the Stream, or Current of the Air; and where such Current is perpetual and fix'd in its Course, 'tis necessary that it proceed from a permanent unintermitting Cause. Wherefore some have been inclined to propose the Diurnal Rotation of the Earth upon its Axis, by which, as the Globe turns Eastwards, the loose and fluid Particles of the Air, being so exceeding light as they be, are left behind, so that in respect of the Earth's Surface, they move Westwards, and become a constant Easterly Wind. This Opinion seems confirmed, for that these Winds are found only near the *Equinoctial*, in those Parallels of Latitude, where the Diurnal Motion is swiftest; but the constant Calms in the *Atlantick Sea*, near the *Aequator*, the Westerly

Westerly Winds near the Coast of *Guinea*, and the periodical *Westerly Monsoons* under the *Equator* in the *Indian Seas*, seemingly declare the Insufficiency of that Hypothesis.

Besides, the Air being kept to the Earth by the Principle of *Gravity*, would in time, acquire the same Degree of Velocity, that the Earth's Surface moves with, as well in respect of the Diurnal Rotation, as of the Annual about the Sun, which is about 30. times swifter.

It remains therefore to substitute some other Cause, capable of producing a like constant Effect, not liable to the same Objections, but agreeable to the known Properties of the Elements of Air and Water, and the Laws of the Motion of Fluid Bodies. Such an one is the Action of the Sun's Beams upon the Air and Water, as he passes every Day over the Oceans, consider'd together with the Nature of the Soil, and Situation of the adjoining Continents.

Therefore, according to the Laws of *Statics*, the Air, which is less rarified or expanded by Heat, and consequently more ponderous, must have a Motion round those Parts thereof, which are more rarified, and less ponderous, to bring it to an *Equilibrium*; also, the Presence of the Sun continually shifting to the Westward, that Part towards which the Air tends, by reason of the Refraction made by his greatest Meridian Heat, is with him carried westward, and consequently the Tendency of the whole Body of the lower Air is that way.

Thus a general Easterly Wind is formed, which being impressed upon all the Air of a vast Ocean, the parts impel one the other, and so keep moving till the next Return of the Sun, whereby so much of the Motion as was lost, is again restored, and thus the Easterly Wind is made perpetual.

From the same Principle it follows, that this Easterly Wind should on the North-side of the *Equator*, be to the Northwards of the East, and in South Latitudes to the Southwards thereof; for near the Line, the Air is much more rarified, than at a greater distance from it; because the Sun is twice in a Year vertical there, and at no time distant above 23. Degrees $\frac{1}{2}$; at which Distance the Heat being at the Sine of the Angle of Incidence, is but little short of that of the perpendicular Ray. Whereas under the Tropicks, though the Sun stay long vertical, yet he is a long 47 Degrees off; which is a kind of Winter, wherein the Air so cools, as that the Summer Heat cannot warm it to the same Degree with that under the Equator. Wherefore the Air towards the Northward and Southward being less rarified than that in the middle; it follows, that from both sides it ought to tend towards the Equator. This Motion compounded with the former Easterly Wind, answers all the Phenomena of the general Trade Winds; which, if the whole Surface of the Globe were Sea, would undoubtedly blow all round the World, as they are found to do in the *Atlantick* and *Æthiopic* Oceans.

But seeing that so great Continents do interpose and break the Continuity of the Oceans, regard must be had to the Nature of the Soil, and the Position of the high Mountains, which are the two principal Causes of the several Variations of the Wind from the former general Rule; for if a Country lying near the Sun, prove to be flat, sandy, and low Land, such as the De-

sarts of *Libya* are usually reported to be, the Heat occasioned by the Reflexion of the Sun's Beams, and the Retention thereof in the Sand, is incredible to those that have not felt it; whereby the Air being exceedingly rarified, it is necessary that this cooler and more dense Air should run thitherwards to restore the *Æquilibrium*: This is supposed to be the Cause, why near the Coast of *Guinea* the Wind always sets in upon the Land, blowing Westerly instead of Easterly, there being sufficient Reason to believe, that the inland Parts of *Africa*, are prodigiously hot, since the Northern Borders thereof were so intemperate, as to give the Ancients cause to conclude, That all beyond the *Tropicks* was made uninhabitable by Excess of Heat.

From the same Cause it happens, that there are so constant Calms in that part of the Ocean, call'd the *Rains*; for this Tract being placed in the middle, between the Westerly Winds, blowing on the Coast of *Guinea*, and the Easterly Trade Winds blowing to the Westwards thereof, the Tendency of the Air here, is indifferent to either, and so stands in *Æquilibrium* between both, and the weight of the incumbent Atmosphere, being diminished by the continual contrary Winds blowing from hence, is the Reason that the Air here holds not the copious Vapour it receives, but lets it fall in so frequent Rains.

But as the cool and dense Air, by reason of its greater Gravity, presses upon the hot and rarified, 'tis demonstrative, that this latter must ascend in a continued Stream, as fast as it rarifies, and that being ascended, it must disperse it self to preserve the *Æquilibrium*; that is, by a contrary Current the upper Air must move from those Parts where the greatest Heat is; so by a kind of Circulation, the North-East Trade-Wind below, will be attended with a South-westerly above, and the South-easterly and North-west Wind above; that this is more than a bare Conjecture, the almost instantaneous Change of the Wind to the opposite Point, which is frequently found in passing the Limits of the Trade-Winds, seems to assure us; but that which above all confirms this Hypothesis, is the Phenomenon of the *Monsoons*, by this means most easily solv'd, and without it hardly explicable.

Supposing therefore such a Circulation as above, 'tis to be considered, that to the Northward of the *Indian Ocean*, there is every where Land within the usual Limits of the Latitude of 30, viz. *Arabia*, *Persia*, *India*, &c. which for the same Reason, as the *Mediterranean* Parts of *Africa*, are subject to unufferable Heats, when the Sun is to the North, passing nearly vertical; but yet are temperate enough when the Sun is remov'd towards the other *Tropick*, because of a Ridge of Mountains at some distance within the Land, said to be frequently in Winter covered with Snow, over which the Air as it passes, must needs be much chilled.

Hence it comes to pass, that the Air coming according to the general Rule, out of the North-East in the *Indian Sea*, is sometimes hotter, sometimes colder, than that which by this Circulation is return'd out of the South-west, and by consequence sometimes the under Current, or Wind, is from the North-East, sometimes from the South-West.

That this has no other Cause, is clear from the Times wherein these Winds set in, *viz.* in *April*, when the Sun begins to warm those Countries to the North, the South-west *Monsoons* begin, and blow during the Heats till *October*; when the Sun being retired, and all things growing cooler Northward, and the Heat increasing to the South, the North-East enter and blow all the Winter till *April* again: And it is undoubtedly from the same Principle that to the Southward of the *Equator* in part of the *Indian Ocean*, the North-West Winds succeed the South-East, when the Sun draws near the *Tropick of Capricorn*.

But in this latter occurs a Difficulty, not well to be accounted for, which is, why this Change of the *Monsoons*, should be any more in this Ocean, than in the same Latitudes in the *Aethiopic*, where there is nothing more certain than a South-East Wind all the Year.

'Tis likewise very hard to conceive why the Limits of the Trade Wind should be fix'd about the thirtieth Degree of Latitude all round the Globe; and that they should so seldom transgress or fall short of those Bounds; as also that in the *Indian Sea*, only the Northern Part should be subject to the changeable *Monsoons*, and in the Southern there should be a constant South-East.

This Account of Wind is from the Learned Captain *Halley's* Discourse on this Subject *Philosoph. Transf. N. 183.*

WIND-GUN. Of this Instrument there are several Descriptions extant, but the following of Mr. *Papins* is in all respects the best. (See Continuation of Mr. *Boyle's Physico-Mechanical Experiments.* Part 2. Iconism. 2. Fig. 4.)

AA, is a Copper Globe, hollow within; BB is a Tube, fastned to that Globe. F is a Valve opening inwardly, and shutting the Globe BB; G is the Spring depressing the foresaid Valve. H is a Gnomon affixed to the Globe AA, and making fast the Spring G.

CC, is a Tube of Iron, fastned to the Tube BB, and the Globe AA. DD is a Plug exactly adapted to the foresaid Tube. EEE is another Plug, fitted also to the Tube BB with an Iron Wire, reaching almost to the Valve F. R is the Protuberance of the Tube CC, somewhat hollowed above to receive the End of the Iron LL; and LL, is a crooked Iron, moving about the Extremity in R, so that it is like a Leaver to lift up the Plug EEE. OPO is a crooked Iron, fastned in M, that the Thumb sticking in the Angle P, the rest of the Fingers may attract the Leaver L, and so force the Plug EEE upwards. But the Use of the Curvature is, that the one End O might be applied to the Shoulder, if it be thought fit to aim at any Mark.

TT, is a Rectangle of Iron, encompassing the Leaver LL, and the Iron OPO, to keep the Leaver in that Posture which the present Scheme holds forth; for otherwise the Plug EEE would be thrust out far away, whilst we intrude the Air into the Globe AA.

II, is an Elliptick Hole in the upper Part of the Globe very well shut with a Valve, opening inwardly, whose Use is to give liberty of Inspection and of amending what is amiss; for the Valve may be drawn through the Hole, by reason of its Elliptick Figure.

SS, is a metalline Plate transversly placed above the Hole II, and perforated to transmit the Screw V, by whose help the Valve shutting, the Hole II is sustained, and is applied closely to the Hole.

Q, is an Hole in the inferior part of the Tube CC, by which the Air enters into the Tube, whilst the Plug D is brought to the lowest part of the Tube.

The Air is thrust into the Engine after this manner: The crooked End of the Plug DD is pressed upon with the Foot, that it mayn't stir from the Ground; and the Engine being lifted upward till the upper part of the Plug be found below the Hole Q; then the Air entering through the foresaid Hole, doth wholly fill the Tube CC.

Then the Engine being forcibly depressed, the Air contain'd in the Tube CC, opens the Valve F, and is thrust into the Globe AA; whence it cannot return, because the Valves presently stop the Passage; and thus by iterated Turns, we may condense the Air in the Globe, until the Force of its Spring cannot be overcome by our Strength.

Now to discharge the Air, so condensed, the Plug DD is wholly to be drawn out, and a Bullet of Lead to be put into the bottom of the Tube CC, then by means of the Leaver LL, the Plug EEE is to be impelled upward, as beforemention'd, and then the Extremity of the Iron Wire opens the Valve B, and the Air breaking out therefrom, expels the Leaden Bullet through the Tube CC with great Violence.

Note. That before the Plug DD is again put into the Tube CC from the Compression of the Air, about half an Ounce of Water is to be poured into the foresaid Tube. For by this means no Air at all can escape out by the Plug; and moreover, that Water filling exactly the upper part of the Tube CC, will cause that the whole compressed Air will be intruded within the Cavity AA, and so the Condensation will be perfected much sooner than if at every Turn part of the compressed Air did remain below the Valve F. See the Figure following.

This

This Engine is much better than any Wind-Guns hitherto mention'd in Print.

1. Because that seeing one only Valve serves both for letting in, and discharging forth of the Air, it is less subject to be spoiled or impaired, than if two Valves were used for that Purpose.

2. If any Disorder happen in other Guns, the Engine remains useles; but here by the Elliptick Hole, a Man may take out the Spring and the Valve, and so mend whatsoever is amiss.

3. In other Guns, the Valves being cover'd with Leather, were put in before the Engine was on every side shut, and therefore Silver Solder could not be used in cementing the Parts, but only Lead Solder; by which the Air, being much compress'd, could by no means be restrain'd: But here all things are well cemented with Silver Solder, without danger of Burning, in regard the Valve cover'd with Leather is put in afterward through the Elliptick Hole II.

4. But this Engine is chiefly to be preferred before others on this account, because we emit several Bodies into the Receiver, through the Ellip-

tick Hole, and so make many Experiments in highly compressed Air.

WIND-Taught, a Sea Term, implying as much as Stiff in the Wind; for they say a thing is *Taught*, when 'tis Stiff. Thus too much Rigging, all high Ropes, or any thing catching or holding Wind aloft, is said to hold a Ship *Wind-taught*; by which they mean, that the sloop too much in her Sailing in a stiff Gale of Wind. So also, when a Ship rides in a main Stress of Wind and Weather, they strike down her Topmasts, and bring her Yards down alongst the Ship, which else would hold too much Wind, or be *Wind-taught*.

WINDING Tackle-Blocks; so the Seamen call those *double Blocks*, with three *Shivers* in each, which are seized fast to the End of a small Cable which is brought about the Head of the Mast, and so serves instead of a Pendant. This hath a *Gay* brought to it from the Foremast. Into the Block is reeved a Hawser, which is also reeved through another double Block, having a Strap at the End of it, which being put through the Eye of the Slings, is lock'd into it with a *Fidd*, in order to hoist in Goods. The *Fall* of this Tackle is reeved into the *Snatch Block*, and so is brought to the Capstan, whereby the Goods are heaved.

WINDLASS, in a Ship, is a piece of Timber having six or eight Squares, and is fix'd abaft the Stern aloft, where the Cables come in from the one Side of the Ship to the other, used now in small Ships only, and in the *Flemish* Ships, which are highly mann'd: But this *Windlass* will purchase more by much than any Capstan in the weighing of an Anchor, and without any Danger to those that heave, because they heave here about with Handspikes put into the Hole at either End of the *Windlass*; of which, tho' one should happen to break, yet would the *Windlass* paul of it self, without any farther Danger.

WING: The Romans called by the Name of *Ala*, the *Wings*, two Bodies of Men in their Army, one on the Right, and the other on the Left, consisting each of 400 Horse, and 4200 Foot usually; and being wholly made up of Confederate Troops: These were design'd to cover the *Roman* Army, as the Wings of a Bird cover its Body. The Troops in these Wings they call *Alares*, and *Alares Copia*; and we at this Day distinguish our Armies into the Main Body, the Right and Left Wings.

WINGS, in Fortification, are the large Sides of Horn-works, Crown-works, Tenailles, and the like Out-works; that is to say, the Ramparts and Parapets, with which they are bounded on the Right and Left, from their Gorge to their Front. These Wings or Sides are capable of being flank'd either with the Body of the Place, if they stand not too far distant; or with certain Redoubts, or with a Traverse made in their Ditch.

WINTER Solstice: See *Solstice*.

WITHERNAM, is the taking or driving of a Distress to the Hold, or out of the County, so that the Sheriff cannot upon Replevin make Delivery thereof to the Party distrained: In which Case, a Writ of *Withernam* is directed to the Sheriff for the taking of as many of his Beasts that did thus unlawfully distrain, or as much Goods of his into his keeping, until he hath made Deliverance of the first Distress. Also, if the Beasts be in a Fortlet or Castle, the Sheriff may take with him

the Power of the County, and beat down the Castle.

Witbernam, in some Statutes, seems also to signify an unlawful Distress made by him that has no Right to Distrain.

WITT. Mr. Locke, in his *Essay on Humane Understanding*, B. II. C. XI. Sect. 2. defines *Witt* (and thereby distinguishes it from *Judgment*) to be a quick and ready Assemblage of Ideas; and putting those together with great Facility and Variety in which can be found any Resemblance and Congruity, thereby to make up pleasant Pictures and agreeable Images in the Fancy. Hence it is that Metaphors and Allusions are so generally entertaining and pleasing; because their Beauty appears at first sight, and there is required no Labour and Toil of Thought to examine what Truth or Reason there is in them.

WOOD and *Wood*, a Sea Term of two pieces of Timber; being so let into each other, that the Wood of one joins close to the other.

WORM; is that winding long Pewter Pipe which Apothecaries and Distillers place in a Tub of Water to cool and condense the Vapours in Distillations of Spirits. Formerly, and sometimes now, this Worm, or something like, was placed above the Head of the Still, and then a Refrigeratory at the upper end of it, which is very good to

distil Spirit of Wine, and such fine Spirits. This the Chymists call a Serpentine.

WORMING, at Sea, is laying all along a small Line or Rope betwixt the Shrouds of any Cable or Hawser, in order to strengthen it; or, as the Seamen call it, *Succour it*.

WOULDING, a board a Ship, signifies the winding of Ropes fast about a Yard or Mast that is *fished* (as they call it) in order to make it hold the better.

WREATH, in Heraldry, signifies a Roll of fine Linnen or Silk (like that a Turkish Turbant) consisting of the Colours born in the Escutcheon, which in an Atchievment is placed between the Helmet and the Crest, and which doth immediately support the Crest.

WRECK, is where a Ship has perished on the Sea, and no Man escapes alive out of it. The Civilians term it *Naufragium*. This *Wreck* being made, the Goods that were in the Ship brought to Land by the Waves, belong to the King, or whom he assigns it to. But if a Man, or a Dog, or a Cat escape alive, and that the Party to whom the Goods belong, come within a Year and a Day, and prove the Goods to be his, he shall have them again, by the Provision of the Statute of *Westm. 1. cap. 4.*

WRIGHT'S *Sailing*. See *Mercator's Sailing*.

XEROPHTHALMY, a dry *Ophthalmy*, or Blood-shot of the Eyes, without Weeping, which happens usually in dry Weather. *Blanchard*.

XIPHIAS, according to some, is a sort of Comet, shaped like Swords; the Head being like the Hilt, and the Tail streight and pointed, yet some-

times bending like a Cymiser, but when it is of a lesser, and of a more contracted Form, 'tis like a Knife, or Dagger.

XYPHOIDES, is a pointed Cartilage of the Breast, called *Cartilago Ensisformis*,

XYSTER, is a Surgeons Instrument to shave and scrape Bones with.

YARDS of a Ship, are those long pieces of Timber which are made a little tapering at each End, and are fitted each to its proper Mast to carry the Sails which are fastned to these Yards at their Head, and are hoisted up and let down together with the Yards, by the Halliards.

For the Proportions of the Yards of a Ship, they commonly allow $\frac{1}{2}$ of the Length of her Keel, or $\frac{2}{3}$ of the Length of her Main-mast, for the Length of her Main-yards; and for the Thickness of them, they allow $\frac{1}{2}$ of an Inch for every Yard in Length; the Top-yard is $\frac{2}{3}$ of the Main-yard, and the Fore-yard is $\frac{1}{2}$ of the Main-yard, or as some say $\frac{8}{9}$: The Spritsail-yard and Cross-jack, are of the same Length, viz. $\frac{1}{2}$ the Main-yard; and the Thickness of the Mizen-yard and Spritsail-yard is $\frac{1}{2}$ Inch to a Yard in Length.

All small Yards are half the great Yards from Cleat to Cleat: When a great Yard is down a Port-luff, it gives the Length of all Topsail-sheets, Lifts and Ties, Jeers and Bunt-lines; as also of the Leech-lines and Halliards, measuring from the Hounds to the Deck: And when it is hoisted, it gives the Length of Clew-lines, Braces, Clew-garners, Tackles, Sheets and Bow-lines.

The Terms belonging to the Yards, are, 1. *Top the Yards*; that is, make them hang even. The Clew-lines do most properly Top the Main and Fore-yards; but when the Top-sails are stowed, then the Topsail-sheets will Top them. 2. *Brace the Yard*, i. e. Traverse aft the Yard-Arm, whose Brace is haled. So that *Traverse the Yard*, is the same as to say, *Brace it aft*. 3. *Square the Yards*, i. e. see that they hang right across the Ship, and one Yard-Arm not traversed more than the other.

YARE, is the Sea word for Nimble, Ready, Quick, or Expedition.

YAWES. At Sea, they say a Ship makes *Yawes*, when through the Fault of him at Helm she is not kept steady in her Course, but makes Angles in and out; to prevent which, the Conner cries, *Steady, Steady*, keep her Thus, Thus.

YEAR: The Time the Sun takes to go through the twelve Signs of the Zodiac. This is properly the Natural or Tropical Year, and contains 365 Days, 5 Hours, and 12 Minutes.

The *Sydereal Year*, is that Time in which the Sun departing from any fixed Star, comes to it again; and this is in 365 Days, 6 Hours, and almost 10 Minutes. But according to Sir Isaac Newton's New Theory of the Moon, the *Sydereal Year* is 365 D. 6 H. 9' 14''; and the *Tropical*, 365 D. 5 H. 48' 57''.

The *Civil Year*, which is commonly used by all Nations, is very various, both as to its Beginning, and also as to its Length, according as they follow the Course of the Sun, Moon, or both.

The *Civil Lunar Year* contains 12 Lunations or Synodical Months, and contains but 354 Days: This being 11 Days less than the Solar Year, its Head in about 33 Years will run through all the Months and Seasons of the Year. This kind of Year is now used by the *Turks*, and seems to have had its first Rise in Countries where the Difference

between Summer and Winter is not so sensible as it is with us; and where, for want of Astronomy, they know not how to estimate the Solar Year, and therefore began their Account of Months from the Phases of the Moon. And hence, as the learned Astronomer Dr. Gregory hints, it came to pass, that they began the Account of their Civil Day at Sun-set; for their Day must begin when their Month and Year did, and that was with the New Moon, which being to be determined by view, could not be discovered till after Sun-set.

The *Jews* had their *Secular Year*, which began at the Autumnal Equinox; and their *Sacred Year*, which began at the Vernal one.

The *Egyptians*, *Chaldeans* and *Assyrians*, first measured the Year by the Course of the Sun, which they supposed to contain but 360 Days; afterwards 5 more were added by *Mercury*, which he called *ἑρμηνεύς*, i. e. added; but yet no notice was taken of the 6 Hours; by which means the *Egyptian Year* hath fixed no place in reference to the true Solar Year; but anticipating a Day every four Years, runs quite round in 1460 Years.

This way of reckoning continued till *Egypt* becoming a Province of the *Roman Empire*, they took the *Julian Account*, only they kept the Names of their Months still, and order'd their matter so, that their *Thot*, the first Day of the Year, always happen'd on the 29th of *August* in the *Julian Year*. So that the *Egyptian* or *Coptick Year* is 4 Months and 3 Days before the *Roman Year*, which begins with the Calends of *January*.

The *Persians* account (according to the *Egyptian way*) 365 Days.

The *Arabs*, *Saracens* and *Turks*, count their Year by the Motion of the Moon, and make it consist of 12 Moons or Months, whereof some have 30, and some 29 Days alternately; and these altogether make but 354 Days; so that their Month *Mubarran*, in which they place the Beginning of the Year, is less than 34 Years will run quite round, and be in all Seasons. The *Arabs* indeed, by a Cycle of 30 Years, do remedy this by means of an *Intercalation* or *Embolism* of 11 Days:

The *Greeks* counted their Year by the Motion of both Sun and Moon, and finding that there was 11 Days difference between the Lunar and Solar Year; at first they added an Intercalary Month every two Years, containing 22 Days, which therefore they called *ἑμβολιασίων*, the added or inserted Month. Afterwards considering the 6 Hours also, they put their *Embolism* off till 4 Years end; and then making the 3 first Years to contain 354 Days a-piece, (which is the Lunar Year) this made the 4th Year to have 399 Days. And to make this *Intercalation* the more remarkable, they instituted the *Olympick Games* on every such 4th Year; whence came the Computation by *Olympiads*; each of which contain'd 4 Years.

Nevertheless they found that this would not do in process of Time; and therefore they first reduced the *Intercalation* to 8, and then to 11 Years; but still there was great Confusion, till one *Meto*, a Citizen and famous Astronomer of *Athens*, thought of joining the two last Periods 8 and 11 together;

together; which doing, he made a Period of 19 Years, in which the two Motions of the Sun and Moon are wholly accommodated, and the Moon changes on the same Day of the Month that she did 19 Years before. This Discovery, for its Fulness, was much celebrated, and the Number of the Period 19, the *Athenians* ordered to be set up in a publick Place, and to be written in Characters of Gold; whence it took the Name it still retains, being called the *Golden Number*.

The *Athenians* began their Year at the New Moon after the Summer Solstice; in their Month *Hecatombeon*, as *Plutarch* says.

There were also some Nations who made their Year to consist only of 4, or of but 3 Months, as *Macrobius* tells us in his *Saturnalia*, Lib. 1.

The *Carians* and *Acharnanians*, saith *Justin*, made their Year to consist of 6 Months, and reckoned but 15 Days to their Month.

The *Romans* had three sorts of Years: 1. That of *Romulus*, which contained but 10 Months; from whence the last Month of our Year retains the Name of *December*, as being the Tenth of his. This Year begun in *March*. 2. *Numa Pompilius* his Year; which had *Romulus* his gross Mistake corrected, and two more Months added to it, viz. *January* and *February*; and then it contained only 355 Days, or 12 Lunar Months. 3. The Year of *Julius Caesar*, who discovering that there were 10 Days more than *Numa* reckoned, made the Year 365 Days: And reserving the 6 Hours till every fourth Year, they then made another Day, which was added before the sixth of the Calends of *March*; so that in this fourth Year they accounted the 6th of the Calends of *March* twice; *Bis-sex-to-calendas*, whence came the Word *Bissextile* or Leap-year, as we call it; which hath 366 Days. This Account is now used in *England*, and is the *Julian* or *Old Style*.

But because there was still found an Error in this Calculation, and that the *Equinoxes* did plainly, tho' insensibly recede from the Points where *Caesar* had fixed them; as also, that the Year was discover'd to want about 11 Minutes of 365 Days and 6 Hours; which 11 Minutes will in 131 Years make the *Equinoxes* go back about a Day; *Pope Gregory XIII.* to reform (as he thought) this Error, ordered 10 Days to be taken from the Year, to bring the *Equinoxes* that Year (which was 1582) to *March 21*, and *Sept. 22*, '23. And this is what is called the *Gregorian Account* or *New Style*, as is used by the *Popish Nations* every where.

The *Great Year*, or the *Annus Magnus*, about 25000 or 26000 Years; in which Time the fixed Stars will appear to come to the same Point again, exactly after one entire Revolution.

YEAR and Day, in Law, is a Time that determines a Right in many Cases; and in some Works an Usucaption, in others a Prescription; as in Case of an Estray, if the Owner (Proclamations being made) challenge it not within that Time, it is Forfeited: So is the Year and Day given in case of Appeal, in case of Descent after Entry or Claim, and in case of a Man so bruised and wounded; of Protection, Effoigns in respect of the King's Service; of a Wreck, and divers other Cases. *Co. Vol. 6. Fol. 107.*

YEAR, Day and Waste, is a Part of the King's Prerogative, whereby he challengeth the Profits of their Lands and Tenements for a Year and a Day, that are attainted of Petty Treason, or Felony, whoever is Lord of the Mannor whereto the Lands or Tenements belong; and not only so, but in the End may waste the Tenements, destroy the Houses, root up the Woods, Gardens; Pasture, and plow up the Meadows, except the Lord of the Soil agree with him for Redemption of such Waste, afterwards restoring it to the Lord of the Fee.

YOKE: See *Sea-Yoke*.

ZENITH, or Vertex, is the Point in the Heavens, right over one's head, being necessarily 90 Degrees distant from the Horizon.

ZENITH Distance, is the Complement of the Sun, or Stars Meridian Altitude, or what the Meridian Altitude wants of 90 Degrees.

ZERNA: See *Lichen*.

ZETETICK Method in Mathematicks, is the Analytick, or Algebraick way, whereby the Nature and Reason of the thing is primarily investigated and discovered.

ZEUGMA, is a Figure in Grammar, when an Adjective or Verb, agreeing with a nearer Word, is also by way of Supplement referred to one more remote. Thus, *saith Terence, Utinam aut hic surdus, aut haec muta facta sit.*

ZOCCO: See *Plinius*.

ZOCLE, is a square Member in Architecture, being lower than its Breadth, which serves to support a Pillar, or any other part of a Building, instead of a Base, Plinth, or Pedestal.

Continued Zocle, is a kind of continued Pedestal, on which a Structure is raised, but hath no Base or Cornish.

ZODIACK, is a great Circle of the Sphere, dividing it into two equal Parts, cutting the Equator in the East and West Points of the Horizon. It cuts the Horizon and Equinoctial obliquely; making with the former an Angle equal to the Sun's greatest Meridian-Altitude in any Latitude; and with the Equinoctial, an Angle of 23° 30' Minutes, which is the Sun's greatest Declination.

This is a broad Circle, and through the middle of it is drawn a Line, called the Ecliptick, or *Via solis*, the Way of the Sun, because the Sun never deviates from it in his Annual Motion; as the Planets do all more or less, (whence it hath its Breadth.)

The *Zodiack*, in the Globe, is mark'd with the Characters of the Twelve Signs, and in it is found out the Sun's Place, which is *under what Star or Constellation he appears to be at Noon*.

By this are determined the four Quarters of the Year; and accordingly it is divided into 4 Parts, and as the Sun goes on here, he hath more or less Declination, North and South.

Also from this Circle, the Latitudes of the Planets and fixed Stars are accounted; from the Ecliptick towards its Poles.

And those Poles are 23 Degrees 30 Minutes distant from the Poles of the World, or of the Equinoctial; and by their Motions are the Polar Circles described.

In these Poles all the Circles of Longitude which are drawn through the *Zodiack*, do terminate, (as the Meridians and Hour Circles do in the Poles of the World) and as the Azimuth Circles do in the Zenith and Nadir.

The Breadth of this Circle, or rather Zone in the Heavens, is 20 Degrees, for beyond 10 Degrees North, or 10 Degrees South, the Latitude of no Planet ever reaches.

It seems to have been divided into 12 Parts, (which they call Signs) because while the Sun in a

Years time is running thro' the *Zodiack* or Ecliptick, there happen to be 12 Lunations: Or the Moon undergoes all her Changes and Phases, 12 times, pretty near. Each Sign is divided into 30 Degrees, so that the whole makes 360: And they begin to reckon at the Eastern Interfection of the Equinoctial and Ecliptick; or at the Vernal Equinox, where they place the first Point of *Aries*; going on thence to *Taurus*, *Gemini*, *Cancer*, &c. and when you count thus forward on according to the usual Order and Course of the Signs, they call it, *in consequentia*, but if you count backwards from *Taurus* to *Aries*, &c. they say, 'tis *in Antecedentia*.

The Reason of the Name of this Circle, and its Origin, was this.

The ancient Astronomers observed the Sun in his (apparent) annual Motion to describe always one and the same Line or Track in the Heavens, and never to deviate from this Path either to the North or the South, as all the other Planets, they found, did more or less. And because they observed the Sun to shift as it were backwards, thro' all the Parts of this Circle or Path, so that in his whole Years Course, he would Rise, Culminate, and Set with every Point of it, they distinguished the fixed Stars which appeared in or near this Circle into 12 Constellations or Divisions, which they called Signs, because they were Marks to distinguish whereabouts the Sun was. These Signs they painted usually in the Form of Animals, and thence came the word *Zodiack*; and the very middle Line of it is called the Ecliptick, because the Eclipses only happen when the Moon also is in that Line.

ZODIACK of the Comets; *Cassini* hath observed a certain Tract in the Heavens, within whose Bounds (by many Observations) he hath found most Comets, tho' not all, to keep. This he makes as broad as the other *Zodiack*, and marks it with Signs or Constellations like that, which are *Antinous*, *Pegasus*, *Andromeda*, *Taurus*, *Orion* the lesser Dog, *Hydra*, the Centaure, *Scorpion*, and *Sagittary*.

ZONE, in Geography, is a Space contained between two Parallels; of these Zones there are five commonly reckon'd, viz. two Frozen, two Temperate, and one Burning Zone.

The *Frozen Zones*, are those Parts of the Globe comprehended between the Pole and the Polar Circle; therefore one must be towards the North, the other towards the South: The *Frozen*, or *Frigid Zone*, towards the North, lying between the North Polar Circle, and the North Pole, contains part of *Iceland*, and *Norway*, *Lapland*, *Finmark*, *Samojeda*, *Nova-Zembla*, *Greenland*, and some other Parts of *North America*. The *Frigid Zone*, toward the South, lying between the South Polar Circle, and the South Pole, is not yet known whether it contains Land or Water.

The *Temperate Zones* are one on the North side of the Equator between the Arctick Circle, and the Tropic of *Cancer*; another on the South side between the Tropic of *Capricorn*, and the Antartick Circle.

Z Y G

Z Y M

Torrid Zone, or *Burning Zone*, contains all that Space of Earth that lieth between the two Tropicks.

ZOOGRAPHY, is a Description of the Nature and Properties of Animal Bodies, such as Beasts, Birds, Fishes, Insects, &c.

ZOOTOMY, is an Artificial Dissection of Brute-Animals, as *Androtomy* is of the Bodies of Men.

ZUGOMATICUS, is a Muscle of the Face, so called by *Riolan*, because it arises from the *Os Fugale*, or *Zugoma*. Its Origination is round and fleshy from the external Part of the said Bone; whence descending obliquely forwards, is inserted near the Angle of the Lips. Whence the Muscle and its Partner act, they draw both Lips upwards, and make a pleasant Countenance.

ZYGOMA, or *Os Mali*, is one of the Bones of

the Upper Jaw, it is of a triangular Figure; on the upper part it joins to the *Os Sphenoides*, on the lower to the *Os Maxillare*; its external part hath a long Process, called *Processus Zygomaticus*; it joins with the *Os Frontis*, at the Corner of the Eye.

ZYGOMATICUM, are Muscles which draw both Lips obliquely to either side, and are otherwise called *Fugale*.

ZYMOMA, is any Ferment, as the Nitrous Air, the Watry Juice in the Mouth, the Acid Liquor in the Stomach, the Blood in the Spleen, &c. *Blanchard*.

ZYMOSIMETRE, is an Instrument whereby the Degree of the Fermentation arising from the mixture of divers Liquors, is measured; or the Temperament or Degree of Heat in the Blood of Animals, &c.

ZYMOSIS: See *Fermentation*.

F I N I S.
